ENCYCLOPÆDIA BRITANNICA.

Electricity || Electrometer.

ELECTRICITY, MEDICAL. See MATERIA MEDICA.

ELECTRIDES, anciently iſlands in the Adriatic ſea, which received their name from the quantity of amber (*electrum*) which they produced. They were at the mouth of the Po, according to Apollonius of Rhodes; but ſome hiſtorians doubt of their exiſtence.

ELECTROMETER. In various parts of the article ELECTRICITY, we have deſcribed a great variety of inſtruments for aſcertaining the preſence of electricity, and meaſuring its quantity or proportion.

But there are ſeveral inſtruments of this kind that have not been deſcribed in that article; and as they are well deſerving a place in this work, either from the ingenuity of their conſtruction, the reputation of their inventors, or the intrinſic value of the inſtruments themſelves, we ſhall give an account of them here.

Fig. 1. Plate CC. is a geometrical repreſentation of Mr Cavallo's improved atmoſpherical electrometer, of half its real ſize. The principal part of this inſtrument is a glaſs tube CDMN, cemented at the bottom into the wooden piece AB, by which part the inſtrument is to be held when uſed for the atmoſphere; and it alſo ſerves to ſcrew the inſtrument into its wooden caſe ABO, fig. 2. when it is not to be uſed. The upper part of the tube CDMN, is ſhaped tapering to a ſmaller extremity, which is entirely covered with ſealing-wax, melted by heat, and not diſſolved in ſpirits. Into this tapering part a ſmall tube is cemented, the lower extremity G of which being alſo covered with ſealing wax, projects a ſhort way within the tube CDMN. Into this ſmaller tube a wire is cemented, which with its lower extremity touches the flat piece of ivory H, faſtened to the tube by means of cork; the upper extremity of the wire projects about a quarter of an inch above the tube, and ſcrews into the braſs cap EF, which cap is open at the bottom, and ſerves to defend the waxed part of the inſtrument from the rain, &c. In fig. 3. a ſection of this braſs cap is repreſented, in order to ſhew its internal ſhape, and the manner in which it is ſcrewed to the wire, projecting above the tube L. The ſmall tube L, and the upper extremity of the large tube CDMN, appear like one continued piece, on account of the ſealing-wax, which covers them both. The conical corks P of this electrometer, which by their repulſion ſhow the electricity, &c. are as ſmall as

can conveniently be made, and they are ſuſpended by exceedingly fine ſilver wires. Theſe wires are ſhaped in a ring at the top, by which they hang very looſely on the flat piece of ivory H, which has two holes for that purpoſe. By this method of ſuſpenſion, which is applicable to every ſort of electrometer, the friction is leſſened almoſt to nothing, and thence the inſtrument is ſenſible of a very ſmall degree of electricity. IM, and KN, are two narrow ſlips of tin-foil, ſtuck to the inſide of the glaſs CDMN, and communicating with the wooden bottom AB; they ſerve to convey off that electricity, which, when the corks touch the glaſs, is communicated to it, and being accumulated, might diſturb the free motion of the corks. Electrometer.

In regard to its uſe, this inſtrument may ſerve to obſerve the artificial, as well as the atmoſpherical electricity. When it is to be uſed for artificial electricity, this electrometer is ſet upon a table or other convenient ſupport; then it is electrified by touching the braſs cap EF with an electrified body, which electricity will ſometimes be preſerved for more than an hour. Mr Cavallo had one of theſe electrometers which would remain electrical for more than twelve hours, though in a room without a fire. If in an electrified ſtate, any electrified ſubſtance be brought near the cap EF, the corks of the electrometer, by their converging, or by increaſing their divergency, will ſhew the ſpecies of that body's electricity.

It is neceſſary to remark, that to communicate any electricity to this electrometer, by means of an excited electric, e. g. a piece of ſealing-wax, (which we ſuppoſe is always negatively electrified), is not very readily done in the uſual manner, on account of the cap EF being well rounded, and free from points or ſharp edges. By the approach of the wax, the electrometer will be cauſed to diverge; but as ſoon as the wax is removed, the wires immediately collapſe. The beſt method to electrify it, is to bring the excited wax ſo near the cap, that one or both the corks may touch the ſide of the bottle CDMN; after which, they will ſoon collapſe and appear unelectrified: if now the wax be moved, they will again diverge, and remain electrified poſitively.

When this inſtrument is to be uſed to try the electricity of the fogs, the air, the clouds, &c. the obſerver is to do nothing more than to unſcrew it from its caſe, and, holding it by the bottom AB, to preſent it to the

Electrometer.

open air, a little above his head, ſo that he may conveniently ſee the corks P, which will immediately diverge if there be any ſufficient quantity of electricity; whoſe nature, i. e. whether poſitive or negative, may be aſcertained by bringing an excited piece of ſealing-wax, or other electric, towards the braſs cap EF.

It is perhaps unneceſſary to remark, that this obſervation muſt be made in an open place, as the roads out oftown, the fields, the top of a houſe, &c.

The principal advantages of this electrometer, as ſtated by Mr Cavallo, are as follow.

1. The ſmallneſs of its ſize. Mr Cavallo made one ſo ſmall, that its caſe, which was of braſs, meaſured only three inches and a half in length, and nine tenths of an inch in diameter, and yet it acted perfectly well.

2. Its being always ready for experiments, without fear of entangling the threads, or having an equivocal reſult by the ſluggiſhneſs of its motion.

3. Its not being diſturbed by wind or rain.

4. Its great ſenſibility; and

5. Its keeping the communicated electricity longer than any other electrometer.

II. *Sauſſure's* ELECTROMETER. M. de Sauſſure's electrometer, with which he made the obſervations on atmoſpherical electricity, that have been related in the ſecond chapter of Part V. of the article ELECTRICITY, and is repreſented at fig. 4. is much the ſame with that of Mr Cavallo above deſcribed. The following are the moſt material circumſtances in which they differ: Firſt, the fine wires, by which the balls are ſuſpended, ſhould not be long enough to reach the tin-foil which is paſted on the inſide of the glaſs, becauſe the electricity, when ſtrong, will cauſe them to touch this tin-foil twice conſecutively, and thus deprive them in a moment of their electricity. To prevent this defect, and yet give them a ſufficient degree of motion, it is neceſſary to uſe larger glaſſes than thoſe that are generally applied to Mr Cavallo's electrometer; two or three inches diameter will be found to anſwer the purpoſe very well. But as it is neceſſary to carry off the electricity which may be communicated to the inſide of the glaſs, and thus be confounded with that which belongs to thoſe ſubſtances that are under examination; four pieces of tin-foil ſhould be paſted on the inſide of the glaſs; the balls ſhould not be more than one-twentieth of an inch diameter, ſuſpended by ſilver wires, moving freely in holes nicely rounded. The bottom of the electrometer ſhould be of metal; for this renders it more eaſy to deprive it of any acquired electricity, by touching the bottom and top at the ſame time.

In order to collect a great quantity of electricity from the air, the electrometer is furniſhed with a pointed wire, 15 inches or two feet long, which unſcrews in three or four pieces, to render the inſtrument more portable; ſee fig. 4. When it rains or ſnows, the ſmall parapluie, fig. 5. is to be ſcrewed on the top of the inſtrument, as by this its inſulation is preſerved, notwithſtanding the rain.

This inſtrument indicates not only the electricity of fogs, but that alſo of ſerene weather, and enables us to diſcover the kind of electricity which reigns in the atmoſphere; and to a certain degree, to form an eſtimate of its quantity, and that under two different points of view, the degree of intenſity, and the diſtance from the earth at which it firſt begins to be ſenſible. Electrometer.

A conductor raiſed for the purpoſe of making obſervation on atmoſpherical electricity will be found to exhibit ſigns of electricity, only when the electric fluid is more or leſs condenſed in the air, than in the earth. Though the air reſiſts the paſſage of the electric fluid, it is not abſolutely impermeable to it; it ſuffers it to paſs gradually, and generally with more eaſe in proportion as its maſs or thickneſs is leſs. It is therefore intereſting to diſcover at what height it is neceſſary to be elevated, in order to find a ſenſible difference between the electricity of the earth, and that of the air. A very ſenſible difference may be generally diſcovered by this inſtrument, at the diſtance of four or five feet from the ground; ſometimes it may be ſeen if the inſtrument is placed even on the ground; while at others, it muſt be raiſed ſeven or more feet before the balls will open; ſometimes, though ſeldom, this height is not ſufficient. This diſtance is generally greateſt when the electricity is ſtrongeſt, though neceſſarily modified by a variety of circumſtances, ſome of which are known, as the degree of dryneſs or humidity of the air, and others are unknown.

The degree of intenſity, at a given height, may be diſcovered thus; raiſe the electrometer, and judge by the diviſions which are placed on the edge of it, the degree of their divergence. To find the relation between this degree of divergence, and the force of the electricity, M. de Sauſſure took the following method: As he could not with certainty double or triple a given quantity of electricity; yet as a given force may be reduced one half, a fourth or eighth, &c. by dividing between two equal and ſimilar bodies, the electricity contained in one; he took two of his unarmed electrometers, which were as ſimilar as poſſible, and electrified one of them, ſo that the balls ſeparated preciſely ſix lines; he then touched the top thereof by the top of that which was not electrified; in an inſtant the electricity was equally divided between them, as was evident by the divergence of the balls, which was four lines in each; conſequently a diminution of half the denſity had only leſſened the divergence one-third. One of theſe electrometers was then deprived of its electricity, and was afterwards brought in contact with the other, as before; the remaining electricity divided itſelf again between them, and the balls fell from four to twenty-eight lines, nearly in the ſame proportion as before; in the third operation they fell to nineteen; in the fourth to one, where he was obliged to ſtop, as there was not now ſufficient force in the fluid to paſs from one electrometer to the other, and diſtribute itſelf uniformly between them. The ſame experiment, repeated ſeveral times, gave very nearly the ſame reſults. Negative electricity decreaſed alſo in the ſame proportion as the poſitive. The following table may therefore be conſidered as giving a general, though not exact idea of the increaſe in force, which correſponds to different degrees of divergence in the balls; it is only calculated to every fourth of a line; the force of electricity is always expreſſed by whole numbers, as it would be ridiculous to put a greater degree of exactneſs in the numbers than is to be found in the experiments which form the baſes of the calculation.

Thoſe who are deſirous to carry this meaſure of the electric force further, may do it by having ſimilar electrometers conſtructed, but made upon a larger ſcale, and with heavier balls, which would only ſeparate one line, with the degree of electricity that makes the ſmaller ones diverge ſix lines; theſe would conſequently meaſure a force 1024 times greater than that which forms the unity of the preceding table; and thus by degrees we may be enabled to diſcover the ratio of the ſtrongeſt diſcharge of a great battery, or perhaps even of thunder itſelf, to that of a piece of amber, which only attracts a bit of ſtraw or any other light ſubſtance.

In order to obſerve the electricity of the atmoſphere with this inſtrument, we muſt firſt bring the electric fluid contained in the electrometer to the ſame degree of denſity with that at the ſurface of the earth; this is eaſily done by letting the bottom and top touch the ground at the ſame time; then raiſe the point, keeping the bottom ſtill in contact with the ground, from whence it may be lifted up in a vertical poſition till the balls are level with the eye.

The ſecond circumſtance is to render the divergence of the balls, which is occaſioned by the electricity of the air permanent. This is effected by touching the top of the electrometer with the finger; but here the acquired electricity becomes contrary to that of the body by which they are electrified. Let us ſuppoſe, for example, that the electrometer is at five feet from the ground, and the balls diverging; touch the top of the electrometer with the finger, and the balls will cloſe; but they will again open, if the electrometer is withdrawn from the influence of the electricity of the air, by being brought nearer the ground, or into the houſe. M. Sauſſure only employed this method when the electricity was ſo weak that he could not perceive any untill the electrometer was raiſed conſiderably above his eye: as in this caſe he could not perceive the divergence of the balls, he always endeavoured to obtain a permanent electricity in the foregoing manner. Electrometer.

The following example will render the uſe of the foregoing obſervations more familiar. Chooſe an open ſituation free from trees and houſes, ſcrew the conductor on the top of the electrometer, lay hold of it by its baſe, and place it ſo that the baſe and conductor may touch the ground at the ſame time; then elevate it to the height of the eye, and obſerve the quantity of lines, or fourths of a line, that the balls have diverged; now lower it till the balls almoſt touch each other, and obſerve at what diſtance the top of the conductor is from the ground; and this is the height from the ground at which the electricity of the air begins to be ſenſible. If the electricity of the air is ſufficiently ſtrong to make the balls diverge when it ſtands upon the ground, one of the lengths of the electrometer muſt be unſcrewed from it. If the balls, however, ſtill diverge, the other parts of the conductor ſhould alſo be unſcrewed, and you may mark down, that the electricity is ſenſible at zero, or on the ſurface of the earth. If, on the contrary, the electricity is ſo weak, as not to cauſe the balls to diverge when they are even with the eye, and conſequently when the conductor is two feet higher, or ſeven feet from the ground, you ſhould then raiſe it a foot higher; while it is thus elevated, touch the top with the other hand; when this hand is taken away, lower the electrometer, and if it is electrified, you may ſay the electricity is ſenſible at eight feet; if it is not, raiſe it as high as the arm can reach, and repeat the ſame operation; if any electricity is found, write down electricity ſenſible at nine feet; if not, mark 0, or no electricity relative to this inſtrument, and this mode of employing it; for ſigns of electricity may ſtill be obtained, by throwing a metallic ball 50 or 60 feet into the air, which is at the ſame time connected with the electrometer by a metallic thread.

One advantage of this inſtrument is, that it will often exhibit ſigns of electricity when none can be obtained from a conductor of 100 feet in height, becauſe it can more eaſily be preſerved from humidity, &c. which will deſtroy the inſulation of the large conductors.

This electrometer may be uſed inſtead of the condenſer of M. Volta, by only placing it on a piece of oiled ſilk, ſomewhat larger than the baſe of the inſtrument; but in this caſe, it is the baſe, and not the top of the inſtrument, which muſt be brought into contact with the ſubſtance whoſe electricity is to be explored.

It is eaſy to diſcover alſo by this inſtrument, the electricity of any ſubſtance, as of cloths, hair of different animals, &c. For this purpoſe, it muſt be held by the baſe, and the ſubſtance rubbed briſkly (only once) by the ball of the electrometer; the kind of electricity may be aſcertained in the uſual manner. It is proper, however, to obſerve here, that as the top of the electrometer acts in this caſe as an inſulated rubber, the electricity it acquires is always contrary to that of the rubbed body.

III. *Cadet's* ELECTROMETER, is thus deſcribed by the author, as tranſlated in Nicholſon's Journal.

Fig. 6. In a glaſs tube A, 18 or 20 inches long, is incloſed another ſhorter tube X, ſealed at both ends. This tube contains a graduated ſcale: one of the ends of theſe two tubes is cemented in a handle of turned

Electrometer. wood, C, by which it is held in the hand; the other end is closed by a brass cap, D; the distance between the extremities of the small tube and that of the large one is filled with red wax, B, B; on the cap D is screwed at pleasure, either a ring E, or a brass hook F. The ring is used for applying the instrument to the ball of a conductor, and the hook when it is hung to a ring: on the cap D is a brass stem G, terminating by a knob. This stem is bended, and the extremity of its knob must be directly beneath the line with which the graduated scale of the small tube commences.

Round the large tube is a brass ring H, half of which extends to the length of twelve or fifteen lines, in the form of a half tube P, applied against the sides of the tube. This gutter serves to mark the degrees, by sliding along the graduated scale by means of a button beneath I. On the ring H is fixed one of the small electrometers invented by Sauſſure, K, K, which is surmounted by a stem V, on which stem is fixed at pleasure either a point L, or a ball M, of the same size as that which terminates the stem G, opposite which it is placed. The extremity of this point or ball must be placed immediately over the extremity of the half tube or scale P, and horizontally to the centre of the ball, which terminates the stem G.

At the top of Sauſſure's electrometer is a small ring N, which serves to connect it with the chain Z when required.

To explain the use of this instrument by a single experiment, charge a Leyden jar, till the spontaneous overflowing announces it to be saturated. Then place the ring E on the knob of this bottle, and cause the electrometer of Sauſſure, armed with its point, to slide towards it. Observe the degree at which the divergence of the thread stream commences, and at that instant suppress the point, and adapt in its place the ball M. Continue to advance the electrometer of Sauſſure till the electric pressure of the atmosphere in the jar causes the threads to diverge; again observe the degrees, replace the point L, and close the shutters of the room; then continue to advance the electrometer till the luminous point appears, which again affords new degrees. Lastly, replace the ball M, and fix the chain Z to the small ring N; cause it to communicate with the exterior coating of the jar, and advance the electrometer till the explosion takes place. Then comparing the different degrees, we may ascertain the comparative difference between the respective methods.

As soon as these relative proportions have been once accurately ascertained by attentive observations, one of those methods alone will be sufficient for measuring the intensity of electricity; and, in fact, if the body intended to be submitted to examination be little charged with the electric fluid, the diverging of the threads, by means of the point, will fix the limits of the electric atmosphere: if it be more, the pressure of the atmosphere on the ball M, which is substituted for the point, will indicate this quantity. In short, if the body be loaded with a considerable mass of electric matter, it will be shown by the luminous point. If a Leyden jar, instead of being positively, is negatively electrified, the point indicates it at the same time that it measures the electric atmosphere, for instead of a luminous point, a star will be observed upon the ball of the jar, and another at the end of the point. Electrometer.

Let us now apply this electrometer to useful observations,

In order to connect the idea of a determinate quantity of fluid to each degree of the electrometer, it is necessary to compare these degrees with the known quantities. Suppose for instance we have a jar, the coating of which is six inches square; electrify it till a spontaneous discharge takes place, and remark, by means of Henly's electrometer, at what degree this discharge is effected. Again, electrify the jar, till it is nearly saturated, and measuring with this electrometer, observe, that the luminous point appears for instance at two degrees; then say, that when the electrometer, applied to an electrified body, marks two degrees, the body contains six inches square of electricity. Repeat this experiment with a plate of glass, the coating of which is seven, eight, ten, or twelve square inches, and we may form a scale of proportion, which is of the greatest utility in accurate experiments.

"In endeavouring to ascertain some of these propositions, (says M. Cadet), I have made an observation which has convinced me of the utility of my electrometer in discovering the capacity of electric apparatus. Having taken a jar from an electric battery, I electrified it, and measured it with a point which I passed along a string of silk; on observing the distance at which the luminous point appeared, I joined this jar to another of the same size, and imagined that by doubling the quantity of matter, the measure I had taken would also be doubled; on the contrary, however, the latter measure was not more than about one-third of the former: I then added a third bottle; and still obtained nearly the same result; whence the following proposition appears to be established; namely, that the extent of the electric atmosphere is in an inverse ratio to the quantity of fluid accumulated. Another observation which I have several times made, on measuring the electric atmosphere of a conductor, is, that the limits of this atmosphere form an elliptic figure around the body, nearly similar to that represented at fig. 7.

"This doubtless arises from the electrified body suspended in a chamber, being nearer to the earth than the ceiling; but it would be a curious experiment to measure it at an equal distance from every attracting body, in order to observe whether the fluid has not really a tendency to descend towards the earth, rather than in any other direction. It is my intention to repeat this experiment, as I consider it of great importance to ascertain whether electricity gravitates towards the globe.

"From these first attempts, I conceive my electrometer would be well adapted for measuring the absolute capacity of Leyden jars, and also their capacity with regard to their size, or to the quality of the glass of which they are constructed; for the latter, by its greater or less density, absorbs a greater or less quantity of fluid."

IV. *Lawſon's* ELECTROMETER. This is a simplified improvement on Brooke's steelyard electrometer, and should have been described when that instrument was mentioned, instead of Mr Adams's; but it did not occur to us till after that sheet was printed.

The

Electrometer.

The following account is given of this electrometer, in a letter from Mr Lawſon to the editor of the Philoſophical Magazine.

"Some time ago it ſtruck me that ſome additions to Brooke's electrometer might be made, ſo as to fit it for a good diſcharging electrometer to meaſure the repulſion between two balls (of a certain ſize) in grains, and alſo effect the diſcharge of a battery at the ſame time. The inſtrument known by the name of Cuthbertſon's diſcharging electrometer, (See ELECTRICITY, N° 203.) was at that time the beſt, and indeed the only inſtrument for diſcharging batteries or jars by its own action, then made; but I think this will be found, in the eſſentials, and in the theory and uſe, a more perfect inſtrument.

"On the baſis (fig. 8.) is fixed the glaſs pillar G, ſupporting the hollow braſs ball B. I is a light graduated braſs tube, divided (from the weight W towards the ball B) into thirty parts, repreſenting grains. W is a ſliding weight. L, a light braſs ball ſcrewed to the end of the tube I. On the other end of which tube adjuſts the heavy counter-balance ball C, the tube I and its two balls being ſuſpended at their common centre of gravity by a ſilk line in the centre of the ball B, the mechaniſm of which is ſhewn in fig. 9. The braſs ball F is ſtationary, and of the ſame ſize as the ball L; and is fixed by, and adjuſts cloſe to, the ball L, or at any lower ſtation between that and the ring *r*. The braſs tube to which the ball A is fixed is divided into inches, halves, and quarters: (a more minute diviſion is unneceſſary and improper). The diviſions begin, or the line o is marked on the ſaid tube at the ring *r*, when the three balls A, L, F, are cloſe together. The ring *r* ſerves as an index, as the diviſions paſs in ſucceſſion into the glaſs tube P on lowering the ball A. The hook H is ſcrewed into the baſe of P. The quadrant, or Henly's electrometer, Q, is ſupported in a long braſs ſtem, to keep it out of the atmoſphere of the lower part of the inſtrument. Fig. 9. ſhows the internal conſtruction of the ball B, fig. 8. In the firſt place the ball ſcrews in half, horizontally. The light tube I paſſes through the ball, and is ſuſpended nearly in the centre of it by ſome ſilk twiſt, *s*, which ſmall ſilk twiſt is fixed into the eye of the adjuſting wire, *a*, part of which wire is filed ſquare and goes through the ſquare hole *b*. The nut *n* ſcrews on *a*, and ſerves to adjuſt the light tube I vertically. The light plates PP are of copper, and move freely on the wire *w w* ſomewhat like a hinge, and reſt on the copper wires CC, ſerving to make the direct communication between the inſide and out of the battery or jar. NN are notches ſerving to let the tube I deſcend when the diſcharge is made. Into the tube Z the glaſs pillar is ground. Note, that at the bottom of the notch N is a piece of braſs filled with a Y, and ſo placed as to keep the centres of the balls L and F, fig. 8. under each other when they come cloſe together.

"When the inſtrument is adjuſted, which is done by placing the weight W, fig 8. at o on the line of grains, and then ſcrewing or unſcrewing the counterbalance ball C, till the tube I riſes ſlowly into its horizontal poſition; then ſet the ball A at the diſtance from the ball L that you chooſe, and the weight W placed at the diviſion or number of grains that you wiſh the repulſive power of the electricity to arrive at before the diſcharge is made: this being done, connect the battery or jar with the ball B, by means of the wire *y*, the end of which goes into B at the hole X, and ſhould ſtand at right angles to B, the ball of *y* reſting on the battery: then connect the outſide of the battery or jar with the hook H. As the battery charges, the electrometer Q continues to riſe; and when it is ſo highly charged that the repulſive power between the balls L and F is equal to the number of grains at which the weight W was placed, the ball L will deſcend, and deliver the charge of the battery to the ball A. The ſubſtance or thing through which the ſhock is intended to be paſſed, muſt form part of the communication between the hook H and the outſide of the battery or jar."

Electrometer.

V. *Hauch's* ELECTROMETER. Fig. 10. contains a repreſentation of this electrometer, and the different parts of which it conſiſts. OP is a board of dry mahogany, twelve inches in length and four in breadth, which ſerves as a ſtand for the inſtrument. In this board are faſtened two maſſy glaſs pillars, M and N, which ſupport the two braſs caps or rings GG, with the two forks of tempered ſteel KK ſcrewed into them. The two rings GG are well covered with varniſh.

In the ring is faſtened a braſs rod, which terminates in a ball E of the ſame metal, and an inch in diameter. The length of the rod and ball together is four inches and a half.

A very delicate beam AB, the arms of which are of unequal length, moves on a ſharp triangular axis (a knife edge) of well tempered ſteel, on the fork K of the pillar M. It is ſeventeen inches in length, and ſo conſtructed that the ſhort arm forms a third, and the long one two-thirds of the whole beam. The ſhort arm of braſs furniſhed with the ball B, exactly of the ſame ſize as the ball E, is divided into forty five parts-equivalent to grains. The long arm A is of glaſs covered with copal varniſh, and ends in an ivory ball A, into which is fitted an ivory hook R, deſtined to ſupport the ivory ſcale H. In order to render the inſulation more complete, this ſcale is ſuſpended by three hairs.

A very delicate beam CD, eleven inches in length, moves on an axis like the former, on the pillar N, though not here ſhewn. This beam is proportioned in the ſame manner, one arm being a third and the other two thirds of the whole length. The long arm of braſs is furniſhed at the end with a ball D, and divided into thirty parts correſponding to grains. The ſhort arm of glaſs terminates in a long roundiſh plate C, covered with copal varniſh. The ſteel forks are ſhewn by the ſections of the two braſs caps FF, as are alſo the two knife edges L, L. By theſe caps the eſcape of the electric matter is partly prevented.

A braſs ring Q, capable of being moved along the ſhort arm of the upper beam AB, ſhews by means of marks determined by trial and cut out on the beam, the number of grains which muſt be placed in the ſmall ſcale to reſtore the equilibrium of the beam, at each diſtance of the ring Q from the point of ſuſpenſion.

On the long arm CD of the lower beam there is alſo a moveable ring S, which, like the ring Q, ſhews in grains, by its diſtance from the point of ſuſpenſion, the power requiſite to overcome the preponderance of LD in regard to LC.

The power neceſſary for this purpoſe will be found, if the

Electrometer.

the ſhell H, which weighs exactly fourteen grains, be ſuffered to ſink down on the glaſs plate C, and the ring *s* be puſhed forwards till both the arms of the beam are in equilibrium. The part of the beam on which the ring *s* has moved, is divided into fourteen parts, ſo that 0 marks the place where the ring *s* muſt ſtand when the beam, in its free ſtate, is in equilibrium; and 14 ſtands at the place where the ring *s* again reſtores a perfect equilibrium when the ſhell H is laid on the glaſs plate C. Each of theſe parts, which are divided into quarters, indicates a grain. The lower diviſions of the ſcale will be found with more accuracy, if quarters of a grain be put, in ſucceſſion, into the ſhell H (after it has been laid on the plate C), and the ring *s* be moved between each quarter of a grain until the perfect equilibrium be reſtored. This place on the beam is then to be marked, and you may continue in this manner until the 30th part of a grain be given. Both ſcales, for the ſake of diſtinctneſs, are divided only ſo low as quarters of a grain; though the inſtrument is ſo delicate, and muſt abſolutely be ſo, that 1-20th of a grain is ſufficient to deſtroy the equilibrium.

The two glaſs pillars M and N, together with the ſteel forks affixed to them, are ſo fitted into the ſtand that both the beams lie parallel to each other as well as to the rod GE. In this poſition of the beams AB, the balls B and E are juſt in contact. The ſmalleſt glaſs pillar N is of ſuch a height that the ball of the beam CD ſtands at the diſtance of exactly four lines from the ring G, and cannot move without touching the latter. The ſmall ſhell H is ſuſpended in ſuch a manner that there is a diſtance of exactly two lines between it and the ſhell C. In each of the braſs rings GG is a ſmall hole, that the inſtrument may be connected with the two ſides of an electric jar. I is a braſs wire, with a hollow bit of ivory, *a*, deſtined to ſupport the beam CD, which is neceſſarily preponderate at D, in order to prevent oſcillation between the diſcharges to be examined by the inſtrument.

It may be readily comprehended that, when the beam AB has moved, A muſt paſs over twice the ſpace that B does; and that in the beam CD, the caſe is the ſame in regard to C and D. If AB be therefore connected with the external, and CD with the internal ſide of a battery, but in ſuch a manner that the inſtrument is at a ſufficient diſtance beyond the electric atmoſphere; and if the battery be charged, the repulſive effect of the electric power will oblige the ball B to ſeparate from the ball E; the ſhell L muſt therefore naturally ſink down with double velocity, ſo that when the ball B riſes a line, the ſhell H muſt ſink two: when it reaches this depth it will touch the ſhell C, and the latter, by the power excited in it, will be obliged to ſink, by which D muſt naturally again aſcend in a double proportion to the ſinking of C; ſo that when C has fallen two lines, D muſt have aſcended four, and D that moment touches the ring by which the two ſides of the battery are connected with each other, and diſcharges the battery.

But as the attractive electric power between unlike atmoſpheres, under like circumſtances, is at leaſt as ſtrong as its repulſive power between like atmoſpheres, it would thence follow, that the electric power, inſtead of repelling the ball B from the ball E, would rather attract D, and by its contact with G, promote the diſcharging; by which the inſtrument would fail of its object, and be ſubjected to the temperature of the atmoſphere like all other electrometers; and, beſides this, the electric power could no longer be determined by weight. To obviate this inconvenience, the inſtrument, in all electrical experiments, muſt be applied in ſuch a manner that the power with which the ball D is attracted by AB may exceed in ſtrength the power required to repel the ball B from the ball E. For this purpoſe the ring *s* muſt always be removed two diviſions farther on CD, towards D, than the ring Q is ſhifted on AB towards B. If, for example, an electric force were required equal to eight grains, according to this electrometer, the ring Q muſt be removed to the place where 8 ſtands, and the ring *s* to the place marked 10. The repulſive power will then naturally repel the balls B and E before G is in a condition to attract the ball D, as a power of two grains would be neceſſary for this purpoſe, beſides that of the eight already in action. The ſhell H with its weight of fourteen grains, will eaſily overcome the preponderance of LD or LC, as it amounts only to ten grains, and therefore nothing exiſts that can impede the diſcharging.

Electrometer.

When the ring 1, according to the required power, is removed ſo far towards D, that the ſhell H is not able by its weight to deſtroy the preponderance of LD in regard to LC, the active power of the ſhell H muſt be ſo far increaſed by the addition of weights, that it can act with a preponderance of four grains on the plate C. If, for example, an electric power of 14 grains be required, the ring 1 muſt be removed to 16, by which LD reſts upon *a*, with a preponderance of 16 grains in regard to LC. Now, to make H act on the plate C with a preponderance of four grains, it muſt be increaſed to 20 grains, that is, ſix grains weight more muſt be added, as it weighs only 14; which ſix grains are again laid upon LB; and therefore the ring Q is ſhifted to 20, as the ſtrength of the repulſive power is pointed out by 14 grains.

If an electric power of 25 grains be required, the ring *s* muſt be removed to 27, and the weight of 17 grains be put into the ſhell H, in order to produce a preponderance of four grains in regard to *s*. Theſe 17 grains are added to the required power of 25 grains, and the ring Q is puſhed to 42, &c. In this manner the repulſive power always acts before the attractive power can.

It may be readily perceived that the faults and inconveniences common to all the electrometers hitherto employed, and which have been already mentioned, cannot take place here; becauſe the diſcharging is performed by immediate connection between the poſitive and negative electricity in the inſtrument itſelf, without any external means being employed.

One of the moſt eſſential advantages of this inſtrument is, the certainty with which the ſame reſult may be expected when the experiment is repeated. From the ſame degree of electric power, whatever be the temperature of the atmoſphere, it will always be neceſſary to commence the ſeparation of the two balls B and E from each other, the quantity of coated glaſs and the diſtance of the ring Q from the axis L being the ſame.

Another no leſs important advantage of this inſtrument is, that in an experiment where the ſame electric

power,

Electrometer.

power, often repeated, is neceſſary to aſcertain the reſult with accuracy; ſuch, for example, as the charging a battery through acids, water, &c.; the ſame degree of precaution is not neceſſary as is indiſpenſibly ſo in any other electrometer, as the perſon who puts the machine in motion has nothing to do but to count how often the electrometer diſcharges itſelf; and the inſtrument may be incloſed in a glaſs caſe, or prevented in any other manner from external contact, or any other circumſtances which might render the experiment uncertain.

"I flatter myſelf (ſays M. Hauch), that the ſimplicity of the conſtruction of this inſtrument, the facility with which it may be made at a very ſmall expence, and the certainty that two inſtruments, prepared according to the ſame ſcale, with a like quantity of coated glaſs, muſt exactly correſpond with each other, but above all, that the certainty and accuracy by which experiments may be made with it, and by theſe means be accurately deſcribed, are advantages which will not be found united in any of the electrometers hitherto invented*".

* *Phil. Magaz.* vol. iv.

We ſhall cloſe this account of electrometers with deſcribing the conſtruction and uſe of M. Coulomb's electrometer, or, as he calls it, *Electrical Balance*.

ABDC (fig. 11.) repreſents a glaſs cylinder, twelve inches in diameter and the ſame in height, covered by a glaſs plate fitted to it by a projecting fillet on the under ſurface. This cover is pierced with two round holes one inch and three fourths in diameter. One of them *f* is in the centre, and receives the lower end of the glaſs tube *fh*, of twenty four inches height, which is fixed in the hole with a cement made of ſealing-wax, or other electric ſubſtance. The top of this tube receives the braſs collar H, (fig. 12. N° 3.) bored truly cylindrical with a ſmall ſhoulder, which reſts on the top of the tube. This collar is faſtened with cement, and receives the hollow cylinder φ (fig. 12. N° 2.), to which is joined the circular plate *a b*, divided on the edge into 360 degrees. It is alſo pierced with a round hole G in the centre, which receives the cylindrical pin *i* (fig. 12. N° 1.) having a milled head *b*, and furniſhed with an index *i o*, whoſe point is bent down ſo as to mark the diviſions on the circle *a b*. This pin turns ſtifly in the hole G, and the cylinder φ moves ſteadily in the collar H. To the lower end of the centre pin is faſtened a little pincer, *q*, formed like the end of a port-crayon, and tightened by the ring *q*, ſo as to hold faſt the ſuſpenſion wire, the lower end of which is graſped by a ſimilar pincer, P *o* (fig. 13.) tightened by the ring φ. The lower end φ *o* is cylindrical, and is of ſuch a weight, as to draw the wire perfectly ſtraight, but without any riſk of breaking it. It may be made equal to half of the weight that will juſt break it.

This pincer is enlarged at C, and pierced with a hole, which tightly receives the arm *g* C *q* of the electrometer. This arm is eight inches long; and conſiſts of a dry ſilk thread, or a ſlender ſtraw completely dried, and dipped in melted lac or fine ſealing wax, and held perpendicularly before a clear fire, till it become a ſlender cylinder of about one tenth of an inch in diameter. This occupies ſix of the eight inches, from *g* to *q*: the remaining two inches conſiſt of a fine thread of the lac or ſealing-wax, as it drains off in forming the arm. At *a*, is a ball of pith or fine cork, one-fourth or one-half of an inch in diameter, made very ſmooth, and gilded. It is balanced by a vertical circle of paper *g*, of large dimenſions, made ſtiff with varniſh. The reſiſtance of the air to this plane ſoon checks the oſcillations of the arm. Electrometer.

The whole inſtrument is ſeen in its place in fig. 11. where the arm hangs horizontally about the middle of the height of the great cylinder. In its oſcillations the ball *a* moves round in a circle, whoſe centre is in the axis of the whole inſtrument. Its ſituation is indicated by a graduated circle $\approx o q$, drawn on a ſlip of paper, and made to adhere to the glaſs by varniſh. The electrified body whoſe action is to be obſerved, is another ſmall ball of cork *t*, alſo gilt, or a braſs ball well poliſhed. This is carried by a ſtalk of lac *m* φ, incloſing a dry ſilk thread. This ſtalk is graſped by a clamp of cleft deal, or any ſimilar contrivance, which is made to lie firm on the glaſs cover. When this ball is let down through the hole *m*, it ſtands ſo as to touch the ball *a* on the arm, when that ball is oppoſite to o on the graduated circle.

In order to electrify the ball *t*, we are to employ the inſulating handle, fig. 14. which is a ſlender ſtick of ſealing-wax or lac, holding a metal wire that carries a ſmall poliſhed metallic ball. This is to be touched with ſome electrified body, ſuch as the prime conductor of a machine, the knob of a jar, &c. This electrified ball is to be introduced cautiouſly into the hole *m*, and the ball *t* is to be touched with it. The ball *a* is immediately repelled to a diſtance, twiſting the ſuſpenſion wire, till the force of twiſt exerted by the wire balances the mutual repulſion of the balls *t* and *a*.

This is the proceſs for examining the law of electric action. When it is deſired to examine the action of different bodies in different ſtates, another apparatus is wanted. This is repreſented by the piece *c* A *d* (fig. 15.) conſiſting of a plug of ſealing-wax A, fitting tightly into the hole *m*, and pierced by the wire *c d*, hooked at *c*, to receive a wire to connect it occaſionally with an electrified body, and having below a poliſhed metal ball *d*.

The inſtrument is fitted for obſervation in the following manner: The milled button *b* is turned at top, till the twiſt index *i o* is at the mark o of the twiſt circle. Then the whole is turned in the collar H, till the ball *a* ſtand oppoſite to the mark o of the paper circle $\approx o$ Q, and at the ſame time the ball *t* or *d* is touched. The obſervation is thus made. The ball *t* is firſt electrified, as juſt deſcribed, and thus *a* is repelled, and retiring twiſts the wire, ſettling, after a few oſcillations, at ſuch a diſtance as is proportional to the repulſion. The twiſt-index is now turned ſo as to force *a* nearer to *t*. The repulſion thus produced is eſtimated by adding the motion of the index to the angle at which the ball firſt ſtopped. Giving the index another, we have another repulſion, which is eſtimated in a ſimilar way, and thus we obtain as many meaſures as required.

It is not neceſſary to make this inſtrument of very large dimenſions; one 14 inches high, and five in diameter, of which the arm *a g* ſhould occupy two inches and an half, will be ſufficiently large for moſt purpoſes. The diameter of the glaſs cylinder muſt always be double the length of the arm *a g*, that the poſition of this may not be diſturbed by the action of the glaſs.

Dr Robiſon conſidered this electrometer as one of the

Electrometer. the moſt valuable inſtruments that have been made, as it is not only extremely delicate, but gives abſolute meaſures with the greateſt accuracy. For all purpoſes in which only repulſions were to be meaſured, he preferred it to his own inſtrument deſcribed in ELECTRICITY, N° 206.

He, however ſuggeſted ſeveral improvements in it, which are deſerving of attention.

The bottom ſhould be furniſhed with a round hole, admitting the lower end of the cylinder C *c* belonging to the lower pincer (when the wire is ſtrained at both ends) to hang freely, by which means much tedious oſcillation will be prevented. It is much more convenient to have the ſuſpenſion wire ſtrained at both ends; and it ſhould extend as far below the arm as above it, and the lower extremity ſhould be graſped by a pincer that turns by a milled head in a hole at the end of a ſlender ſpring. The inſtrument may then be ſpeedily adjuſted by placing the twiſt index at o, and gently turning the lower button till the ball *a* point exactly at o on the paper circle.

The inſtrument will be greatly improved, if, in place of the apparatus with the ball *t*, we ſubſtitute the piece repreſented at fig. 15. making ſome little changes in its conſtruction. Thus, inſtead of the wire *c d*, is uſed the ſmalleſt glaſs tube that will admit of being varniſhed on the inſide, which is done by drawing through it a ſilk thread dipped in varniſh, made of lac.

The outſide of the tube muſt alſo be varniſhed, and a braſs ball *d* fixed at its lower end, and a ſlender wire, ſurmounted by a ball, is to be inſerted into the tube, ſo as to touch the ball below. The poſition of the ball *d* will not be liable to alteration, when the hole *m* is once ſtopped with the plug. In making delicate experiments, the upper ball *c*, muſt be touched with the charger, repreſented at fig. 14. by which means the ball *d* is electrified. Then drawing out C by means of the forceps, the ball *d* is left completely inſulated. In examining the electricity of the atmoſphere, to which purpoſe this inſtrument is well adapted, the wire muſt be allowed to remain in the tube.

It was by means of this incomparable inſtrument, that M. Coulomb made the valuable experiments, to which we alluded in the article ELECTRICITY, when treating of the law of action of the electric fluid. By means of this electrometer, he alſo made his experiments on the diſſipation of electricity into the air, and along imperfect conductors. He aſcertained the law of diſſipation into the air from bodies in contact, and the relation which this bore to the original repulſion, by firſt obſerving the gradual approach of the ball *a* towards *t*, in proportion as the electricity diſſipated from both, and then ſlackening the twiſt index till the ball *a* reſumed its original ſituation.

The following was the general reſult of Mr Coulomb's experiments.

That the momentary diſſipation of moderate degrees of electricity is proportional to the degree of electricity at the moment. He found that the diſſipation is not ſenſibly affected by the ſtate of the barometer or thermometer; nor is there any ſenſible difference of bodies of different ſizes or different ſubſtances, or even different figures, provided that the electricity is very weak.

But he found that the diſſipation was greatly affected by the different ſtates of humidity of the air. In the Electrometer. ſcale of Sauſſure's hygrometer, the relation to the quantity of water which a cubic foot of air is capable of holding in ſolution is diſtinctly marked; the relation of this ſolution to the diſſipation of electricity in Coulomb's experiments may hence be ſeen in the following table, the firſt column of which marks the degrees of Sauſſure's hygrometer, the ſecond how many grains of water are diſſolved in a cubic foot of air at each degree, and the third column ſhews the correſponding diſſipation per minute.

69	6,197	$\frac{1}{60}$
75	7,295	$\frac{1}{41}$
80	8,045	$\frac{1}{29}$
87	9,221	$\frac{1}{14}$

Hence it follows, that the diſſipation is very nearly in the triplicate ration of the moiſture of the air. Thus if we make $\frac{60}{41} = \left|\frac{7,197}{6,180}\right|^m$; *m* will be = 2,764. If we make $\frac{60}{29} = \left|\frac{8,045}{6,180}\right|^m$; *m* will be = 2,76; and if we make $\frac{60}{14} = \left|\frac{9,240}{6,180}\right|^m$; *m* will be = 3,61; or at a medium *m* will be = 3,40.

The immediate object, that M. Coulomb had in view in his experiments, was to aſcertain the diminution of repulſion. He found that this, in a given ſtate of the air, was a certain proportion of the whole repulſion taken at the moment of diminution, which is double the proportion of the denſity of the fluid; for the repulſions by which we judge of the diſſipation are reciprocal, being exerted by every particle of fluid in the ball *t* of the electrometer, on every particle of fluid in the ball *a*. The diminution of repulſion is therefore proportional to the denſity of the electric fluid in each ball; and, as during the whole diſſipation, the denſities continue to have their original proportion, and as the diminution of repulſion is directly proportional to the diminution of the products of the denſities, it is conſequently directly proportional to the ſquare of either. If we put *d* for the denſity, the mutual repulſion will be repreſented by d^2, and its momentary diminution by the fluxion of d^2, or $2\,d\,\dot{d} = 2\,d \times \dot{d}$. But $2\,d \times \dot{d} : d^2 = 2\,\dot{d} : d$. The diminution of repulſion obſerved by experiment will be to the whole repulſion, in double the proportion that the diminution of denſity, or the diſſipation of fluid will have to the whole quantity of fluid at the moment of obſervation. Let us, for inſtance, ſuppoſe the obſerved diminution of repulſion to be $\frac{1}{40}$; we may conclude, that the quantity of fluid loſt by diſſipation is $\frac{1}{80}$. M. Coulomb did not examine the proportion of the diſſipations from bodies of various ſizes. But we know, that if two ſpheres communicate by a very long canal, their ſuperficial denſities, and the tendencies of fluid to eſcape from them, are inverſely as the diameters of the ſpheres. Now, in a body that has twice the diameter of another body, the ſurface of the former is quadruple of that of the latter; and though the tendency of fluid to eſcape from the former is only the half of its tendency to eſcape from the latter, yet the greater ſurface of the former may ſo far make up for its ſmaller denſity, that the

Electrometer.

the diſſipation of fluid from a large ſphere may in fact be greater than that from a ſmall one in the ſame given time.

We have remarked above, that theſe experiments were made in a particular ſtate of the air; and the law of diſſipation aſcertained by them is of courſe adapted only to that given ſtate. In a different ſtate of the air, even if this ſhould be impregnated with the ſame proportion of moiſture, the law of diſſipation may be different. The inference which M. Coulomb expected to draw from his experiments was, that the ratio of diſſipation would prove to be leſs than the cube of the quantity of water held in ſolution, except when that quantity of water was what the air was capable of holding in ſolution at the given temperature.

This is agreeable to obſervation; for we know that air which is conſidered as dry, that is, when it is not nearly ſaturated with moiſture, is the moſt favourable to electrical phenomena.

Such is the general reſult of Coulomb's experiments on the diſſipation of electricity into the air.

The method in which M. Coulomb examined the diſſipation along imperfect conductors, by means of this inſtrument, was, by completely inſulating the ball *t*, and then, after obſerving the loſs ſuſtained by a body in contact with it from the air, ſliding a metallic rod down the inſulating ſtalk, till the diſſipation began to exceed what took place only by the air.

From his experiments reſpecting the diſſipation along imperfect conductors, he found that this took place in a different manner from that in which electricity eſcaped by communication with the contiguous air. The electricity ſeems to be diffuſed chiefly along the ſurface of the inſulator, and appears principally to be produced by the moiſture that is more or leſs attached to it. M. Coulomb illuſtrates this in the following manner.

Water is found to adhere to the ſurface of all bodies, from which it is prevented by adheſion from eſcaping when the bodies are electrified, and is thus rendered capable of receiving a greater degree of electric power. Let us ſuppoſe that the particles of moiſture are diſpoſed uniformly over the ſurface, with intervals between them; the electricity that is communicated to one particle, muſt acquire a certain degree of denſity, before it can fly from this particle to the next, acroſs the intervening inſulating ſpace. When an imperfect conductor of this kind is electrified at one extremity, the communicated electricity, in paſſing to the other extremity, muſt be weakened every ſtep in paſſing from particle to particle.

Suppoſe we have three adjacent particles, which we may call *a*, *b*, and *c*; we infer from N° 374 of the article ELECTRICITY, that the motion of *b* is ſenſibly effected, only by the difference of *a* and *c*; and therefore the paſſage of electric fluid from *b* to *c*, requires that this difference be ſuperior, or at leaſt equal to the force neceſſary for clearing this coercive interval. Let a particle paſs over. The denſity of fluid of the particle *b* is diminiſhed, while the denſity of the particle on the other ſide of *a* remains as before. Therefore ſome fluid will paſs from *a* to *b*, and from the particle preceding *a* to *a*; and ſo on, till we come to the electrified end of this inſulator. It is plain, from this conſideration, that we muſt at laſt arrive at a particle beyond *c*, where the whole repulſion of the preceding particle is juſt ſufficient to clear the coercive interval. Some fluid will come over; and the repulſion of this, acting now in the oppoſite direction, will prevent any fluid from coming to ſupply its place in the particle which it has juſt quitted; the transferrence of fluid will therefore ſtop here, and beyond this point the inſulation will be complete. Hence we perceive that there is a mathematical relation between the inſulating power, and the length of the canal; and this may be aſcertained by the theory which we adopted in the article ELECTRICITY. We ſhall here give an inſtance of this inveſtigation; and, for the ſake of ſimplicity, we ſhall take a very probable caſe, viz. where the inſulating interval, or, as we may more properly call it, the coercive interval, is equal in every part of the canal.

Let R repreſent the coercive power of the inſulator, or the degree of force required to clear the coercive interval between two particles. Suppoſe a ball C, fig. 16. ſuſpended by a ſilken thread AB; and let us denote the quantity of redundant fluid in the ball by C, and let the denſities at the different points of the canal be denoted by AD, P*d*, &c. ordinates to ſome curve D*d*B, cutting the axis in B, the point where the thread AB begins to inſulate completely. Let P*p* be an element of the axis; draw the ordinate *pf*, a tangent to the curve *df*F, the normal *d*E, and draw *fe* perpendicular to P*d*. Suppoſe AC=*r*, AP=*x*, and P*d*=*y*. Then we ſhall have P*p*=$\dot{x}$, and *de*=$-\dot{y}$. It was ſhewn in N° 374. of the article ELECTRICITY, that the only ſenſible action of the fluid on a particle at P is $-\frac{y\dot{y}}{x}$, when the action of the redundant fluid in the globe on the particle at P, having the denſity *y*, is denoted by $\frac{Cy}{(r+x)^2}$. Therefore $\frac{y\dot{y}}{x}$ is =R, the coercive power of the thread, which is ſuppoſed to be conſtant, $\frac{Pd \times de}{Pp}$ is therefore equal to ſome conſtant line R. But P*p* (or *fe*) : *de* = P*d* : PE. The ſubnormal PE, is therefore a conſtant line. But as this is the property of a parabola, the curve of denſity D*d*B muſt be a parabola, of which 2PE = 2R, is the parameter.

COR. 1.—The denſities at different points of an imperfect inſulator are in the ſubduplicate ratio of their diſtances from the point of complete inſulation: for Pd^2 : AD^2 = BP : BA.

COR. 2.—The lengths of canal requiſite for inſulating different denſities of the electric fluid are in the duplicate ratio of their denſities; for AB = $\frac{AD^2}{2PE}$, and PE is a conſtant quantity.

COR. 3.—The length of canal requiſite for inſulation is inverſely as its coercive power, and may be repreſented by $\frac{D^2}{R}$. For AB = $\frac{DA^2}{2PE} = \frac{D^2}{2R}$.

If we reflect on this theory, we ſhall perceive, that our formulæ determine the diſtribution of fluid along the ſurface of an imperfect conductor, only in a certain manner, ſuppoſing that the ball C has received a certain determinate portion of fluid, for this portion diffuſing itſelf, particle by particle, through the conducting matter, will extend to *b* in ſuch a manner, as that

Electrometer. the repulsion shall be everywhere in equilibrio with the coercive power of the insulating interval, taken at a *maximum*. We must here remark that this resistance is not *active*, but only coercive, and may be compared to the resistance afforded by viscidity or friction. Any repulsion of electric fluid, which falls short of this, will not disturb the stability of the fluid that is spread along the canal, according to any law whatever. So that if AD represent the electric density of the globe, and remain constant, any curve of density will answer, provided that $\frac{d\dot{d}}{\dot{x}}$ be everywhere less than R. It is therefore an indeterminate problem, to assign in general the disposition of fluid in the canal. The density is as the ordinates of a parabola on this supposition only that the maximum of R is everywhere the same. And, in this case, the distance AB is a minimum: for, in other cases of density we must have $\frac{d\dot{d}}{\dot{x}}$ less than R. If, therefore, we vary a single element of the curve D*d* B, in order that the stability of the fluid may not be disturbed, having *d* constant, we must necessarily have x larger, that $\frac{d\dot{d}}{\dot{x}}$ may still be less than R; that is, we must lengthen the axis.

The reasonings which have thus been deduced from theory, were confirmed by M. Coulomb in a numerous set of experiments. These are chiefly valuable for having stated the relation that subsists between the electric density, and the length of support necessary for complete insulation. But as M. Coulomb has not given us the scale of his electrometer, according to which the absolute measures of the densities were determined, the experiments can be of but little use till this be known.

We hinted, at the end of the theoretical part of ELECTRICITY, that the theory of Volta's *condenser* might be more satisfactorily explained after we had considered the above experiments of Coulomb. The account which we gave of the condenser in Chap. xiii. of that article, (chiefly from Cavallo), was the only one we could properly give in that early part of our view of the science. We are now prepared for a more scientific account of the effects of that instrument. The following is nearly the manner in which Dr Robison considered the subject.

Let the cover of an electrophorus be furnished with a graduated electrometer, such as may indicate the proportional *degrees of electricity*; electrify it positively to any degree, we shall suppose six, while it is held in the hand, at a little distance, directly over a metallic plate lying on a wine glass, or such like insulating stand, but made to communicate with the ground by a wire. Now bring it gradually down towards the plate. Theory teaches, and we see it confirmed by experiment, that the electrometer will gradually subside, and will perhaps fall to 2°, before the electricity is communicated in a spark: but let us stop it before this happens; the attraction of the lying plate produces a compensation of four degrees of the mutual repulsion of the parts of the cover, by condensing the fluid on its inferior surface, and forming a deficient stratum above. This needs no farther explanation, after what we said under ELECTRICITY, on the charging of coated glass plates. Now we may suppose that the escape of the fluid from this body into the air, begins as soon as it is electrified to 6°, and that it will fly to the insulated plate with the degree 2, if it be brought nearer. But if we can prevent this communication to the insulated plate, by interposing an electric, we may electrify the cover again, while so near the metallic plate, to 6°, before it will pass off into the air. If now it be removed from the lying plate, the fluid would cause the electrometer to rise to 10°, if it did not immediately pass off; and an electric excitement of any kind which could raise this body only to 6° by its intensity, will, by means of this apparatus, raise it to the degree 10, if it be sufficiently copious in extent. If we do the same thing when the wire which connects the lying plate with the ground is taken away, we know that the same diminution of the electricity of the other plate cannot be produced by bringing it down near the lying insulated plate. Electrometer.

The theory of Volta's *condenser* now becomes very simple. M. Volta seems to have obscured his conceptions of it, by being intent on the electrophorus which he had lately invented, and was thus led into fruitless attempts to explain the advantages of the imperfect conductor above the perfect insulator. But the condensing apparatus is wholly different from an electrophorus; its operations are more analogous to those of a coated plate not charged, and insulated only on one side; and such a coated plate lying on a table will be a complete condenser, if the upper coating be of the same dimensions as the plate of the condenser. All the directions given by M. Volta for preparing the the imperfect conductors prove, that the effect produced is to make them as perfect conductors as possible for any degree of electricity that exceeds a certain small intensity, but such as shall not suffer this very weak electricity to clear the first step of the conducting space. The marble must be thoroughly dried, and even heated in an oven, and either used in this warm state, or must be varnished, so as to prevent the reabsorption of moisture. We know that marble of slender dimensions, so as to be completely dried throughout, will not conduct electricity till it has again become moist. A thick piece of marble is rendered dry only superficially, and still conducts internally. It is then in the best possible state for a condenser. The same is the case with dry unbaked wood. Varnishing the upper surface of a piece of marble or wood is equivalent to covering it with a thin glass plate. Now by this method of covering the top of the marble, a book, or even the table, with a piece of clean dry silk, they all become most perfect condensators. This view of the matter has great advantages. We learn from it how to form a condensing apparatus much more simple and at the same time much more efficacious. We require only the simple moveable plate, which must be covered on the under side with a very thin coating of the finest coachpainters varnish. By connecting this, by a wire, with the substance whose weak electricity is to be examined, this electricity will be raised in the proportion of the thickness of the varnish to the fourth of the plate's diameter. This condensation will be produced by detaching the wire from the insulating handle of the condensing plate, and then lifting this from the table on which it was lying. It will then afford sparks, though the original electricity

Electrophorus || Elements.

electricity was not ſtrong enough to affect the moſt delicate electrometer.

ELECTROPHORUS. See ELECTRICITY *Index*.

ELECTRUM, in *Natural Hiſtory*. See AMBER.

ELECTUARY, in *Pharmacy*, a form of medicine compoſed of powders and other ingredients, incorporated with ſome conſerve, honey, or ſyrup; to be divided into doſes, like boluſes, when taken.

Voſſius obſerves, that all the remedies preſcribed for the ſick, as well as the confections taken by way of regale, were called by the Greeks εκλειγματα, and εκλεικτα, of the verb λειχω, "I like;" whence, ſays he, was formed the Latin *electarium*, and afterwards *electuarium*. This conjecture he ſupports from the laws of Sicily, where it is ordained, that *electuaries*, ſyrups, and other remedies, be prepared after the legal manner. The Bollandiſts, who relate this etymology, ſeem to confirm it. For the compoſition and different ſorts of electuaries. See PHARMACY.

ELEEMOSYNA *Carucarum*, or *pro Aratris*, or *Aratri*, in our ancient cuſtoms, a penny which King Ethelred ordered to be paid for every plough in England towards the ſupport of the poor. Sometimes it is alſo called *eleemoſyna regis*, becauſe firſt appointed by the king.

ELEEMOSYNARIUS, in our old writers, is uſed for the almoner or peculiar officer who received the eleemoſynary rents and gifts, and diſtributed them to pious and charitable uſes. There was ſuch an officer in all religious houſes. The biſhops alſo uſed to have their almoners, as now the king has.

ELEGANCE, (from *eligo* "I chooſe,") denotes a manner of doing or ſaying things politely, agreeably, and with choice. With choice, ſo as to riſe above the common manners; politely, ſo as to ſtrike people of delicate taſte; and agreeably, ſo as to diffuſe a reliſh which gratifies every body.

ELEGANCE, in oratory and compoſition, an ornament of politeneſs and agreeableneſs ſhown in any diſcourſe, with ſuch a choice of rich and happy expreſſions, as to riſe politely above the common manners, ſo as to ſtrike people of a delicate taſte.

It is obſerved, that elegance, though irregular, is preferable to regularity without elegance: that is, by being ſo ſcrupulous of grammatical conſtruction, we loſe certain licences wherein the elegance of language conſiſts.

ELEGIAC, in ancient poetry, any thing belonging to elegy. See ELEGY.

ELEGIT, in *Law*, a writ of execution, which lies for a perſon who has recovered debt or damages; or upon a recognizance in any court, againſt a defendant that is not able to ſatisfy the ſame in his goods.

ELEGY, a mournful and plaintive kind of poem. See the article POETRY.

ELEMENTS, in *Phyſics*, the firſt principles of which all bodies in the ſyſtem of nature are compoſed.

Theſe are ſuppoſed to be few in number, unchangeable, and by their combinations to produce that extenſive variety of objects to be met with in the works of nature.

That there is in reality ſome foundation for this doctrine of elementary bodies is plain; for there are ſome principles evidently exempted from every change or decay, and which can be mixed or changed into different forms of matter. A perſon who ſurveys the works of nature in an inattentive manner, may perhaps form a contrary opinion, when he conſiders the numerous tribes of foſſils, plants, and animals, with the wonderful variety that appears among them in almoſt every inſtance. He may from thence be induced to conclude, that nature employs a vaſt variety of materials in producing ſuch prodigious diverſity. But let him inquire into the origin of this apparent diverſity, and he will find that theſe bodies which ſeem the moſt different from each other are compoſed nearly of the ſame elements. Thus the blood, chyle, milk, urine, &c. as well as the various ſolid parts of animals, are all compoſed of one particular ſubſtance; graſs, for inſtance, by the aſſiſtance of air and water, and even ſometimes of very inſipid kinds of graſs. The ſame ſimplicity preſents itſelf in the original compoſition of the nouriſhment of vegetables, notwithſtanding the variety among them with reſpect to hardneſs, ſoftneſs, elaſticity, taſte, odour, and medical qualities. They chiefly depend, for theſe, upon water and the light of the ſun; and the ſame ſimplicity muſt take place in animals that are fed on vegetables. The analyſis of animal ſubſtances confirms this hypotheſis; for they can all be reduced into a few principles, which are the ſame in all, and only differ with regard to the proportions in which they are combined. With regard to animals, the caſe appears to be the ſame: and the more we are acquainted with them, the more reaſon we have to believe that the variety in their origin is very ſmall. Elements.

Notwithſtanding the infinite variety of natural productions, therefore, it appears, that the materials employed in their formation are but few; that theſe are uniformly and certainly the ſame, totally exempted from any change or decay; and that the conſtant and gradual change of one body into another is produced by the various ſeparations and combinations of the original and elementary parts, which is plain from the regularity and uniformity of nature at all times. There is a change of forms and combinations through which it paſſes, and this has been the caſe from the earlieſt accounts of time; the productions of nature have always been of the ſame kind, and ſucceeded one another in the ſame order. If we examine an oak, for inſtance, we find it compoſed of the ſame matter with that of any other that has exiſted from the earlieſt ages. This regularity and uniformity in the courſe of nature ſhows that the elementary parts of bodies are permanent and unchangeable; for if theſe elementary particles which conſtituted an oak ſome thouſand years ago, had been undergoing any gradual decay, the oaks of the preſent times would have been found conſiderably different from thoſe that exiſted long ago; but as no difference has been obſerved, it would ſeem that the ultimate elements of bodies have always continued the ſame.

Reflections of this kind have ſuggeſted an idea of ſeveral principal elements of which all other bodies are compoſed, which by their various combinations furniſhed all the variety of natural bodies. Democritus, and other great philoſophers of antiquity, fixed the number to four, which have retained the name of elements ever ſince. Theſe are, fire, air, earth, and water; each of which they imagined was naturally

Elements. diſpoſed to hold its own place in the univerſe. Thus, the earth, as heavieſt, naturally tended towards the centre, and occupied the lower parts; the water, as approaching next to it in gravity, was ſpread chiefly on the outſide of the earth; the air, being more ſubtile and rare, occupied the middle place; while the fire, being ſtill more ſubtile and active, receded to the greateſt diſtance of all, and was ſuppoſed to compoſe the planets and ſtars. This ſyſtem was extended to all the productions of nature. Meteors were produced from a combination of fire and air; animals were conſidered as compoſed of earth and water; and thoſe that were warm had likewiſe a proportion of the element of fire. Thus they went on, explaining ſome of the moſt ſtriking qualities of the ſeveral productions of nature from the different proportions of the four elements they contained.

But though this ſyſtem appears not at all deſtitute of beauty and propriety, and on this account has been long received, we know from modern diſcoveries that theſe four ſubſtances are not really elementary bodies; nor do they anſwer our purpoſe in forming a ſyſtem, as we know too little of the intimate ſtructure and texture of them to enable us to explain other bodies by them.

Any other attempts that have been made to aſſign the number of elementary bodies have been much leſs fortunate. The older chemiſts, with Paracelſus at their head, pretend to ſpeak of four elementary bodies, ſalt, ſulphur, earth, and mercury: but when we attempt to form an idea of what they mean, we find it very perplexed; and that the expreſſions concerning them are enveloped in ſo much obſcurity, that they cannot be comprehended; and the theory is built entirely upon experiments made on metallic ſubſtances.

Attempts have been made by ſome to ſhow that the elements, whatever they are, muſt neceſſarily be inviſible or imperceptible by any of our ſenſes. An inquiry into their number or properties therefore muſt be attended with very little ſucceſs; and all the knowledge we can have upon the ſubject muſt be drawn from a view of their combinations, and reaſoning analogically from the tranſmutations we obſerve to take place in nature. The modern diſcoveries in aerology have enabled us to proceed farther in this way than what it was poſſible for the ancient philoſophers to do. We now find that all the different kinds of air are compoſed of that inviſible and ſubtile fluid named *heat*, united in a certain way with ſome other ſubſtance: by which union the compound acquires the properties of gravitation, expanſion, rarefaction, &c. for pure heat, unleſs when united with ſome terreſtrial ſubſtance, neither gravitates nor expands. This is evident from the phenomena of the burning glaſs, where the light concentrated in the focus will neither heat the air nor water, unleſs it meets with ſomething with which it can form a permanent union. Heat therefore is juſtly to be conſidered as one of the original elements; being always capable of uniting with bodies, and of being extricated from them unchanged; while the ſame bodies are by their union with it changed into various forms; water, for inſtance, into ice or vapour, both of which return into their original ſtate by the abſtraction or addition of heat in a certain degree. Hence it becomes almoſt natural to conclude, that there are only two elements in the univerſe: and this opinion we find adopted by ſeveral philoſophers, particularly the count de Treſſan in Elements. his Eſſay on the Electric Fluid. According to this doctrine, two primitive material ſubſtances ſeem to exiſt in nature; one that inceſſantly acts, and to which it is eſſential to be in motion; the other abſolutely paſſive, and whoſe nature it is to be inert, and move entirely as directed by the former. Should this doctrine be adopted, little difficulty would occur in determining the active matter to be that univerſal fluid which in its various modifications of light, heat, and electricity, has ſuch a ſhare in the operations of nature. But in fixing on the paſſive element we are greatly embarraſſed; nor are the diſcoveries in aerology or any other ſcience as yet able to remove the difficulty entirely. According to the doctrines which long prevailed among chemical philoſophers, there are three things that ſeem to be unchangeable, viz. earth; phlogiſton; and that inviſible, though terreſtrial and gravitating principle, called by the antiphlogiſtians the *oxygenous* or acidifying principle, and by the phlogiſtians the baſis of dephlogiſticated air. In our experiments, ſay they, on the firſt, we find that earth, though vitrified by the moſt intenſe fire, may be recovered in its proper form: and ſome very pure earths, particularly magneſia alba, cannot be changed even in the focus of the moſt powerful mirror. In like manner we may diſſipate charcoal *in vacuo* by the ſolar rays, and the compound is inflammable air: we may decompoſe this compound by a metallic calx, and we have our charcoal again unchanged, for all metals contain charcoal in ſubſtance. Let us try to deſtroy it by common fire, and we have it then in the fixed air produced, from which it may be recovered unchanged by means of the electric ſpark. With the baſis of dephlogiſticated air the caſe is ſtill more difficult; for we cannot by any means procure a ſight of it by itſelf. We may combine it with heat, and we have dephlogiſticated air; to the compound we may add charcoal, and we have fixed air: by decompoſing the former by burning iron in it, we have the metal greatly increaſed in weight by ſome unknown ſubſtance: and if we attempt to ſeparate the latter, we have water, or ſome kind of vapour which ſtill conceals it from our view.

In ſome experiments which were made by the ingenious Mr Watt, it was found that nitrous acid might be phlogiſticated by the pureſt earth or metallic calx; whence, according to this doctrine, it is not unreaſonable to ſuppoſe that phlogiſton may be only a certain modification of earth, and not an element diſtinct from it: but with regard to the baſis of dephlogiſticated air, no experiment has ever ſhown that it can either be procured by itſelf, or changed into any other ſubſtance; ſo that it appears to have the nature of an element as much as light or heat. Though we ſhould therefore be inclined to divide the whole matter of the univerſe into two claſſes, the one active and the other acted upon, we muſt allow that the paſſive matter even on this earth is not preciſely of the ſame kind: much leſs are we to extend our ſpeculations in this reſpect to the celeſtial regions; for who can determine whether the ſubſtance of the moon is the ſame with that of our earth, or that the elements of Jupiter are the ſame with thoſe of Saturn? There is even a difficulty with regard to the diviſion which ſeems ſo well eſtabliſhed, viz. of matter in general into active

Element || Elephanta.

active and passive; for no person can prove, that the matter which is active in one case may not be passive in another, and occasionally resume its activity. Something like this certainly happens in the case of the electric fluid, which is modified into heat or light, according to different circumstances; and we cannot know but it is the very same substance that constitutes the most solid bodies. This opinion at least did not seem absurd to Sir Isaac Newton, who proposed it as a query, Whether gross bodies and light were not convertible into one another? The end of our inquiries on this subject therefore must be, That the universe may be composed of many elements, or of one element; and of the nature of these elements, or of the single one, we know nothing.

ELEMENT, in a figurative sense, is used for the principles and foundations of any art or science; as Euclid's Elements, &c.

ELEMENTS, in *Astronomy*, are those principles deduced from astronomical observations and calculations, and those fundamental numbers which are employed in the construction of tables of the planetary motions. Thus, the elements of the theory of the sun, or rather of the earth, are his mean motion and eccentricity, and the motion of the aphelia. The elements of the theory of the moon are its mean motion; that of its node and apogee, its eccentricity, the inclination of its orbit to the plane of the ecliptic, &c.

ELEMI, or ELEMY, in the *Materia Medica*. See AMYRIS.

ELENCHUS, in antiquity, a kind of ear-rings set with large pearls.

ELENCHUS, in *Logic*, by the Latins called *argumentum* and *inquisitio*, is a vicious or fallacious argument, which deceives under the appearance of a truth; the same with what is otherwise called *sophism*.

ELEPHANT. See ELEPHAS, MAMMALIA *Index*.

American ELEPHANT: An animal only known in a fossil state, and that but partially, from the teeth, some of the jaw-bones, the thigh-bones, and vertebræ, found with many others five or six feet beneath the surface on the banks of the Ohio. But these bones differ in several respects from those of the elephant; for which, see *Fossil Bones*. As yet the living animal has evaded our search. Mr Pennant thinks it "more than probable, that it still exists in some of those remote parts of the vast new continent unpenetrated yet by Europeans. Providence maintains and continues every created species; and we have as much assurance that no race of animals will any more cease while the earth remains, than *seed-time and harvest, cold and heat, summer and winter, day or night.*" See MAMMUTH.

Elephant Beetle. See SCARABÆUS.

Knights of the ELEPHANT, an order of knighthood in Denmark, conferred upon none but persons of the first quality and merit. It is also called the *order of St Mary*. Its institution is said to have been owing to a gentleman among the Danish croises having killed an elephant, in an expedition against the Saracens, in 1184; in memory of which, King Canutus instituted this order, the badge of which is a towered elephant, with an image of the holy virgin encircled with rays, and hung on a watered sky-coloured ribbon, like the George in England.

ELEPHANTA, a small, but very remarkable island, about five miles from the castle of Bombay in the East Indies. Of this we have the following description in Mr Grose's Voyage to the East Indies. "It can at most be but about three miles in compass, and consists of almost all hill: at the foot of which, as you land, you see, just above the shore, on your right, an elephant, coarsely cut out in stone, of the natural bigness, and at some little distance not impossible to be taken for a real elephant, from the stone being naturally of the colour of that beast. It stands on a platform of stones of the same colour. On the back of this elephant was placed, standing, another young one, appearing to have been all of the same stone, but has been long broken down. Of the meaning, or history, of this image, there is no tradition old enough to give any account. Returning then to the foot of the hill, you ascend an easy slant, which about half way up the hill brings you to the opening or portal of a large cavern hewn out of a solid rock into a magnificent temple: for such surely it may be termed, considering the immense workmanship of such an excavation; and seems to me a far more bold attempt than that of the pyramids of Egypt. There is a fair entrance into this subterraneous temple, which is an oblong square, in length about 80 or 90 feet, by 40 broad. The roof is nothing but the rock cut flat at top, and in which I could not discern any thing that did not show it to be all of one piece. It is about 10 feet high, and supported towards the middle, at equidistance from the sides and from one another, with two regular rows of pillars of a singular order. They are very massive, short in proportion to their thickness, and their capital bears some resemblance to a round cushion pressed by the superincumbent mountain, with which they are also of one piece. At the further end of this temple are three gigantic figures; the face of one of them is at least five feet in length, and of a proportionable breadth. But these representations have no reference or connection either to any known history or the mythology of the Gentoos. They had continued in a tolerable state of preservation and wholeness, considering the remoteness of their antiquity, until the arrival of the Portuguese, who made themselves masters of the place; and in the blind fury of their bigotry, not suffering any idols but their own, they must have even been at some pains to maim and deface them, as they now remain, considering the hardness of the stone. It is said they even brought field-pieces to the demolition of images, which so greatly deserved to be spared for the unequalled curiosity of them. Of this Queen Catherine of Portugal was, it seems, so sensible, that she could not conceive that any traveller would return from that side of India without visiting the wonders of this cavern; of which too the sight appeared to me to exceed all the descriptions I had heard of them. About two-thirds of the way up this temple, on each side, and fronting each other, are two doors or outlets into smaller grots or excavations, and freely open to the air. Near and about the door-way, on the right hand, are several mutilated images, single and in groups. In one of the last, I remarked a kind of resemblance to the story of Solomon dividing the child, there standing a figure with a drawn sword, holding in one hand an infant with the head downwards, which it appears in act to cleave through the middle. The

Elephanta.

outlet

Elephantiasis || Eleave.

outlet of the other on the left hand is into an area of about 20 feet in length and 12 in breadth; at the upper end of which, as you turn to the right, preſents itſelf a colonnade covered at top, of 10 or 12 feet deep, and in length anſwering to the breadth of the area: this joins to an apartment of the moſt regular architecture, an oblong ſquare, with a door in perfect ſymmetry; and the whole executed in quite a contrary taſte and manner from any of the oldeſt or beſt Gentoo buildings anywhere extant. I took particular notice of ſome paintings round the cornices, not for any thing curious in the deſign, but for the beauty and freſhneſs of the colouring, which muſt have laſted ſome thouſands of years, on ſuppoſing it, as there is all reaſon to ſuppoſe it, cotemporary with the building itſelf. The floor of the apartment is generally full of water, its pavement or ground-work not permitting it to be drawn off or to be ſoaked up. For it is to be obſerved, that even the cavern itſelf is not viſitable after the rains until the ground of it has had time to dry into a competent hardneſs."

ELEPHANTIASIS, called alſo the *lepra of the Arabians*, in *Medicine*, a chronical diſeaſe, one of the two ſpecies of leproſy which affects the whole body, where even the bones as well as the ſkin are covered with ſpots and tumours, which being red at laſt turn black. See MEDICINE *Index*.

ELEPHANTINE, or ELEPHANTIS, in *Ancient Geography*, an iſland in the Nile to the ſouth of Syene; with a cognominal town, where the navigation on the Nile ends, becauſe juſt below the leſs cataract. And here to the weſt of the Nile ſtood the laſt Roman garriſon (Notitia Imperii).

ELEPHANTINE, in Roman antiquity, an appellation given to the books wherein were regiſtered the tranſactions of the ſenate and magiſtrates of Rome, of the emperors or generals of armies, and even of the provincial magiſtrates; the births and claſſes of the people and other things relating to the cenſus.

They are ſuppoſed to have been ſo called, as being made of leaves of ivory or elephants tuſks.

ELEPHANTOMACHI. See ETHIOPIA.

ELEPHANTOPUS, a genus of plants belonging to the ſyngeneſia claſs, and in the natural method ranking under the 49th order, *Compoſitæ*. See BOTANY *Index*.

ELEPHAS, the ELEPHANT, a genus of quadrupeds belonging to the order of bruta. See MAMMALIA *Index*.

ELEVATION, the ſame with ALTITUDE or height.

ELEVATION of the Hoſt, in the church of Rome, that part of the maſs where the prieſt raiſes the hoſt above his head for the people to adore.

ELEVATOR, in *Anatomy*, the name of ſeveral muſcles, ſo called from their ſerving to raiſe the parts of the body to which they belong.

ELEVATORY, in *Surgery*, an inſtrument for raiſing depreſſed on fractured parts of the ſkull, to be applied after the integuments and periosteum are removed. See SURGERY.

ELEVE, a term purely French, though of late uſed alſo in our language. Literally it ſignifies a diſciple or ſcholar bred up under any one, being formed from the Italian *allievo*, an "apprentice" or "novice."

It was firſt uſed by the French writers in ſpeaking of painters; ſuch a painter was an eleve of Da Vinci, of Raphael, &c. From painting it came to be applied to ſuch as ſtudied or learned any other art under a maſter. In the Royal Academy of Sciences, there were 20 eleves: and in that of inſcriptions, 10 eleves. The eleves are to act in concert with the penſionaries. See ACADEMY. Eleventh, Eleuſinia.

The denomination *eleve*, however, has been ſince ſuppreſſed, and that of *adjoint* ſubſtituted in its room; becauſe every body did not know the ſenſe affixed to it by the academy: and now the penſionary academiſts have not, as formerly, each of them an eleve; but the eleves are become adjoints, or aſſociates of the academy.

ELEVENTH, or chord of the eleventh. See INTERVAL.

ELEUSINIA, in Grecian antiquity, a feſtival kept in honour of Ceres, every fourth year by ſome ſtates, but by others every fifth. The Athenians celebrated it at Eleuſis, a town of Attica: whence the name.

Ceres, ſays an Athenian orator (Iſocrates), wandering in queſt of her daughter Proſerpine, came into Attica, where ſome good offices were done her, which it is unlawful for thoſe who are not initiated to hear. In return ſhe conferred two unparalleled benefits; to wit, the knowledge of agriculture, by which the human race is raiſed above the brute creation; and the myſteries, from which the partakers derive ſweeter hopes than other men enjoy, both as to the preſent life and to eternity. It was the popular opinion, that the Eleuſinian goddeſſes ſuggeſted prudent counſel to their votaries, and influenced their conduct; that theſe were reſpected in the infernal regions, and had precedence in the aſſemblies of the bleſſed; while the unhallowed were in utter darkneſs, wallowing in mire, or labouring to fill a leaky veſſel. The Athenians were ſolicitous to ſecure theſe advantages to their children, by having them initiated as ſoon as was allowed.

Ceres was ſuppoſed to be particularly partial to Eleuſis and its vicinity. *There* were the memorials of her preſence and of her bounty; the well named *Callichorus*, by which ſhe had reſted, in the reign of Erectheus; the ſtone on which ſhe ſat, named *the ſorrowful*; the Rharian plain, where barley was firſt ſown; and the threſhing-floor and altar of Triptolemus, a herdſman whom ſhe inſtructed in the culture of that grain, the uſe of which ſucceeded to acorns. Her myſteries continued to poſſeſs a pre-eminence in holineſs, and to be accounted as much ſuperior to all other religious feſtivals as the gods were to the heroes. Even the garments worn at the ſolemnity were ſuppoſed to partake of their efficacy, and to be endued with ſignal virtues. It was uſual to retain them until they were periſhing; and then to dedicate them in the temple, or to reſerve them for the purpoſe of enwrapping newborn children.

The myſtic temple, as it was called, provided by Pericles for the ſolemnity, created ſuch awe by its ſanctity as could be equalled only by the effect of its beauty and magnitude, which excited aſtoniſhment in every beholder. The profane or uninitiated were forbidden to enter it on any pretence. Two young Acarnanians happened inadvertently to mix with the crowd

Eleuſinia. crowd at the ſeaſon of the myſteries, and to go in; but the queſtion ſuggeſted by their ignorance preſently betrayed them, and their intruſion was puniſhed with death. The chief prieſt, hierophant, or myſtagogue, was taken from the Eumolpidæ, a holy family flouriſhing at Athens, and deſcended from Eumolpus, a ſhepherd and favourite of Ceres. He was enjoined celibacy, and wore a ſtole or long garment, his hair, and a wreath of myrtle. The grand requiſite, in his character were ſtrength and melody of voice, ſolemnity of deportment, magnificence, and great decorum. Under him, beſides many of inferior ſtation, was the daduchus or torch-bearer, who had likewiſe his hair, with a fillet; the prieſt, who officiated at the altar; and the hiero-ceryx or ſacred herald; all very important perſonages. The latter was of a family which claimed the god Mercury and Aglauros the daughter of Cecrops for its anceſtors.

The ſecrecy in which the myſteries were enveloped, ſerved to enhance the idea of their conſequence, and to increaſe the deſire of participation. It was ſo particular, that no perſon was allowed even to name the hierophant by whom he had been initiated. Public abhorrence and deteſtation awaited the babbler, and the law directed he ſhould die.

The Athenians ſuffered none to be initiated into theſe myſteries but ſuch as were members of their city. This regulation, which compelled Hercules, Caſtor, and Pollux, to become citizens of Athens, was ſtrictly obſerved in the firſt ages of the inſtitution, but afterwards all perſons, barbarians excepted, were freely initiated.

The feſtivals were divided into great and leſs myſteries. The leſs were inſtituted from the following circumſtance. Hercules paſſed near Eleuſis while the Athenians were celebrating the myſteries, and deſired to be initiated. As this could not be done, becauſe he was a ſtranger, and as Eumolpus was unwilling to diſpleaſe him on account of his great power, and the ſervices which he had done to the Athenians, another feſtival was inſtituted without violating the laws. It was called μικρα, and Hercules was ſolemnly admitted to the celebration and initiated. Theſe leſs myſteries were obſerved at Agræ near the Iliſſus. The greater were celebrated at Eleuſis, from which place Ceres has been called *Eleuſinia*. In later times the ſmaller feſtivals were preparatory to the greater, and no perſon could be initiated at Eleuſis without a previous purification at Agræ. This purification they performed by keeping themſelves pure, chaſte, and unpolluted, during nine days; after which they came and offered ſacrifices and prayers, wearing garlands of flowers, called ισμεγα or ιμηρα, and having under their feet Διος κωδιον, *Jupiter's ſkin*, which was the ſkin of a victim offered to that god. The perſon who aſſiſted was called υδραιος from υδωρ *water*, which was uſed at the purification, and they themſelves were called μυσται, *the initiated*.

A year after the initiation at the leſs myſteries they ſacrificed a ſow to Ceres, and were admitted in the greater, and the ſecrets of the feſtivals were ſolemnly revealed to them, from which they were called εποπται and εποπται, *inſpectators*.

This feſtival was obſerved in the month Boedromion or September, and continued nine days from the 15th till the 23d. During that time it was unlawful to arreſt any man, or preſent any petition, on pain of forfeiting a thouſand drachmas, or according to others on pain of death. It was alſo unlawful for thoſe who were initiated to ſit upon the cover of a well, to eat beans, mullets, or weazels. If any woman rode to Eleuſis in a chariot, ſhe was obliged by an edict of Lycurgus to pay 6000 drachmas. The deſign of this law was to deſtroy all diſtinction between the richer and poorer ſort of citizens. When the ſeaſon approached, the myſtæ or perſons who had been initiated only in the leſſer myſteries, repaired to Eleuſis to be inſtructed in the ceremonial. The ſervice for the opening of the temple, with morning ſacrifice, was performed. The ritual was then produced from the ſanctuary. It was enveloped in ſymbolical figures of animals, which ſuggeſted words compendiouſly, in letters with ligatures, implicated, the tops huddled together, or diſpoſed circularly like a wheel; the whole utterly inexplicable to the profane. The caſe, which was called *petroma*, conſiſted of two ſtones exactly fitted. The myſterious record was replaced after the reading, and cloſed up until a future feſtival. The principal rite was nocturnal, and confined to the temple and its environs. The myſtæ waited without, with impatience and apprehenſion. Lamentations and ſtrange noiſes were heard. It thundered. Flaſhes of light and of fire rendered the deep ſucceeding darkneſs more terrible. They were beaten, and perceived not the hand. They beheld frightful apparitions, monſters, and phantoms of a canine form. They were filled with terror, became perplexed and unable to ſtir. The ſcene then ſuddenly changed to brilliant and agreeable. The propylæa or veſtibules of the temple were opened, the curtains withdrawn, the hidden things diſplayed. They were introduced by the hierophant and daduchus, and the former ſhowed them the myſteries. The ſplendor of illumination, the glory of the temple and of the images, the ſinging and dancing which accompanied the exhibition, all contributed to ſoothe the mind after its late agitation, and to render the wondering devotee tranquil and ſelf-ſatisfied. After this inſpection, or, as it was called, the *autopſia*, they retired, and others advanced. The ſucceeding days were employed in purification, in ſacrifice, in pompous proceſſions, and ſpectacles, at which they aſſiſted, wearing myrtle crowns. The ſecond day was called αλαδε μυσται, *to the ſea, you that are initiated;* becauſe they were commanded to purify themſelves by bathing in the ſea. On the third day ſacrifices, and chiefly a mullet, were offered; as alſo barley from a field of Eleuſis. Theſe oblations were called Θυα, and held ſo ſacred that the prieſts themſelves were not, as in other ſacrifices, permitted to partake of them. On the fourth day they made a ſolemn proceſſion, in which the καλαθιον, *holy baſket of Ceres*, was carried about in a conſecrated cart, while on every ſide the people ſhouted χαιρε Δημητερ, *Hail, Ceres!* After theſe followed women, called κιστοφοροι, who *carried baſkets*, in which was ſeſamin, carded wool, grains of ſalt, a ſerpent, pomegranates, reeds, ivy boughs, certain cakes, &c. The fifth was called Η των λαμπαδων ημερα, *the torch day;* becauſe on the following night the people ran about with torches in their hands. It was uſual to dedicate torches to Ceres, and contend which ſhould offer the biggeſt.

Eleuſinia.

Eleuſinia. biggeſt, in commemoration of the travels of the goddeſs, and of her lighting a torch in the flames of Mount Ætna. The ſixth day was called Ιακχος, from Iacchus, the ſon of Jupiter and Ceres, who accompanied his mother in her ſearch after Proſerpine with a torch in his hand. From that circumſtance his ſtatue had a torch in his hand, and was carried in ſolemn proceſſion from the Ceramicus to Eleuſis. The ſtatue with thoſe that accompanied it, called Ιακχαγωγος, was crowned with myrtle. In the way nothing was heard but ſinging and the noiſe of brazen kettles as the votaries danced along. The way through which they iſſued from the city was called Ἱερα οδος, *the ſacred way*, the reſting place Ἱερα συκη, from a *fig-tree* which grew in the neighbourhood. They alſo ſtopped on a bridge over the Cephiſus, where they derided thoſe that paſſed by. After they had paſſed this bridge, they entered Eleuſis by a place called μυστικη εισοδος, *the myſtical entrance*. On the ſeventh day were ſports, in which the victors were rewarded with a meaſure of barley, as that grain had been firſt ſown in Eleuſis. The eighth day was called Επιδαυριων ἡμερα, becauſe once Æſculapius at his return from Epidaurus to Athens was initiated by the repetition of the leſs myſteries. It became cuſtomary therefore to celebrate them a ſecond time upon this, that ſuch as had not hitherto been initiated might be lawfully admitted. The ninth and laſt day of the feſtival was called Πλημοχοαι, *earthen veſſels*, becauſe it was uſual to fill two ſuch veſſels with wine; one of them being placed towards the eaſt, and the other towards the weſt; which, after the repetition of ſome myſtical words, were both thrown down, and the wine being ſpilt on the ground, was offered as a libation.

The ſtory of Ceres and Proſerpine, the foundation of the Eleuſinian myſteries, was partly local. It was both verbally delivered, and repreſented in allegorical ſhow. Proſerpine was gathering flowers when ſhe was ſtolen by Pluto. Hence the proceſſion of the holy baſket, which was placed on a car dragged along by oxen, and followed by a train of females, ſome carrying the myſtic cheſts, ſhouting, *Hail, Ceres!* At night a proceſſion was made with lighted torches, to commemorate the goddeſs ſearching for her daughter. A meaſure of barley, the grain which, it was believed, ſhe had given, was the reward of the victors in the gymnic exerciſes; and the tranſaction at the temple had a reference to the legend. A knowledge of theſe things and places, from which the profane were excluded, was the amount of initiation; and the mode of it, which had been deviſed by craft, was ſkilfully adapted to the reigning ſuperſtitions. The operation was forcible, and the effect in proportion. The prieſthood flouriſhed as piety increaſed. The diſpenſation was corrupt, but its tendency not malignant. It produced ſanctity of manners and an attention to the ſocial duties; deſire to be as diſtinguiſhed by what was deemed virtue as by ſilence.

Some have ſuppoſed the principal rites at this feſtival to have been obſcene and abominable, and that from thence proceeded all the myſterious ſecrecy. They were carried from Eleuſis to Rome in the reign of Adrian, where they were obſerved with the ſame ceremonies as before, though perhaps with more freedom and licentiouſneſs. They laſted about 1800 years, and were at laſt aboliſhed by Theodoſius the Great. Eleuſinia.

ELEUSIS, in *Ancient Geography*, a town in Attica, between Megara and the Piræus, celebrated for the feſtivals of Ceres. See the preceding article.—Thoſe rites were finally extinguiſhed in Greece upon the invaſion of Alaric the Goth. Eleuſis, on the overthrow of its goddeſs and the ceſſation of its gainful traffic, probably became ſoon an obſcure place, without character or riches. For ſome ages, however, it was not entirely forſaken, as is evident from the vaſt conſumption of the ancient materials, and from the preſent remains, of which the following account is given by Dr Chandler*. "The port was ſmall and of a circular form. The ſtones of one pier are ſeen above water, and the correſponding ſide may be traced. About half a mile from the ſhore is a long hill, which divides the plain. In the ſide next the ſea are traces of a theatre, and on the top are ciſterns cut in the rock. In the way to it, ſome maſſes of wall and rubbiſh, partly ancient, are ſtanding; with ruined churches; and beyond, a long broken aqueduct croſſes to the mountains. The Chriſtian pirates had infeſted the place ſo much, that in 1676 it was abandoned. It is now a ſmall village at the eaſtern extremity of the rocky brow, on which was once a caſtle; and is inhabited by a few Albanian families, employed in the culture of the plain, and ſuperintended by a Turk, who reſides in an old ſquare tower. The proprietor was Achmet Aga, the primate or principal perſon of Athens.

* *Travels into Greece*, p. 189.

"The myſtic temple at Eleuſis was planned by Ictinus, the architect of the Parthenon. Pericles was overſeer of the building. It was of the Doric order; the cell ſo large as to admit the company of a theatre. The columns on the pavement within, and their capitals, were raiſed by Coræbus. Mentagenes of Xypete added the architraves and the pillars above them, which ſuſtained the roof. Another completed the edifice. This was a temple *in antis*, or without exterior columns, which would have occupied the room required for the victims. The aſpect was changed to *Proſtylos* under Demetrius the Phalerean; Philo, a famous architect, erecting a portico, which gave dignity to the fabric, and rendered the entrance more commodious. The ſite was beneath the brow, at the eaſt end, and encompaſſed by the fortreſs. Some marbles, which are uncommonly maſſive, and ſome pieces of the columns, remain on the ſpot. The breadth of the cell is about 150 feet; the length, including the pronaos and portico, is 216 feet; the diameter of the columns, which are fluted, 6 inches from the bottom of the ſhafts, is 6 feet and more than 6 inches. The temple was a decaſtyle, or had 10 columns in the front, which was to the eaſt. The peribolus or incloſure, which ſurrounded it on the north-eaſt and on the ſouth ſide, meaſures 387 feet in length from north to ſouth, and 328 feet in breadth from eaſt to weſt. On the weſt ſide it joined the angles of the weſt end of the temple in a ſtraight line. Between the weſt wall of the incloſure and temple and the wall of the citadel was a paſſage of 42 feet 6 inches wide, which led to the ſummit of a high rock at the north-weſt angle of the incloſure, on which are viſible the traces of a temple *in antis*, in length 74 feet 6 inches from north to ſouth, and in breadth from the eaſt

Eleutheria. east to the wall of the citadel, to which it joined on the west, 54 feet. It was perhaps that sacred to Triptolemus. This spot commands a very extensive view of the plain and bay. About three-fourths of the cottages are within the precincts of the mystic temple, and the square tower stands on the ruined wall of the inclosure.

"At a small distance from the north end of the inclosure is a heap of marble, consisting of fragments of the Doric and Ionic orders; remains, it is likely, of the temples of Diana Propylea and of Neptune, and of the Propyleum or gateway. Wheler saw some large stones carved with wheat-ears and bundles of poppy. Near it is the bust of a colossal statue of excellent workmanship, maimed, and the face disfigured; the breadth at the shoulders, as measured by Pococke, five feet and an half; and the basket on the head above two feet deep. It probably represented Proserpine. In the heap are two or three inscribed pedestals; and on one are a couple of torches, crossed. We saw another fixed in the same stairs, which lead up the square tower on the outside. It belonged to the statue of a lady, who was hierophant or priestess of Proserpine, and had covered the altar of the goddess with silver. A well in the village was perhaps that called Callichorus, where the women of Eleusis were accustomed to dance in honour of Ceres. A tradition prevails, that if the broken statue be removed, the fertility of the land will cease. Achmet Aga was fully possessed with this superstition, and declined permitting us to dig or measure there, until I had overcome his scruples by a present of a handsome snuff-box containing several zechins or pieces of gold."

ELEUTHERIA, a festival celebrated at Platæa in honour of Jupiter *Eleutherius*, or "the assertor of liberty," by delegates from almost all the cities of Greece. Its institution originated in this: After the victory obtained by the Grecians under Pausanias over Mardonius the Persian general, in the country of Platæa, an altar and statue were erected to Jupiter Eleutherius, who had freed the Greeks from the tyranny of the barbarians. It was further agreed upon in a general assembly, by the advice of Aristides the Athenian, that deputies should be sent every fifth year, from the different cities of Greece, to celebrate Eleutheria, festivals of liberty. The Platæans celebrated also an anniversary festival in memory of those who had lost their lives in that famous battle. The celebration was thus: At break of day a procession was made with a trumpeter at the head, sounding a signal for battle. After him followed chariots loaded with myrrh, garlands, and a black bull, and certain free young men, as no signs of servility were to appear during the solemnity, because they in whose honour the festival was instituted had died in the defence of their country. They carried libations of wine and milk in large-eared vessels, with jars of oil, and precious ointments. Last of all appeared the chief magistrate, who, though not permitted at other times to touch iron, or wear garments of any colour but white, yet appeared clad in purple, and taking a water-pot out of the city-chamber, proceeded through the middle of the town, with a sword in his hand, towards the sepulchres. There he drew water from a neighbouring spring, and washed and anointed the monuments, after which he sacrificed a bull upon a pile of wood, invoking Jupiter and infernal Mercury, and inviting to the entertainment the souls of those happy heroes who had perished in the defence of their country. After this he filled a bowl with wine, saying, I drink to those who lost their lives in the defence of the liberties of Greece. There was also a festival of the same name observed by the Samians in honour of the god of love. Slaves also, when they obtained their liberty, kept a holiday, which they called *Eleutheria*.

Elf || Elginshire

ELF, a term now almost obsolete, formerly used to denote a fairy or hobgoblin; an imaginary being, the creature of ignorance, superstition, and craft. See FAIRY.

Elf-Arrows, in *Natural History*, a name given to the flints anciently fashioned into arrow-heads, and still found fossil in Scotland, America, and several other parts of the world: they are believed by the vulgar to be shot by fairies, and that cattle are sometimes killed by them.

ELGIN, the capital of the county of Moray in Scotland, and formerly a bishop's see, is situated on the river Lossie, about six miles north from the Spey, in W. Long. 2. 25. N. Lat. 57. 40. Mr Pennant says, it is a good town, and has many of the houses built over piazzas; but, excepting its great cattle-fairs, has little trade. It is principally remarkable for its ecclesiastical antiquities. The cathedral, now in ruins, has been formerly a very magnificent pile. The west door is very elegant and richly ornamented. The choir is very beautiful, and has a fine and light gallery running round it; and at the east end are two rows of narrow windows in an excellent Gothic taste. The chapter-house is an octagon; the roof supported by a fine single column with neat carvings of coats of arms round the capital. There is still a great tower on each side of this cathedral; but that in the centre, with the spire and whole roof, are fallen in; and form most awful fragments, mixed with the battered monuments of knights and prelates. Boethius says, that Duncan, who was killed by Macbeth at Inverness, lies buried here. The place is also crowded with a number of modern tomb-stones.—The cathedral was founded by Andrew de Moray, in 1224, on a piece of land granted by Alexander II.; and his remains were deposited in the choir, under a tomb of blue marble, in 1244. The great tower was built principally by John Innes bishop of this see, as appears by the inscription cut on one of the great pillars: "Hic Jacet in Xto, pater et dominus, Dominus *Johannes de Innes*, hujus ecclesiæ Episcopus;—qui hoc notabile opus incepit et per septennium ædificavit." Elgin is a royal borough; and gives title of earl to the family of Bruce.

ELGINSHIRE, is the middle district of the ancient county of Moray. It is bounded on the north by that branch of the German ocean called the *Moray Frith*; on the east and south-east by Banff-shire; on the south-west, by Inverness-shire; and on the west by the counties of Inverness and Nairn. It extends about 42 miles in length, and its average breadth is about 20. The southern part is rocky and mountainous, called the district of *Braemoray*, which is occupied with extensive forests. The lower parts, towards the north, are rich and fertile; but might easily be rendered more

Elginſhire, Eli.

productive. The principal rivers are, the *Spey*, *Findhorne*, and *Loſſie*; all of which abound with ſalmon. It contains two royal boroughs, viz. Elgin, the county town, and Forres; and ſeveral conſiderable towns, as *Grantown*, *Garmouth*, *Loſſiemouth*, &c. The principal ſeats are, *Gordon-caſtle*, the ſeat of the duke of Gordon; *Caſtle Grant*, the ſeat of Sir James Grant; *Altyre*, the ſeat of Colonel Cumming, &c. Morayſhire abounds with many remains of antiquity; the principal of which are the magnificent cathedral of Elgin, the priory of Pluſcardine near the town of Elgin, the biſhop's palace at Spynie, the caſtles of *Lochindorb*, *Dunphail*, and the *dun* of *Relugas*, in the pariſh of Edenkeillie. The ancient Scottiſh hiſtorians, particularly Fordun and Buchanan, give accounts of the Danes landing in Moray, about 1008, when Malcolm II. marched againſt them, and was defeated near Forres: after this they brought over their wives and children, and were in poſſeſſion of the country for ſome time; until they were finally expelled by that monarch, after the victories gained over them at Luncarty near Perth, at Barrie in the county of Angus, and at Mortlach in the county of Banff. There are many monuments of that nation; the moſt remarkable of which is *Sweno's ſtone* or *pillar*, on the road from Nairn and Forres, in the pariſh of Rafford. Except freeſtone, limeſtone, and marl, no mineral ſubſtance of value has been diſcovered.

ELI, high prieſt of the Iſraelites, and judge over them for forty years, was deſcended from Ithamar, a junior branch of the houſe of Aaron, and ſeems to have blended the prieſtly with the judicial character in the year 1156 before the commencement of the Chriſtian æra. It appears that the Jews were in a ſtate of ſubjection or vaſſalage to the Philiſtines during the greater part of Eli's adminiſtration, and, what may at firſt appear ſingular, he contributed to the degeneracy of his countrymen, although his own piety and goodneſs were unqueſtionably great. He did not exert his magiſterial authority in the exemplary puniſhment of vice, and even permitted his own ſons with impunity to perpetrate the moſt atrocious acts of impiety and debauchery. This want of firmneſs, to give it no worſe a name, was very reprehenſible in one who filled ſuch an important office, and peculiarly ſo in a man who was himſelf a ſaint.

Eli II Elijah.

The celebrated Samſon made his appearance during the adminiſtration of Eli, taking part in the management of public affairs for about twenty years, by whoſe aſtoniſhing deeds the independant ſpirit of that people was in ſome meaſure revived. The circumſtances attending the death of Samſon, which proved ſo calamitous to the nobility of the Philiſtines, might have induced the Jews to throw off the yoke; but they did not poſſeſs a ſufficient degree of virtue and public ſpirit for ſuch an exertion. Eli at this period was very far advanced in years, and, if poſſible, ſtill more negligent in the diſcharge of his duty as a chief magiſtrate, allowing his two ſons, Hophni and Phineas, to proceed to the moſt extravagant height of impiety and debauchery, whoſe example had a moſt powerful influence on the manners of the people. He was far from being unacquainted with their conduct, but he reproved them with ſuch gentleneſs as was highly reprehenſible, and but ill calculated to produce any change on the behaviour of his ſons.

The deity was ſo juſtly offended with this deportment of Eli, that a ſacred ſeer was commiſſioned to upbraid him for his ingratitude and want of reſolution. Young Samuel likewiſe was favoured with a viſion of the approaching ruin of Eli's family, which he related to the otherwiſe venerable old man, on being ſolemnly adjured not to conceal a ſingle circumſtance. When Eli heard the declaration of the young prophet, being fully convinced that his conduct had been highly reprehenſible, he exclaimed, "It is the Lord; let him do what ſeemeth him good." Soon after this the Iſraelites ſuſtained a conſiderable loſs in attempting to procure their emancipation, carrying the ark of God into their camp to animate the people, and intimidate their enemies; but the ark was captured by the Philiſtines, and Hophni and Phineas were ſlain. This intelligence having been brought to Eli, be no ſooner heard that the ark of God was taken, than he fell backwards from his ſeat, broke his neck, and died in the 98th year of his age.

ELIAS, the prophet, memorable for having eſcaped the common cataſtrophe of mankind; being taken up alive into heaven, in a fiery chariot, about 895 B. C. See *the Bible*.

ELIJAH, who is ſometimes denominated Elias, was one of the moſt diſtinguiſhed of the Jewiſh prophets, and ſurnamed the *Tiſbbite*, probably from the diſtrict in which he was born. He began his prophetic office about 920 years before Chriſt, in the reign of wicked Ahab, by whom the Sidonian idolatry was introduced among the Iſraelites. The prophet was commiſſioned to appear before this impious prince, and threaten the country with a long drought as a puniſhment for his crimes. The indignation of Ahab was ſo great againſt the prophet for this prediction, that he reſolved to puniſh him in a ſignal manner; but Elijah withdrew to

Elijah. a ſecret place from his fury, at the divine command, where he was ſuſtained in a miraculous manner. He was afterwards ordered to go to Sarepta, in the territory of Sidon, where a miraculous interpoſition of heaven, in the houſe of an indigent widow, ſuſtained him for ſome time, whoſe ſon the prophet reſtored to life.

When the three years of famine, occaſioned by the drought, were expired, the prophet was ordered to appear before the king, and exhort him to that genuine repentance which an interpoſition of the deity ſo very remarkable unqueſtionably demanded. He had an interview with Obadiah, the governor of the king's houſe, who was a religious man, and had frequently ſcreened many from the vengeance of Jezebel the queen, at the hazard of his own life. Fired with undaunted fortitude, the prophet ſaid to Obadiah, "Go, tell thy lord, behold Elijah is here." The good man's regard for the prophet was ſo great, that he was afraid to deliver this meſſage, ſince he knew that Ahab had uſed every effort to diſcover the prophet's retreat. The king was informed of his coming; and the firſt interview was diſtinguiſhed by invectives on the part of the intrepid prophet and the proud ſovereign, the former giving a promiſe of rain on the following terms. The prieſts of the Sidonian gods, and an aſſembly of the people of Iſrael, were to meet on Mount Carmel, where the prophet Elijah intended to give an inconteſtable proof of the almighty power of the God of Iſrael, and the total inſignificance of the Sidonian divinities. For a detailed account of this memorable experiment, we muſt refer our readers to the book of Kings, as an abridgement of ſuch a beautiful narration would do it manifeſt injury. It produced the fulleſt conviction in the minds of the Iſraelites, that Jehovah alone was entitled to adoration; and the prieſts of Baal were inſtantaneouſly put to death, as the moſt abominable perverters of the divine law.

This was followed by abundance of rain, in anſwer to the devout prayers of the prophet; but his glorious triumph over idolatry ſo exaſperated Jezebel, that ſhe reſolved to murder the prophet, to avoid whoſe rage he fled into the wilderneſs, till the deity again employed him in the honourable, but often hazardous, duties of a prophet. He afterwards foretold that Hazael ſhould be king of Syria, Jehu king over Iſrael; and he appointed Eliſha the ſon of Shaphat to be his own ſucceſſor. He denounced dreadful judgements againſt Ahab and his wicked queen Jezebel; but thoſe which reſpected the king were not executed during his life, on account of the genuine repentance which he diſcovered. The ſucceſſor of Ahab having been confined to bed in conſequence of an accident, the god of Ekron was conſulted relative to his recovery, which induced the prophet to declare that he ſhould aſſuredly die. The king being informed that it was Elijah who dared to ſend ſuch a meſſage, he diſpatched a captain and 50 men to force him into the royal preſence; but they were deſtroyed by fire from heaven, and a ſecond company ſhared the ſame fate. A third company confeſſed the viſible interference of heaven in the prophet's behalf, and the captain throwing himſelf on the mercy of Elijah, went with him to the king. In the royal preſence he undauntedly repeated the ſame denunciation againſt the idolatrous monarch, which was very ſoon accompliſhed; and not long after this the holy prophet, at the divine command, divided aſunder the waves of Jordan, dropped his prophetic mantle to the aſtoniſhed Eliſha, took the flaming chariot commiſſioned for his reception, and rode in majeſty to heaven.

Eliquation || Elis.

ELIQUATION, in *Chemiſtry*, an operation by which a more fuſible ſubſtance is ſeparated from one that is leſs ſo, by means of a heat ſufficiently intenſe to melt the former, but not the latter. Thus an alloy of copper and lead may be ſeparated by a heat capable of melting the latter, but not the former.

ELIS. See ELEA.

ELIS, in *Ancient Geography*, the capital of the diſtrict of that name in Peloponneſus, ſituated on the Peneus, which ran through it. It was the country of Phædo the philoſopher, ſcholar of Socrates, and friend of Plato; who inſcribes with his name the dialogue on the immortality of the ſoul. Pyrrho alſo was of this city, at the head of the ſect called after him *Pyrrhoniſts*.

The city of Elis owed its origin to an union of ſmall towns after the Perſian war. It was not encompaſſed immediately with a wall; for it had the care of the temple at Olympia, and its territory was ſolemnly conſecrated to Jupiter. To invade or not protect it was deemed impiety; and armies, if marching through, delivered up their weapons, which, on their quitting it, were reſtored. Amid warring ſtates the city enjoyed repoſe, was reſorted to by ſtrangers, and flouriſhed. The region round about it was called *cœle* or *hollow*, from the inequalities. The country was reckoned fertile, and particularly fit for the raiſing of flax. This, which grew nowhere elſe in Greece, equalled the produce of Judæa in fineneſs, but was not ſo yellow. Elis was a ſchool, as it were, for Olympia, which was diſtant 37 miles. The athletic exerciſes were performed there, before the more ſolemn trial, in a gymnaſium, by which the Peneus ran. The hellanodics or præfects of the games paired the rival combatants by lot, in an area called *Plethrium* or *The Acre*. Within the wall grew lofty plane-trees; and in the court, which was called the *Xyſtus*, were ſeparate courſes made for the foot-races. A ſmaller court was called the *Quadrangle*. The præfects, when choſen, reſided for ten months in a building erected for their uſe, to be inſtructed in the duties of their office. They attended before ſunriſe to preſide at the races; and again at noon, the time appointed for the pentathlum or five ſports. The horſe were trained in the agora or market-place, which was called the *Hippodrome*. In the gymnaſium were altars and a cenotaph of Achilles. The women, beſides other rites, beat their boſoms in honour of this hero, on a fixed day toward ſunſet. There alſo was the town-hall, in which extemporary harangues were ſpoken and compoſitions recited. It was hung round with bucklers for ornaments. A way led from it to the baths through the Street of Silence; and another to the market-place, which was planned with ſtreets between porticoes of the Doric order adorned with altars and images. Among the temples, one had a circular periſtyle or colonnade; but the image had been removed and the roof was fallen in the time of Pauſanias. The theatre was ancient, as was alſo a temple of Bacchus, one of the deities principally adored at Elis. Minerva had a temple in the citadel, with an image of ivory and gold, made

Eliſha || Elizabeth.

(it was ſaid) by Phidias. At the gate leading to Olympia was the monument of a perſon, who was buried, as an oracle had commanded, neither within nor without the city. The ſtructures of Elis, Dr Chandler obſerves, ſeem to have been raiſed with materials far leſs elegant and durable than the produce of the Ionian and Attic quarries. The ruins are of brick, and not conſiderable, conſiſting of pieces of ordinary wall, and an octagon building with niches, which, it is ſuppoſed, was the temple with a circular periſtyle. Theſe ſtand detached from each other, ranging in a vale ſouthward from the wide bed of the river Peneus; which, by the margin, has ſeveral large ſtones, perhaps relicks of the gymnaſium. The citadel was on a hill, which has on the top ſome remnants of a wall.

ELISHA the prophet, famous for the miracles he performed, died about 830 B. C. See *the Bible*.

ELISION, in *Grammar*, the cutting off or ſuppreſſing a vowel at the end of a word, for the ſake of ſound or meaſure, the next word beginning with a vowel.

Eliſions are pretty frequently met with in Engliſh poetry, but more frequently in the Latin, French, &c. They chiefly conſiſt in ſuppreſſions of the *a*, *e*, and *i*, though an eliſion ſuppreſſes any of the other vowels.

ELIXATION, in *Pharmacy*, the extracting the virtues of ingredients by boiling or ſtewing.

ELIXIR, in *Medicine*, a compound tincture extracted from many efficacious ingredients. Hence the difference between a tincture and an elixir ſeems to be this, that a tincture is drawn from one ingredient, ſometimes with an addition of another to open it and to diſpoſe it to yield to the menſtruum; whereas an elixir is a tincture extracted from ſeveral ingredients at the ſame time.

ELIZABETH, queen of England, daughter of Henry VIII. and Anne Boleyn, was born at Greenwich, September 7. 1553. According to the humour of the times, ſhe was early inſtructed in the learned languages, firſt by Grindal, who died when ſhe was about 17, and afterwards by the celebrated Roger Aſcham. She acquired likewiſe conſiderable knowledge of the Italian, Spaniſh, and French languages. Dr Grindal was alſo her preceptor in divinity, which ſhe is ſaid to have ſtudied with uncommon application and induſtry. That Elizabeth became a Proteſtant, and her ſiſter Mary a Papiſt, was the effect of that cauſe which determines the religion of all mankind; namely, the opinion of thoſe by whom they were educated: and this difference of opinion, in their tutors, is not at all ſurpriſing, when we recollect, that their father Harry was of both religions, or of neither.

But the ſtudies of Elizabeth were not confined merely to languages and theology: ſhe was alſo inſtructed in the political hiſtory of the ancients; and was ſo well ſkilled in muſic, as to ſing and play "artfully and ſweetly."

After the ſhort reign of her brother Edward, our heroine being then about 20 years of age, her *firebrand* ſiſter acceding to the crown, Elizabeth experienced a conſiderable degree of perſecution, ſo as to be not a little apprehenſive of a violent death. She was accuſed of nobody knows what; impriſoned; and, we are told, inhumanly treated. At laſt, by the interceſſion of King Philip of Spain, ſhe was ſet at liberty; which ſhe continued to enjoy, till, on the death of her *pious* ſiſter, ſhe, on the 17th of November 1558, aſcended the throne of England. Her political hiſtory as a queen, is univerſally known and admired *: but her attention to the government of her kingdom did not totally ſuſpend her purſuit of learning. Aſcham, in his *Schoolmaſter*, tells us, that, about the year 1563, five years after her acceſſion, ſhe being then at Windſor, beſides her perfect readineſs in Latin, Italian, French, and Spaniſh, ſhe read more Greek in one day than ſome prebendaries of that church did read Latin in a whole week, (p. 21.)—She employed Sir John Forteſcue to read to her Thucydides, Xenophon, Polybius, Euripides, Æſchines, and Sophocles. (*Ballard*, p. 219.)—That the Latin language was familiar to her, is evident from her ſpeech to the univerſity of Oxford, when ſhe was near ſixty; alſo from her ſpirited anſwer to the Poliſh ambaſſador in the year 1598. And that ſhe was alſo ſkilled in the art of poetry, appears not only from the ſeveral ſcraps which have been preſerved, but likewiſe from the teſtimony of a contemporary writer, Puttenham, in his *Art of Engl. Poetry* (a very ſcarce book.) Theſe are his words:—"But, laſt in recital, "and firſt in degree, is the queen, whoſe learned, de- "licate, noble muſe, eaſily ſurmounteth all the reſt, "for ſenſe, ſweetneſs, or ſubtility, be it in ode, elegy, "epigram, or any other kind of poem," &c. In this author are to be found only a ſpecimen of 16 verſes of her Engliſh poetry. "But," ſays Mr Walpole, "a "greater inſtance of her genius, and that too in La- "tin, was her extempore reply to an inſolent prohibi- "tion delivered to her from Philip II. by his ambaſſa- "dor, in this tetraſtic.

Te veto ne pergas bello defendere Belgas:
Quæ Dracus eripuit, nunc reſtituantur oportet:
Quas pater evertit, jubeo te condere cellas:
Religio papæ fac reſtituatur ad unguem.

"She inſtantly anſwered him, with as much ſpirit as ſhe uſed to return his invaſions;

Ad Græcas, bone rex, fient mandata kalendas."

Being earneſtly preſſed by a Romiſh prieſt, during his perſecution, to declare her opinion concerning the real preſence of Chriſt's body in the wafer, ſhe anſwered,

Chriſt was the word that ſpake it;
He took the bread, and brake it:
And what that word did make it,
That I believe, and take it. *Fuller's Holy State.*

She gave the characters of four knights of Nottinghamſhire in the following diſtich:

Gervaſe the gentle, Stanhope the ſtout,
Markham the lion, and Sutton the lout. *Walp. Cat.*

Coming into a grammar-ſchool, ſhe characterized three claſſic authors in his hexameter:

Perſius a crab-ſtaff; bawdy Martial; Ovid a fine wag.
Full. Worth. of Warw. 126.

Elizabeth.

Sir Walter Raleigh having wrote on a window,

Fain would I climb, yet fear I to fall;

She immediately wrote under it,

If thy heart fail thee, climb not at all.

Worth. of Devonſh. 261.

Doubtleſs, ſhe was a woman of ſingular capacity and extraordiary acquirements: and, if we could forget the ſtory of the Scottiſh Mary, and of her favourite Eſſex, together with the burning of a few Anabaptiſts; in ſhort, could we forbear to contemplate her character through the medium of religion and morality, we might pronounce her the moſt illuſtrious of illuſtrious women. See further the articles ENGLAND, MARY, and SCOTLAND. She died in her palace at Richmond, the 24th of March 1602, aged 70, having reigned 44 years; and was interred in the chapel of Henry VII. in Weſtminſter Abbey. Her ſucceſſor James erected a magnificent monument to her memory. —She wrote, 1. The Mirror, or Glaſs of the Sinful Soul. This was tranſlated out of French verſe into Engliſh proſe, when ſhe was eleven years old. It was dedicated to Queen Catharine Parr. Probably it was never printed; but the dedication and preface are preſerved in the *Sylloge epiſtolarum*, in Hearne's edition of *Livii Foro-Julienſis*, p. 161. 2. Prayers and Meditations, &c. Dedicated to her father, dated at Hatfield, 1545. Manuſcript, in the royal library. 3. A Dialogue out of Xenophon, in Greek, between Hiero a King, yet ſome time a private perſon, and Simonides a Poet, as touching the life of the Prince and Private Man. Firſt printed, from a manuſcript in her majeſty's own hand-writing, in the Gentleman's Magazine for 1743. 4. Two Orations of Iſocrates, tranſlated into Latin. 5. Latin Oration at Cambridge. Preſerved in the king's library: alſo in Hollinſhed's Chron. p. 1206; and in Fuller's Hiſt. of Cambr. p. 138. 6. Latin Oration at Oxford. See Wood's Hiſt. and Antiq. of Oxf. lib. i. p. 289. alſo in Dr Jebb's Append. to his Life of Mary Queen of Scots. 7. A comment on Plato. 8. *Boethius de conſolatione philoſophiæ*, tranſlated into Engliſh anno 1593. 9. *Salluſt de bello Jugurthino*, tranſlated into Engliſh anno 1590. 10. A play of Euripides, tranſlated into Latin, (Cat. of Royal Auth.). 11. A Prayer for the uſe of her fleet in the great expedition in 1596. 12. Part of Horace's Art of Poetry, tranſlated into Engliſh anno 1598. 13. *Plutarch de curioſitate*, tranſlated into Engliſh. 14. Letters on various occaſions to different perſons: ſeveral ſpeeches to her parliament; and a number of other pieces.

ELIZABETH PETROWNA, (daughter of Peter the Great), the laſt empreſs of Ruſſia, diſtinguiſhed herſelf by her ſignal clemency. She made a vow, that no perſon ſhould be put to death in her reign, and ſhe ſtrictly obſerved it. The example was followed, and confirmed by law, under the auguſt ſovereign of Ruſſia, Catharine II. Elizabeth died in 1762, in the 21ſt year of her reign and 52d of her age. Elizabeth || Elliot.

ELK, in *Zoology*. See CERVUS, MAMMALIA *Index*.

ELL, (*ulna*,) a meaſure, which obtains, under different denominations, in moſt countries, whereby cloths, ſtuffs, linens, ſilks, &c. are uſually meaſured; anſwering nearly to the yard of England, the canna of Italy, the vara of Spain, the palm of Sicily, &c.

Servius will have the ell to be the ſpace contained between the two hands when ſtretched forth; but Suetonius makes it only the cubit.

The ells moſt frequently uſed with us are the Engliſh and Flemiſh; the former containing three feet nine inches, or one yard and a quarter; the latter only 27 inches, or three quarters of a yard; ſo that the ell Engliſh is to the Flemiſh ell as five to three. In Scotland, the ell contains $37\frac{2}{10}$ Engliſh inches.

M. Ricard, in his Treatiſe of Commerce, reduces the ells thus: 100 ells of Amſterdam are equal to $98\frac{3}{4}$ of Brabant, Antwerp, and Bruſſels; to $58\frac{1}{2}$ of England and France; to 122 of Hamburgh, Francfort, Leipſic, and Cologne; 125 of Breſlaw; 110 of Bergen and Drontheim; and 117 of Stockholm.

ELLIOT, the Right Honourable George Auguſtus, Lord Heathfield, was the youngeſt ſon of the late Sir Gilbert Elliot, Baronet, of Stobbs (A) in Roxburghſhire; and was born about the year 1718. He received the firſt rudiments of his education under a private tutor: and at an early time of life was ſent to the univerſity of Leyden, where he made conſiderable progreſs in claſſical learning, and ſpoke with fluency and elegance the German and French languages. Being deſigned for a military life, he was ſent from thence to the celebrated *Ecole Royale du Genie Militaire*, conducted by the great Vauban, at La Fere in Picardy; where he laid the foundation of what he ſo conſpicuouſly exhibited at the defence of Gibraltar. He completed his military courſe on the continent by a tour, for the purpoſe of ſeeing in practice what he had ſtudied in theory. Pruſſia was the model for diſcipline, and he continued ſome time as a volunteer in that ſervice.

Mr Elliot returned in the 17th year of his age to his native country, Scotland; and was the ſame year, 1735, introduced by his father Sir Gilbert to Lieutenant-Colonel Peers of the 23d regiment of foot, then lying at Edinburgh, as a youth anxious to bear arms for

(A) The ancient and honourable family of Elliot of Stobbs, as well as the collateral branch of Elliot of Minto in the ſame county, and of Elliot of Port-Elliot in Cornwall, are originally from Normandy. Their anceſtor, Mr Aliott, came over with William the Conqueror, and held a diſtinguiſhed rank in his army. There is a traditionary anecdote in the family relating to an honourable diſtinction in their coat, which, as it correſponds with hiſtory, bears the probability of truth. When William ſet foot on Engliſh land, he ſlipped and fell on the earth. He ſprung up, and exclaimed that it was a happy omen—he had embraced the country of which he was to become the lord. Upon this Aliott drew his ſword, and ſwore by the honour of a ſoldier, that he would maintain, at the hazard of his blood, the right of his lord to the ſovereignty of the earth which he had embraced. On the event of the conqueſt, King William added to the arms of Aliott, which was a baton *er*, on a field *azure*, an arm and ſword as a creſt, with the motto, *Per ſaxa, per ignes, fortiter et rectè*.

Elliot. for his king and country. He was accordingly entered as a volunteer in that regiment, where he continued for a year or more. From the 23d regiment he went into the engineer corps at Woolwich, and made great progreſs in that ſtudy, until his uncle Colonel Elliot brought him in his adjutant of the ſecond troop of horſe grenadiers. With theſe troops he went upon ſervice to Germany, and was with them in a variety of actions. At the battle of Dettingen he was wounded. In this regiment he bought the rank of captain and major, and afterwards purchaſed the lieutenant-colonelcy from Colonel Brewerton, who ſucceeded to his uncle. On arriving at this rank, he reſigned his commiſſion as an engineer, which he had enjoyed along with his other rank, and in which ſervice he had been actively employed very much to the advantage of his country. He received the inſtructions of the famous engineer Bellidor, and made himſelf completely maſter of the ſcience of gunnery. Had he not ſo diſintereſtedly reſigned his rank in the engineer department, he would long before his death, by regular progreſſion, have been at the head of that corps. Soon after this he was appointed aid-de camp to George II. and was diſtinguiſhed for his military ſkill and diſcipline. In the year 1759, he quitted the ſecond troop of horſe grenadier guards, being ſelected to raiſe, form, and diſcipline, the firſt regiment of light horſe, called after him *Elliot's*. As ſoon as they were raiſed and formed, he was appointed to the command of the cavalry in the expedition on the coaſts of France, with the rank of brigadier general. After this he paſſed into Germany, where he was employed on the ſtaff, and greatly diſtinguiſhed himſelf in a variety of movements; where his regiment diſplayed a ſtrictneſs of diſcipline, an activity and enterpriſe, which gained them ſignal honour: and indeed they have been the pattern regiment, both in regard to diſcipline and appointment, to the many light dragoon troops that have been ſince raiſed in our ſervice. From Germany he was recalled for the purpoſe of being employed as ſecond in command in the memorable expedition againſt the Havannah; the circumſtances of which conqueſt are well known.

On the peace, his gallant regiment was reviewed by the king, when they preſented to his majeſty the ſtandards which they had taken from the enemy. Gratified with their fine diſcipline and high character, the king aſked General Elliot what mark of his favour he could beſtow on his regiment equal to their merit? He anſwered, that his regiment would be proud if his majeſty ſhould think, that, by their ſervices, they were entitled to the diſtinction of *Royals*. It was accordingly made a royal regiment, with this flattering title, "The 15th, or *King's* Royal Regiment of Light Dragoons." At the ſame time the king expreſſed a deſire to confer ſome honour on the general himſelf; but the latter declared, that the honour and ſatisfaction of his majeſty's approbation of his ſervices was his beſt reward.

During the peace he was not idle. His great talents in the various branches of the military art gave him ample employment. In the year 1775, he was appointed to ſucceed General A'Court as commander in chief of the forces in Ireland; but did not continue long in this ſtation, not even long enough to unpack all his trunks; for finding that interferences were made by petty authority derogatory of his own, he reſiſted the practice with becoming ſpirit; and not chooſing to diſturb the government of the ſiſter kingdom on a matter perſonal to himſelf, he ſolicited to be recalled. He accordingly was ſo, and appointed to the command of Gibraltar in a fortunate hour for the ſafety of that important fortreſs. The ſyſtem of his life, as well as his education, peculiarly qualified him for this truſt. He was perhaps the moſt abſtemious man of the age; neither indulging himſelf in animal food nor wine. He never ſlept more than four hours at a time; ſo that he was up later and earlier than moſt other men. He ſo inured himſelf to habits of hardineſs, that the things which are difficult and painful to other men, were to him his daily practice, and rendered pleaſant by uſe. It could not be eaſy to ſtarve ſuch a man into a ſurrender, nor poſſible to ſurpriſe him. The example of the commander in chief in a beſieged garriſon had a moſt perſuaſive efficacy in forming the manners of the ſoldiery. Like him his brave followers came to regulate their lives by the moſt ſtrict rules of diſcipline before there aroſe a neceſſity for ſo doing; and ſevere exerciſe, with ſhort diet, became habitual to them by their own choice. The military ſyſtem of diſcipline which he introduced, and the preparations which he made for his defence, were contrived with ſo much judgment, and executed with ſo much addreſs, that he was able with a handful of men to preſerve his poſt againſt an attack, the conſtancy of which, even without the vigour, had been ſufficient to exhauſt any common ſet of men. Collected within himſelf, he in no inſtance deſtroyed, by premature attacks, the labours which would coſt the enemy time, patience, and expence to complete; he deliberately obſerved their approaches, and ſeized on the proper moment, with the keeneſt perſpection, in which to make his attack with ſucceſs. He never ſpent his ammunition in uſeleſs parade or in unimportant attacks. He never relaxed from his diſcipline by the appearance of ſecurity, nor hazarded the lives of his garriſon by wild experiments. By a cool and temperate demeanour, he maintained his ſtation for three years of conſtant inveſtment, in which all the powers of Spain were employed. All the eyes of Europe were on this garriſon; and his conduct has juſtly exalted him to the moſt elevated rank in the military annals of the day. On his return to England, the gratitude of the Britiſh ſenate was as forward as the public voice in giving him that diſtinguiſhed mark his merit deſerved. Both houſes of parliament voted an unanimous addreſs of thanks to the general. The king conferred on him the honour of Knight of the Bath, with a penſion during his own and a ſecond life of his own appointment; and on June 14. 1787, his majeſty advanced him to the peerage, by the title of *Lord Heathfield, Baron Gibraltar*, permitting him to take, in addition to his family arms, the arms of the fortreſs he had ſo bravely defended, to perpetuate to futurity his noble conduct. Elliot.

His lordſhip died on the 6th of July 1790, at his chateau at Aix-la-Chapelle, of a ſecond ſtroke of the palſy, after having for ſome weeks preceding enjoyed tolerable good health and an unuſual flow of ſpirits. His death happened two days before he was to have ſet out for Leghorn in his way to Gibraltar; of which place he was once more appointed to the de-

fence,

Ellipomacrostyla || Elmacinus.

fence, in the view of an approaching war.—He married Anne, daughter of Sir Francis Drake of Devonſhire; and had by her (who died in 1769) Francis-Auguſtus, now Lord Heathfield, lieutenant-colonel of the 6th regiment of horſe.

ELLIPOMACROSTYLA, an old term, in *Natural Hiſtory*, from the Greek, ελλιπης *imperfect*, μακρος *long*, and στυλος *a column*; which expreſſes an imperfect cryſtal with a long column, one end of the column being affixed to ſome ſolid body, and compoſed of thin and ſlender hexangular columns, terminated by hexangular pyramids.

ELLIPOPACHYSTYLA, an old term, in *Natural Hiſtory*, derived from the Greek, ελλιπης *imperfect*, παχυς *thick*, and στυλος *a column*, and expreſſes a cryſtal of the imperfect kind with a thick column.

ELLIPSIS, in *Geometry*, a curve line returning into itſelf, and produced from the ſection of a cone by a plane cutting both its ſides, but not parallel to the baſe. See *Conic Sections*.

ELLIPSIS, in *Grammar*, a figure of ſyntax, wherein one or more words are not expreſſed; and from this deficiency it has got the name *ellipſis*.

ELLIPTIC, or ELLIPTICAL, ſomething belonging to an ellipſis.

ELLISIA, a genus of plants belonging to the pentandria claſs; and in the natural method ranking under the 28th order, *Luridæ*. See BOTANY *Index*.

ELLYS, DR ANTHONY, who was born in 1693, and educated at Clarehall, Cambridge, after riſing through many inferior degrees of dignity in the church of England, was, in 1752, promoted to the ſee of St David's. He died at Glouceſter in 1761, and is mentioned here only for the ſake of his works, which are leſs known than they ſhould in the preſent time of novel opinions. They are, beſides occaſional ſermons, 1. A Plea for the Sacramental Teſt, as a juſt ſecurity to the Church eſtabliſhed, and very conducive to the welfare of the State. 2. Remarks on Hume's Eſſay on Miracles. 3. Tracts on the Liberty ſpiritual and temporal of Proteſtants in England, addreſſed to J. N. Eſq; at Aix-la Chapelle; the firſt part of which was printed in 1763, the ſecond in 1765. In theſe tracts, as the editors of them truly obſerve, he "diſcovers not only fine parts, extenſive knowledge, and ſound judgement, but a heart overflowing with benevolence and candour, and a moſt Chriſtian temper: for he always thought a perſon, though on the right ſide of the queſtion, with principles of perſecution, to be a worſe man than he that was on the wrong." This amiable and reſpectable writer affords in his own conduct a proof that a man may be ſteadily attached to a party, without wiſhing to encroach upon the rights of others.

ELM. See ULMUS, BOTANY *Index*.

ELMACINUS, GEORGE, author of a *Hiſtory of the Saracens*, was born in Egypt towards the middle of the 13th century. His hiſtory comes down from Mahomet to the year of the Hegira 512, anſwering to the year of our Lord 1134; in which he ſets down year by year, in a very conciſe manner, whatever regards the Saracen empire, intermixed with ſome paſſages relating to the eaſtern Chriſtians. His abilities muſt have been conſiderable; ſince, though he profeſſed Chriſtianity, he held an office of truſt near the perſons of the Mahometan princes. He was ſon to Yaſer Al Amid, ſecretary to the council of war under the ſultans of Egypt for 45 years; and in 1238, when his father died, ſucceeded him in his place. His hiſtory of the Saracens was tranſlated from Arabic into Latin by Erpinius: and printed in theſe two languages in folio, at Leyden, in 1625. Erpinius died before the publication; but Golius took care of it, and added a preface. It was dedicated by Erpinius's widow to Dr Andrews, biſhop of Wincheſter.

Elocution || Elphinſton.

ELOCUTION. See ORATORY, Part III.

ELOGY, a praiſe or panegyric beſtowed on any perſon or thing, in conſideration of its merit. The beauty of elogy conſiſts in an expreſſive brevity. Eulogiums ſhould not have ſo much as one epithet, properly ſo called, nor two words ſynonymous: they ſhould ſtrictly adhere to truth: for extravagant and improbable elogies rather leſſen the character of the perſon or thing they would extol.

ELOHI, ELOI, or *Elohim*, in ſcripture, one of the names of God. But it is to be obſerved, that angels, princes, great men, judges, and even falſe gods, are ſometimes called by this name. The ſequel of the diſcourſe is what aſſiſts us in judging rightly concerning the true meaning of this word. It is the ſame as *Eloha*. One is the ſingular, the other the plural. Nevertheleſs *Elohim* is often conſtrued in the ſingular number, particularly when the true God is ſpoken of: but when falſe gods are ſpoken of, it is conſtrued rather in the plural.

ELOINED, in *Law*, ſignifies reſtrained or hindered from doing ſomething: thus it is ſaid, that if thoſe within age be eloined, ſo that they cannot ſue perſonally, their next friend ſhall ſue for them.

ELONGATION, in *Aſtronomy*, the digreſſion or receſs of a planet from the ſun, with reſpect to an eye placed on our earth. The term is chiefly uſed in ſpeaking of Venus or Mercury, the arch of a great circle intercepted between either of theſe planets and the ſun being called the *elongation* of that planet from the ſun.

ELONGATION, in *Surgery*, is an imperfect luxation, occaſioned by the ſtretching or lengthening of the ligaments of any part.

ELOPEMENT, in *Law*, is where a married woman departs from her huſband, and cohabits with an adulterer; in which caſe the huſband is not obliged to allow her any alimony out of her eſtate, nor is he chargeable for neceſſaries for her of any kind. However, the bare advertiſing a wife in the gazette, or other public paper, is not a legal notice to perſons in general not to truſt her; though a perſonal notice given by the huſband to particular perſons is ſaid to be good.—An action lies, and large damages may be recovered, againſt a perſon for carrying away and detaining another man's wife.

ELOQUENCE, the art of ſpeaking well, ſo as to affect and perſuade. See ORATORY.

ELPHINSTON, WILLIAM, a Scotch prelate and ſtateſman of conſiderable eminence, who flouriſhed in the end of the 15th and commencement of the 16th century, was born at Glaſgow in the year 1431. At the univerſity of this city he received his education, and in the learning which diſtinguiſhed that period he made extraordinary proficiency. His ſtudies being completed, he went over to France, to make himſelf maſter

of

Elphinſton || Elſimburg.

of the civil and canon law in the univerſity of Paris, where he afterwards became a profeſſor, and for the ſpace of ſix years acquired conſiderable reputation in the diſcharge of his duty. On his return to Scotland, he entered into holy orders, was ſoon appointed official of Glaſgow, and afterwards of St Andrews. He was admitted a member of the king's council; and on a miſunderſtanding taking place between James III. of Scotland and Louis XI. of France, his powerful mediation at the latter court, in conjunction with the biſhop of Dunkeld and the earl of Buchan, effected an amicable reconciliation. As Elphinſton on this occaſion diſplayed ſuch prudence and eloquence, the king was ſo grateful for his meritorious ſervices, that he rewarded him with the ſee of Roſs, from which he was tranſlated to the dioceſe of Aberdeen about the year 1484, and alſo appointed to the high office of chancellor of the kingdom, which he managed with ſo much moderation and equity, that all parties eſteemed and admired him. When the civil wars broke out between James and the diſcontented nobility, Biſhop Elphinſton appears to have declined all interference with public affairs of a political nature, and confined himſelf to the diſcharge of his miniſterial duties. But when James IV. aſcended the throne, his abilities as a ſtateſman were again called forth, and he was choſen ambaſſador to the emperor Maximilian, in order to bring about a marriage alliance between his royal maſter and the emperor's daughter; but ſhe had been previouſly promiſed to another. Yet the biſhop's miſſion was not without its ſalutary effects, as he was the mean of terminating an enmity which had long exiſted between the Dutch and Scots. This he conducted in ſuch a maſterly manner, that James never undertook any thing of importance, without firſt procuring the ſanction of his approbation. He was equally the zealous patron of learning; and it is generally believed that the eſtabliſhment of a univerſity at Aberdeen was entirely owing to his influence with the Pope, from whom he obtained a bull for that purpoſe; and by his exertions was King's college undertaken and completed. He bequeathed, at the time of his deceaſe, large ſums of money for its ſupport. He terminated his mortal career in 1514, about 83 years of age, at which advanced period his conſtitutional vigour was very little impaired, and all the faculties of his mind were in full force; but the ſerious loſſes at the memorable battle of Flowden had broken his heart. He wrote a hiſtory of his native country, which is among the manuſcripts of Sir Thomas Fairfax, in the Bodleian library at Oxford.

EDSHEMIER, Adam, a celebrated painter, born at Francfort on the Maine, in 1574. He was firſt a diſciple of Philip Uffenbach, a German; but his deſire of improvement carrying him to Rome, he ſoon became a moſt excellent artiſt in landſcapes, hiſtory, and night-pieces, with ſmall figures. His works are but few; and the great pains he beſtowed in finiſhing them raiſed their prices ſo high, that they are hardly anywhere to be found but in the cabinets of princes. He was of a melancholy turn, and ſunk under the embaraſſments of his circumſtances in 1610. James Erneſt Thomas of Landau was his diſciple; and imitated his ſtyle ſo nicely, that their performances are not eaſily diſtinguiſhed.

ELSIMBURG, a port town of Sweden, in the province of Gothland, and territory of Schonen, ſeated on the ſide of the Sound, over againſt Elſinore. It was formerly a fortreſs belonging to the Danes; but all the fortifications were demoliſhed in 1679, and there is only one tower of a caſtle which remains undemoliſhed. It now belongs to Sweden. E. Long. 13. 20. N. Lat. 56. 2.

Elſinore, Elvas.

ELSINORE, or Elsinoor, a port town of Denmark, ſeated on the Sound, in the iſle of Zealand. E. Long. 13. 23. N. Lat. 56. 0.—It was a ſmall village, containing a few fiſhermen's huts, until 1445, when it was made a ſtaple town by Eric of Pomerania; who conferred upon the new ſettlers conſiderable immunities, and built a caſtle for their defence. From that period it gradually increaſed in ſize and wealth, and is now the moſt commercial place in Denmark next to Copenhagen. It contains about 5000 inhabitants, amongſt whom are a conſiderable number of foreign merchants, and the conſuls of the principal nations trading to the Baltic. The paſſage of the Sound is guarded by the fortreſs of Cronborg, which is ſituated upon the edge of a peninſular promontory, the neareſt point of land from the oppoſite coaſt of Sweden. It is ſtrongly fortified towards the ſhore by ditches, baſtions, and regular entrenchments; and towards the ſea by ſeveral batteries, mounted with 60 cannon, the largeſt whereof are 48 pounders. Every veſſel, as it paſſes, lowers her top-ſails, and pays a toll at Elſinore. It is generally aſſerted, that this fortreſs guards the Sound; and that all the ſhips muſt, on account of the ſhoal waters and currents, ſteer ſo near the batteries as to be expoſed to their fire in caſe of refuſal. This, however, is a miſtaken notion. On account indeed of the numerous and oppoſite currents in the Sound, the ſafeſt paſſage lies near the fortreſs; but the water in any part is of ſufficient depth for veſſels to keep at a diſtance from the batteries, and the largeſt ſhips can even ſail cloſe to the coaſt of Sweden. The conſtant diſcharge, however, of the toll, is not ſo much owing to the ſtrength of the fortreſs as to a compliance with the public law of Europe. Many diſputes have ariſen concerning the right by which the crown of Denmark impoſes ſuch a duty. The kings of Sweden, in particular, claiming an equal title to the free paſſage of the Strait, were for ſome time exempted by treaty from paying it; but in 1720, Frederic I. agreed that all Swediſh veſſels ſhould for the future be ſubject to the uſual impoſts. All veſſels, beſide a ſmall duty, are rated at 1¼ per cent. of their cargoes, except the Engliſh, French, Dutch, and Swediſh, which pay only one per cent; and in return the crown takes the charge of conſtructing light-houſes, and erecting ſignals to mark the ſhoals and rocks, from the Categate to the entrance into the Baltic. The tolls of the Sound, and of the two Belts, ſupply an annual revenue of above 100,000l.

ELVAS, a large town, and one of the beſt and moſt important in Portugal, ſeated in the province of Alentejo, a few miles from the frontiers of Eſtremadura in Spain. It is built on a mountain, and is ſtrongly fortified with works of free-ſtone. The ſtreets of the town are handſome, and the houſes neat; and there is a ciſtern ſo large, that it will hold water enough to ſupply the whole town ſix months. The water is conveyed to it by a magnificent aqueduct, three

Eluding || Ely.

three miles in length, ſuſtained in ſome places by four or five high arches, one upon another. It was bombarded by the French and Spaniards in 1706, but without effect. It has generally a garriſon of 1000 men. The king founded an academy here, in 1733, for young gentlemen. W. Long. 7. 28. N. Lat. 38. 39.

ELUDING, the act of evading or rendering a thing vain and of no effect; a dexterous getting clear, or eſcaping out of an affair, difficulty, embarraſſment, or the like. We ſay, to *elude* a propoſition, &c. The deſign of chicanery is, to *elude* the force of the laws: This doctor has not reſolved the difficulty, but *eluded* it. Alexander, ſays the hiſtorian, in cutting the Gordian knot, either *eluded* the oracle or fulfilled it: *Ille nequicquam luctatus cum latentibus nodis, Nihil, inquit, intereſt, quomodo ſolvatur; gladioque ruptis omnibus loris, oraculi ſortem vel* eludit, *vel implevit.*

ELVELA, a genus of plants belonging to the cryptogamia claſs, and order of fungi. The fungus is turbinated, or like an inverted cone. See BOTANY *Index.*

ELUL, in ancient chronology, the 12th month of the Jewiſh civil year, and the ſixth of the eccleſiaſtical: it conſiſted of only 29 days, and anſwered pretty nearly to our Auguſt.

ELUTRIATION, in *Chemiſtry*, an operation performed by waſhing ſolid ſubſtances with water, ſtirring them well together, and haſtily pouring off the liquid, while the lighter part remains ſuſpended in it, that it may thereby be ſeparated from the heavier part. By this operation metallic ores are ſeparated from earth, ſtones, and other unmetallic particles adhering to them.

ELY, a city and biſhop's ſee of Cambridgeſhire, ſituated about 12 miles north of Cambridge. E. Long. 0. 51. N. Lat. 52. 24. It is a county of itſelf, including the territory around; and has a judge who determines all cauſes civil and criminal within its limits. The church hath undergone various alterations ſince it was firſt eſtabliſhed by Etheldra, the wife of Egfride, king of Northumberland, who founded a religious houſe here, and planted it with virgins, and became the firſt abbeſs of it herſelf. The Danes entirely ruined this eſtabliſhment; then Ethelwald, the 27th biſhop of Wincheſter, rebuilt the monaſtery, and filled it with monks; to whom King Edgar, and many ſucceeding monarchs, beſtowed many privileges, and great grants of land; ſo that this abbey became in proceſs of time the beſt of any in England. Richard, the 11th abbot, wiſhing to free himſelf of the biſhop of Lincoln, within whoſe dioceſe his monaſtery was ſituated, and not liking ſo powerful a ſuperior, he made great intereſt with King Henry I. to get Ely erected into a biſhoprick; and ſpared neither purſe nor prayers to bring this about. He even brought the biſhop of Lincoln to conſent to it, by giving him and his ſucceſſors the manors of Bugden, Biggleſwade, and Spalding, which belonged to the abbey, in lieu of his juriſdiction; but he lived not to taſte the ſweets of his induſtry and ambition, he dying before his abbey was erected into a ſee. His ſucceſſor was the firſt biſhop of Ely: but the great privileges the biſhop enjoyed were almoſt wholly taken away, or much reſtricted, by the act of parliament, 27th Henry VIII. regarding the reſtoring to the crown the ancient royalties: So, inſtead of being palatine of the iſle of Ely, the biſhop and his temporal ſteward were by that act declared to be from thenceforth juſtices of the peace in the ſaid iſland. This dioceſe contains all Cambridgeſhire, and the iſle of Ely, excepting Iſelham, which belongs to the ſee of Rocheſter, and 15 other pariſhes, that are in the dioceſe of Norwich; but it has a pariſh in Norfolk, viz. Emneth. The number of pariſhes in this dioceſe are 141, whereof 75 are impropriate. It hath but one archdeacon, viz. of Ely. It is valued in the king's books at 2134l. 18s 5d. The clergy's tenth amounting to the ſum of 384l. 14s. 9½d. The biſhopric is computed to be worth annually 4000l. The church is dedicated to St Ethelred. The building, as it now appears, has been the work of ſeveral of its biſhops. The weſt parts were rebuilt by Biſhop Ridal; the choir and lanthern were begun by Biſhop Norwold, and finiſhed by Biſhop Frodiham. This ſee hath given two ſaints and two cardinals to the church of Rome; and to the Engliſh nation nine lord chancellors, ſeven lord treaſurers, one lord privy ſeal, one chancellor of the exchequer, one chancellor to the univerſity of Oxford, two maſters of the rolls, and three almoners. To this cathedral belong a biſhop, a dean, an archdeacon, eight prebendaries, with vicars, lay-clerks, choriſters, a ſchoolmaſter, uſher, and 28 king's ſcholars.

Elymais || Elyſium.

ELYMAIS, the capital city of the land of Elam, or the ancient Perſia. We are told (1 Mac. vi. 1.) that Antiochus Epiphanes, having underſtood that there were very great treaſures lodged in a temple at Elymais, determined to go and plunder it: but the citizens getting intelligence of his deſign, made an inſurrection, forced him out of the city, and obliged him to fly. The author of the ſecond book of Maccabees (ix. 2.) calls this city *Perſepolis*, in all probability becauſe formerly it was the capital of Perſia; for it is known from other accounts, that Perſepolis and Elymais were two very different cities, the latter ſituated upon the Eulæus, the former upon the Araxis.

ELYMUS, a genus of plants belonging to the triandria claſs, and in the natural method ranking under the fourth order, *Gramina*. See BOTANY *Index.*

ELYOT, SIR THOMAS, a gentleman of eminent learning in the 16th century, was educated at Oxford, travelled into foreign countries, and upon his return was introduced to court. His learning recommended him to Henry VIII. who conferred the honour of knighthood on him, and employed him in ſeveral embaſſies: particularly in 1532, to Rome, about the divorce of Queen Catharine, and afterwards to Charles V. about 1536. He wrote, *The Caſtle of Health*, *the Governor*, *Banquet of Sapience*, *Of the Education of Children*, *De rebus memorabilibus Angliæ*, and other books; and was highly eſteemed by all his learned contemporaries.

ELYSIUM (Ελυσιος), in the ancient theology, or rather mythology, a place in the *inferi* or lower world, furniſhed with fields, meads, agreeable woods, groves, ſhades, rivers, &c. whither the ſouls of good people were ſuppoſed to go after this life.

Orpheus, Hercules, and Æneas, were ſuppoſed to have

Elyſium, Elzevirs.

have deſcended into Elyſium in their life time, and to have returned again; (Virg. lib. vi. ver. 638, &c.) Tibullus (lib. i. eleg. 3.) gives us fine deſcriptions of the Elyſian fields.

Virgil oppoſes Elyſium to Tartarus; which was the place where the wicked underwent their puniſhment.

Hic locus eſt, partes ubi ſe via findit in ambas:
Dextera, quæ Ditis magni ſub mœnia tendit:
Hac iter Elyſium *nobis: at læva malorum*
Exercet pœnas, et ad impia Tartara mittit.

He aſſigns Elyſium to thoſe who died for their country, to thoſe of pure lives, to truly inſpired poets, to the inventors of arts, and to all who have done good to mankind.

Some authors take the fable of Elyſium to have been borrowed from the Phœnicians; as imagining the name *Elyſium* formed from the Phœnician עלז *alaz*, or עלץ *alats*, or עלם *alas*, "to rejoice," or "to be in joy;" the letter *a* being only changed into *e*, as we find done in many other names; as in *Enakim* for *Anakim*, &c. On which footing, Elyſian fields ſhould ſignify the ſame thing as a place of pleaſure; or,

——— *Locos Lætos, et amœna vireta*
Fortunatorum nemorum, ſedeſque beatas. VIRG.

Others derive the word from the Greek λυω *ſolvo*, "I deliver, I let looſe or diſengage;" becauſe here men's ſouls are freed or diſencumbered from the fetters of the body. Beroaldus, and Hornius (Hiſt. Philoſoph. lib. iii. cap. 2.) take the place to have derived its name from Eliza, one of the firſt perſons who came into Greece after the deluge, and the author and father of the Ætolians.

The Elyſian fields were, according to ſome, in the Fortunate Iſlands on the coaſt of Africa, in the Atlantic. Others place them in the iſland of Leuce; and, according to the authority of Virgil, they were ſituated in Italy. According to Lucian, they were near the moon, or in the centre of the earth, if we believe Plutarch. Olaus Wormius contends that it was in Sweden the Elyſian fields were placed.

ELZEVIRS, celebrated printers at Amſterdam and Leyden, who greatly adorned the republic of letters with many beautiful editions of the beſt authors of antiquity. They fell ſomewhat below the Stephenſes in point of learning, as well as in their editions of Greek and Hebrew authors; but as to the choice of good books, they ſeem to have equalled, and in the neatneſs and elegance of their ſmall characters, greatly to have exceeded them. Their Virgil, Terence, and Greek Teſtament, have been reckoned their maſterpieces; and are indeed ſo very fine, that they juſtly gained them the reputation of being the beſt printers in Europe. There were five of theſe Elzevirs, namely, Lewis, Bonaventure, Abraham, Lewis, and Daniel. Lewis began to be famous at Leyden in 1595, and was remarkable for being the firſt who obſerved the diſtinction between the *v* conſonant and *u* vowel, which had been recommended by Ramus and other writers long before, but never regarded. Daniel died in 1680 or 1681; and though he left children who carried on the buſineſs, paſſes nevertheleſs for the laſt of his family who excelled in it. The Elzevirs have printed ſeveral catalogues of their editions; but the laſt, publiſhed by Daniel, is conſiderably enlarged, and abounds with new books. It was printed at Amſterdam, 1674, in 12mo, and divided into ſeven volumes.

Emanation, Embalming.

EMANATION, the act of flowing or proceeding from ſome ſource or origin. Such is the emanation of light from the ſun; or that of effluvia from odorous, &c. bodies; of wiſdom from God, &c.—The word is formed of the Latin *è* "out of," and *manare* "to flow or ſtream."

EMANATION is alſo uſed for the thing that proceeds, as well as the act of proceeding. The power given a judge is an emanation from the regal power; the reaſonable ſoul is an emanation from the Divinity.

EMANCIPATION, in the Roman law, the ſetting free a ſon from the ſubjection of his father; ſo that whatever moveables he acquires belong in property to him, and not to his father, as before emancipation.

Emancipation puts the ſon in a capacity of managing his own affairs, and of marrying without his father's conſent, though a minor. Emancipation differs from manumiſſion, as the latter was the act of a maſter in favour of a ſlave, whereas the former was that of a father in favour of his ſon.

There were two kinds of emancipation: the one tacit, which was by the ſon's being promoted to ſome dignity, by his coming of age, or by his marrying; in all which caſes he became his own maſter of courſe. The other, expreſs; where the father declared before a judge, that he emancipated his ſon. In performing this, the father was firſt to ſell his ſon imaginarily to another, whom they called *pater fiduciarius*, father in truſt; of whom being bought back again by the natural father, he manumitted him before the judge by a verbal declaration.

Emancipation formerly obtained in France with regard to minors or pupils, who were hereby ſet at liberty to manage their own effects, without the advice or direction of their parents or tutors.

EMARGINATED, among botaniſts. See BOTANY *Index*.

EMASCULATION, the act of caſtrating or depriving a male of thoſe parts which characterize his ſex. See CASTRATION and EUNUCH.

EMAUS, EMMAUS, or *Ammaus*, in *Ancient Geography*, a village, 60 ſtadia to the north weſt of Jeruſalem, or about ſeven miles: it afterwards became a town, and a Roman colony, *Nicopolis*, (Jerome). Reland has another *Emmaus* towards Lydda, 22 miles from Jeruſalem, (Itinerary); a third, near Tiberias.

EMBALMING, is the opening a dead body, taking out the inteſtines, and filling the place with odoriferous and deſiccative drugs and ſpices, to prevent its putrefying. The Egyptians excelled all other nations in the art of preſerving bodies from corruption; for ſome that they have embalmed upwards of 2000 years ago, remain whole to this day, and are often brought into other countries as great curioſities. Their manner of embalming was thus: they ſcooped the brains with an iron ſcoop out at the noſtrils, and threw in medicaments to fill up the vacuum: they alſo took out the entrails, and having filled the body with myrrh, caſſia, and other ſpices, except frankincenſe, proper to dry up the humours, they pickled it in nitre, where it lay

Embalming || Embargo.

lay ſoaking for 70 days. The body was then wrapped up in bandages of fine linen and gums, to make it ſtick like glue; and ſo was delivered to the kindred of the deceaſed, entire in all its features, the very hairs of the eye-lids being preſerved. They uſed to keep the bodies of their anceſtors, thus embalmed, in little houſes magnificently adorned, and took great pleaſure in beholding them, alive as it were, without any change in their ſize, features, or complexion. The Egyptians alſo embalmed birds, &c. The prices for embalming were different; the higheſt was a talent, the next 20 mine, and ſo decreaſing to a very ſmall matter: but they who had not wherewithal to anſwer this expence, contented themſelves with infuſing, by means of a ſyringe, through the fundament, a certain liquor extracted from the cedar; and, leaving it there, wrapped up the body in ſalt of nitre: the oil thus preyed upon the inteſtines, ſo that when they took it out, the inteſtines came away with it, dried, and not in the leaſt putrified: the body being encloſed in nitre, grew dry, and nothing remained beſides the ſkin glued upon the bones.

The method of embalming uſed by the modern Egyptians, according to Maillet, is to waſh the body ſeveral times with roſe-water, which, he elſewhere obſerves, is more fragrant in that country than with us; they afterwards perfume it with incenſe, aloes, and a quantity of other odours, of which they are by no means ſparing; and then they bury the body in a winding ſheet, made partly of ſilk and partly of cotton, and moiſtened, as is ſuppoſed, with ſome ſweet-ſcented water or liquid perfume, though Maillet uſes only the term *moiſtened*; this they cover with another cloth of unmixed cotton, to which they add one of the richeſt ſuits of clothes of the deceaſed. The expence, he ſays, on theſe occaſions, is very great, though nothing like what the genuine embalming coſt in former times.

EMBARCADERO, in commerce, a Spaniſh term, much uſed along the coaſts of America, particularly thoſe on the ſide of the South ſea. It ſignifies a place which ſerves ſome other conſiderable city farther within land, for a port or place of ſhipping, i. e. of embarking and diſembarking commodities. Thus Calao is the embarcadero of Lima, the capital of Peru; and Arica the embarcadero of Potoſi. There are ſome embarcaderos 40, 50, and even 60 leagues off the city which they ſerve in that capacity.

EMBARGO, in commerce, an arreſt on ſhips or merchandiſe, by public authority; or a prohibition of ſtate, commonly on foreign ſhips, in time of war, to prevent their going out of port, ſometimes to prevent their coming in, and ſometimes both, for a limited time.

The king may lay embargoes on ſhips, or employ thoſe of his ſubjects, in time of danger, for the ſervice and defence of the nation; but they muſt not be for the private advantage of a particular trader or company; and therefore a warrant to ſtay a ſingle ſhip is no legal embargo. No inference can be made from embargoes which are only in war-time; and are a prohibition by advice of council, and not at proſecution of parties. If goods be laden on board, and after an embargo or reſtraint from the prince or ſtate comes forth, and then the maſter of the ſhip breaks ground, or endeavours to ſail, if any damage accrues, he muſt be reſponſible for the ſame; the reaſon is, becauſe his freight is due, and muſt be paid, even though the goods be ſeized as contraband. Embarraſs || Emblem.

EMBARRASS, (*Embarraſſment*), a French term, though now naturalized; denoting a difficulty or obſtacle which perplexes or confounds a perſon, &c.

EMBASSADOR. See AMBASSADOR.

EMBASSY, the office or function of an AMBASSADOR.

EMBDEN, a port-town and city of Germany, capital of a county of the ſame name, now in poſſeſſion of the king of Pruſſia; it is ſituated at the mouth of the river Ens. E. Long. 6. 45. N. Lat. 53. 50.

EMBER-WEEKS, are thoſe wherein the *ember*, or *embring days* fall.

In the laws of King Alfred, and thoſe of Canute, thoſe days are called *ymbren*, that is, circular days, from whence the word was probably corrupted into *ember days*: by the canoniſts they are called *quatuor anni tempora*, the four cardinal ſeaſons, on which the circle of the year turns: and hence Henſhaw takes the word to have been formed, viz. by corruption from *temper* of *tempora*.

The ember-days are, the Wedneſday, Friday, and Saturday, after Quadrageſima Sunday, after Whitſunday, after Holy-rood day in September, and after St Lucia's day in December: which four times anſwer well enough to the four quarters of the year, Spring, Summer, Autumn, and Winter.

Mr Somner thinks they were originally faſts, inſtituted to beg God's bleſſing on the fruits of the earth. Agreeable to which, Skinner ſuppoſes the word *ember* taken from the aſhes, *embers*, then ſtrewed on the head.

Theſe ember-weeks are now chiefly taken notice of, on account of the ordination of prieſts and deacons; becauſe the canon appoints the Sundays next ſucceeding the ember-weeks, for the ſolemn times of ordination: Though the biſhops, if they pleaſe, may ordain on any Sunday or holiday.

EMBERIZA, a genus of birds belonging to the order of paſſeres. See ORNITHOLOGY *Index*.

EMBLEM, a kind of painted enigma, which, repreſenting ſome obvious hiſtory, with reflections underneath, inſtructs us in ſome moral truth or other matter of knowledge. See DEVISE, ÆNIGMA, &c.

Such is that very ſignificant image of Scævola holding his hand in the fire; with the words, *Agere et pati fortiter Romanum eſt*, "To do and ſuffer courageouſly is Roman."

The word is pure Greek, formed of the verb ἐμβάλλω, "to caſt in, to inſert." Suetonius relates, that Tiberius made the word be eraſed out of the decree of the Roman ſenate, becauſe borrowed from another language.

The emblem is ſomewhat plainer and more obvious than the ænigma.—Gale defines emblem an ingenious picture, repreſenting one thing to the eye, and another to the underſtanding.

The Greeks alſo gave the name EMBLEMS, ἐμβλήματα, to inlayed or moſaic works, and even to all kinds of ornaments of vaſes, moveables, garments, &c. And the Latins uſed *emblema* in the ſame ſenſe. Accordingly, Cicero reproaching Verres with the ſtatues and fine wrought works he had plundered from the Sicilians,

Emboliſmus || Embroidery.

calls the ornaments fixed thereto (and which on occaſion might be ſeparated from them) *emblemata*. Add, that Latin authors frequently compare the figures and ornaments of diſcourſe to theſe *emblemata*. Thus, an ancient Latin poet praiſing an orator, ſays, that all his words were ranged like the pieces in moſaic:

Quam lepide λεξεις compoſtæ, ut teſſerulæ omnes,
At te pavimenti, atque emblemate *vermiculato.*

With us emblem ordinarily ſignifies no more than a painting, baſſo-relievo, or other repreſentation, intended to hold forth ſome moral or political inſtruction.

What diſtinguiſhes an emblem from a deviſe is, that the words of an emblem have a full complete ſenſe of themſelves; nay, all the ſenſe and ſignification which they have, together with the figure. But there is a yet further difference between emblem and deviſe: for a deviſe is a ſymbol appropriated to ſome perſon, or that expreſſes ſomething which concerns him particularly; whereas an emblem is a ſymbol that regards all the world alike.

Theſe differences will be more apparent, from comparing the emblem above quoted, with the deviſe of a candle lighted, and the words *Juvando conſumor*, "I waſte myſelf in doing good." See DEVISE.

EMBOLISMUS, Εμβολισμος, in *Chronology*, ſignifies "intercalation." The word is formed of εμβαλλειν, "to inſert."

As the Greeks made uſe of the lunar year, which is only 354 days; in order to bring it to the ſolar, which is 365 years, they had every two or three years an emboliſm, i. e. they added a 13th lunar month every two or three years, which additional month they called *emboliмæus*, εμβολιμαιος, becauſe inſerted, or intercalated.

EMBOSSING, or IMBOSSING, in *Architecture* and *Sculpture*, the forming or faſhioning works in relievo, whether cut with a chiſel or otherwiſe.

Emboſſing is a kind of ſculpture, wherein the figures ſtick out from the plane whereon it is cut: and according as the figures are more or leſs prominent, they are ſaid to be in alto, mezzo, or baſſo, relievo; or high, mean, or low relief. See ENCHASING.

EMBOTHRIUM, a genus of plants belonging to the tetrandria claſs. See BOTANY *Index*.

EMBRASURE, in *Architecture*, the enlargement made of the aperture of a door or window on the inſide of the wall; its uſe being to give the greater play for the opening of the door or caſement, or to admit the more light.

EMBROCATION, in *Surgery* and *Pharmacy*, an external kind of remedy, which conſiſts in an irrigation of the part affected, with ſome proper liquor, as oils, ſpirits, &c. by means of a woollen or linen cloth, or a ſponge, dipped in the ſame.

EMBROIDERY, a work in gold, or ſilver, or ſilk thread, wrought by the needle upon cloth, ſtuffs, or muſlin, into various figures. In embroidering ſtuffs, the work is performed in a kind of loom; becauſe the more the piece is ſtretched, the eaſier it is worked. As to muſlin, they ſpread it upon a pattern ready deſigned; and ſometimes, before it is ſtretched upon the pattern, it is ſtarched, to make it more eaſy to handle. Embroidery on the loom is leſs tedious than the other, in which, while they work flowers, all the threads of the muſlin, both lengthwiſe and breadthwiſe, muſt be continually counted; but, on the other hand, this laſt is much richer in points, and ſuſceptible of greater variety. Cloths too much milled are ſcarce ſuſceptible of this ornament, and in effect we ſeldom ſee them embroidered. The thinneſt muſlins are left for this purpoſe; and they are embroidered to the greateſt perfection in Saxony; in other parts of Europe, however, they embroider very prettily, and eſpecially in France. Embroidery || Emerald.

There are ſeveral kinds of embroidery: as, 1. Embroidery on the ſtamp; where the figures are raiſed and rounded, having cotton or parchment put under them to ſupport them. 2. Low embroidery; where the gold and ſilver lie low upon the ſketch, and are ſtitched with ſilk of the ſame colour. 3. Guimped embroidery: this is performed either in gold or ſilver; they firſt make a ſketch upon the cloth, then put on cut vellum, and afterwards ſew on the gold and ſilver with ſilk thread: in this kind of embroidery they often put gold and ſilver cord, tinſel, and ſpangles. 4. Embroidery on both ſides; that which appears on both ſides of the ſtuff. 5. Plain embroidery; where the figures are flat and even, without cords, ſpangles, or other ornaments.

By ſtat. 22 Geo. II. c. 36. no foreign embroidery, or gold and ſilver brocade, ſhall be imported, upon pain of being forfeited and burnt, and penalty of 100l. for each piece. No perſon ſhall ſell, or expoſe to ſale, any foreign embroidery, gold or ſilver thread, lace, fringe, brocade, or make up the ſame into any garment, on pain of having it forfeited and burnt, and penalty of 100l. All ſuch embroidery, &c. may be ſeized and burnt; and the mercer, &c. in whoſe cuſtody it was found, ſhall forfeit 100l.

EMBRUN, or AMBRUN, a city of Dauphiny, in France, near the confines of Piedmont. E. Long. 6. 6. N. Lat. 44 35.

EMBRYO, in *Phyſiology*, the firſt rudiments of an animal in the womb, before the ſeveral members are diſtinctly formed; after which period it is denominated a *fetus*. See GENERATION and FETUS.

EMERALD, a genus of precious ſtones belonging to the order of ſiliceous earths. The word is derived, according to ſome, from the French *eſmaraude*, and that from the Latin *ſmaragdus*, ſignifying the ſame thing; by others it is ſaid to be derived from the Italian *ſmeraldo*, or the Arabian *zomorrad*. According to Cronſtedt the emerald is the ſofteſt of all the precious ſtones, though other naturaliſts place it the next after the diamond in this reſpect. It is perhaps the moſt beautiful of all the gems, and, according to Wallerius, when heated in the fire, changes its colour to a deep blue, and becomes phoſphoreſcent; but recovers its green colour when cold. When pulverized it has a white appearance, and, with borax, melts to a very thin and colourleſs glaſs. It becomes electric by being rubbed, and ſome have the property of the tourmalin, viz. of being electrified by heat, and in that ſtate attracting aſhes or other light ſubſtances; though the emeralds are leſs powerful than the tourmalin, and after having attracted the aſhes, they retain them without any ſigns of repulſion.

Pliny mentions twelve different kinds of theſe precious ſtones; though it appears, from the vaſt ſize of ſome of them, that they muſt have been only certain kinds of green ſpar, or other green ſtone, which at that time

Emerald. time went under the name of *emerald* among the ancients. The true emerald is found only in very ſmall cryſtals, from the ſize of $\frac{1}{8}$th of an inch in diameter to that of a walnut. Theophraſtus, however, mentions one four cubits long and three broad; likewiſe an obeliſk compoſed of only four emeralds, the whole length being 40 cubits, and the breadth from four to two.

Engeſtroom informs us, that the emeralds, in their rough or native ſtate, conſiſt of hexagonal columns moſtly truncated at both ends; and that he had ſome in his poſſeſſion, which in a gentle heat became colourleſs; but in a ſtrong heat white and opaque, without any mark of fuſion. Brunick diſtinguiſhes them into two claſſes. 1. The pale green emerald, which comes from the eaſt and from Peru, the figure being that of an hexagonal truncated priſm, and the baſis a vein of white quartz. 2. The dark green emerald, which is alſo columnar, but very dark coloured, ſtriped longitudinally, and has little tranſparency. The points are generally broken off longitudinally, though Davila mentions one reſembling a blunt triangular pyramid; and in the Imperial cabinet at Vienna there is one with a five-ſided pyramid. Theſe are the emeralds which become electrical by heat; though all of them do not; and thoſe which do ſo cannot be known but by actual experiment. The fineſt ſpecimen of the former kind of emeralds is to be ſeen in the treaſury of the holy chapel of Loretto, containing upwards of 100 of theſe precious ſtones great and ſmall. A fellow to this was made by art, and both were preſents to the king of Sicily, deſigned to repreſent two Mount Calvaries.

Emeralds are diſtinguiſhed by the jewellers into two kinds, the oriental and occidental. The true oriental emerald is very ſcarce, and at preſent only found in the kingdom of Cambay. So great indeed is the ſcarcity of them, that an opinion prevailed that there are no oriental emeralds. This opinion is adopted, among others, by Mr Bruce; who informs us, that he made an excurſion to the iſland of emeralds in the Red ſea, and endeavours to ſhow that there never were any emeralds but what came from America, and that thoſe ſaid to have been found in the Eaſt Indies were imported from that continent. It is probable indeed, that in former times any kind of cryſtal tinged of a green colour might be called an *emerald*, and hence the green cockle ſpar brought from Egypt may have obtained the name of *mother of emeralds*; but of late ſome emeralds have been brought from Cambay into Italy which greatly excelled thoſe of America. The beſt emeralds of the weſtern continent come from Peru, and are called *oriental* by the jewellers: ſome are found in Europe, principally in the duchy of Sileſia in Germany.

Rough EMERALDS.—Thoſe of the firſt and coarſeſt ſort, called *plaſmes*, for grinding, are worth 27 ſhillings ſterling the marc, or 8 ounces. The demi-morillons, 8l. ſterling per marc. Good morillons, which are only little pieces, but of fine colour, from 13l. to 15l. per marc. Emeralds, larger than morillons, and called *of the third colour* or *ſort*, are valued at from 50l. to 60l. the marc. Emeralds, called *of the ſecond ſort*, which are in larger and finer pieces than the preceding, are worth from 65l. to 75l. per marc. Laſtly, thoſe of the firſt colour, otherwiſe called *negres cartes*, are worth from 110l. to 115l.

EMERALDS ready cut, or poliſhed and not cut, being of good ſtone, and a fine colour, are worth— Emeralds ‖ Emerſon.

	L.	s.
Thoſe weighing one carat, or four grains	0	10
Thoſe of two carats	1	7
Thoſe of three carats	2	5
Thoſe of four carats	3	10
Thoſe of five carats	4	10
Thoſe of ſix carats	7	10
Thoſe of ſeven carats	15	0
Thoſe of eight carats	19	0
Thoſe of nine carats	23	0
Thoſe of ten carats	33	0

To counterfeit EMERALDS: Take of natural cryſtal, four ounces; of red lead, four ounces; verdegris, forty-eight grains; crocus martis, prepared with vinegar, eight grains: let the whole be finely pulverized and ſifted; put this into a crucible, leaving one inch empty: lute it well, and put it into a potter's furnace, and let it ſtand there as long as they do their pots. When cold, break the crucible; and you will find a matter of a fine emerald colour, which, after it is cut and ſet in gold, will ſurpaſs in beauty an oriental emerald.

EMERSION, in *Phyſics*, the riſing of any ſolid above the ſurface of a fluid ſpecifically heavier than itſelf, into which it had been violently immerged or thruſt.

It is one of the known laws of hydroſtatics, that a lighter ſolid being forced down into a heavier fluid, immediately endeavours to emerge; and that with a force or moment equal to the exceſs of weight of a quantity of the fluid above that of an equal bulk of the ſolid. Thus, if a ſolid be immerged in a fluid of double its ſpecific gravity, it will emerge again till half its bulk or body be above the ſurface of the fluid.

EMERSION, in *Aſtronomy*, is when the ſun, moon, or other planet, begins to re-appear, after its having been eclipſed, or hid by the interpoſition of the moon, earth, or other body.

The difference of longitude is ſometimes found by obſerving the immerſions and emerſions of the firſt of Jupiter's ſatellites. The immerſions are obſerved from the time of Jupiter's being in conjunction with the ſun to his oppoſition; and the emerſions, from the oppoſition to the conjunction; which two intervals are uſually ſix months a-piece, and divide the year between them. But when Jupiter is in conjunction with the ſun, and 15 days before and afterwards, there is nothing to be obſerved; the planet, with his ſatellites, being then loſt in the light of the ſun.

EMERSION is alſo uſed when a ſtar, before hid by the ſun, as being too near him, begins to re-appear and to get out of his rays.

EMERSON, WILLIAM, an eminent mathematician, was born in June 1701, at Hurworth, a village about three miles ſouth of Darlington; at leaſt it is certain that he reſided here from his childhood. His father Dudley Emerſon was a tolerable proficient in mathematics; and without his books and inſtructions, perhaps his own genius (moſt eminently fitted from mathematical diſquiſitions) would have never been unfolded. He was inſtructed in the learned languages by a young clergyman, then curate of Hurworth, who was

Emerſon. was boarded at his father's houſe. In the earlier part of his life he attempted to teach a few ſcholars: but whether from his conciſe method (for he was not happy in explaining his ideas), or the warmth of his natural temper, he made no progreſs in his ſchool: he therefore ſoon left it off; and ſatisfied with a moderate competence left him by his parents, he devoted himſelf to a ſtudious retirement. Towards the cloſe of the year 1781 (being ſenſible of his approaching diſſolution), he diſpoſed of the whole of his mathematical library to a bookſeller at York; and on May 20th 1782, he died of a lingering and painful diſorder at his native village, aged near 81 years.

Mr Emerſon in his perſon was rather ſhort, but ſtrong and well-made, with an open countenance and ruddy complexion. He was exceedingly ſingular in his dreſs. He had but one coat, which he always wore open before, except the lower button; no waiſtcoat; his ſhirt quite the reverſe of one in common uſe, no opening before, but buttoned cloſe at the collar behind; a kind of ſlaxen wig which had not a crooked hair in it, and probably had never been tortured with a comb from the time of its being made. He always walked up to London when he had any thing to publiſh, reviſing ſheet by ſheet himſelf:—Truſting no eyes but his own, was always a favourite maxim with him. He never advanced any mathematical propoſition that he had not firſt tried in practice, conſtantly making all the different parts himſelf on a ſmall ſcale, ſo that his houſe was filled with all kinds of mechanical inſtruments together or disjointed. He would frequently ſtand up to his middle in water while fiſhing, a diverſion he was remarkably fond of. He uſed to ſtudy inceſſantly for ſome time, and then for relaxation take a ramble to any pot-alehouſe where he could get any body to drink with and talk to. The duke of Manchеſter was highly pleaſed with his company, and uſed often to come to him in the fields and accompany him home, but could never perſuade him to get into a carriage. On theſe occaſions he would ſometimes exclaim, "Damn your whim-wham! I had rather walk." He was a married man; and his wife uſed to ſpin on an old-faſhioned wheel, whereof a very accurate drawing is given in his mechanics. He was deeply ſkilled in the ſcience of muſic, the theory of ſounds, and the various ſcales both ancient and modern, but was a very poor performer.

The following is a liſt of Mr Emerſon's works. 1. The Doctrine of Fluxions. 2. The Projection of the Sphere, orthographic, ſtereographic, and gnomonical. 3. The Elements of Trigonometry. 4. The Principles of Mechanics. 5. A Treatiſe of Navigation on the Sea. 6. A Treatiſe of Algebra, in two books. 7. The Arithmetic of Infinites, and the differential Method, illuſtrated by Examples. 8. Mechanics; or the Doctrine of Motion. 9. The Elements of Optics, in four books. 10. A Syſtem of Aſtronomy. 11. The Laws of Centripetal and Centrifugal Force. 12. The Mathematical Principles of Geography. 13. Tracts, 8vo. 14. Cyclomatheſis; or an eaſy Introduction to the ſeveral branches of the Mathematics. 15. A ſhort comment on Sir Iſaac Newton's Principia; to which is added, A Defence of Sir Iſaac againſt the objections that have been made to ſeveral Parts of his Works. 16. A Miſcellaneous Treatiſe, containing ſeveral Mathematical Subjects, 8vo. 1776. Emery.

EMERY, in *Natural Hiſtory*, a rich iron-ore found in large maſſes of no determinate ſhape or ſize, extremely hard, and very heavy. It is uſually of a duſky brownish red on the ſurface; but when broken, is of a fine bright iron-gray, but not without ſome tinge of redneſs; and is ſpangled all over with ſhining ſpecks, which are ſmall flakes of a foliaceous ſtalk, highly impregnated with iron. It is alſo ſometimes very red, and then uſually contains veins of gold. It makes no effervescence with any of the acid menſtruums; and is found in the iſland of Guernſey, in Tuſcany, and many parts of Germany.

Dr Lewis is of opinion, that ſome kinds of emery may contain the metal called *platina*, and on this ſubject has the following curious obſervations. "Alonſo Barba mentions a ſubſtance called *chumpi*; which is a hard ſtone of the emery kind, participating of iron, of a gray colour ſhining a little, very hard to work, becauſe it reſiſts the fire much, found in Potoſi, Chocaya, and other places, along with blackiſh and reddiſh ores that yield gold. If platina is really found in large maſſes, either generally or only now and then, one might reaſonably expect thoſe maſſes to be ſuch as are here deſcribed.

"Of the ſame kind perhaps alſo is the mineral mentioned by ſeveral authors under the name of Spaniſh emery, *ſmiris Hiſpanicus*, which ſhould ſeem, from the accounts given of it, to be no other than platina or its matrix. The *ſmiris* is ſaid to be found in the gold mines, and its exportation prohibited; to contain ſilms or veins of native gold; to be in great requeſt among the alchemiſts; to have been ſometimes uſed for the adulteration of gold; to ſtand, equally with the noble metal, cupellation, quartation, antimony, and the regal cement; and to be ſeparable from it by amalgamation with mercury, which throws out the *ſmiris* and retains the gold; properties ſtrongly characteriſtic of platina, and which do not belong to any known ſubſtance beſides. This debaſement of gold *per extractum ſmiridis Hiſpanici* is mentioned by Becher in his *Minera arenaria*, and ſeveral times hinted at in his *Phyſica ſubterranea*. Both Becher and Stahl indeed call the ſubſtance which the gold receives from the emery an earth, whereas platina is undoubtedly a metal; but this does not at all invalidate our ſuppoſition, for they give the name of earth alſo to the ſubſtance which copper receives from calamine in being made into braſs, which is now known to be metallic.

"From theſe obſervations I have been led to ſuſpect, that the European emeries likewiſe might poſſibly participate of platina. If this was certain, it would account ſatisfactorily for the uſe which ſome of the alchemiſts are ſaid to have made of emeries and other ferruginous ores; and we ſhould no longer doubt, or wonder, that by treating gold with theſe kinds of minerals, they obtained a permanent augmentation; that this augmentation, though it reſiſted lead, antimony, aquafortis, and the regal cement, was ſeparable, as Becher owns it was, by quickſilver; and that, when it exceeded certain limits, it rendered the gold pale and brittle.

"If emery contains platina, I imagined it might be

Emery || Emir.

be diſcoverable by boiling the powdered mineral in melted lead, and afterwards working off the lead upon a teſt or cupel. The experiment was made with eight ounces of the fineſt powder of common emery, and the ſame quantity of lead; which were covered with black flux to prevent the ſcorification of the lead, and urged with a ſtrong fire for two or three hours. The lead became hard, rigid, of a dark colour, and a granulated texture, as if it had really imbibed ſome platina from the emery; but in cupellation it worked almoſt entirely off, leaving only a head about the ſize of a ſmall pin's head, which was probably no other than ſilver contained in the lead.

"I repeated the experiment with ſome variation, thinking to obtain a more perfect reſolution of the emery by vitrifying it with the lead. Two ounces of fine emery and ſix ounces of minium were well mixed together, and urged with a ſtrong fire, in a cloſe crucible, for an hour: they melted into an uniform dark brownish glaſs. The glaſs was powdered, mixed with four ounces of fixt alkaline ſalt and ſome powdered charcoal, and put into a freſh crucible, with ſome common ſalt on the ſurface: The fire was pretty ſtrongly excited; but the fuſion was not ſo perfect as could be wiſhed, and only about two ounces of lead were found revived. This lead had ſuffered nearly the ſame change as that in the foregoing experiment; and like it, gave no appearance of platina on being cupelled.

"It ſeems to follow from theſe experiments, that the emery employed in them contained no platina; but as it is not to be ſuppoſed that all emeries are of one compoſition, other ſorts may deſerve to be ſubmitted to the ſame trials. As gold is contained in ſome parcels of common minerals, and by no means in all the individuals of any one ſpecies; platina may poſſibly in like manner be found in ſome European ores, though there is not the leaſt footſtep of it in other parcels of the ſame kind of ore."

EMETICS, medicines that induce vomiting. See Materia Medica *Index*.

EMIMS, ancient inhabitants of the land of Canaan beyond Jordan, who were defeated by Chedorlaomer and his allies, Gen. xiv. 5. Moſes tells us, that they were beaten in Shaveh Kirjathaim, which was in the country of Sihon conquered from the Moabites, Joſh. xiii. 19.—21. The Emims were a warlike people, of a gigantic ſtature, great and many, and tall as the Anakims.

EMINENCE, in *Geography*, a little hillock or aſcent above the level of the adjoining champaign.

Eminence is alſo a title of honour given to cardinals. The decree of the Pope, whereby it was appointed that the cardinals ſhould be addreſſed under the quality of *eminence*, bears date the 10th of January 1630. They then laid aſide the titles of *illuſtriſſimi* and *reverendiſſimi*, which they had borne before.

The grand maſter of Malta is likewiſe addreſſed under the quality of *eminence*. The popes John VIII. and Gregory VII. gave the ſame title to the kings of France. The emperors have likewiſe borne it.

Eminentiſſimus, the ſuperlative of *eminent*, has of late been attributed to the cardinals.

EMIR, a title of dignity among the Turks, ſignifying a prince.

This title was firſt given to the caliphs; but when they aſſumed the title of Sultans, that of emir remained to their children; as that of Ceſar among the Romans. At length the title came to be attributed to all who were judged to deſcend from Mahomet by his daughter Fatimah, and who wear the green turban inſtead of the white. The Turks make an obſervation, that the emirs, before their fortieth year, are men of the greateſt gravity, learning, and wiſdom; but after this, if they are not great fools, they diſcover ſome ſigns of levity and ſtupidity. This is interpreted by the Turks as a ſort of divine impulſe in token of their birth and ſanctity. The Turks alſo call the vizirs, bashaws, or governors of provinces, by this name.

Emiſſary || Emmius.

EMISSARY, in a political ſenſe, a perſon employed by another to ſound the opinions of people, ſpread certain reports, or act as a ſpy over other people's actions.

Emissary Veſſels, in *Anatomy*, the ſame with thoſe more commonly called Excretory.

EMISSION, in *Medicine*, a term uſed chiefly to denote the ejaculation of the ſemen or ſeed in the act of coition. See Coition and Generation.

EMMANUEL, or Immanuel, a Hebrew word which ſignifies 'God with us.' Iſaiah (viii. 14.), in that celebrated propheſy, wherein he declares to Ahaz the birth of the Meſſiah, who was to be born of a virgin, ſays, This child ſhall be called, and really be, Emmanuel, that is, *God with us*. The ſame prophet (viii. 8.) repeats the ſame thing, while he is ſpeaking of the enemy's army, which, like a torrent, was to overflow Judea. 'The ſtretching out of his wings ſhall fill the breadth of thy land, O Emmanuel.' The evangeliſt Matthew (i. 23.) informs us, that this propheſy was accompliſhed in the birth of Chriſt, born of the virgin Mary, in whom the two natures divine and human were united, and ſo in this ſenſe he was really Emmanuel, or 'God with us.'

EMMERICK, a rich fortified town of Germany, in the circle of Weſtphalia, and duchy of Cleves. It carries on a good trade with the Dutch, and both Proteſtants and Catholics have the free exerciſe of their religion. The ſtreets are neat and regular, and the houſes tolerably built. It was taken by the French in 1672, and delivered to the elector of Brandenburg in 1673, under whoſe juriſdiction it now is. It is ſeated near the Rhine. E. Long. 5. 29. N. Lat. 52. 5.

EMMIUS, Ubbo, born at Gretha in Eaſt Frieſland in 1547, was a very learned profeſſor, and choſen rector of the college of Norden in 1579. This ſeminary flouriſhed exceedingly under his care; and declined as viſibly after he was ejected, in 1587, for refuſing to ſubſcribe the Confeſſion of Augſburg. The year after, he was made rector of the college of Leer; and when the city of Groningen confederated with the United Provinces, the magiſtrates appointed him rector of that college: which employment he filled with the higheſt repute near 20 years; until, the college being erected into an univerſity, he was the firſt rector, and one of the chief ornaments of it by his lectures, till his infirmities prevented his public appearance. His wiſdom was equal to his learning; ſo that the governor of Frieſland and Groningen often conſulted him, and ſeldom failed to follow his advice. He wrote

Vetus

Emmenagogues || Emouy.

Vetus Græcia illuſtrata, 3 vols; *Decades Rerum Freſicarum*; and many other valuable works. He died in 1625.

EMMENAGOGUES, Εμμηναγωγα, in *Medicine*, ſuch remedies as promote the menſtrual diſcharge. They are thus called from εν "in," μην "month," αγω *duco*, "I lead," becauſe their natural periods of flowing are once a-month.

EMOLLIENTS, in *Medicine* and *Pharmacy*, are ſuch remedies as ſheath and ſoften the aſperity of the humours, and relax and ſupple the ſolids at the ſame time.

EMOLUMENT, is properly applied to the profits ariſing daily from an office or employ. The word is formed of the Latin *emolumentum*, which, according to ſome, primarily ſignifies the profits redounding to the miller from his mill; of *molo*, *molere*, "to grind."—The patent, or other inſtrument, whereby a perſon is preferred to an office, gives him a right to enjoy all the duties, honours, profits, and emoluments belonging thereto.—*Emolument* is alſo uſed, in a ſomewhat greater latitude, for profit or advantage in the general.

EMOTION and PASSION, in the human mind, are thus diſtinguiſhed by a celebrated writer *. An internal motion or agitation of the mind, when it paſſeth away without deſire, is denominated *an emotion:* when deſire follows, the motion or agitation is denominated *a paſſion*. A fine face, for example, raiſeth in me a pleaſant feeling: if that feeling vaniſh without producing any effect, it is in proper language an *emotion;* but if the feeling, by reiterated views of the object, becomes ſufficiently ſtrong to occaſion deſire, it loſes its name of emotion, and acquires that of *paſſion*. The ſame holds in all the other paſſions. The painful feeling raiſed in a ſpectator by a ſlight injury done to a ſtranger, being accompanied with no deſire of revenge, is termed an emotion; but that injury raiſeth in the ſtranger a ſtronger emotion, which being accompanied with deſire of revenge, is a paſſion. External expreſſions of diſtreſs produce in the ſpectator a painful feeling, which being ſometimes ſo ſlight as to paſs away without any effect, is an emotion; but if the feeling be ſo ſtrong as to prompt deſire of affording relief, it is a paſſion, and is termed *pity*. Envy is emulation in exceſs: if the exaltation of a competitor be barely diſagreeable, the painful feeling is an emotion; if it produce deſire to depreſs him, it is a paſſion. See PASSION.

* *Elem. of Criticiſm*, vol. i. p. 45.

EMOUY, or HIA-MEN, an iſland and port of China, under the juriſdiction of the province of FO-KIEN.

The port is properly but an anchoring-place for ſhips, incloſed on one ſide by the iſland from which it takes its name, and on the other by the main land: but it is ſo extenſive, that it can contain ſeveral thouſands of veſſels; and the depth of its water is ſo great, that the largeſt ſhips may lie cloſe to the ſhore without danger.

In the beginning of the preſent century it was much frequented by European veſſels; but few viſit it at preſent, as all the trade is carried on at Canton. The emperor keeps here a garriſon of 6 or 7000 men, commanded by a Chineſe general. In entering this road, a large rock muſt be doubled which ſtands at the mouth of it, and divides it almoſt as the Mingant divides the harbour of Breſt. This rock is viſible, and riſes ſeveral feet above the ſurface of the water. Emouy.

The iſland of Emouy is particularly celebrated on account of the magnificence of its principal pagod, conſecrated to the deity Fo. This temple is ſituated in a plain, terminated on one ſide by the ſea, and on the other by a lofty mountain. Before it the ſea, flowing through different channels, forms a large ſheet of water which is bordered with turf of the moſt beautiful verdure. The front of this edifice is 180 feet to length, and its gate is adorned with figures in relief, which are the uſual ornaments of the Chineſe architecture. On entering, you find a vaſt portico, with an altar in the middle, on which is placed a gigantic ſtatue of gilt braſs, repreſenting the god Fo, ſitting croſs-legged. Four other ſtatues are placed at the corners of this portico, which are 18 feet high, although they repreſent people ſitting. Each of theſe ſtatues is formed from a ſingle block of ſtone. They bear in their hands different ſymbols which mark their attributes, as formerly in Athens and Rome the trident and caduceus diſtinguiſhed Neptune and Mercury. One holds a ſerpent in his arms, which is twiſted round its body in ſeveral folds; the ſecond has a bent bow and a quiver; the two others preſent, one a kind of battle-axe, and the other a guitar, or ſome inſtrument of the ſame kind.

After croſſing this portico, you enter a ſquare outer court, paved with large gray ſtones, the leaſt of which is ten feet in length and four in breadth. At the four ſides of this court ariſe four pavilions, which terminate in domes, and have a communication with one another by means of a gallery which runs quite round it. One of theſe contains a bell ten feet in diameter; the wooden-work which ſupports this heavy maſs cannot be ſufficiently admired. In the other is kept a drum of an enormous ſize, which the bonzes uſe to proclaim the days of new and full moon. It muſt be obſerved, that the clappers of the Chineſe bells are on the outſide, and made of wood in the form of a mallet. The two other pavilions contain the ornaments of the temple, and often ſerve to lodge travellers, whom the bonzes are obliged to receive. In the middle of this court is a large tower, which ſtands by itſelf, and terminates alſo in a dome, to which you aſcend by a beautiful ſtone ſtair-caſe that winds round it. This dome contains a temple remarkably neat; the ceiling is ornamented with moſaic work, and the walls are covered with ſtone figures in relief, repreſenting animals and monſters. The pillars which ſupport the roof of this edifice are of wood varniſhed; and on feſtivals are ornamented with ſmall flags of different colours. The pavement of the temple is formed of little ſhells, and its different compartments preſent birds, butterflies, flowers, &c.

The bonzes continually burn incenſe upon the altar, and keep the lamps lighted, which hang from the ceiling of the temple. At one extremity of the altar ſtands a brazen urn, which when ſtruck ſends forth a mournful ſound: on the oppoſite ſide is a hollow machine of wood, of an oval form, uſed for the ſame purpoſe, which is to accompany with its ſound their voices when they ſing in praiſe of the tutelary idol of the pagod. The god Pouſſa is placed on the middle of this altar, on a flower of gilt braſs, which ſerves as a baſe, and holds

Emouy, Empalement.

holds a young child in his arms; ſeveral idols, which are no doubt ſubaltern deities, are ranged around him, and ſhow by their attitudes their reſpect and veneration.

The bonzes have traced out on the walls of this temple ſeveral hieroglyphical characters in praiſe of Pouſſa; there is alſo to be ſeen an hiſtorical or allegorical painting in freſco, which repreſents a burning lake, in which ſeveral men appear to be ſwimming, ſome carried by monſters, others ſurrounded by dragons and winged ſerpents. In the middle of the gulf riſes a ſteep rock, on the top of which the god is ſeated, holding in his arms a child, who ſeems to call out to thoſe who are in the flames of the lake; but an old man, with hanging ears and horns on his head, prevents them from climbing to the ſummit of the rock, and threatens to drive them back with a large club. The bonzes are at a loſs what anſwer to give, when any queſtions are aſked them concerning this painting. Behind the altar is a kind of library, containing books which treat of the worſhip of idols.

On deſcending from this dome you croſs the court, and enter a kind of gallery, the walls of which are lined with boards; it contains 24 ſtatues of gilt braſs, repreſenting the ſame number of philoſophers, ancient diſciples of Confucius. At the end of this gallery you find a large hall, which is the refectory of the bonzes; and after having traverſed a ſpacious apartment, you at length enter the temple of Fo, to which there is an aſcent by a large ſtone ſtaircaſe. It is ornamented with vaſes full of artificial flowers (a work in which the Chineſe excel); and here alſo are found the ſame kind of muſical inſtruments as thoſe mentioned before. The ſtatue of the god is not to be ſeen but through a piece of black gauze, which forms a kind of veil or curtain before the altar. The reſt of the pagod conſiſts of ſeveral large chambers, exceedingly neat, but badly diſpoſed; the gardens and pleaſure grounds are on the declivity of the mountain; and a number of delightful grottoes are cut out in the rock, which afford an agreeable ſhelter from the exceſſive heat of the ſun.

There are ſeveral other pagods in the iſle of Emouy; among which is one called *The Pagod of the Ten Thouſand Stones*, becauſe it is built on the brow of a mountain where there is a like number of little rocks, under which the bonzes have formed grottoes and very pleaſant covered ſeats. A certain rural ſimplicity reigns here, which captivates and delights.

Strangers are received by theſe bonzes with great politeneſs, and may freely enter their temples; but they muſt not attempt to gratify their curioſity fully, nor to enter thoſe apartments into which they are not introduced, eſpecially if they are accompanied by ſuſpicious perſons; for the bonzes, who are forbid under pain of ſevere puniſhment to have any intercourſe with women, and who often keep them in private, might, from fear of being diſcovered, revenge themſelves for too impertinent a curioſity.

EMPALEMENT, an ancient kind of puniſhment, which conſiſted in thruſting a ſtake up the fundament. The word comes from the French *empaler*, or the Italian *impalare;* or rather, they are all alike derived from the Latin *palus*, "a ſtake," and the prepoſition *in*, "in or into." We find mention of empaling in Juvenal. It was frequently practiſed in the time of Nero, and continues to be ſo in Turkey. Empalement || Emperor.

Empalement of a flower, the ſame with Calyx.

EMPANELLING. See Impanelling.

EMPARLANCE. See Imparlance.

EMPEDOCLES, a celebrated philoſopher and poet, was born at Agrigentum, a city in Sicily. He followed the Pythagorean philoſophy, and admitted the metempſychoſis. He conſtantly appeared with a crown of gold on his head; to maintain, by this outward pomp, the reputation he had acquired of being a very extraordinary man. Yet Ariſtotle ſays, that he was a great lover of liberty, extremely averſe to ſtate and command, and that he even refuſed a kingdom that was offered him. His principal work was a Treatiſe in verſe on the Nature and Principles of Things. Ariſtotle, Lucretius, and all the ancients, make the moſt magnificent elogiums on his poetry and eloquence.

He taught rhetoric; and often alleviated the anxieties of his mind, as well as the pains of his body, with muſic. It is reported, that his curioſity to viſit the flames of the crater of Ætna proved fatal to him. Some maintain that he wiſhed it to be believed that he was a god; and that his death might be unknown, he threw himſelf into the crater and periſhed in the flames. His expectations, however, were fruſtrated; and the volcano, by throwing up one of his ſandals, diſcovered to the world that Empedocles had periſhed by fire. Others report that he lived to an extreme old age; and that he was drowned in the ſea about 440 years before the Chriſtian era.

EMPEROR, (*Imperator*), among the ancient Romans, ſignified a general of an army, who, for ſome extraordinary ſucceſs, had been complimented with this appellation. Thus Auguſtus, having obtained no leſs than twenty famous victories, was as often ſaluted with the title *emperor;* and Titus was denominated *emperor* by his army after the reduction of Jeruſalem.

Afterwards it came to denominate an abſolute monarch or ſupreme commander of an empire. In this ſenſe Julius Cæſar was called *emperor:* the ſame title deſcended with the dignity to Octavius Auguſtus, Tiberius, and Caligula; and afterwards it became elective.

In ſtrictneſs, the title *emperor* does not, and cannot, add any thing to the rights of ſovereignty: its effect is only to give precedence and pre-eminence above other ſovereigns; and as ſuch, it raiſes thoſe inveſted with it to the ſummit of all human greatneſs.

It is diſputed, whether or not emperors have the power of diſpoſing of the regal title. It is true, they have ſometimes taken upon them to erect kingdoms; and thus it is that Bohemia and Poland are ſaid to have been raiſed to the dignity: thus alſo, the emperor Charles the Bald, in the year 877, gave Provence to Boſon, putting the diadem on his head, and decreeing him to be called "king," *ut more priſcorum imperatorum regibus videretur dominari.* Add, that the emperor Leopold erected the ducal Pruſſia into a kingdom in favour of the elector of Brandenburg; and though ſeveral of the kings of Europe refuſed for ſome time to acknowledge him in that capacity, yet by the treaty of Utrecht in 1712 they all came in.

In the eaſt, the title and quality of emperor are more frequent than they are among us; thus, the ſo-

Emperor. vereign princes of China, Japan, Mogul, Perſia, &c. are all emperors of China, Japan, &c. In the year 1723, the czar of Muſcovy aſſumed the title of *emperor of all Ruſſia*, and procured himſelf to be recognized as ſuch by moſt of the princes and ſtates of Europe.

In the Weſt, the title has been a long time reſtrained to the emperors of Germany. The firſt who bore it was Charlemagne, who had the title of emperor conferred on him by Pope Leo III though he had all the power before. The imperial prerogatives were formerly much more extenſive than they are at preſent. At the cloſe of the Saxon race, A. D. 1024, they exerciſed the right of conferring all the eccleſiaſtical benefices in Germany; of receiving the revenues of them during a vacancy; of ſucceeding to the effects of inteſtate eccleſiaſtics; of confirming or annulling the elections of the popes; of aſſembling councils, and of appointing them to decide concerning the affairs of the church; of conferring the title of king on their vaſſals; of granting vacant fiefs; of receiving the revenues of the empire; of governing Italy as its proper ſovereigns; of erecting free cities, and eſtabliſhing fairs in them; of aſſembling the diets of the empire, and fixing the time of their duration; of coining money, and conferring the ſame privilege on the ſtates of the empire; and of adminiſtering both high and low juſtice within the territories of the different ſtates: but in the year 1437, they were reduced to the right of conferring all dignities and titles, except the privilege of being a ſtate of the empire; of *preces primariæ*, or of appointing once during their reign a dignitary in each chapter or religious houſe; of granting diſpenſations with reſpect to the age of majority; of erecting cities, and conferring the privilege of coining money; of calling the meetings of the diet, and preſiding in them.

To which ſome have added, 1. That all the princes and ſtates of Germany are obliged to do them homage, and ſwear fidelity to them. 2. That they, or their generals, have a right to command the forces of all the princes of the empire, when united together. 3. That they receive a kind of tribute from all the princes and ſtates of the empire, for carrying on a war which concerns the whole empire, which is called the *Roman month*. For the reſt, there is not a foot of land or territory annexed to his title: but ever ſince the reign of Charles IV. the emperors have depended entirely on their hereditary dominions as the only ſource of their power, and even of their ſubſiſtence. See DIET and ELECTORS.

The kings of France were anciently alſo called emperors, at the time when they reigned with their ſons, whom they aſſociated to the crown. Thus Hugh Capet, having aſſociated his ſon Robert, took the title of emperor, and Robert that of king; under which titles they are mentioned in the Hiſtory of the Council of Rheims, by Gerbert, &c. King Robert is alſo called emperor of the French by Helgau of Fleury. Louis le Gros, upon aſſociating his ſon, did the ſame. In the Firſt Regiſter of the King's Charters, fol. 166, are found letters of Louis le Gros, dated in 1116, in favour of Raymond biſhop of Maguelonne, wherein he ſtyles himſelf, *Ludovicus, Dei ordinante providentia, Francorum imperator auguſtus*. The kings of England had likewiſe anciently the title of emperors, as appears from a charter of King Edgar: *Ego Edgarus Anglorum baſileus, omniumque regum inſularum oceani quæ Britanniam circumjacent, &c. imperator et dominus.* Empetrum || Empire.

EMPETRUM, BERRY-BEARING HEATH, a genus of plants belonging to the monœcia claſs. In the natural method this genus is ranked by Linnæus under the 54th order, *Miſcellaneæ*. See BOTANY *Index*.

EMPHASIS, in *Rhetoric*, a particular ſtreſs of the voice and action, laid on ſuch parts or words of the oration as the orator wants to inforce upon his audience. See DECLAMATION; ORATORY, Part IV.; and READING.

EMPHYSEMA, in *Surgery*, a windy tumor, generally occaſioned by a fracture of the ribs, and formed by the air inſinuating itſelf, by a ſmall wound, between the ſkin and muſcles, into the ſubſtance of the cellular or adipoſe membrane, ſpreading itſelf afterwards up to the neck, head, belly, and other parts, much after the manner in which butchers blow up their veal.

EMPIRE (*imperium*), in political geography, a large extent of land, under the juriſdiction or government of an emperor. See EMPEROR.

In ancient hiſtory we read of four great monarchies or empires, viz. that of the Babylonians, Chaldeans, and Aſſyrians; that of the Medes and Perſians; that of the Greeks; and that of the Romans. The firſt ſubſiſted from the time of Nimrod, who founded it in the year of the world 1800, according to the computation of Uſher, to Sardanapalus their laſt king in 3257, and conſequently laſted above 1450 years. The empire of the Medes commenced under Arbaces, in the year of the world 3257, and was united to that of the Babylonians and Perſians under Cyrus, in 3468, and it cloſed with the death of Darius Codomannus in 3674. The Grecian empire laſted only during the reign of Alexander the Great, beginning in the year of the world 3674, and terminating with the death of this conqueror in 3681, his conqueſts being divided among his captains. The Roman empire commenced with Julius Cæſar, when he was made perpetual dictator, in the year of the city 708, and of the world 3956, 48 years before Chriſt. The ſeat of the empire was removed to Byzantium by Conſtantine, in the year of our Lord 334; the eaſt and weſt were then united under the title of the Roman empire, till the Romans proclaimed Charlemagne emperor, A. D. 800. From this epocha the eaſt and weſt formed two ſeparate empires; that of the eaſt, governed by Greek emperors, commenced A. D. 302: and being gradually weakened, terminated under Conſtantine Palæologus in 1453. The weſtern empire was afterwards known by the appellation of the empire, or German empire.

Antiquaries diſtinguiſh between the medals of the *upper*, and *lower* or *bas*, *empire*.—The curious only value thoſe of the upper empire, which commences with Cæſar or Auguſtus, and ends in the year of Chriſt 260. The lower empire comprehends near 1200 years, reckoning down to the deſtruction of Conſtantinople in 1453.—They uſually diſtinguiſh two ages, or periods, of the lower empire: the firſt beginning where the upper ends, viz. with Aurelian, and ending with Anaſtaſius, including 200 years; the ſecond beginning with Anaſtaſius, and ending with the Palæologi, which includes 1000 years.

EMPIRE,

Empire ‖ Emporium.

EMPIRE, or *The empire*, uſed abſolutely and without any addition, ſignifies the empire of Germany: called alſo, in juridical acts and laws, The holy Roman empire. It had its beginning with the ninth century; Charlemagne being created firſt emperor by Pope Leo III. who put the crown on his head in St Peter's church on Chriſtmas-day in the year 800.

Authors are at a loſs under what form of government to range the empire. Some of them maintain it to be a monarchical ſtate, becauſe all the members thereof are obliged to aſk the inveſtiture of their ſtates of the emperor, and to take an oath of fidelity to him. Others conſider it as a republic, or ariſtocratic ſtate, becauſe the emperor cannot reſolve or determine any thing without the concurring ſuffrages of the princes. It is added, that if they require inveſtiture from, and ſwear fealty to him, it is only as head of the republic, and in the name of the republic, and not in his own; juſt as at Venice every thing is tranſacted in name of the doge. Others will have the empire to be a monarcho-ariſtocratic ſtate, *i. e.* a mixture of monarchy and ariſtocracy; becauſe, though the emperor in many caſes ſeems to act ſovereignly, yet his decrees and reſolves have no force, in caſe the ſtate refuſe to confirm them. Laſtly, it has been called an ariſto-democratic ſtate, becauſe the diet, wherein the ſovereignty is lodged, is compoſed of princes and the deputies of the cities; and is divided into three orders or bodies, called *colleges*, viz. the college of electors, the college of princes, and the college of cities.

We ſay, diet of the empire, circles of the empire, fiefs of the empire, princes of the empire, eſtates of the empire, members of the empire, capitulations of the empire. See DIET, CIRCLE, PRINCE, CAPITULATION, &c.

The ſtates or eſtates of the empire are of two kinds, mediate and immediate. The immediate ſtates are thoſe who hold immediately of the empire: Whereof, again, there are two kinds; the firſt, ſuch as have ſeats and voices in the imperial diet; the ſecond, ſuch as have none. The mediate ſtates are thoſe who hold of the immediate.

The ſtates which now compoſe the empire are, The princes of the empire, the counts of the empire, the free barons of the empire, the prelates of the empire, the princeſſes or abbeſſes of the empire, the nobles of the empire, and the imperial cities.

EMPIRIC, an appellation given to thoſe phyſicians who conduct themſelves wholly by their own experience, without ſtudying phyſic in a regular way. Some even uſe the term, in a ſtill worſe ſenſe, for a quack who preſcribes at random, without being at all acquainted with the principles of the art.

EMPIS, a genus of inſects belonging to the order Diptera. See ENTOMOLOGY *Index*.

EMPLASTER. See PLASTER.

EMPORIÆ, a double city of the Hither Spain, near the Pyrenees; ſeparated by a wall; one part occupied by the Greeks of Phocæa, whence originally are the Maſſilienſes; the other, by native Spaniards, to whom was added by Auguſtus a Roman colony. Now Ampurias, in Catalonia. E. Long. 2. 50. N. Lat. 42. 15.

EMPORIUM, in *Medicine*, is often uſed for the common ſenſory in the brain. See BRAIN.

Emporium ‖ Enamel.

EMPORIUM, in *Ancient Geography*, two cities near Placentia; one well fortified, and guarded by a ſtrong garriſon, at which Hannibal met a repulſe: the other, Hannibal took and plundered. Now thought to be Pont-Nura, in the duchy of Placentia.

EMPRESS, the ſpouſe of an emperor, or a woman who governs an empire. See EMPEROR.

EMPROSTHOTONOS, a ſpecies of convulſion, wherein the head bends forward.

EMPYÆMA, in *Medicine*, a diſorder wherein purulent matter is contained in the thorax or breaſt, after an inflammation and ſuppuration of the lungs and pleura. See MEDICINE *Index*.

EMPYREAL AIR. So Dr Higgins denominates that which Dr Prieſtley calls *dephlogiſticated* air, and other philoſophers *vital* or *pure* air.

EMPYREUM, a term uſed by divines for the higheſt heaven, where the bleſſed enjoy the beatific viſion. The word is formed of ἐν and πῦρ *fire*, becauſe of its ſplendour.

EMPYREUMA, in *Chemiſtry*, ſignifies a very diſagreeable ſmell produced from burnt oils. It is often perceived in diſtillations of animal as well as vegetable ſubſtances, when they are expoſed to a quick fire.

EMRODS. See HEMORRHOIDS.

EMULATION, a generous ardour kindled by the praiſe-worthy examples of others, which impels us to imitate, to rival, and, if poſſible, to excel them. This paſſion involves in it eſteem of the perſon whoſe attainments or conduct we emulate, of the qualities and actions in which we emulate him, and a deſire of reſemblance, together with a joy ſpringing from the hope of ſucceſs. The word comes originally from the Greek ἀμιλλα, *diſpute, conteſt*; whence the Latin, *æmulus*, and thence our *emulation*.

Plato obſerves of emulation, that it is the daughter of envy; if ſo, there is a great difference between the mother and the offſpring; the one is a virtue and the other a vice. Emulation admires great actions, and ſtrives to imitate them; envy refuſes them the praiſes that are their due; emulation is generous, and only thinks of ſurpaſſing a rival; envy is low, and only ſeeks to leſſen him. Perhaps, therefore, it would be more juſt to ſuppoſe emulation the daughter of admiration: admiration, however, is a principal ingredient in the compoſition of it.

EMULGENT, or RENAL, ARTERIES, thoſe which ſupply the kidneys with blood; being ſometimes ſingle, ſometimes double, on each ſide. See ANATOMY *Index*.

EMULSION, a ſoft liquid remedy, of a colour and conſiſtence reſembling milk. See PHARMACY.

EMUNCTORY, in *Anatomy*, a general term for all thoſe parts which ſerve to carry off the excrementitious parts of the blood and other humours of the body. Such more eſpecially are the kidneys, bladder, and moſt of the glands.

ENALLAGE, in *Grammar*, is when one word is ſubſtituted for another of the ſame part of ſpeech: A ſubſtantive for an adjective; as *exercitus victor*, for *victoriosus; ſcelus*, for, *ſceleſtus*: A primitive for a derivative; as *Dardana arma*, for *Dardania*: An active for a paſſive; as *nox humida cælo præcipitat*, for *præcipitatur*, &c.

ENAMEL, in general, is a vitrified matter betwixt

Enamel, Enamelling.

the parts of which is diſperſed ſome unvitrified matter: hence enamel ought to have all the properties of glaſs except tranſparency.

Enamels have for their baſis a pure cryſtal glaſs or frit, ground up with a fine calx of lead and tin prepared for the purpoſe, with the addition uſually of white ſalt of tartar. Theſe ingredients baked together are the matter of all enamels, which are made by adding colours of this or that kind in powder to this matter, and melting or incorporating them together in a furnace.

For white enamel, Neri (*De Arte Vitriar.*) directs only manganeſe to be added to the matter which conſtitutes the baſis. For azure, zaffer mixed with calx of braſs. For green, calx of braſs with ſcales of iron, or with crocus martis. For black, zaffer with manganeſe or with crocus martis; or manganeſe with tartar. For red, manganeſe, or calx of copper and red tartar. For purple, manganeſe with calx of braſs. For yellow, tartar and manganeſe. And for violet-coloured enamel, manganeſe with thrice-calcined braſs.

In making theſe enamels, the following general cautions are neceſſary to be obſerved. 1. That the pots muſt be glazed with white glaſs, and muſt be ſuch as will bear the fire. 2. That the matter of enamels muſt be very nicely mixed with the colours. 3. When the enamel is good, and the colour well incorporated, it muſt be taken from the fire with a pair of tongs. 4. The general way of making the coloured enamel is this: Powder, ſift, and grind, all the colours very nicely, and firſt mix them with one another, and then with the common matter of enamels: then ſet them in pots in a furnace; and when they are well mixed and incorporated, caſt them into water; and when dry, ſet them in a furnace again to melt; and when melted, take a proof of it. If too deep-coloured, add more of the common matter of enamels; and if too pale, add more of the colours.

Enamels are uſed either in counterfeiting or imitating precious ſtones, in painting in enamel; or by enamellers, jewellers, and goldſmiths, in gold, ſilver, and other metals. The two firſt kinds are uſually prepared by the workmen themſelves, who are employed in theſe arts. That uſed by jewellers, &c. is brought to us chiefly from Venice or Holland, in little cakes of different ſizes, commonly about four inches diameter, having the mark of the maker ſtruck upon it with a puncheon. It pays 1s. $7\frac{41}{100}$d. the pound on importation, and draws back 1s. $5\frac{70}{100}$d. at the rate of 4s. per pound.

ENAMELLING, the art of laying enamel upon metals, as gold, ſilver, copper, &c. and of melting it at the fire, or of making divers curious works in it at a lamp. It ſignifies alſo to paint in enamel.

The method of painting in ENAMEL. This is performed on plates of gold or ſilver, and moſt commonly of copper, enamelled with the white enamel; whereon they paint with colours which are melted in the fire, where they take a brightneſs and luſtre like that of glaſs. This painting is the moſt prized of all for its peculiar brightneſs and vivacity, which is very permanent, the force of its colours not being effaced or ſullied with time as in other painting, and continuing always as freſh as when it came out of the workmen's hands. It is uſual in miniature; it being the more difficult the larger it is, by reaſon of certain accidents it is liable to in the operation. Enamelling ſhould only be practiſed on plates of gold, the other metals being leſs pure: copper, for inſtance, ſcales with the application, and yields fumes; and ſilver turns the yellow white. Nor muſt the plate be made flat; for in ſuch caſe, the enamel cracks; to avoid which, they uſually forge them a little round or oval, and not too thick. The plate being well and evenly forged, they uſually begin the operation by laying on a couch of white enamel (as we obſerved above) on both ſides, which prevents the metal from ſwelling and bliſtering; and this firſt layer ſerves for the ground of all the other colours. The plate being thus prepared, they begin at firſt by drawing out exactly the ſubject to be painted with red vitriol, mixed with oil of ſpike, marking all parts of the deſign very lightly with a ſmall pencil. After this, the colours (which are to be before ground with water in a mortar of agate extremely fine, and mixed with oil of ſpike ſomewhat thick) are to be laid on, obſerving the mixtures and colours that agree to the different parts of the ſubject; for which it is neceſſary to underſtand painting in miniature. But here the workman muſt be very cautious of the good or bad qualities of the oil of ſpike he employs to mix his colours with, for it is very ſubject to adulterations.

Enamelling.

Great care muſt likewiſe be taken, that the leaſt duſt imaginable come not to your colours while you are either painting or grinding them; for the leaſt ſpeck, when it is worked up with it, and when the work comes to be put into the reverberatory to be made red hot, will leave a hole, and ſo deface the work.

When the colours are all laid, the painting muſt be gently dried over a ſlow fire to evaporate the oil, and the colours afterwards melted to incorporate them with the enamel, making the plate red-hot in a fire like what the enamellers uſe. Afterwards that part of the painting muſt be paſſed over again which the fire hath any thing effaced, ſtrengthening the ſhades and colours, and committing it again to the fire, obſerving the ſame method as before, which is to be repeated till the work be finiſhed.

Method of ENAMELLING *by the Lamp.* Moſt enamelled works are wrought at the fire of a lamp, in which, inſtead of oil, they put melted horſe-greaſe, which they called *caballine oil*. The lamp, which is of copper, or white iron, conſiſts of two pieces; in one of which is a kind of oval plate, ſix inches long, and two high, in which they put the oil and the cotton. The other part, called the *box*, in which the lamp is incloſed, ſerves only to receive the oil which boils over by the force of the fire. This lamp, or, where ſeveral artiſts work together, two or three more lamps are placed on a table of proper height. Under the table, about the middle of its height, is a double pair of organ-bellows, which one of the workmen moves up and down with his foot to quicken the flame of the lamps, which are by this means excited to an incredible degree of vehemence. Grooves made with a gauge in the upper part of the table, and covered with parchment, convey the wind of the bellows to a pipe of glaſs before each lamp; and that the enamellers may not be incommoded with the heat of the lamp, every pipe is covered at ſix inches diſtance with a little tin plate, fixed into the table by a wooden handle. When the works do not require a long blaſt,

Enamelling || Encaustic Painting.

blaſt, they only uſe a glaſs pipe, into which they blow with their mouth.

It is incredible to what a degree of fineneſs and delicacy the threads of enamel may be drawn at the lamp. Thoſe which are uſed in making falſe tufts of feathers are ſo fine, that they may be wound on the reel like ſilk or thread. The fictitious jets of all colours, uſed in embroideries, are alſo made of enamel; and that with ſo much art, that every ſmall piece hath its hole to paſs the thread through wherewith it is ſewed. Theſe holes are made by blowing them into long pieces; which they afterwards cut with a proper tool.

It is ſeldom that the Venetian or Dutch enamels are uſed alone: they commonly melt them in an iron ladle, with an equal part of glaſs or cryſtal; and when the two matters are in perfect fuſion, they draw it out into threads of different ſizes, according to the nature of the work. They take it out of the ladle while liquid, with two pieces of broken tobacco-pipes, which they extend from each other at arm's length. If the thread is required ſtill longer, then another workman holds one end, and continues to draw it out, while the firſt holds the enamel to the flame. Thoſe threads, when cold, are cut into what lengths the workman thinks fit, but commonly from 10 to 12 inches: and as they are all round, if they are required to be flat, they muſt be drawn through a pair of pinchers while yet hot. They have alſo another iron inſtrument in form of pinchers, to draw out the enamel by the lamp when it is to be worked and diſpoſed in figures. Laſtly, they have glaſs tubes of various ſizes, ſerving to blow the enamel into various figures, and preſerve the neceſſary vacancies therein; as alſo to ſpare the ſtuff, and form the contours. When the enameller is at work, he ſits before the lamp with his foot on the ſtep that moves on the bellows; and holding in his left hand the work to be enamelled, or the braſs or iron wires the figures are to be formed on, he directs with his right the enamel thread, which he holds to the flame with a management and patience equally ſurpriſing. There are few things they cannot make or repreſent with enamel: and ſome figures are as well finiſhed, as if done by the moſt ſkilful carvers.

ENARTHROSIS, in *Anatomy*, a ſpecies of DIARTHROSIS.

ENCÆNIA, the name of three ſeveral feſtivals celebrated by the Jews in memory of the dedication, or rather purification, of the temple, by Judas Maccabæus, Solomon, and Zorobbabel. This term is likewiſe uſed in church hiſtory for the dedication of Chriſtian churches.

ENCAMPMENT, the pitching of a CAMP.

ENCANTHIS, in *Surgery*, a tubercle ariſing either from the caruncula lachrymalis, or from the adjacent red ſkin; ſometimes ſo large, as to obſtruct not only the punctæ lachrymalia, but alſo part of the ſight or pupil itſelf. See SURGERY.

ENCAUSTIC and ENCAUSTUM, the ſame with enamelling and enamel. See ENAMELLING and ENAMEL.

Encaustic Painting, a method of painting made uſe of by the ancients, in which wax was employed to give a gloſs to their colours, and to preſerve them from the injuries of the air.

Encauſtic Painting.

This ancient art, after having been long loſt, was reſtored by Count Caylus, a member of the Academy of Inſcriptions in France; and the method of painting in wax was announced to the Academy of Painting and Belles Lettres in the year 1753; though M. Bachelier, the author of a treatiſe *De l'Hiſtoire et du Secret de la Peinture en Cire*, had actually painted a picture in wax in 1749; and he was the firſt who communicated to the public the method of performing the operation of inuſtion, which is the principal characteriſtic of the encauſtic painting. The Count kept his method a ſecret for ſome time, contenting himſelf with exhibiting a picture at the Louvre in 1754, repreſenting the head of Minerva, painted in the manner of the ancients, which excited the curioſity of the public, and was very much admired. In the interval of ſuſpenſe, ſeveral attempts were made to recover the ancient method of painting. The firſt ſcheme adopted was that of melting wax and oil of turpentine together, and uſing this compoſition as a vehicle for mixing and laying on the colours. But this method did not explain Pliny's meaning, as the wax is not burnt in this way of managing it. In another attempt, which was much more agreeable to the hiſtorian's deſcription of encauſtic painting, the wax was melted with ſtrong lixivium of ſalt of tartar, and with this the colours were ground. When the picture was finiſhed, it was gradually preſented to the fire, ſo as to melt the wax; which was thus diffuſed through all the particles of the colours, ſo that they were fixed to the ground, and ſecured from the acceſs of air or moiſture. But the method of Count Caylus is much more ſimple: the cloth or wood which he deſigned for the baſis of his picture, is waxed over, by only rubbing it ſimply with a piece of bees-wax; the wood or cloth, ſtretched on a frame, being held horizontally over, or perpendicularly before a fire, at ſuch a diſtance, that the wax might gradually melt, whilſt it is rubbed on, diffuſe itſelf, penetrate the body, and fill the interſtices of the texture of the cloth, which, when cool, is fit to paint upon; but as water-colours, or thoſe that are mixed up with common water, will not adhere to the wax, the whole picture is to be firſt rubbed over with Spaniſh chalk or white, and then the colours are applied to it; when the picture is dry, it is put near the fire, whereby the wax melts, and abſorbs all the colours.

Mr. J. H. Muntz, in a treatiſe on this ſubject, has propoſed ſeveral improvements in the art of encauſtic painting. When the painting is on cloth, he directs it to be prepared by ſtretching it on a frame, and rubbing one ſide ſeveral times over with a piece of bees-wax, or virgin wax, till it is covered with a coat of wax of conſiderable thickneſs. In fine linen, this is the only operation neceſſary previous to painting; but coarſe cloth muſt be rubbed gently on the unwaxed ſide with a pumice-ſtone, to take off all thoſe knots which would prevent the free and accurate working of the pencil. Then the ſubject is to be painted on the unwaxed ſide with colours prepared and tempered with water; and when the picture is finiſhed, it muſt be brought near the fire, that the wax may melt and fix the colours. This method, however, can only be applied to cloth or paper, through the ſubſtance of which the wax may paſs; but in wood, ſtone, metals,

Encauſtic Painting.

or plaſter, the former method of Count Caylus muſt be obſerved.

Mr Muntz has alſo diſcovered a method of forming grounds for painting with crayons, and fixing theſe, as well as water-colours employed with the pencil. On the unwaxed ſide of a linen cloth, ſtretched and waxed as before, lay an even and thick coat of the colour proper for the ground; having prepared this colour by mixing ſome proper pigment with an equal quantity of chalk, and tempering them with water. When the colour is dry, bring the picture to the fire, that the wax may melt, paſs through the cloth, and fix the ground. An additional quantity of wax may be applied to the back of the picture, if that which was firſt rubbed on ſhould not be ſufficient for the body of colour; but as this muſt be laid on without heat, the wax ſhould be diſſolved in oil of turpentine, and applied with a bruſh, and the canvas be again expoſed to the fire, that the freſh ſupply of wax may paſs through the cloth, and be abſorbed by the colour; and thus a firm and good body will be formed for working on with the crayons. If cloth and paper are joined together, the cloth muſt be firſt fixed to the ſtraining frame, and then the paper muſt be paſted to it with a compoſition of paſte made with wheaten flour, or ſtarch and water, and about a twelfth part of its weight of common turpentine. The turpentine muſt be added to the paſte when it is almoſt ſufficiently boiled, and the compoſition well ſtirred, and left to ſimmer over the fire for five or ſix minutes: let wax be diſſolved in oil of turpentine to the conſiſtence of a thin paſte: and when the cloth and paper are dry, let them be held near a fire; and with a bruſh lay a coat of the wax and turpentine on both ſides the joined cloth and paper, in ſuch a degree of thickneſs, that both ſurfaces may ſhine throughout without any appearance of dull ſpots. Then expoſe the cloth to the fire, or to the ſun; by which means the oil will evaporate, and the wax become ſolid, and be fit to receive any compoſition of colour for a ground, which is to be laid on as above directed in the caſe of cloth without paper.

Almoſt all the colours that are uſed in oil-painting may be alſo applied in the encauſtic method. Mr Muntz objects, indeed, to brown, light pink, and unburnt *terra di Sienna;* becauſe theſe, on account of their gummy or ſtony texture, will not admit ſuch a coheſion with the wax as will properly fix them; but other colours which cannot be admitted in oil painting, as red lead, red orpiment, cryſtals of verdegris, and red precipitate of mercury, may be uſed here. The crayons uſed in encauſtic painting are the ſame with thoſe uſed in the common way of crayon painting, excepting thoſe that in their compoſition are too tenacious; and the method of uſing them is the ſame in both caſes.

The encauſtic painting has many peculiar advantages: though the colours have not the natural varniſh or ſhining which they acquire with oil, they have all the ſtrength of paintings in oil, and all the airineſs of water-colours, without partaking of the apparent character or defects of either: they may be looked at in any light and in any ſituation, without any falſe glare: the colours are firm, and will bear waſhing; and a picture, after having been ſmoked, and then expoſed to the dew, becomes as clean as if it had been but juſt painted. It may alſo be retouched at pleaſure without any detriment to the colours; for the new colours will unite with the old ones, without ſpots, as is the caſe in common ſize painting; nor is it neceſſary to rub the places to be touched with oil as in oil pictures; it is not liable to crack, and eaſily repaired, if it ſhould chance to ſuffer any injury. The duration of this painting is alſo a very material advantage; the colours are not liable to fade and change; no damp can affect them, nor any corroſive ſubſtance injure them; nor can the colour fall off in ſhivers from the canvas. However notwithſtanding all theſe and other advantages enumerated by the Abbé Mazeas and Mr Muntz, this art has not yet been much practiſed. Many of theſe properties belong to a much higher ſpecies of encauſtic painting afterwards diſcovered in England, the colours of which are fixed by a very intenſe heat; nor are the colours or grounds on which they are laid liable to be diſſolved or corroded by any chemical menſtruum, nor, like the glaſſy colours of enamel, to run out of the drawing on the fire. What this method conſiſts in will appear from the following account communicated in a letter from Joſiah Colebrooke to the earl of Macclesfield, preſident of the Royal Society in 1759.

Encauſtic Painting.

"The art of painting with burnt wax (ſays he) has long been loſt to the world. The uſe of it to painters in the infancy of the art of painting was of the utmoſt conſequence. Drying oil being unknown, they had nothing to preſerve their colours entire from the injury of damps and the heat of the ſun: a varniſh of ſome ſort was therefore neceſſary; but they being unacquainted with diſtilled ſpirits, could not, as we now do, diſſolve gums to make a tranſparent coat for their pictures: this invention therefore of burnt wax ſupplied that defect to them; and with this manner of painting the chambers and other rooms in their houſes were furniſhed: this Pliny calls *encauſtum*, and we *encauſtic painting*.

"The following experiments which I have the honour to lay before your Lordſhip and the Society, were occaſioned by the extract of a letter from the Abbé Mazeas, tranſlated by Dr Parſons, and publiſhed in the ſecond part of the 49th volume of the Philoſophical Tranſactions, N° 100. concerning the ancient method of painting with burnt wax, revived by Count Caylus.

"The count's method was, 1. To rub the cloth or board deſigned for the picture ſimply over with beeswax. 2. To lay on the colours mixed with common water: but as the colours will not adhere to the wax, the whole picture was firſt rubbed over with (A) Spaniſh

(A) "Spaniſh chalk is called by Dr Parſons, in a note, *Spaniſh white*. This is a better kind of whitening than the common, and was the only white that had the name of *Spaniſh* annexed to it that I could procure, though I inquired for it at moſt if not all the colour ſhops in town.

Encauſtic Painting.

niſh chalk, and then the colours are uſed. 3. When the picture is dry, it is put near the fire, whereby the wax melts, and abſorbs all the colours.

" *Exp.* 1. A piece of oak board was rubbed over with bees-wax, firſt againſt the grain of the wood, and then with the grain, to fill up all the pores that remained after it had been planed, and afterwards was rubbed over with as much dry Spaniſh white as could be made to ſtick on it. This, on being painted (the colours mixed with water only), ſo clogged the pencil, and mixed ſo unequally with the ground, than it was impoſſible to make even an outline, but what was ſo much thicker in one part than another, that it would not bear ſo much as the name of painting; neither had it any appearance of a picture. However, to purſue the experiment, this was put at a diſtance from the fire, on the hearth, and the wax melted by ſlow degrees: but the Spaniſh white (though laid as ſmooth as ſo ſoft a body would admit, before the colour was laid on), on melting the wax into it, was not ſufficient to hide the grain of the wood, nor ſhow the colours by a proper whiteneſs of the ground; the wax, in rubbing on the board, was unavoidably thicker in ſome parts than in others, and the Spaniſh white the ſame: on this I ſuſpected there muſt be ſome miſtake in the Spaniſh white, and made the inquiry mentioned in the note (A).

" To obviate the inequality of the ground in the firſt experiment.

" *Exp.* 2. A piece of old wainſcot (oak-board) $\frac{1}{4}$th of an inch thick; which, having been part of an old drawer, was not likely to ſhrink on being brought near the fire: this was ſmoothed with a fiſh-ſkin; made quite warm before the fire; and then, with a bruſh dipped in white wax, melted in an earthen pipkin, ſmeared all over, and applied to the fire again. That the wax might be equally thick in all parts of the board, a ground was laid (on the waxed board) with levigated chalk mixed with gum-water (viz. gum-arabic diſſolved in water): When it was dry, I painted it with a kind of landſcape; and purſuing the method laid down by Count Caylus, brought it gradually to the fire. I fixed the picture on a fire-ſcreen, which would preſerve the heat, and communicate it to the back part of the board. This was placed firſt at the diſtance of three feet from the fire, and brought forwards by ſlow degrees, till it came within one foot of the fire, which made the wax ſwell and bloat up the picture; but as the chalk did not abſorb the wax, the picture fell from the board and left it quite bare.

" *Exp.* 3. I mixed three parts white wax, and one part white reſin, hoping the tenacity of the reſin might preſerve the picture. This was laid on a board heated with a bruſh as in the former; and the ground was chalk prepared as before. This was placed horizontally on an iron box, charged with a hot heater, ſhifting it from time to time, that the wax and reſin might penetrate the chalk; and hoping from this poſition, that the ground, bloated by melting the wax, would ſubſide into its proper place; but this, like the other, came from the board, and would not at all adhere.

" *Exp.* 4. Prepared chalk four drams, white wax, white reſin, of each a dram, burnt alabaſter half a dram, were all powdered together and ſifted, mixed with ſpirit of molaſſes inſtead of water, and put for a ground on a board ſmeared with wax and reſin, as in *Exp.* 3. This was alſo placed horizontally on a box-iron as the former: the picture bliſtered, and was cracked all over; and though removed from the box-iron to an oven moderately heated (in the ſame horizontal poſition), it would not ſubſide, nor become ſmooth. When it was cold, I took an iron ſpatula made warm, and moved it gently over the ſurface of the picture, as if I were to ſpread a plaiſter. (This thought occurred, from the board being prepared with wax and reſin, and the ground having the ſame materials in its compoſition, the force of the ſpatula might make them unite). This ſucceeded ſo well, as to reduce the ſurface to a tolerable degree of ſmoothneſs; but as the ground was broke off in many places, I repaired it with flake white, mixed up with the yoke of an egg and milk, and repainted it with molaſſes ſpirit (inſtead of water), and then put it into an oven with a moderate degree of heat. In this I found the colours fixed, but darker than when it was at firſt painted; and it would bear being waſhed with water, not rubbed with a wet cloth.

" *Exp.* 5. A board (that had been uſed in a former experiment) was ſmeared with wax and reſin, of each equal parts; was wetted with molaſſes ſpirit, to make whitening (or Spaniſh white) mixed with gum water adhere. This, when dry, was ſcraped with a knife, to make it equally thick in all places. It was put into a warm oven, to make the varniſh incorporate partly with the whitening before it was painted; and it had only a ſmall degree of heat: water was only uſed to mix the colours. This was again put into an oven with a greater degree of heat; but it flaked off from the board: whether it might be owing to the board's having had a ſecond coat of varniſh (the firſt having been ſcraped and melted off), and that the unctuous parts of the wax had ſo entered its pores, that it would not retain a ſecond varniſh, I cannot tell.

" *Exp.* 6. Having miſcarried in theſe trials, I took a new board, planed ſmooth, but not poliſhed either with a fiſh ſkin or ruſhes: I warmed it, and ſmeared it with wax only; then took *cimolia* (tobacco-pipe clay) diveſted of its ſand, by being diſſolved in water and poured off, leaving the coarſe heavy parts behind. After this was dried and powdered, I mixed it with a ſmall quantity of the yolk of an egg and cow's milk, and made a ground with this on the waxed board: this I was induced to try, by knowing that the yolk of an egg will diſſolve almoſt all unctuous ſubſtances, and make them incorporate with water; and I apprehended, that a ground thus prepared, would adhere ſo much the more firmly to the board than the former had done, as to prevent its flaking off. The milk, I thought, might

" My friend M. da Coſta ſhowed me a piece of Spaniſh chalk in his collection, which ſeemed more like a CIMOLIA (tobacco-pipe clay), and was the reaſon of my uſing that in one of the experiments.

Encauſtic Painting.

might anſwer two purpoſes; firſt, by uniting the ground with the wax; and ſecondly, by anſwering the end of ſize or gum-water, and prevent the colours from ſinking too deep into the ground, or running one into another. When the ground was near dry, I ſmoothed it with a pallet knife, and waſhed with milk and egg where I had occaſion to make it ſmooth and even: when dry I painted it, mixing the colours with common water; this, on being placed horizontally in an oven only warm enough to melt the wax, flaked from the board; but held ſo much better together than any of the former, that I paſted part of it on paper.

"*Exp.* 7. Flake-white (or the pureſt ſort of white-lead) mixed with egg and milk, crumbled to pieces in the oven, put on the waxed board, as in the laſt experiment.

"The bad ſucceſs which had attended all the former experiments, led me to conſider of what uſe the wax was in this kind of painting: and it occurred to me, that it was only as a varniſh to preſerve the colours from fading.

"In order to try this:

"*Exp.* 8. I took what the brick-layers call *fine ſtuff*, or *putty*, (B): to this I added a ſmall quantity of burnt alabaſter, to make it dry: this it ſoon did in the open air; but before I put on any colours, I dried it gently by the fire, leſt the colours ſhould run. When it was painted, I warmed it gradually by the fire (to prevent the ground from cracking) till it was very hot. I then took white wax three parts, white reſin one part; melted them in an earthen pipkin, and with a bruſh ſpread them all over the painted board, and kept it cloſe to the fire in a perpendicular ſituation, that what wax and reſin the plaſter would not abſorb might drop off. When it was cold, I found the colours were not altered, either from the heat of the fire, or paſſing the bruſh over them. I then rubbed it with a ſoft linen cloth, and thereby procured a kind of gloſs, which I afterwards increaſed by rubbing it with a hard bruſh; which was ſo far from ſcratching or leaving any marks on the picture, that it became more ſmooth and poliſhed by it.

"After I had made all the foregoing experiments, in converſation with my honoured and learned friend Dr Kidby, a fellow of this ſociety, I ſaid I had been trying to find out what the encauſtic painting of the ancients was. Upon which he told me, that there was a paſſage in Vitruvius *de Architectura* relative to that kind of painting: and was ſo good as to tranſcribe it for me from the 7th book, chap. 9. *De minii temperatura.* Vitruvius's words are: *At ſi quis ſubtilior fuerit, et voluerit expolitionem miniaceam ſuum colorem retinere, cum paries expolitus et aridus fuerit, tunc ceram Punicam liquefactam igni, paulo oleo temperatam, ſeta inducat, deinde poſtea carbonibus in ferreo vaſe compoſitis, eam ceram apprime cum pariete, calefaciendo ſudore cogat, fiatque ut peræquetur, deinde cum candela linteiſque puris fulgiat, uti ſigna marmorea nuda curantur. Hæc autem* καυσις *Græcè dicitur. Ita obſtans ceræ Punicæ lorica non patitur, nec lunæ ſplendorem, nec ſolis radios lambendo eripere ex his polutionibus colorem.*

Encauſtic Painting.

"Which I thus tranſlate: 'But if any one is more wary, and would have the poliſhing [painting] with vermilion hold its colour, when the wall is painted and dry, let him take Carthaginian [Barbary] wax, melted with a little oil, and rub it on the wall with a hair-pencil; and afterwards let him put live coals into an iron veſſel [chafing-diſh], and hold it cloſe to the wax, when the wall, by being heated, begins to ſweat; then let it be made ſmooth: afterwards let him rub it with a (C) candle and (D) clean linen rags, in the ſame manner as they do the naked marble ſtatues. This the Greeks call καυσις. The coat of Carthaginian wax (thus put on) is ſo ſtrong, that it neither ſuffers the moon by night, nor the ſun-beams by day, to deſtroy the colour.'

"Being ſatisfied, from this paſſage in Vitruvius, that the manner of using wax in *Exp.* 8. was right, I was now to find if the wax-varniſh, thus burnt into the picture, would bear waſhing. But here I was a little diſappointed; for rubbing one corner with a wet linen cloth, ſome of the colour came off; but waſhing it with a ſoft hair-pencil dipped in water, and letting it dry without wiping, the colour ſtood very well.

"A board painted, as in *Exp.* 8. was hung in the moſt ſmoky part of a chimney for a day, and expoſed to the open air in a very foggy night. In the morning the board was ſeemingly wet through, and the water ran off the picture. This was ſuffered to dry without wiping: and the picture had not ſuffered at all from the ſmoke or the dew, either in the ground or the colours; but when dry, by rubbing it, firſt with a ſoft cloth, and afterwards with a bruſh, it recovered its former gloſs.

"Suſpecting that ſome tallow might have been mixed with the white wax I had uſed, which might cauſe the colours to come off on being rubbed with a wet cloth, I took yellow wax which had been melted from the honeycomb in a private family, and conſequently not at all adulterated: to three parts of this I added one part reſin, and melted them together.

"*Exp.* 9. Spaniſh-white, mixed with fiſh-glue, was put for a ground on a board, and painted with water-colours only. The board was made warm; and then the wax and reſin were put on with a bruſh, and kept cloſe to the fire till the picture had imbibed all the varniſh,

(B) "Putty is lime flaked, and while warm, diſſolved in water, and ſtrained through a ſieve.

(C) "The account of the method of poliſhing [painting] walls coloured with vermilion, gave me great ſatisfaction, as it proved the method I had taken in experiment 8. (which I had tried before I ſaw or knew of this paſſage in Vitruvius) was right. The uſe of the candle, as I apprehend, was to melt the wax on the walls where by accident the bruſh had put on too much, or afford wax where the bruſh had not put on enough, or had left any part bare.

(D) "The rubbing the wall with a linen cloth, while warm, will do very well where there is only one colour to be preſerved; but where there are many, as in a landſcape, it will be apt to take off ſome, or render the colouring rather faint; which I found by wiping the wax off from a painting while it was hot.

Encauſtic. varniſh, and looked dry. When it was cold, I rubbed it firſt with a linen cloth, and then poliſhed it with a hard bruſh.

" In theſe experiments I found great difficulties with regard to colours. Many water colours being made from the juices of plants, have ſome degree of an acid in them; and theſe, when painted on an alkaline ground, as chalk, whitening, *cimolia*, and plaſter, are totally changed in their colours, and from green become brown; which contributes much to make the experiments tedious. I would therefore adviſe the uſe of mineral or metallic colours for this ſort of painting, as moſt likely to preſerve their colour: for although I neutralized Spaniſh white, by fermenting it with vinegar, and afterwards waſhed it very well with water, it did not ſucceed to my wiſh.

" Theſe experiments, and this paſſage from Vitruvius, will in ſome meaſure explain the obſcurity of part of that paſſage in Pliny which Dr Parſons, in his learned comment on the encauſtic painting with wax, ſeems to deſpair of.

" *Ceris pingere*, was one ſpecies of encauſtic painting. Ενκαυστον, *inuſtum*, may be tranſlated, " forced in by the means of fire; burnt in:" for whatever is forced in by the help of fire can be rendered into Latin by no other ſignificant word that I known of but *inuſtum*. If this is allowed me, and I think I have the authority of Vitruvius (a writer in the Auguſtan age) for it, who ſeems to have wrote from his own knowledge, and not like Pliny, who copied from others much more than he knew himſelf, the difficulty with regard to this kind of painting is ſolved, and the encauſtic with burnt wax recovered to the public.

" What he means by the next kind he mentions, *in ebore ceſiro id eſt viriculo*, I will not attempt to explain at preſent.

" The ſhip-painting is more eaſily accounted for, the practice being in part continued to this time; and is what is corruptly called *breaming*, for brenning or burning.

" This is done by reeds ſet on fire, and held under the ſide of a ſhip till it is quite hot; then reſin, tallow, tar, and brimſtone, melted together, and put on with a hair bruſh while the planks remain hot, make ſuch a kind of paint as Pliny deſcribes: which, he ſays, *nec ſole, nec ſale ventiſque corrumpitur*. As they were ignorant of the uſe of oil-painting, they mixed that colour with the wax, &c. which they intended for each particular part of the ſhip, and put it on in the manner above deſcribed.

" In the pictures painted for theſe experiments, and now laid before your lordſhip and the ſociety, I hope neither the deſign of the landſcape, nor the execution of it, will be ſo much taken into conſideration as the varniſh (which was the thing wanted in this inquiry): and I think that will evince, that the encauſtic painting with burnt wax is fully reſtored by theſe experiments; and though not a new invention, yet having been loſt for ſo many ages, and now applied further, and to other purpoſes, than it was by Vitruvius (who confined it to vermilion only), may alſo amount to a new diſcovery, the uſe of which may be a means of preſerving many curious drawings to poſterity; for this kind of painting may be on paper, cloth, or any other ſubſtance that will admit a ground to be laid on it. The proceſs is very ſimple, and is not attended with the diſ- Encauſtic.
agreeable ſmell unavoidable in oil-painting, nor with ſome inconveniences inſeparable from that art; and as there is no ſubſtance we know more durable than wax, it hath the greateſt probability of being laſting."

Still, however, there ſeem to have been ſome defects or inconveniences attending theſe and other ſubſequent attempts: for we find the ancient or ſome ſimilar method of painting in wax remaining a deſideratum upwards of 25 years after the publication of the preceding experiments; when in 1787 a method was communicated to the Society of Arts by Miſs Greenland, for which ſhe was rewarded with a prize. The ground of her information ſhe received at Florence, through the acquaintance of an amateur of painting, who procured her the ſatisfaction of ſeeing ſome paintings in the ancient Grecian ſtyle, executed by Signora Parenti, a profeſſor at that place, who had been inſtructed by a Jeſuit at Pavia, the perſon who made the fartheſt diſcoveries in that art. Miſs Greenland's friend knowing ſhe was fond of painting, informed her what were the materials the paintreſs uſed, but could not tell her the proportions of the compoſition; however, from her anxiety to ſucceed in ſuch an acquiſition, ſhe made various experiments, and at laſt obtained ſuch a ſufficient knowledge of the quantities of the different ingredients as to begin and finiſh a picture, which ſhe afterwards preſented to the Society for their inſpection.

Her method is as follows: " Take an ounce of white wax, and the ſame weight of gum maſtich powdered. Put the wax in a glazed earthen veſſel over a very ſlow fire; and when it is quite diſſolved, ſtrew in the maſtich, a little at a time, ſtirring the wax continually until the whole quantity of gum is perfectly melted and incorporated: then throw the paſte into cold water; and when it is hard, take it out of the water, wipe it dry, and beat it in one of Mr Wedgwood's mortars, obſerving to pound it at firſt in a linen cloth to abſorb ſome drops of water that will remain in the paſte, and would prevent the poſſibility of reducing it to a powder, which muſt be ſo fine as to paſs through a thick gauze. It ſhould be pounded in a cold place and but a little while at a time, as after long beating the friction will in a degree ſoften the wax and gum, and inſtead of their becoming a powder they will return to a paſte.

" Make ſome ſtrong gum-arabic water; and when you paint, take a little of the powder, ſome colour, and mix them together with the gum-water. Light colours require but a ſmall quantity of the powder, but more of it muſt be put in proportion to the body and darkneſs of the colours; and to black there ſhould be almoſt as much of the powder as colour.

" Having mixed the colours, and no more than can be uſed before they grow dry, paint with fair water, as is practiſed in painting with water-colours, a ground on the wood being firſt painted of ſome proper colour prepared in the ſame manner as is deſcribed for the picture; walnut-tree and oak are the ſorts of wood commonly made uſe of in Italy for this purpoſe. The painting ſhould be very highly finiſhed; otherwiſe, when varniſhed, the tints will not appear united.

" When the painting is quite dry, with rather a hard bruſh, paſſing it one way, varniſh it with white wax, which is put into an earthen veſſel, and kept melted over a very ſlow fire till the picture is varniſhed, taking

Enceinte ‖ Enchasing.

king great care the wax does not boil. Afterwards hold the picture before a fire, near enough to melt the wax, but not make it run; and when the varnish is entirely cold and hard, rub it gently with a linen cloth. Should the varnish blister, warm the picture again very slowly, and the bubbles will subside. When the picture is dirty, it need only be washed with cold water."

The opinion given by the Society upon the above is: The method made use of by Miss Greenland provides against all inconveniences; and the brilliancy of the colours in the picture painted by her, and exhibited to the Society, fully justifies the opinion, that the art of painting in wax, as above described, highly merited the reward of a gold pallet voted to her on this occasion.

ENCEINTE, in *Fortification*, is the wall or rampart which surrounds a place, sometimes composed of bastions or curtains, either faced or lined with brick or stone, or only made of earth. The enceinte is sometimes only flanked by round or square towers, which is called a *Roman wall*.

ENCEPHALI, in *Medicine*, worms generated in the head, where they cause so great a pain as sometimes to occasion distraction.

The encephali are very rare; but there are some diseases wherein they swarm: from whence we are told pestilential fevers have wholly arisen. Upon the dissection of one who died of this fever, a little, short, red worm was found in the head, which malmsey wine, wherein horse-radish had been boiled, could alone destroy. This medicine was afterwards tried on the sick, most of whom it cured.

The like worms have also been taken out by trepanning, and the patient cured. Those worms that generate in the nose, ears, and teeth, are also called *encephali*.

ENCHANTER, a person supposed to practise enchantment or fascination. See FASCINATION, WITCHCRAFT, &c.

Enchanter's Nightshade. See CIRCÆA, BOTANY *Index*.

ENCHASING, INCHASING, or *Chasing*, the art of enriching and beautifying gold, silver, and other metal-work, by some design or figures represented thereon in low relievo.

Enchasing is practised only on hollow thin works, as watch-cases, cane-heads, tweezer-cases, or the like. It is performed by punching or driving out the metal, to form a figure, from withinside, so as to stand out prominent from the plane or surface of the metal. In order to this, they provide a number of fine steel blocks or puncheons of divers sizes; and the design being drawn on the surface of the metal, they apply the inside upon the heads or tops of these blocks, directly under the lines or parts of the figures; then, with a fine hammer, striking on the metal, sustained by the block, the metal yields, and the block makes an indenture or cavity on the inside, corresponding to which there is a prominence on the outside, which is to stand for that part of the figure.

Thus the workman proceeds to chase and finish all the parts by the successive application of the block and hammer to the several parts of the design. And it is wonderful to consider with what beauty and justness, by this simple piece of mechanism, the artists in this kind will represent foliages, grotesques, animals, histories, &c.

Enclitic ‖ Endym

ENCLITICA, in *Grammar*, particles which are so closely united with other words as to seem part of them, as in *virumque*, &c.—There are three enclitic particles in Latin, viz. *que*, *ne*, *ve*.

ENCRATITES, in church-history, heretics who appeared towards the end of the second century: they were called *Encratites*, or *Continentes*, because they gloried in abstaining from marriage and the use of wine and animal food.

ENCURECK, in *Natural History*, a venomous insect found in Persia, and said to be a kind of tarantula. According to Olearius, as quoted by Mr Boyle, it neither stings nor bites; but lets fall its venom like a drop of water, which causes insufferable pain in the part for a time, and afterwards so profound a sleep, that, as report says, nothing can awake the patient except crushing one of the creatures on the part affected. It is nevertheless said, that the sheep eat these insects without damage.

ENCYCLOPÆDIA, a term nearly synonymous with CYCLOPÆDIA; but adopted in preference to it in denominating the present work, as being more definite and of better authority. According to an observation of the late learned printer Mr Bower, the preposition EN makes the meaning of the word more precise. For *Cyclopædia* may denote "the instruction OF a circle," as *Cyropædia* is "the instruction OF Cyrus," whereas in *Encyclopædia* the preposition determines the word to be from the dative of *cyclus*, "instruction IN a circle." And Vossius, in his book *De vitiis sermonis*, has observed, "That *Cyclopædia* is used by some authors, but *Encyclopædia* by the best."

ENDEMIC, or ENDEMICAL, DISEASES, those to which the inhabitants of particular countries are subject more than others, on account of the air, water, situation, and manner of living.

ENDIVE. See CICHORIUM, BOTANY and GARDENING *Index*.

ENDLESS, something without an end: thus authors mention endless rolls, the endless screw, &c.

ENDOR, in *Ancient Geography*, a town of Galilee, four miles to the south of Mount Tabor, in the tribe of Manasseh, where the Pythoness was consulted by Saul: at this day, says Jerome, a large village.

ENDORSE, in *Heraldry*, an ordinary, containing the eighth part of a pale, which Leigh says is only used when a pale is between two of them.

ENDORSED, in *Heraldry*, is said of things borne back to back, more usually called ADOSSE.

ENDORSEMENT, in *Law* and *Commerce*. See INDORSEMENT.

ENDOWMENT, in *Law*, denotes the settling a dower on a woman; though sometimes it is used figuratively, for settling a provision upon a parson, on the building of a church; or the severing a sufficient portion of tithes for a vicar, when the benefice is appropriated.

ENDYMION, in fabulous history, a shepherd, son of Æthlius and Calyce. It is said that he required of Jupiter to grant to him to be always young, and to sleep as much as he would; whence came the proverb of *Endymionis somnum dormire*, to express a long sleep. Diana saw him naked as he slept on Mount Latmos; and

and was so struck with his beauty, that she came down from heaven every night to enjoy his company. Endymion married Chromia daughter of Itonus; by whom he had three sons Pæon, Epeus, and Æolus, and a daughter called *Eurydice*. The fable of Endymion's amours with Diana, or the moon, arose from his knowledge of astronomy; and as he passed the night on some high mountain to observe the heavenly bodies, it came to be reported that he was courted by the moon. Some suppose that there were two of that name; the son of a king of Elis, and the shepherd or astronomer of Caria. The people of Heraclea maintained that Endymion died on Mount Latmos; and the Eleans pretended to show his tomb at Olympia in Peloponnesus.

ENEMY, in *Law*, an alien or foreigner, who publicly invades the kingdom.

ENERGUMENS, in church-history, persons supposed to be possessed by the devil, concerning whom there were many regulations among the primitive Christians. They were denied baptism and the eucharist; at least, this was the practice of some churches: and though they were under the care of exorcists, yet it was thought a becoming act of charity to let them have the public prayers of the church, at which they were permitted to be present. See EXORCISM.

ENERGY, a term of Greek origin, signifying the power, virtue, or efficacy of a thing. It is also used, figuratively, to denote emphasis of speech.

ENERVATING, the act of destroying the force, use, or office, of the nerves, either by cutting them, by weakening them with debauchery, or by some other violence.

Excess of wine, and other strong, hot, spirituous liquors, enervate or weaken the nerves. When they would render a horse useless, they enervate him, or cut his nerves.

ENFANS PERDUS, the same with forlorn hope. See FORLORN.

ENFIELD, WILLIAM, LL. D. an elegant and very justly admired writer, was born in the year 1741, at Sudbury. His original destination was for the sacred office of the ministry, and he was educated among the protestant dissenters at Daventry, where the high polish which he gave to his compositions, distinguished him from many of his cotemporaries. The congregation of Benn's-garden of Liverpool made choice of him for their minister in the year 1763, when he was not more than 22 years of age; and in this situation he was soon taken notice of as an amiable member of society, and an engaging preacher. While he resided in Liverpool, he published two volumes of sermons, 12mo, as well as a collection of hymns and family prayers, which met with a very favourable reception. In the year 1770, he was appointed tutor and lecturer in the belles lettres at Warrington academy, which he filled for some years with general approbation and unwearied diligence. He was the compiler of many useful books, among the most popular of which we may rank his "Speaker," composed of pieces of recitation from the best and most approved English authors. At the beginning of this collection there is an excellent essay on elocution. The Preacher's Directory; the English Preacher, a collection of sermons in 9 vols 12mo, from the most celebrated authors; Biographical Sermons on the principal characters in the Old and New Testament, with a number of single sermons on particular occasions, were also the productions of his pen. The controversy relative to literary property also engaged his attention, and on this he wrote a quarto pamphlet. He likewise published in one volume 4to, Institutes of Natural Philosophy, theoretical and experimental; and during the time of his residence at Warrington, as teacher in the academy, the university of Edinburgh conferred on him the degree of LL. D. When that academy was dissolved in 1783, Dr Enfield continued for two years at Warrington in the capacity of a private tutor, after which he was chosen pastor of the Octagon meeting-house at Norwich, in the year 1785. He at length gave up his private tuition, and entirely devoted his time to literary labours, and the peculiar duties of his pastoral charge. About this time he lost his eldest son, who had been appointed to the office of town-clerk of Nottingham. This event would have been productive of very serious effects on his health and spirits, had it not been for the consolation of religion and philosophy, which are sufficient to support the human mind under the pressure of the severest calamities. He undertook and executed the laborious task of abridging Brucker's History of Philosophy, which in 1791 he published in 2 vols 4to. It has been allowed that the tenets of the different sects of philosophers were never before exhibited to the world with such perspicuity and elegance; qualifications for which Dr Enfield was undoubtedly eminent. He contributed largely to the Biographical Dictionary, published under the inspection of Dr Aiken and others.

An unsuspected distemper hastened the termination of his useful life, and on the 3d of November 1797, he expired in the 57th year of his age. The general love of mankind which Dr Enfield possessed, falls to the lot of few; nor does it often happen, that an individual dies so universally lamented. It was essential to him to be amiable in every station and condition of life. His posthumous sermons in 3 vols 8vo, had a very numerous list of subscribers, a strong proof of the estimation in which he was held by all who knew him, either personally or by report. In these discourses he treats chiefly on moral topics, which he discusses with the nicest discrimination, and in a train of the most pleasing and manly eloquence.

ENFILADE, in the art of war, is used in speaking of trenches, or other places, which may be scoured by the enemy's shot along their whole length. In conducting the approaches at a siege, care must be taken that the trenches be not enfiladed from any work of the place.

ENFINE', formerly ANTINOE, a city of Egypt, built by Adrian in honour of his favourite Antinous. It is situated towards the middle of the Said, or Upper Egypt, and still contains several stately monuments of antiquity. In ancient times this city was very magnificent. It was about half a league in circumference, having two principal streets 45 feet wide, intersecting each other at right angles, and running through its whole length. The others were more narrow, but equally straight; the two largest having gates at each end, part of which still remain. According to the Nubian geographer, it was called the city of the Magi, because Pharaoh is said to have caused the magicians

Enfine ‖ Engendering.

come from thence to his court. Near it were the ruins of Abydus, where there was an oracle of the god Beſa, one of the moſt ancient in Egypt, and which was ſtill famous in the time of Conſtantius; and hence ſome have derived the appellation juſt mentioned, the neighbouring people coming in crowds to conſult the oracle.

The ruins of the gates are the moſt beautiful pieces of architecture to be met with in this place. The handſomeſt has three vaulted entries; the middle one being 40 feet in height, 22 wide, and 20 thick; the other two ſmaller. Each of the facades of this edifice is ornamented with four pilaſters in bas relief, with Corinthian capitals, the acanthus leaves of which have a conſiderable projection. It was ſurrounded by eight Corinthian columns, of which only one now remains, but the pedeſtals of the reſt are ſtill entire. Beſides theſe, there are heaps of rubbiſh in different parts of the town, apparently the remains of ancient temples or palaces. All theſe ſeem to have been bordered by a colonnade, forming a portico on each ſide, where the inhabitants might walk ſecure from the heat of the ſun. One of the ſquares was ornamented with four large Corinthian pillars, three of which are deſtroyed all but the baſes. The fourth is quite entire, about 50 feet high, and the ſhaft compoſed of ſeveral ſtones. The pedeſtal has a Greek inſcription, pretty much defaced, dedicating it to the emperor Alexander Severus, to whom the ſenate of ALEXANDRIA had already dedicated the famous column mentioned under that article. Theſe four other columns were therefore probably raiſed in honour of that emperor after his victories over the Perſians; for the foliage of the oak, with which the firſt ſtone of the ſhaft is decorated, was a ſign of victory among the Romans. Towards the end of the fourth century the city was peopled by Chriſtians; and Palladius aſſures us, that there were at that place 12 convents of virgins, and ſeveral others inhabited by monks. In the convents there are ſtill ſeveral Coptic monaſteries poſſeſſed by monks equally miſerable and ignorant. The Nubian geographer informs us, that the city was ſurrounded by a well cultivated country, abounding in fruits and harveſts; but theſe have now given place to ſands and barren deſerts. The ruins of Abydus above mentioned are ſtill to be ſeen near this place.

ENFRANCHISEMENT, in *Law*, the incorporating a perſon into any ſociety or body-politic.

ENGASTRIMYTHI, in Pagan theology, the Pythians, or prieſteſſes of Apollo, who delivered oracles from within, without any action of the mouth or lips.

The ancient philoſophers, &c. are divided upon the ſubject of the engaſtrimythi. Hippocrates mentions it as a diſeaſe. Others will have it a kind of divination. Others attribute it to the operation or poſſeſſion of an evil ſpirit. And others to art and mechaniſm. M. Scottus maintains that the engaſtrimythi of the ancients were poets, who, when the prieſts could not ſpeak, ſupplied the defect by explaining in verſe what Apollo dictated in the cavity of the baſon on the ſacred tripod.

ENGENDERING, a term ſometimes uſed for the act of producing or forming any thing: thus meteors are ſaid to be engendered in the middle region of the atmoſphere, and worms in the belly.

ENGINE, in *Mechanics*, is a compound machine, made of one or more mechanical powers, as levers, pulleys, ſcrews, &c. in order to raiſe, caſt, or ſuſtain any weight, or produce any effect which could not be eaſily effected otherwiſe. The word is formed of the French *engin*, from the Latin *ingenium*, "wit;" by reaſon of the ingenuity required in the contrivance of engines to augment the effect of moving powers. Engin ‖ Englan

Engine for Extinguiſhing Fires. See HYDROSTATICS *Index*.

Pile-Engine, one contrived for driving piles. See *PILE-Engine*.

Steam-Engine, a machine to raiſe water by fire, or rather by the force of water turned into ſteam. See *STEAM-Engine*.

ENGINEER, in the military art, an able expert man, who, by a perfect knowledge in mathematics, delineates upon paper, or marks upon the ground, all ſorts of forts, and other works proper for offence and defence. He ſhould underſtand the art of fortification, ſo as to be able, not only to diſcover the defects of a place, but to find a remedy proper for them; as alſo how to make an attack upon, as well as to defend, the place. Engineers are extremely neceſſary for theſe purpoſes: wherefore it is requiſite, that beſides being ingenious, they ſhould be brave in proportion. When at a ſiege, the engineers have narrowly ſurveyed the place, they are to make their report to the general, by acquainting him which part they judge the weakeſt, and where approaches may be made with moſt ſucceſs. Their buſineſs is alſo to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, and lodgments, taking care that none of their works be flanked or diſcovered from the place. After making a faithful report to the general of what is a-doing, the engineers are to demand a ſufficient number of workmen and utenſils, and whatever elſe is neceſſary.

ENGLAND, the ſouthern diviſion of the iſland of Great Britain. Including Wales, it is of a triangular form, and lies between the 50th and 55th degrees of north latitude, extending about 400 miles in length from ſouth to north, and in ſome places it is 300 miles in breadth. It is bounded by Scotland on the north; by the Engliſh Channel on the ſouth, dividing it from France; by the German ſea on the eaſt; and on the weſt by St George's, or the Iriſh Channel.

I

When people

At what time the iſland of Britain was peopled is uncertain; nor do we know whether the ſouthern or northern parts were firſt inhabited. We have no accounts that can be depended upon before the arrival of Julius Cæſar, and it is certain he found the ſouthern parts full of people of a very warlike diſpoſition. Theſe people, according to Cæſar, were a colony of the Gauls; and this opinion is embraced by moſt of the ancient as well as modern writers. It is chiefly founded on the agreement obſerved by the Romans between the two nations in their cuſtoms, manners, language, religion, government, way of fighting, &c. The more northern inhabitants, according to Tacitus, came from Germany. This he infers from the make of their limbs; but Cæſar ſimply calls them *Aborigenes*.

England,

England.

England, including the principality of Wales, when first invaded by the Romans, was divided into 17 petty states.

2 Inhabited by 17 different nations.

1. The Dannonii, called also *Dumnonii* and *Donmonii*, inhabiting the counties of Cornwall and Devonshire. 2. The Durotriges, who inhabited the tract now called *Dorsetshire*. 3. The Belgæ possessed Somersetshire, Wiltshire, and Hampshire. 4. The Attrebatii, or inhabitants of Berkshire. 5. The Regni, whose country bordered on that of the Attrebatii, and comprehended Surrey, Sussex, and part of the sea-coast of Hampshire. 6. The Cantii, inhabiting the county now called *Kent*. 7. The Dobuni are placed by Ptolemy on the north side of the Thames, near its head, in the counties of Gloucestershire and Oxfordshire. 8. The Cattieuchlani, *Calyeuchlani*, *Cattidudani*, or *Cathieludani*, inhabited Buckinghamshire, Bedfordshire, and Hertfordshire. 9. The Trinobantes, who possessed the counties of Essex and Middlesex. 10. The Iceni, whose country comprehended Suffolk, Norfolk, Cambridge, and Huntingdonshire. These are by Ptolemy called *Simeni*, and by others *Tigeni*. Camden is of opinion, that they were the same whom Cæsar calls *Cenomagni*. 11. The Coritani, whose country comprehended Northamptonshire, Leicestershire, Rutlandshire, Lincolnshire, Nottinghamshire, and Derbyshire. 12. The Cornavii possessed Warwickshire, Worcestershire, Staffordshire, Shropshire, and Cheshire. 13. The Silures inhabited the counties of Radnorshire, Brecknockshire, Glamorganshire, with Herefordshire and Monmouthshire. 14. The Demetæ inhabited part of Caermarthenshire, Pembrokeshire, and Cardiganshire. 15. The country of the Ordovices comprehended Montgomeryshire, Merionethshire, Caernarvonshire, Denbighshire, and Flintshire. 16. The Brigantes possessed the counties of Yorkshire, the bishopric of Durham, Lancashire, Westmorland, and Cumberland. 17. The county of Northumberland was held by the Ottadini, Ottadeni, or Ottalini. Their country, according to some, reached from the Tyne to the river Forth; though the most common opinion is, that it reached only to the Tweed.

The above-mentioned names of these nations are plainly Roman, but the etymology of them is not easily ascertained. Some attempt to derive them from words in the old British language; but as this subject at best must be very obscure and uncertain, we shall not enter into it.

3 Julius Cæsar undertakes an expedition into Britain.

Before the time of Julius Cæsar, the Romans had scarcely any knowledge of Britain; but that conqueror having subdued most of the Gallic nations on the opposite side of the channel, began to think of extending his conquests by the reduction of Britain. The motive for this expedition, ascribed to him by Suetonius, was a desire of enriching himself with the British pearls, which were then very much esteemed. The pretence, however, which he made use of in order to justify his invasion was, that the Britons had sent assistance to the Gauls during his wars with them.

Cæsar undertook his first expedition against Britain when the summer was already far spent, and therefore he did not expect to finish the conquest of the country that campaign. He thought, however, that it would be a considerable advantage to view the island, and learn something of the manners and customs of the natives; after which he could more easily take such measures as would ensure a permanent conquest on his return. Having marched all his forces into the country of the Morini, now the province of Picardy, from whence was the shortest passage into Britain; he ordered at the same time all the vessels that lay in the neighbouring ports, and a fleet which he had built the year before for an expedition against the Morini, to attend him. The Britons, alarmed at his preparations, sent ambassadors with offers of submission; but Cæsar, though he received them with great kindness, did not abandon his intended scheme of an invasion. He waited till the arrival of C. Volusenus, whom he had sent out with a single galley to make discoveries on the coast. Volusenus did not think proper to land; but, having made what observations he could, returned after five days absence, and Cæsar immediately set sail for Britain. His force consisted of two legions, embarked on board 80 transports; and he appointed 18 more which lay wind-bound about eight miles off, to convey over the cavalry; but these last orders were too slowly executed, which occasioned some difficulty in his landing. England.

4 Manners customs, &c. of the Britons.

The Britons at this time, according to Cæsar and other Roman historians, were very numerous, and had their country well stocked with cattle. Their houses resembled those of the Gauls; and they used copper or iron plates weighed by a certain standard instead of money. Their towns were a confused parcel of huts placed at a small distance from one another, generally in the middle of a wood, to which all the avenues were slightly guarded with ramparts of earth, or with trees. All the nations were in a state of the most wretched barbarism, even when compared with the barbarous Gauls on the continent. The use of clothes was scarcely known in the island. Only the inhabitants of the southern coast covered their nakedness with the skins of wild beasts; and this rather to avoid giving offence to the strangers who came to trade with them, than out of any principle of decency. It was a general custom among the Britons to paint their bodies with the juice of woad: but whether this was designed as ornament, or for any other purpose, is not known. They shaved their beards all except their upper lip, and wore long hair. They also had their wives in common, a custom which made them detestable to all other nations.

The arms of the Britons were a sword, a short lance, and a shield. Breast-plates and helmets they looked upon rather to be incumbrances, and therefore made no use of them. They usually fought in chariots, some of which were armed with scythes at the wheels; they were fierce and cruel, and exceedingly bloodthirsty. When driven to distress, they could subsist themselves even on the bark and roots of trees; and Dio Cassius tells us, that they had ready, on all occasions, a certain kind of food, of which, if they took but the quantity of a bean, they were not troubled with hunger or thirst for a considerable time after. The southern nations, however, were somewhat more civilized; and the Cantii, or inhabitants of Kent, more so than any of the rest.

All the British nations at this time were very brave and resolute, owing to the continual dissensions among themselves. They proved therefore very formidable enemies to the Romans; but the same dissensions which had

England. had taught them the art of war, alſo prevented them from uniting in the defence of their country. As ſoon as they perceived Cæſar's fleet approaching, a number of cavalry and chariots were diſpatched to oppoſe his landing, while a conſiderable body of infantry haſtened after. What chiefly embarraſſed the Romans in their attempt to land, was the largeneſs of their ſhips, which required a conſiderable depth of water. The ſoldiers, therefore, were obliged to leap into the ſea while loaded with their armour; and at the ſame time to encounter the enemy, who were quite diſengaged, as they either ſtood on dry ground, or waded but a little way into the water. Cæſar perceiving this diſadvantage, ordered his galleys to advance, with their broadſides towards the ſhore, in order to drive the Britons from the water-ſide with their ſlings and arrows. On this the Britons, ſurpriſed at the galleys, a ſort of ſhipping they had never before ſeen, began to give ground. The fight, however, continued for ſome time, greatly to the diſadvantage of the Romans; till at laſt Cæſar, obſerving the diſtreſs of his men, cauſed ſeveral boats to be manned, and ſent them to the aſſiſtance of thoſe who were moſt expoſed to the enemy's aſſault. The Romans then ſoon got the better of the undiſciplined barbarians, however brave, and made good their landing; but they were unable to purſue the enemy for want of cavalry, which had not yet arrived.

5 They oppoſe Cæſar's landing.

6 They are defeated and ſue for peace.

The Britons were ſo diſheartened with this bad ſucceſs, that they immediately ſent ambaſſadors to ſue for peace; which was granted, on condition of their delivering a certain number of hoſtages for their fidelity. Part of theſe they brought immediately; and promiſed to return in a few days with the reſt, who, they ſaid, lived at ſome diſtance. But, in the mean time, the 18 tranſports which carried Cæſar's cavalry, being driven back by a violent ſtorm, and the fleet which lay in the road being greatly damaged by the ſame, the Britons thought proper to break their engagements. Having therefore privately aſſembled their forces, they fell unexpectedly on the ſeventh legion while at a diſtance from the reſt and buſied in foraging. Cæſar being appriſed of their danger, haſtened to their aſſiſtance with two cohorts, and at laſt repulſed the enemy.—This, however, proved only a temporary deliverance; for the Britons, thinking it would be poſſible for them to cut off all the Romans at once, diſpatched meſſengers to inform ſeveral of the neighbouring nations of the weakneſs of the enemy's forces, and the happy opportunity that offered itſelf of deſtroying all theſe invaders at one blow.—On this, they drew together a great body of horſe and foot, which boldly advanced to the Roman intrenchments. But Cæſar came out to meet them; and the undiſciplined Britons being by no means able to cope with the Romans, were put to flight with great ſlaughter. Having burnt ſeveral towns and villages, the victors returned to their camp, where they were ſoon followed by new deputies from the Britons. Cæſar being in want of horſe, and afraid leſt another ſtorm ſhould deſtroy the remainder of his fleet, granted them peace on condition of their ſending him double the number of hoſtages into Gaul which they had before promiſed. The ſame night he ſet ſail, and ſoon arrived ſafe in Gaul.

7 Their treachery.

The Britons no ſooner perceived the Romans gone, than, as before, they broke through their engagements. Of all the ſtates who had promiſed to ſend hoſtages, only two performed their promiſes; and this neglect ſo provoked Cæſar, that he determined to return the year following with a far greater force. Having, therefore, cauſed his old veſſels to be refitted, and a great many new ones to be built, he arrived off the coaſt of Britain with a fleet of 600 ſhips and 28 galleys. The Britons made no oppoſition to his landing; but Cæſar, getting intelligence that an army was aſſembled at no great diſtance, marched in queſt of them. He found them encamped on the banks of a river, ſuppoſed to be the *Stour*, about 12 miles diſtant from the place where he had landed. They attempted to oppoſe his paſſage; but being briſkly attacked by the Roman cavalry, they were obliged to retire into a wood, all the avenues of which were blocked up by trees cut down for that purpoſe. This fortification, however, proved inſufficient to protect them. The ſeventh legion having caſt themſelves into a teſtudo, and thrown up a mount againſt their works, drove them from their aſylum; but as the day was far ſpent, a purſuit was not thought adviſable.

England.

8 Cæſar returns.

9 Defeats the Britons.

Next morning Cæſar, with the greateſt part of his army, which he divided into three bodies, marched out in queſt of the enemy. But when he was already come in ſight of their rear, he was overtaken by meſſengers, who informed him, that his fleet was greatly damaged by a violent ſtorm which had happened the preceding night. This put an end to the purſuit for that time; but Cæſar having employed all the carpenters he had with him, and ſent for others from Gaul, in order to repair the damage, reſolved to prevent misfortunes of this kind for the future. He therefore drew all his ſhips aſhore, and encloſed them within the fortifications of his camp. This arduous undertaking employed his whole army for 10 days; after which he again ſet out in queſt of the enemy.

The Britons had made the beſt uſe they could of the reſpite afforded them by the ſtorm. They were headed by Caſſibelaunus king of the Trinobantes. He had formerly made war upon his neighbours; and having rendered himſelf terrible to them, was looked upon to be the moſt proper perſon for leading them on againſt the common enemy; and as ſeveral ſtates had now joined their forces, the Britiſh army was very numerous. Their cavalry and chariots attacked the Roman army while on their march; but were repulſed with loſs, and driven into the woods. The Romans purſued them too eagerly, and thus loſt ſome of their own men; which encouraged the Britons to make another fierce attack; but in this alſo they were finally unſucceſsful, and obliged to retire, though their loſs ſeems not to have been great.

Next day the Britons ſuddenly attacked the Roman legions as they were foraging; but meeting with a vigorous reſiſtance, they ſoon betook themſelves to flight. The Romans purſued them ſo cloſely, that having neither time to rally nor get down from their chariots according to cuſtom, great numbers of them were cut in pieces: and this overthrow had ſuch an effect upon the auxiliaries of Caſſibelaunus, that all of them abandoned him; nor did the Britons ever afterwards engage Cæſar with united forces. Cæſar, purſuing his victory, marched

England.

marched towards the Thames, with a deſign to croſs that river, and enter the territories of the Trinobantes. The river was fordable only at one place, and that not without great difficulty; but when he came to it, he found the enemy's forces drawn up in a conſiderable body on the oppoſite bank, which was fortified with ſharp ſtakes. They had likewiſe driven many ſtakes of the ſame kind into the bottom of the river, the tops of which were covered with water. Theſe ſtakes are viſible to this day as a place called *Walton* in Surry. They are made of oak; and though they have been ſo long in the water, are as hard as Brazil, and as black as jet; and have ſometimes been pulled out in order to make knife handles of them.

10 Cæſar croſſes the Thames.

11 Gives the Britons frequent overthrows.

Cæſar was not at all diſmayed at theſe difficulties, which he had intelligence of by priſoners and deſerters. He ordered the cavalry to enter firſt, and the foot to follow. His orders were obeyed, and the ſoldiers advanced with ſuch reſolution, that though the infantry were up to the chin in water, the enemy, unable to ſuſtain their aſſault, abandoned the bank and fled. After this defeat, Caſſibelaunus himſelf deſpaired of ſucceſs, and therefore diſmiſſed all his forces except about 4000 chariots, with which he obſerved the motions of the Romans, haraſſing them by cutting off ſtraggling parties, &c. This, however, was not ſufficient to keep up the ſpirits of his countrymen. On the contrary, they depoſed him from the kingdom, and choſe Mandubratius, whoſe father had been murdered by Caſſibelaunus, who thereupon uſurped the kingdom. The young prince had fled to Cæſar, who gave him protection; and the Trinobantes now offered to ſubmit to the conqueror, provided he would give them Mandubratius for their king.

Cæſar readily complied with the requeſt of the Trinobantes upon their ſending him 40 hoſtages; and the ſubmiſſion of the Trinobantes was ſoon followed by that of other ſtates and tribes; for each of the 17 nations already mentioned were compoſed of ſeveral different tribes, of which no particular account can be given. —Cæſar next marched to Verulamium, or Canterbury, which was Caſſibelaunus's capital, and which he ſtill kept poſſeſſion of; but though the place was ſtrongly fortified both by nature and art, the Britons were unable to bear the aſſault of the Romans, and therefore ſoon fled out at one of the avenues. Many were taken as they attempted to make their eſcape, and many more cut in pieces.

After this loſs, Caſſibelaunus, as his laſt reſource, found means to draw into confederacy with him four kings of the Cantii. But though Cæſar gives them the title of kings, it is probable that they were only petty princes, tributary to the king of that nation. Their names were Cingetorix, Corvilius, Taximagulus, and Segonax. Theſe, having raiſed what forces they could, attacked the camp where the ſhips were laid up: but the Romans having made a ſally, repulſed them with great ſlaughter, and then returned to their trenches without any loſs; after which, Caſſibelaunus thought proper to ſubmit to the conqueror. As the ſummer was already far ſpent, Cæſar hearkened to his propoſals. A peace was concluded on the following terms, viz. that the Britons ſhould pay an annual tribute to the Romans, that Caſſibelaunus ſhould leave Maudubratius in peaceable poſſeſſion of his dominions, that he ſhould not moleſt the Trinobantes, and that he ſhould deliver a certain number of hoſtages. Theſe terms being agreed to, Cæſar ſet ſail with his whole fleet from Britain, to which he never returned.

England.

12 He leaves the iſland altogether.

Such is the account given by Cæſar himſelf of his two expeditions into Britain; but other authors have ſpoken very doubtfully of his victories in this iſland. Dio Caſſius tells us, that the Britons utterly defeated the Roman infantry, but were at laſt put in diſorder by their cavalry. Horace and Tibullus, in many parts of their works, ſpeak of the Britons as a people not yet conquered. Tacitus ſays, that Cæſar rather ſhowed the Romans the way to Britain, than put them in poſſeſſion of it; and Lucan tells us plainly, that Cæſar turned his back to the Britons and fled. This laſt, however, conſidering the conſummate military genius of Cæſar, is by no means probable. That he left Britain, during the winter, was, in all probability, to prevent inſurrections among the Gauls, which might very readily have happened: and that he did not return to finiſh his conqueſt can be no wonder, ſeeing his ambition would certainly be more gratified by being called emperor of Rome, than conqueror of Britain.

The departure of Julius Cæſar, which happened about 53 years before Chriſt, left the Britons without any fear of a foreign enemy. We are not, therefore, to imagine, that they would regard their promiſes of paying tribute; nor was it probably demanded for a good number of years afterwards. Auguſtus, however, when he had got himſelf fully eſtabliſhed on the throne, had twice a deſign of invading Britain and forcing the inhabitants to pay the tribute promiſed to Julius Cæſar. Both times, however, he was prevented by revolts in different provinces in the empire, ſo that the Britons ſtill continued to enjoy their liberty. They thought proper, however, to court the favour of the Romans as much as they could by pretended ſubmiſſions; but, in the reign of Claudius, the Romans ſet about reducing them to ſubjection in good earneſt. The occaſion of this war is related by Dio Caſſius as follows. "Cunobelinus, the third in ſucceſſion from Caſſibelaunus, being dead, his two ſons, Togodumnus and Caractacus, ſucceeded to the throne; but whether they reigned jointly or ſeparately, is not known. In their reign one Bericus, of whom we alſo know very little, being driven out of the iſland for attempting to raiſe a ſedition, fled with ſome of his partiſans to Rome, and perſuaded Claudius to make war on his countrymen. The Britons, on the other hand, reſented the behaviour of Claudius in receiving theſe vagabonds, and therefore prohibited all intercourſe with the Romans. A much ſmaller offence than this would have been ſufficient at any time to provoke that haughty nation to declare war. An army was therefore immediately ordered into Britain, under the command of Plautius prætor in Gaul. The ſoldiers at firſt refuſed to embark, from a ſuperſtitious notion, that they were going to be ſent without the compaſs of the world; and this mutiny being related to the Britons, they did not make the neceſſary preparations for their own defence. The Roman ſoldiers were ſoon brought to a ſenſe of their duty; and ſet out from three different ports, in order to land in three different places of Britain at once.

13 Why the war with the Romans was renewed.

Being

England. Being driven back by contrary winds, their fears began to return; but they reſumed their courage on the appearance of a meteor ſhooting from the eaſt, which they imagined was ſent from heaven to direct their courſe. They landed without oppoſition; and the Britons, not having drawn together a ſufficient army, kept in ſmall bodies behind their marſhes, and in woods, in order to ſpin out the war till winter; which they thought Plautius, as Cæſar had done, would paſs in Gaul. England.

14 The Britons defeated. The Roman general marched firſt in queſt of the two kings Togodumnus and Caractacus; both of whom he found out, and defeated one after another. He then reduced part of the Dobuni, at that time ſubject to the Cattieuchlani; and leaving a garriſon to keep them in awe, he advancéd to a river where the Britons lay careleſsly encamped, ſuppoſing that the Romans could not paſs it without a bridge. But the Germans in the Roman army had been accuſtomed to ſwim acroſs the ſtrongeſt currents with their heavy armour. They therefore paſſed the river firſt; and having, according to their orders, fallen only upon the enemy's horſes which drew their chariots, theſe formidable machines were rendered entirely uſeleſs; and the Britons were put to flight as ſoon as another part of the forces could paſs the river.

The Britons were not diſheartened with this defeat, but engaged the Romans next day with great bravery. Victory continued long doubtful; but at length the Romans prevailed, and the Britons were forced to betake themſelves to flight. This battle is thought to have been fought on the banks of the Severn. From thence the Britons fled to the mouth of the Thames. They were cloſely purſued by the Romans; but the latter being unacquainted with the flats and ſhallows of the river, were often in great danger. The Germans, however, croſſed by ſwimming as before, and the reſt on a bridge ſomewhat farther up the river; ſo that the Britons were in a ſhort time ſurrounded on all ſides, and great numbers of them cut in pieces. Many of the Romans, alſo, purſuing the fugitives with too great eagerneſs, were loſt in the marſhes.—In one of theſe battles Togodumnus was killed; but the Britons were ſo far from being diſheartened, that they ſhowed more eagerneſs than ever to oppoſe the Romans, in order to revenge his death. Plautius, therefore, did not think proper to penetrate farther into the country, but contented himſelf with putting garriſons in the places he had already conquered. He then wrote to the emperor himſelf; who no ſooner received an account of his ſucceſs, than he ſet out for Britain; where, having landed after a ſhort voyage, he joined Plautius on the banks of the Thames.

15 Claudius arrives in Britain.

Soon after the arrival of Claudius, the Romans paſſed the Thames, attacked the Britiſh army, and totally defeated it. The conſequence of this was the taking of Cunobelinus's capital, and the ſubmiſſion of ſeveral of the neighbouring ſtates. The emperor, however, did not make a long ſtay in the iſland, but left Plautius to purſue his conqueſts. This he did with ſuch ſucceſs, that, on his return to Rome, he was met without the gates by the emperor himſelf, who, at his ſolemn entry, gave him the right hand.—The Britons ſeem to have made a very obſtinate reſiſtance to the Roman arms about this time. Veſpaſian, who was afterwards emperor, is ſaid to have fought 30 battles with them; and the exploits of Titus his ſon are alſo much celebrated by the Roman hiſtorians. England.

In the ninth year of Claudius, P. Oſtorius Scapula was ſent into Britain. By far the greater part of the 17 nations formerly mentioned were at this time unconquered. Some of theſe had broken into the Roman territories; but Oſtorius falling unexpectedly upon them, put great numbers to the ſword, and diſperſed the reſt. To prevent them for the future from making inroads into the territories of the Romans or their allies, he built ſeveral forts on the Severn, the Avon, and the Nen, reducing the country ſouth of theſe rivers to a Roman province. This ſo highly offended the Iceni, that, being joined by the neighbouring nations, they raiſed a conſiderable army, and encamped in an advantageous ſituation, in order to prevent the Romans from penetrating farther into the iſland. Oſtorius, however, ſoon advanced againſt them. The Romans, as uſual, got the victory, and the enemy were purſued with great ſlaughter. The Roman general then, having quelled an inſurrection among the Brigantes, led his army againſt the Silures. They were headed by their king Caractacus, a moſt renowned warrior. He ſhowed his military talents by chooſing a very advantageous place for engaging the enemy. Tacitus tells us, "it was on the ridge of an exceeding ſteep mountain; and where the ſides of it were inclining and acceſſible, he reared walls of ſtone for a rampart. At the foot of the mountain flowed a river dangerous to be forded, and an army of men guarded his entrenchments." This hill is thought to be one called *Caer-Caradoc* in Shropſhire, ſituated near the conflux of the rivers Colun and Teme, and where the remains of ancient entrenchments are ſtill viſible.—On the approach of the enemy, Caractacus drew up his troops in order of battle, animating them with the following ſpeech, according to Tacitus. "That from this day, and this battle, they muſt date their liberty reſcued, or their ſlavery for ever eſtabliſhed. He then invoked the ſhades of thoſe heroes who had expelled Cæſar the dictator; thoſe brave men by whoſe valour they ſtill enjoyed freedom from Roman tribute and taxes, and by which their wives and children were as yet preſerved from proſtitution." The whole army then took a ſolemn oath either to conquer or die, and prepared for the charge with the moſt terrible ſhouts. Oſtorius was ſomewhat diſmayed when he conſidered the uncommon fierceneſs of the enemy, and the other difficulties which he had to encounter. He led on his men, however, to the charge; and the Romans were attended with their uſual good fortune. The Britons were put to flight. Vaſt numbers fell on the field of battle and in the purſuit, and many more were taken priſoners. Among the latter were the wife, the daughter, and the brothers, of Caractacus. The unfortunate prince himſelf fled to Cartiſmundua queen of the Brigantes, by whom he was delivered up to the Roman general, who ſent him in chains to Rome. Caractacus bore his misfortunes with magnanimity; and when he came before the emperor, addreſſed him in the following terms. "If my moderation in proſperity, O Claudius! had been as conſpicuous as my birth and fortune, I ſhould now have entered this city as a friend, and not as priſoner; nor would you have diſdained the

16 Caractacus defeated and taken priſoner.

17 His ſpeech to the Roman emperor.

England. the friendſhip of a prince deſcended from ſuch illuſtrious anceſtors, and governing ſo many nations. My preſent condition, I own, is to you honourable, to me humiliating. I was lately poſſeſſed of ſubjects, horſes, arms, and riches. Can you be ſurpriſed that I endeavoured to preſerve them? If you Romans have a deſire to arrive at univerſal monarchy, muſt all nations, to gratify you, tamely ſubmit to ſervitude? If I had ſubmitted without a ſtruggle, how much would it have diminiſhed the luſtre of my fall, and of your victory? And now, if you reſolve to put me to death, my ſtory will ſoon be buried in oblivion; but if you think proper to preſerve my life, I ſhall remain a laſting monument of your clemency."—This ſpeech had ſuch an effect upon Claudius, that he immediately pardoned Caractacus and his whole family, and commanded them to be ſet at liberty.

The Silures, notwithſtanding this terrible blow, continued the war with great vigour, and gained conſiderable advantages over the Romans; which ſo much affected Oſtorius, that he died of grief. He was ſucceeded by A. Didius, who reſtrained the incurſions of the Silures, but was not able to reſtore Cartiſmundua queen of the Brigantes, who had been depoſed by her ſubjects. Didius was ſucceeded by Veranius, and he by Suetonius Paulinus, who reduced the iſland of ANGLESEY, as related under that article. But while Paulinus was employed in the conqueſt of this iſland, he was alarmed by the news of an almoſt univerſal revolt among thoſe nations which had ſubmitted to the Romans. The Britons, though conquered, had ſtill a deſire of returning to their former ſtate of independence; and the Roman yoke became every day more unſupportable to them, through the inſolence and oppreſſions of the Roman ſoldiers. The Britons had been long diſcontented, and were already in a very proper diſpoſition for a revolt, when an event happened which kindled theſe diſcontents into an open flame. Praſutagus king of the Iceni, a prince renowned for opulence and grandeur, had, by his laſt will, left the Roman emperor, joint-heir with his two daughters, in hopes of obtaining his favour and protection by ſo great an obligation. But the event turned out very different. No ſooner was he dead, than his houſes and poſſeſſions were all plundered by the Roman ſoldiers. The queen Boadicea remonſtrated againſt this injuſtice; but, inſtead of obtaining any redreſs, ſhe herſelf was publicly whipped, her daughters raviſhed, and all the relations of the late king reduced to ſlavery. The whole country alſo was plundered, and all the chiefs of the Iceni deprived of their poſſeſſions.

18 General revolt of the Britons.

Boadicea was a woman of too haughty a ſpirit tamely to bear ſuch indignities. She therefore perſuaded the Iceni to take up arms, which they very readily did. Then, being joined by the Trinobantes, and ſome other nations, they poured like a torrent on the Roman colonies. Every thing was deſtroyed with fire and ſword. The ninth legion, which had been left for the defence of the country under Petilius Cerealis, was defeated, the infantry totally cut in pieces, and the commander himſelf with the cavalry eſcaped with the utmoſt difficulty. Suetonius, alarmed at this news, immediately left Angleſey, and marched with the greateſt expedition to London. The inhabitants were overjoyed at his arrival, and uſed their utmoſt endeavours to detain him for their defence. But he refuſed to ſtay, and in a ſhort time left the place, notwithſtanding the intreaties of the inhabitants. The whole city lamented his departure; and they had reaſon. Suetonius was ſcarce gone, when Boadicea with her Britons entered, and put all they found in it to the ſword. None were taken priſoners, nor was any ſex or age ſpared, and many were tortured in the moſt cruel manner. Seventy thouſand perſons are ſaid to have periſhed on this occaſion at London and other Roman colonies.

England. 19 They deſtroy 70,000 Romans.

The Britons, now elated with ſucceſs, aſſembled from all quarters in great numbers, ſo that Boadicea's army ſoon amounted to 230,000 men. They deſpiſed the Romans; and became ſo confident of victory, that they brought their wives and children along with them in waggons to be ſpectators of the deſtruction of their enemies. The event was what might naturally have been expected from ſuch ill-judged confidence. The Britons were overthrown with moſt terrible ſlaughter, no fewer than 80,000 being killed in the battle and purſuit; while the Romans had not above 400 killed, and not many more wounded. Boadicea, not able to ſurvive ſo great a calamity, put an end to her life by poiſon.

20 They are totally defeated.

By this overthrow the Britons, who had once been ſubdued, were thoroughly prevented from raiſing any more inſurrections, and even thoſe who had not yet ſubmitted to the Roman yoke ſeemed to be intimidated from making incurſions into their dominions. Nothing remarkable therefore happened for ſome time. In the time of Veſpaſian, Petilius Cerealis being appointed governor of Britain, attacked the Brigantes, defeated them in ſeveral battles, and reduced great part of their country. He was ſucceeded by Julius Frontinus; who not only maintained the conqueſts of his predeceſſor, but reduced entirely the warlike nation of the Silures. Frontinus was ſucceeded by the celebrated Cneius Julius Agricola, who completed the conqueſt of all the ſouthern Britons.

Juſt before the arrival of Agricola, the Ordovices had cut in pieces a band of horſe ſtationed on their confines, after which the whole nation had taken arms. The ſummer was pretty far ſpent, and the Roman army was quite ſeparated and diſperſed, the ſoldiers having aſſured themſelves of reſt for the remaining part of the year. Agricola, however, was no ſooner landed, than, having drawn together his legions, he marched againſt the enemy without delay. The Britons kept upon the ridges of the mountains; but Agricola led them in perſon up the aſcents. The Romans were victorious; and ſuch a terrible ſlaughter was made of the Britons, that almoſt the whole nation of Ordovices was cut off. Without giving the enemy time to recover from the terror which this overthrow had occaſioned, Agricola reſolved upon the immediate reduction of Angleſey, which had been loſt by the revolt of Boadicea. Being deſtitute of ſhips, he detached a choſen body of auxiliaries who knew the fords, and were accuſtomed to manage their arms and horſes in the water. The Britons, who had expected a fleet and tranſports, were ſo terrified by the appearance of the Roman forces on their iſland, that they immediately ſubmitted, and Angleſey was once more reſtored to the Romans.

21 Britain conquered by Agricola.

With the conqueſt of Angleſey ended the firſt campaign

England. paign of Agricola; and he employed the winter in reconciling the Britons to the Roman yoke. In this he met with ſuch ſucceſs, through his wiſe and equitable conduct, that the Britons, barbarous as they were, began to prefer a life of ſecurity and peace, to that independency which they had formerly enjoyed, and which continually expoſed them to the tumults and calamities of war. The ſucceeding campaigns of Agricola were attended with equal ſucceſs; he not only ſubdued the 17 nations inhabiting England, but carried the Roman arms almoſt to the extremity of Scotland. He alſo cauſed his fleet to ſail round the iſland, and diſcovered the Orcades, or Orkney iſlands, which had before been unknown to the reſt of the world. His expedition took him up about ſix years, and was completed in the year of Chriſt 84.

Had this commander been continued in Britain, it is probable that both Scotland and England would have been permanently ſubdued; but he was recalled by Domitian in the year 85, and we are then almoſt totally in the dark about the Britiſh affairs till the reign of the emperor Adrian. During this interval the Caledonians had taken arms, and not only refuſed ſubjection to the Roman power themſelves, but ravaged the territories of the Britons who continued faithful to them. Adrian, for what reaſon is not well known, abandoned to them the whole tract lying between the Tyne and the Forth. At the ſame time, in order to reſtrain them from making incurſions into the Roman territories, he built a wall 80 miles in length from the river Eden in Cumberland to the Tyne in Northumberland *. He was ſucceeded by Antoninus Pius, in whoſe reign the Brigantes revolted; and the Caledonians, having in ſeveral places broken down the wall built by Adrian, began anew to ravage the Roman territories. Againſt them the emperor ſent Lollius Urbicus, who reduced the Brigantes; and having defeated the northern nations, confined them within narrower bounds by a new wall †, extending probably between the friths of Forth and Clyde. From the time of Antoninus to that of Severus, the Roman dominions in Britain continued to be much infeſted by the inroads of the northern nations. That emperor divided Britain into two governments, the ſouthern and northern; but the governor of the northern diviſion was ſo haraſſed by continual incurſions of the Caledonians, that he was at length obliged to purchaſe a peace with money. The Caledonians kept the treaty for 15 years; after which, breaking into the Roman territories anew, they committed terrible ravages. Virius Lupus the governor, not being in a condition to withſtand them, acquainted the emperor with his diſtreſs, intreating him to ſend powerful and ſpeedy ſupplies. Upon this Severus reſolved to put an end to the perpetual incurſions of the enemy, by making a complete conqueſt of their country; for which purpoſe he ſet out for Britain, together with his two ſons Caracalla and Geta, at the head of a numerous army. The Caledonians no ſooner heard of his arrival, than they ſent ambaſſadors offering to conclude a peace upon honourable terms. But theſe the emperor detained till he was ready to take the field, and then diſmiſſed them without granting their requeſt.

As ſoon as the ſeaſon was fit for action, Severus marched into the territories of the Caledonians, where he put all to fire and ſword. He advanced even to the moſt northerly parts of the iſland; and though no battle was fought in this expedition, yet through the continual ambuſcades of the enemy, and the inhoſpitable nature of the country, he is ſaid to have loſt 50,000 men. At laſt the Caledonians were obliged to ſue for peace; which was granted them on condition of their yielding part of their country, and delivering up their arms. After this the emperor returned to York, leaving his ſon Caracalla to command the army, and finiſh the new wall which had been begun between the friths of Forth and Clyde. But the emperor being taken ill at York, the Caledonians no ſooner heard of his indiſpoſition, than they again took up arms. This provoked Severus to ſuch a degree, that he commanded his ſon Caracalla to enter their country anew with the whole army, and to put all he met to the ſword without diſtinction of ſex or age. Before theſe orders, however, could be put in execution, his two ſons, having concluded a ſhameful peace with the Caledonians, returned to Rome. England.

A long chaſm now takes place in the hiſtory of the Roman dominions in Britain. In the beginning of Diocleſian's reign, Carauſius a native of Gaul, paſſing over into Britain, took upon him the title of *emperor*, and was acknowledged by all the troops quartered here. He was, however, killed in a battle with one of Conſtantius's officers, after he had enjoyed the ſovereignty for ſix or ſeven years. Conſtantine the Great began his reign in this iſland; and returned ſoon after he had left it, probably with a deſign to put a ſtop to the daily incurſions of the Caledonians. He altered the diviſion of that part of Britain ſubject to the Romans. Severus had divided it only into two provinces; but Conſtantine increaſed the number to three, viz. Britannia Prima, Britannia Secunda, and Maxima Cæſarienſis; and this laſt was afterwards divided into two, viz. Maxima Cæſarienſis and Flavia Cæſarienſis. The removal of the imperial ſeat from Rome to Conſtantinople, which happened in the reign of Conſtantine, gave the northern nations an opportunity of making frequent incurſions into the Roman provinces; the emperor having carried with him, firſt into Gaul, and then into the Eaſt, not only moſt of the Roman troops, but likewiſe the flower of the Britiſh youth.

About the latter end of the reign of Conſtantius ſon to Conſtantine the Great, the government of the province of Britain, and other weſtern parts of the empire, was committed to Julian, afterwards called the *apoſtate*. While he was in his winter quarters at Paris, he was informed that the Scots and Picts, about this time firſt diſtinguiſhed by theſe names, had broken into the Roman territories and committed everywhere dreadful ravages. Againſt them Julian diſpatched a body of troops under the command of Lupicinius. He embarked from Boulogne in the depth of winter, but was no ſooner arrived at London than he was recalled; the enemy having probably found means to appeaſe Julian by their ſubmiſſions. Till the reign of Valentinian I. theſe nations ſtill continued to infeſt the Roman territories in Britain, and had now reduced the country to a moſt deplorable condition by their continual ravages. Valentinian ſent againſt them Theodoſius, father to the emperor of that name. That gene-

ral

22 Expedition of Severus into Britain.

England. ral having divided his forces into ſeveral bodies, advanced againſt the enemy, who were roving up and down the country. The Scots and Picts were obliged to yield to the ſuperior valour and diſcipline of the Romans. Great numbers were cut in pieces; they were forced to abandon all the booty and priſoners they had taken, and to retire beyond the friths of Forth and Clyde. Theodoſius then entered London in triumph, and reſtored that city to its former ſplendor, which had ſuffered greatly by the former incurſions of the northern Britons. To reſtrain them from breaking anew into the provinces, Theodoſius built ſeveral forts or caſtles between the two friths; and having thus recovered all the country between Adrian's wall and the friths of Forth and Clyde, he formed of it a fifth province, which he called *Valentia*.

Though Britain was now reduced to a ſtate of temporary tranquillity, yet as the Roman empire was daily declining, it is not to be ſuppoſed that ſufficient care could be taken to ſecure ſuch a diſtant province. In the reign of the emperor Honorius, the provincial Britons found themſelves annoyed not only by the Scots and Picts, but alſo by the depredations of the Saxons, who began to commit ravages on the ſea-coaſts. By the care, however, of Stilicho, prime miniſter to Honorius, matters were once more ſettled, and a particular officer was appointed to guard the coaſt againſt the attempts of the Saxons, with the title of *Comes litoris Saxonici*. But, not long after, the empire being overrun by barbarians, moſt of the Roman troops quartered in Britain were recalled, and the country left quite open to the attacks of the Scots and Picts.

23 The Britons chooſe an emperor of their own.

Upon this the provincials expecting no more aſſiſtance from Honorius, reſolved to ſet up an emperor of their own. Accordingly they inveſted with the imperial dignity one *Mark*, an officer of great credit among them. Him they murdered in a few days, and placed on the throne one Gratian a native of Britain. After a reign of four months, Gratian underwent the fate of his predeceſſor; and was ſucceeded by *Conſtantine*, a common ſoldier, who was choſen merely for the ſake of his name. He ſeems, however, to have been a man of ſome knowledge and experience in war. He drove the Scots and Picts beyond the limits of the Roman territories; but being elated with this ſucceſs, he would now be ſatisfied with nothing leſs than the conqueſt of the whole Roman empire. He therefore paſſed over into Gaul; and took with him not only the few Roman forces that had been left, but ſuch of the provincial Britons as were moſt accuſtomed to arms. That unhappy people, being now left entirely defenceleſs, were haraſſed in the moſt cruel manner by their enemies; who broke into the country, and deſtroyed all with fire and ſword. In this miſerable ſituation they continued from the year 407, when the uſurper Conſtantine paſſed over into Gaul, till the year 410. Having during the laſt three years frequently implored aſſiſtance from Rome without receiving any, they now reſolved to withdraw their allegiance from an empire which was no longer able to protect them. Honorius himſelf applauded their conduct; and adviſed them by letters to provide for their own ſafety, which was in effect an implicit reſignation of the ſovereignty of the iſland.

The provincial Britons now regained their liberty; but they had loſt the martial ſpirit which had at firſt rendered them ſo formidable to the Romans. They ſeem, however, to have met with ſome ſucceſs in their firſt enterpriſes; for Zoſimus tells us, that they delivered their cities from the inſults of an haughty enemy. But being at laſt overpowered, they were again obliged to have recourſe to the Roman emperor, to whom they promiſed a moſt perfect ſubmiſſion, provided they were delivered from the hands of their mercileſs and implacable enemies. Honorius, touched with compaſſion, ſent a legion to their relief. The Roman forces landed in Britain unexpectedly; and having deſtroyed great numbers of the Scots and Picts, they drove them beyond the friths of Forth and Dunbritton. After this they adviſed the natives to build a wall on the iſthmus from ſea to ſea, and to reaſſume their courage, and defend themſelves from their enemies by their own valour. The Romans then quitted the country; being obliged to return, in order to repulſe thoſe barbarians who had broken into the empire from all quarters.

England. 24 Implore the aſſiſtance of the Romans.

The Britons immediately ſet about building the wall, as they had been deſired, with great alacrity. But as it was conſtructed only of turf, the Scots and Picts ſoon broke it down in ſeveral places; and, pouring in upon the defenceleſs and effeminate provincials, committed more cruel ravages than ever. At laſt, after very many and grievous calamities, the latter ſent ambaſſadors once more to Rome. Theſe appeared with their garments rent and duſt on their heads; and at laſt prevailed on the emperor, by their earneſt intreaties, to ſend another legion to their relief. The troops arrived in Britain before the enemy had the leaſt knowledge of their having ſet ſail. They were therefore quite unprepared for an attack, and roving up and down the country in the utmoſt diſorder. The Romans made a terrible havock among them, and drove the remainder into their own country. As Honorius had ſent them not with any ambitious view of retaining the iſland in ſubjection, but merely out of compaſſion to the unhappy provincials, the Romans told them, they had now no farther aſſiſtance to expect from them. They informed them, that the legion muſt immediately return to the continent, to protect the empire from the barbarians, who had extended their ravages almoſt to every part of it; and therefore, that they muſt now take their laſt farewel of Britain, and totally abandon the iſland. After this declaration Gallio, the commander of the Roman troops, exhorted the provincials to defend themſelves, by fighting bravely for their country, wives, and children, and what ought to be dearer than life itſelf, their liberty; telling them, at the ſame time, that their enemies were no ſtronger than themſelves, provided they would but lay aſide their fears, and exert their ancient courage and reſolution. That they might the better withſtand the attacks of the enemy, he adviſed them to build a wall, not of turf, but of ſtone; offering to aſſiſt them with his ſoldiers, and to direct them himſelf in the execution. Upon this the Britons immediately fell to work; and with the aſſiſtance of the Romans, finiſhed it in a ſhort time, though it was no leſs than eight feet thick, and twelve feet in height. It is thought to have been built on the ſame place where Severus's wall formerly ſtood. Towers were alſo built at con-

25 Send ambaſſadors a ſecond time to Rome.

England.

venient diſtances on the eaſt coaſt, to prevent the deſcents of the Saxons and other barbarians that came from Germany. Gallio employed the reſt of his time in teaching the provincials the art of war. He left them patterns of the Roman weapons, which he alſo taught them to make; and after many encouraging exhortations, he took his laſt farewel of Britain, to which the Romans never returned. There is a great diſagreement among chronologers as to the year in which the Romans finally abandoned Britain; ſome placing it in 422; others in 423, or 426; and ſome in 431, 435, or 437.

26 Britain finally abandoned by the Romans.

The final departure of the Romans was no ſooner known to the Scots and Picts, than they poured in upon the provincial Britons from all quarters, like hungry wolves breaking into a ſheep-fold. When the Scots approached the new built-wall, they found it completely finiſhed, and guarded by great numbers of armed men. But ſo little had the provincial Britons profited by the military inſtructions of the Romans, that inſtead of placing proper guards and centinels, and relieving one another by turns, their whole number had ſtaid ſeveral days and nights upon the ramparts without intermiſſion. Being therefore quite benumbed and wearied out, they were able to make but very little reſiſtance. Many were pulled down with hooks from the battlements, and daſhed in pieces. The reſt were driven from their ſtations with ſhowers of darts and arrows. They betook themſelves to flight; but that could not ſave them. The Scots and Picts purſued them cloſe, made a dreadful havock among the fugitives, and took poſſeſſion of the frontier towns, which they found deſerted by the inhabitants. As they now met with no more oppoſition, they overran the whole country, putting every thing to fire and ſword. Their ravages ſoon occaſioned a famine; and this was followed by a kind of civil war. The provincials, unable to ſupport themſelves, were obliged to plunder each other of the little the common enemy had left them. The whole country at laſt became ſo incapable of ſupporting thoſe who were left in it, that many fled into the woods, in order to ſubſiſt themſelves there by hunting.

27 Britons miſerably haraſſed by the Scots and Picts.

28 Implore the aſſiſtance of the Romans.

In this extremity of diſtreſs they had once more recourſe to the Romans; and wrote in the moſt mournful ſtyle that can poſſibly be imagined to Aetius, who was then conſul the third time. Their letter they directed thus: "The groans of the Britons to the conſul Aetius." The contents of this letter were anſwerable to the direction. "The barbarians (ſay they) drive us to the ſea; the ſea drives us back to the barbarians; between which we have only the choice of two deaths, either to be ſwallowed up by the waves, or to be cruelly maſſacred by the enemy."

To this letter the Roman general gave no ſatisfactory anſwer, and the provincials were thereupon reduced to deſpair. Great numbers of them fled over to Armorica, where they ſettled along with others who had formerly gone over with an uſurper called *Maximus*; while others ſubmitted to the Scots and Picts. Some, however, more reſolute than the reſt, had once more recourſe to arms. They ſallied out in parties from the woods and caves where they had been obliged to hide themſelves, and, falling unexpectedly on the enemy, cut great numbers of them in pieces, and obliged the reſt to retire. Having thus obtained ſome reſpite, they began again to cultivate their lands; which, having lain fallow for a long time, now produced all ſorts of corn in the greateſt plenty. This plenty, according to the hiſtorian Gildas, occaſioned the moſt conſummate wickedneſs and corruption of manners among all ranks of men. The clergy, ſays he, who ſhould have reclaimed the laity by their example, proved the ringleaders in every vice; being addicted to drunkenneſs, contention, envy, &c.—It is poſſible, however, that this deſcription might be exaggerated by Gildas, who was himſelf a monk. But however this was, the Britons had not long enjoyed peace, when they were alarmed by a report, that the Scots and Picts were about to return with a far greater force than before, utterly to extirpate the name of their ſouthern neighbours, and ſeize upon the country for themſelves. This report threw them into a terrible conſternation; and to add to the reſt of their misfortunes, they were now viſited by a dreadful plague, which raged with ſuch violence, that the living were ſcarce ſufficient to bury the dead. The contagion no ſooner ceaſed, than they found their country invaded by the Scots and Picts, who deſtroyed every thing with fire and ſword; ſo that the provincials were ſoon reduced to the ſame miſerable ſtate they had formerly been in.

29 They at laſt repulſe their enemies.

30 Are again threatened with an invaſion.

At this time the chief, if not the only, king of the ſouthern diviſion of Britain, was one *Vortigern*. He is ſaid to have been a cruel, debauched tyrant, regardleſs of the public welfare, and totally incapable of promoting it. Being now rouſed from his inſenſibility, however, by a ſenſe of his own danger, he ſummoned a council of the chief men of the nation, in order to deliberate about the proper means for delivering the country from thoſe calamities under which it groaned. In this council the moſt pernicious meaſure was adopted that could poſſibly have been reſolved on; namely, to invite to their aſſiſtance the *Saxons*, a people famous for their piracies and cruelty, and juſtly dreaded by the Britons themſelves *. This fatal expedient being agreed upon, ambaſſadors were immediately diſpatched into Germany with advantagous propoſals to the Saxons in caſe they would come over to their aſſiſtance.

31 They reſolve to call in the Saxons.

* See *Saxons*.

The Britiſh ambaſſadors ſoon arrived in Germany, and, according to Witichind, a Saxon hiſtorian of the ninth century, made the following ſpeech before an aſſembly of the Saxons.—"Illuſtrious Saxons, the fame of your victories having reached our ears, the diſtreſſed Britons, haraſſed by the continual inroads of a neighbouring enemy, ſend us to implore your aſſiſtance. We have a fertile and ſpacious country, which we are commanded to ſubmit to you. We have hitherto lived under the protection of the Roman empire; but our ancient maſters having abandoned us, we know no nation more powerful than you, and better able to protect us. We therefore recur to your valour. Forſake us not in our diſtreſs, and we ſhall readily ſubmit to what terms you yourſelves ſhall think fit to preſcribe to us."—If this abject and ſhameful ſpeech was really made, it muſt give us a very ſtrange idea of the national ſpirit of the provincial Britons at that time. It is, however probable that the whole is a fiction, deſigned only to excuſe the perfidious treatment which theſe Britons afterwards received from the Saxons.

England. Saxons. The moſt reſpectable even of the Saxon hiſtorians make no mention of ſuch a ſpeech; and it is certain, that when the Saxons themſelves wanted to quarrel with the Britons, they never inſiſted upon the promiſe made by the Britiſh ambaſſadors; which they moſt certainly would have done, had any ſuch promiſe ever been made.

The Britiſh ambaſſadors were very favourably received by the Saxons. The latter embraced their propoſal with joy; and the rather, becauſe their ſoothſayers foretold that they ſhould plunder their Britiſh allies for 150 years, and reign over them for twice that time. Three long ſhips, in the Saxon language called *chiules*, were therefore fitted out, under the conduct of Hengiſt and Horſa. Theſe were two brothers much celebrated both for their valour and nobility. They were ſons of Witigiſil, ſaid to be great-grandſon to the Saxon god Woden; a circumſtance which added much to their authority. Having embarked about 1600 men on board their three veſſels, the two brothers arrived in the iſle of Thanet, in the year 449 or 450.

32 The Saxons arrive in Britain, and defeat the Scots and Picts.

They were received by the inhabitants with the greateſt demonſtrations of joy: the iſle in which they had landed was immediately appointed for their habitation; and a league was concluded, in virtue of which the Saxons were to defend the provincial Britons againſt all foreign enemies; and the provincials were to allow the Saxons pay and maintenance, beſides the place allotted them for their abode. Soon after their arrival, King Vortigern led them againſt the northern nations, who had lately broke into the kingdom, and advanced as far as Stanford in the county of Lincolnſhire. Here a battle was fought, in which the Scots and Picts were utterly defeated, and obliged to relinquiſh their booty.

Vortigern was ſo highly pleaſed with the behaviour of his new allies, that he beſtowed large poſſeſſions in the country they had newly delivered, upon the two commanders Hengiſt and Horſa. It is ſaid, that, even at this time, Hengiſt was taken with the wealth and fertility of the country; and at the ſame time obſerving the inhabitants to be quite enervated with luxury, began to entertain hopes of conquering part of it. He therefore, with Vortigern's conſent, invited over ſome more of his countrymen; giving them notice at the ſame time of the fruitfulneſs of the country, the effeminacy of the inhabitants, and how eaſily a conqueſt might be effected.

33 New ſupplies of Saxons arrive.

The Saxons readily complied with the invitation; and, in 452, as many more arrived in 17 veſſels, as, with thoſe already in Britain, made up an army of 5000 men. Along with theſe, according to Nennius, came over Rowena the daughter of Hengiſt. Vortigern fell in love with this lady; and in order to obtain her in marriage, divorced his lawful wife. Hengiſt pretended to be averſe to the match; but Vortigern obtained his conſent by inveſting him with the ſovereignty of Kent. The Saxon hiſtorians, indeed, make no mention of Rowena; but rather inſinuate, that their countrymen made themſelves maſters of Kent by force of arms. It ſeems moſt probable, however, that Vortigern had as yet continued in friendſhip with the Saxons, and even put more confidence in them than in his own ſubjects. For, not long after the arrival of this firſt reinforcement, Hengiſt obtained leave to ſend for a ſecond, in order, as was pretended, to defend England. the king from the attempts of his rebellious ſubjects, as well as of the Scots and Picts. Theſe embarked in 40 ſhips, under the command of Octa and Ebuſa, the ſon and nephew, or, according to ſome, the brother and nephew of Hengiſt. They landed at the Orkney iſlands; and having ravaged them, as well as all the northern coaſts of Scotland, they conquered ſeveral places beyond the Frith, and at laſt obtained leave to ſettle in Northumberland.

The pretence made for this ſettlement was, that the Saxons under Octa and Ebuſa might defend the northern frontiers of the kingdom, as thoſe under Hengiſt and Horſa did the ſouthern parts. Many more Saxons were, under various pretences, invited over; till at laſt the countries from which they came were in a manner depopulated. And now their numbers being greatly increaſed, the Saxons began to quarrel with the natives. They demanded larger allowances of corn, and other proviſions; threatening to lay waſte the whole country if their demands were not complied with. The Britons, inſtead of complying with theſe demands, deſired them to return home, ſince their numbers exceeded what they were able to maintain. Upon this, the Saxons concluded a peace with the Scots and Picts; and, turning their arms againſt the unhappy provincials, overran the whole country. The Saxons committed everywhere the greateſt cruelties. All buildings, whether public or private, they levelled with the ground. The cities were pillaged and burnt; and the people maſſacred without diſtinction of ſex or age, and that in ſuch numbers, that the living ſcarce ſufficed to bury the dead. Some of thoſe who eſcaped the general ſlaughter, took refuge among inacceſſible rocks and mountains; but there great numbers periſhed with hunger, or were forced to ſurrender themſelves as ſlaves to their enemies. Some croſſed the ſea and ſettled either in Holland or in Armorica, now the province of Britanny in France.

34 They quarrel with the Britons.

Vortigern, we are told by Nennius, was ſo far from being reclaimed by theſe calamities, that he added inceſt to his other crimes, and married his own daughter. At laſt, his own ſubjects, provoked at his enormous wickedneſs, and the partiality he ſhowed to the Saxons, depoſed him, and raiſed his ſon Vortimer to the throne. He was a young man of great valour, and willingly undertook the defence of his diſtreſſed country. He firſt fell upon the Saxons with what troops he could aſſemble, and drove them into the iſle of Thanet. Here they were beſieged, till, being reinforced by freſh ſupplies from Germany, they opened themſelves a way through the Britiſh troops. Vortimer, however, was not yet diſheartened. He engaged the Saxons on the banks of the Derwent in Kent, where he obtained a complete victory, and cut in pieces great numbers of the enemy. Another battle was fought at Aylesford in Kent. Some aſcribe the victory at this time to the Saxons, and ſome to the Britons. It is certain, however, that Horſa the brother of Hengiſt was killed in this engagement. He is ſaid to have been buried at a place in the neighbourhood, which from him obtained the name of *Horſted*.—A third battle was fought, in which the victory was uncertain, as is alſo the place where it happened. The fourth battle, however, according to Nennius proved

35 They are defeated and driven out by Vortimer.

deciſive

England. decisive in favour of the Britons. Vortimer engaged his enemies, according to some, at Folkstone; according to others, at a place called *Stonar*, in the isle of Thanet. The Saxons were defeated with great slaughter, and driven back to their ships. So complete is the victory said to have been, that the Saxons quitted the island, without making any attempt upon it for five years afterwards. These battles, however, rest entirely upon the credit of Nennius, and the historians who have followed him. They are taken notice of neither by Gildas nor Bede. The former only acquaints us, that the Saxons retired. This, by most historians, is understood of their returning home; though it is possible he might mean no more, than that, after they had laid waste the country, they retired into the territories allotted them by Vortigern, in Kent and Northumberland.

Vortimer is said to have died after a reign of six years. On his death-bed, he desired his servants to bury him near the place where the Saxons used to land; being persuaded, that the virtue of his bones would effectually prevent them from ever touching the British shore. This command, however, was neglected; and Vortimer was buried at Lincoln, according to some, or London, according to others. Hengist was no sooner informed of his death, than he invaded Britain anew with a numerous body of Saxons. He was opposed by Vortigern, who had been restored to the throne after the death of his son Vortimer. Several battles were fought on this occasion; but at last the provincials being overthrown at a place called *Crecanford*, with the loss of 4000 men, were obliged to abandon Kent to their enemies, and retire to London. This happened about the year 458 or 459; and from this time most historians date the erection of the first Saxon kingdom in Britain, viz. that of Kent. Hengist assumed the title of *king*, and chose Esk his son for his colleague.

36 They return and defeat the Britons, and erect a kingdom in Kent.

The Britons under Vortigern still continued the war. Hengist finding himself unable to gain a decisive advantage over them in the field, had recourse to treachery. He pretended to be desirous of concluding a peace with the British monarch, and of renewing his ancient friendship with him; and therefore required an interview. To this Vortigern readily consented, and accepted of an entertainment prepared for him by Hengist. The king was attended by 300 nobility all unarmed; but the Saxons had concealed daggers below their garments. The British nobility were all treacherously massacred in the height of their mirth; Vortigern himself was taken and put in fetters; nor could his liberty be procured, but by ceding to the Saxons those provinces now called *Essex*, *Sussex*, and *Middlesex*. Thus the Saxons got such a footing in Britain, that they could never afterwards be expelled. Vortigern, after being set at liberty, is said to have retired to a vast wilderness near the fall of the Wye in Radnorshire, where he was some time after consumed by lightning, together with a city called *Kaer Gourtigern* which he had built in that place.

37 Treachery of the Saxons.

On the retreat of Vortigern, the command of the British forces devolved upon Aurelius Ambrosius, or as Gildas calls him, Ambrosius Aurelianus. He was a Roman, and perhaps the last that remained in the island. He is said to have gained several victories over the Saxons. Notwithstanding this, however, they still continued to gain ground; and in the year 491, the foundation of a second Saxon kingdom was laid in Britain. This at first comprehended only the county of Sussex, but soon after extended over most of the counties lying south of the Humber. It was called the *kingdom of the South Saxons*. England.

38 Second Saxon kingdom.

The German nations being now informed of the good success which had attended the Saxons in Britain, new adventurers daily flocked over to share the good fortune of the others. They were chiefly composed of three nations, the Saxons, Angles, and Jutes. All these passed under the common appellation sometimes of *Saxons*, sometimes of *Angles*. They spoke the same language, and agreed very much in their customs and institutions, so that all of them were naturally led to combine against the natives. The most active of these adventurers was Cerdic a Saxon, said to be the tenth in descent from Woden. He landed with his son Cenric, and as many men as he could convey in five ships, at Yarmouth in Norfolk. The provincials immediately attacked him with great vigour; but after a short engagement, they were totally defeated. Many other battles were fought, the event of which was always favourable to the Saxons, so that the Britons were forced to abandon their sea-coasts to them.

In 497, *Porta*, another Saxon, with his two sons *Bleda* and *Magla*, arrived at *Portsmouth*, so called, as some imagine, from this chieftain. The provincials, under the command of a young prince a native of the country, attempted to oppose the landing of the Saxons: but his army was defeated with great slaughter, and he himself killed in the engagement; after which Porta made himself master of all the neighbouring country. The progress of Cerdic, however, alarmed the Britons more than that of all the other Saxon princes. About the year 508, therefore, *Nazaleod*, styled, by Henry of Huntingdon, the *greatest of all the British kings*, assembled almost the whole strength of the provincial Britons in order to drive him out of the island. Cerdic, on the other hand, took care to strengthen himself by procuring assistance from all the Saxons already in the island. He then advanced against the Britons, commanding the right wing himself, and his son Cenric the left. As the two armies drew near each other, Nazaleod perceived the enemy's right wing to be much stronger than the left. He therefore attacked it with the flower of his army; and after an obstinate resistance, obliged Cerdic to save himself by flight. Being too eager in the pursuit, however, Cenric fell upon his rear, and the battle was renewed with great vigour. The British army was at last entirely defeated; and 5000 men, among whom was Nazaleod himself, were left dead on the spot.

39 Nazaleod king of Britain defeated and killed.

Who succeeded Nazaleod in the kingdom of Britain, is not known. The Welsh annals leave an interregnum of about six years, after which they place the beginning of the reign of Arthur, the most renowned British prince mentioned in history. The history of King Arthur is so much obscured by fables, and many absurd, romantic, and ridiculous stories, that some have supposed that no such person ever existed. On this subject Milton gives the following reasons against the existence of King Arthur: 1. He is not mentioned by Gildas,

40 Whether such a person as a king Arth. ever existed.

Gildas, or any Britiſh hiſtorian except Nennius, who is allowed on all hands to have been a very credulous writer, and to have publiſhed a great many fables. 2. Though William of Malmeſbury and Henry of Huntingdon have both related his exploits, yet the latter took all he wrote from Nennius; and the former, either from the ſame fabulous writer, or ſome monkiſh legends in the abbey of Glaſtenbury; for both theſe writers flouriſhed ſeveral centuries after King Arthur. 3. In the pretended hiſtory of Geoffroy of Monmouth, ſuch contradictions occur concerning this monarch's victories in France, Scotland, Ireland, Norway, Italy, &c. as muſt cauſe us to look upon him as a hero altogether fabulous and romantic.

In anſwer to this it has been ſaid, 1. That his not being mentioned by Gildas cannot ſeem ſtrange to us, ſeeing it was not that author's deſign to write an exact hiſtory of his country, but only to give a ſhort account of the cauſes of its ruin by the Scots, Picts, and Saxons. He had alſo a particular ſyſtem to ſupport, namely, That the ruin of the Britons was owing to the judgements of God upon them for their wickedneſs. He lies therefore under a great temptation to conceal the ſucceſſes of the Britons, and to relate only their misfortunes. 2. Though Nennius was a credulous writer, it is unreaſonable to think that the whole hiſtory of King Arthur was an invention of his. It is more probable that he copied it from other more ancient authors, or took it from the common tradition of his countrymen. That the Saxon annals make no mention of this king is not to be wondered at, ſeeing it is natural to think that they would wiſh to conceal the many defeats he gave their nation. 3. The moſt convincing proof of the exiſtence of King Arthur is, that his tomb was diſcovered at Glaſtenbury in Somerſetſhire, and his coffin dug up, in the reign of Henry II. with the following inſcription upon it in Gothic characters: "Hic jacet ſepultus inclytus rex Arturius in inſula Avalonia." We are told that on his body were plainly to be ſeen the marks of 10 wounds, only one of which ſeemed to be mortal.

41 His exploits.

This renowned prince is ſaid to have defeated the Saxons under Cerdic in 12 pitched battles. The laſt of theſe was fought on Badon-hill, ſuppoſed to be Banſdown near Bath; in which the Saxons received ſuch a terrible overthrow, that for many years they gave the Britons no further moleſtation. As new ſupplies of Saxons, however, were continually flocking over, a third and fourth kingdom of them were ſoon formed. The third kingdom comprehended the counties of Devon, Dorſet, Somerſet, Wiltſhire, Hampſhire, and Berkſhire; to which was afterwards added Cornwall. This was called the *kingdom of the Weſt Saxons*. The other kingdom, which was called the *kingdom of the Eaſt Saxons*, comprehended Eſſex, Middleſex, and part of Hertfordſhire.

42 Two other Saxon kingdoms erected.

In the year 542, happened the death of the great King Arthur, ſaid to have been killed in battle with a treacherous kinſman of his own. Five years afterwards was erected the Saxon kingdom of Northumberland. It extended, however, much farther than the preſent bounds of that county; for it comprehended all Yorkſhire, Lancaſhire, Durham, Cumberland, Weſtmorland, and Northumberland, with part of Scotland, as far as the Frith of Forth. Between the Saxon kings frequent contentions now aroſe; by which means the Britons enjoyed an uninterrupted tranquillity for at leaſt 44 years. This interval, however, according to Gildas, they employed only in corrupting their manners more and more, till at laſt they were roufed from their ſecurity by the ſetting up of a ſixth Saxon kingdom, called the kingdom of the *Eaſt Angles*. It was founded in 575, and comprehended the counties of Norfolk, Suffolk, Cambridgeſhire, and the Iſle of Ely. The Saxons once more attacked the Britons, and overthrew them in many battles. The war was continued for ten years; after which, another Saxon kingdom called *Mercia* was ſet up. It comprehended 17 counties; viz. Glouceſter, Hereford, Worceſter, Warwick, Leiceſter, Rutland, Northampton, Lincoln, Huntingdon, Bedford, Buckingham, Oxford, Stafford, Nottingham, Derby, Shropſhire, Cheſhire, and part of Hertfordſhire.

43 The Britons defeat the Saxons, but are obliged to retire into Wales.

The provincial Britons were now confined within very narrow bounds. However, before they entirely gave up the beſt part of their country to their enemies, they once more reſolved to try the event of a battle. At this time they were aſſiſted by the Angles, who were jealous of the overgrown power of the Weſt Saxons. The battle was fought in Wiltſhire, at Woden's Bearth, a place near the ditch called *Wanſdike* or *Wodenſdike*; which runs through the middle of the county. The battle was very obſtinate and bloody; but at laſt the Saxons were entirely defeated, and almoſt their whole army cut off. The victory, however, proved of little ſervice to the Britons: for being greatly inferior in number to the Saxons, and haraſſed by them on the one ſide, and by the Scots and Picts on the other, they were daily more and more confined; and at laſt obliged to take refuge among the craggy and mountainous places in the weſt of the iſland, where their enemies could not purſue them. At firſt they poſſeſſed all the country beyond the rivers Dee and Severn, which anciently divided Cambria, or Wales, from England; the towns which ſtand on the eaſtern banks of theſe rivers having moſtly been built in order to reſtrain the incurſions of the Welſh. But the Engliſh, having paſſed the Severn, by degrees ſeized on the country lying between that river and the Wye. Nay, in former times, ſome parts of Flintſhire and Denbighſhire were ſubject to the kings of Mercia: for Offa, the moſt powerful king of that country, cauſed a deep ditch to be drawn, and a high wall built, as a barrier between his dominions and the territories of the Welſh, from the mouth of the Dee, a little above Flint-caſtle, to the mouth of the Wye. This ditch is ſtill to be ſeen in ſeveral places; and is called by the Welſh *Claudh Offa*, or the Ditch of Offa. The inhabitants of the towns on the eaſt ſide of this ditch are called by the ſame people *Guyr y Mers*; that is, the men of Mercia.

44 Account of the heptarchy.

Thus, after a violent conteſt of near 150 years, the Saxons entirely ſubdued the Britons whom they had come to defend, and had erected ſeven independent kingdoms in England, now commonly denominated the *Saxon Heptarchy*. By theſe conquerors the country was now reduced to a degree of barbarity almoſt as great as it had been in when firſt invaded by the Romans. The provincial Britons, during their ſubjection to that people, had made conſiderable advances in civilization.

England. vilization. They had built 28 conſiderable cities, beſides a number of villages and country-ſeats; but now theſe were all levelled with the ground, the native inhabitants who remained in England were reduced to the moſt abject ſlavery, and every art and ſcience totally extinguiſhed among them.

Before theſe fierce conquerors could be civilized in any degree, it was neceſſary that all the ſeven kingdoms ſhould be reduced under one head; for as long as they remained independent, their continual wars with each other ſtill kept them in the ſame ſtate of barbarity and ignorance.

The hiſtory of theſe ſeven kingdoms affords no event that can be in the leaſt intereſting. It conſiſts only of a detail of their quarrels for the ſovereignty. This was at laſt obtained by Egbert king of the Weſt Saxons, or Weſſex, in 827. Before this time, Chriſtianity had been introduced into almoſt all the kingdoms of the heptarchy; and however much corrupted it might be by coming through the impure channel of the church of Rome, and miſunderſtood through the ignorance of thoſe who received it, it had conſiderably ſoftened the barbarous manners of the Saxons. It had alſo opened a communication between Britain and the more polite parts of Europe, ſo that there was now ſome hope of the introduction of arts and ſciences into this country. Another effect was, that, by the ridiculous notions of preſerving inviolable chaſtity even between married people, the royal families of moſt of the kingdoms were totally extinct; and the people, being in a ſtate of anarchy, were ready to ſubmit to the firſt who aſſumed any authority over them.

All theſe things contributed to the ſucceſs of Egbert in uniting the heptarchy under his own dominion. He was of the royal family of Weſſex; and a nearer heir than Brithric, who had been raiſed to the kingdom in 784. As Egbert was a prince of great accompliſhments, Brithric, knowing that he had a better title to the crown than himſelf, began to look upon him with a very jealous eye. Young Egbert, ſenſible of his danger, privately withdrew to France; where he was well received by Charlemagne, the reigning monarch. The French were reckoned at this period the moſt valiant and polite people in Europe; ſo that this exile proved of great ſervice to Egbert.

He continued at the court of France till he was recalled by the nobility to take poſſeſſion of the kingdom of Weſſex. This recal was occaſioned by the following accident. Brithric the king of Weſſex had married Eadburga, natural daughter of Offa king of Mercia; a woman infamous for cruelty and incontinence. Having great influence over her huſband, ſhe often perſuaded him to deſtroy ſuch of the nobility as were obnoxious to her; and where this expedient failed, ſhe herſelf had not ſcrupled to become their executioner. She had mixed a cup of poiſon for a young nobleman, who had acquired a great ſhare of her huſband's friendſhip: but, unfortunately, the king drank of the fatal potion along with his favourite, and ſoon after expired. By this and other crimes Eadburga became ſo odious to the people, that ſhe was forced to fly into France, while Egbert was at the ſame time recalled, as above-mentioned.

Egbert aſcended the throne of Weſſex in the year 799. He was the ſole deſcendant of thoſe conquerors who firſt invaded Britain, and who derived their pedigree from the god Woden. But though this circumſtance might have given him great advantages in attempting to ſubdue the neighbouring kingdoms, Egbert for ſome time gave them no diſturbance; but turned his arms againſt the Britons, who had retired into Cornwall, whom he defeated in ſeveral battles. He was recalled from his conqueſts in that country, by hearing that Bernulf king of Mercia had invaded his dominions. Egbert quickly led his army againſt the invaders, whom he totally defeated at Ellendun in Wiltſhire. He then entered their kingdom on the ſide of Oxfordſhire with an army, and at the ſame time ſent his eldeſt ſon Ethelwolf with another into Kent. The young prince expelled Baldred the tributary king of Kent, and ſoon made himſelf maſter of the country. The kingdom of Eſſex was conquered with equal eaſe; and the Eaſt Angles, who had been reduced under ſubjection by the Mercians, joyfully put themſelves under the protection of Egbert. Bernulf himſelf marched againſt them, but was defeated and killed; and Ludecan his ſucceſſor met with the ſame fate two years after. England

Theſe misfortunes greatly facilitated the reduction of Mercia. Egbert ſoon penetrated into the very heart of the Mercian territories, and gained an eaſy victory over a diſpirited and divided people; but in order to engage them to ſubmit with the leſs reluctance, he allowed Wiglef, their countryman, to retain the title of *king*, whilſt he himſelf exerciſed the real power of a ſovereign. Northumberland was at preſent in a ſtate of anarchy: and this tempted Egbert to carry his victorious arms into that kingdom alſo. The inhabitants, being deſirous of living under a ſettled form of government, readily ſubmitted, and owned him for their ſovereign. To them, however, he likewiſe allowed the power of electing a king; who paid him a tribute, and was dependent on him.

45 Egbert the firſt king of England.

Egbert became ſole maſter of England about the year 827. A favourite opportunity was now offered to the Anglo-Saxons of becoming a civilized people, as they were at peace among themſelves, and ſeemed free from any danger of a foreign invaſion. But this flattering proſpect was ſoon overcaſt. Five years after Egbert had eſtabliſhed his new monarchy, the Danes landed in the iſle of Shepey, plundered it, and then made their eſcape with ſafety. Encouraged by this ſucceſs, next year they landed from a fleet of 35 ſhips. They were encountered by Egbert at Charmouth in Dorſetſhire. The battle was obſtinate and bloody. Great numbers of the Danes were killed, but the reſt made good their retreat to their ſhips. They next entered into an alliance with the Britons of Cornwall; and landing two years after in that country, they made an irruption into Devonſhire. Egbert met them at Hengeſdown, and totally defeated them; but before he had time to form any regular plan for the defence of the kingdom, he died, and left the government to his ſon Ethelwolf.

46 Daniſh invaſion.

47 Ethelwolf.

The new king was weak and ſuperſtitious. He began with dividing the kingdom, which had ſo lately been united, with his ſon Athelſtan. To the young prince he gave the counties of Eſſex, Kent, and Suſſex. But though this diviſion might have been productive

England. of bad conſequences at another time, the fear of the Danes kept every thing quiet for the preſent. Theſe barbarians had ſome how or other conceived ſuch hopes of enriching themſelves by the plunder of England, that they ſcarce ever failed of paying it an annual viſit. The Engliſh hiſtorians tell us, that they met with many ſevere repulſes and defeats; but on the whole it appears that they had gained ground: for in 851 a body of them took up their winter-quarters in England. Next year they received a ſtrong reinforcement of their countrymen in 350 veſſels; and advancing from the iſle of Thanet, where they had ſtationed themſelves, they burnt the cities of London and Canterbury. Having next put to flight Brichtric the governor of Mercia, they marched into the heart of Surry, laying waſte the whole country through which they paſſed.

Ethelwolf, though naturally little fitted for military enterprifes, was now obliged to take the field. He marched againſt the Danes at the head of the Weſt Saxons, and gained an indeciſive and bloody victory over his enemies. The Danes ſtill maintained their ſettlement in the iſle of Thanet. They were attacked by Ealher and Huda, governors of Kent and Surry: both of whom they defeated and killed. Afterwards they removed to the iſle of Shepey, where they took up their winter-quarters, with a deſign to extend their ravages the next year.

The deplorable ſtate of the kingdom did not hinder Ethelwolf from making a pilgrimage to Rome, whither he carried his fourth and favourite ſon Alfred, then only ſix years of age. He paſſed a twelvemonth in that city; made preſents to the principal eccleſiaſtics there; and made a grant of 300 mancuſes (a ſilver coin about the weight of our half-crown) annually to the ſee of Rome. One-third of this was to ſupport the lamps of St Peter's, another thoſe of St Paul's, and the third was for the Pope himſelf. In his return to England, Ethelwolf married Judith, daughter of the emperor Charles the Bald; but when he landed, he found himſelf deprived of his kingdom by his ſon Ethelbald. That prince aſſumed the government of Athelſtan's dominions, who was lately dead; and, with many of Ethelwolf's nobles, formed a deſign of excluding him from the throne altogether, on account of his weakneſſes and ſuperſtitions. Ethelwolf, however, delivered the people from the calamities of a civil war, by dividing the kingdom with his ſon. He gave to Ethelbald the government of the weſtern, and reſerved to himſelf that of the eaſtern, part of the kingdom. Immediately after this, he ſummoned the ſtates of the whole kingdom, and conferred on the clergy a perpetual donation of tythes, for which they had long contended, and which had been the ſubject of their ſermons for ſeveral centuries.

This conceſſion was deemed ſo meritorious by the Engliſh, that they now thought themſelves ſure of the favour of heaven; and therefore neglected to uſe the natural means for their ſafety which they might have done. They even agreed, that, notwithſtanding the deſperate ſituation of affairs at preſent, the revenues of the church ſhould be exempted from all burdens, though impoſed for the immediate ſecurity and defence of the nation. Ethelwolf died two years after he had made the above-mentioned grant, and left the kingdom to his two eldeſt ſons Ethelbald and Ethelbert. Both theſe princes died in a few years, and left the kingdom to Ethered their brother, in the year 866. England.

43 Ethered. The whole courſe of Ethered's reign was diſturbed by the irruptions of the Danes. The king defended himſelf againſt them with great bravery, being ſeconded in all his military enterpriſes by his younger brother Alfred, who afterwards aſcended the throne. In this reign, the Danes firſt landed among the Eaſt Angles. That people treacherouſly entered into an alliance with the common enemy; and furniſhed them with horſes, which enabled them to make an irruption into Northumberland. There they ſeized upon the city of York. Oſbricht and Ælla, two Northumbrian princes who attempted to reſcue the city, were defeated and killed. Encouraged by this ſucceſs, the Danes penetrated into the kingdom of Mercia, took up their winter-quarters at Nottingham, and thus threatened the kingdom with a final ſubjection. From this poſt, however, they were diſlodged by Ethered and Alfred, who forced them to retire into Northumberland. Their reſtleſs and ſavage diſpoſition, however, did not ſuffer them to continue long in one place. They broke into Eaſt Anglia; defeated and took priſoner Edmund the tributary king of that country, whom they afterwards murdered; and committed everywhere the moſt barbarous ravages. In 871, they advanced to Reading; from whence they infeſted the neighbouring country by their incurſions. The Mercians, deſirous of recovering their independency, refuſed to join Ethered with their forces; ſo that he was obliged to march againſt the Danes, attended only by the Weſt Saxons, who were his hereditary ſubjects. Several actions enſued, in which the Danes are ſaid to have been unſucceſsful; but being continually reinforced from their own country, they became every day more and more formidable to the Engliſh. During the confuſion and diſtreſs in which the nation was now neceſſarily involved, King Ethered died of a wound he had received in an action with the Danes; and left to his brother Alfred the kingdom almoſt totally ſubdued by a foreign power.

49 Alfred the Great. Alfred, who may properly be called the founder of the Engliſh monarchy, aſcended the throne in the year 871, being then only 22 years of age. His great virtues and ſhining talents ſaved his country from ruin, which ſeemed almoſt unavoidable. His exploits againſt the Danes, his dangers and diſtreſſes, are related under the article ALFRED. Having ſettled the nation in a much better manner than could have been expected, he died in 901, leaving the kingdom to his ſecond ſon Edward the Elder.

50 Edward the elder. The beginning of this monarch's reign was diſturbed by thoſe inteſtine commotions from which the wiſe and politic Alfred had taken ſo much pains to free the nation. Ethelwald, ſon to King Ethelbert, Alfred's elder brother, claimed a right to the throne. Having armed his partiſans, he took poſſeſſion of Winburne, where he ſeemed determined to hold out to the laſt extremity. On the approach of Edward, however, with a powerful army, he firſt fled into Normandy, and afterwards into Northumberland. He hoped to find the Northumbrians ready to join him, as moſt of them were Danes, lately ſubdued by Alfred, and very impatient of peace. The event did not diſappoint his expectations.

England. pectations. The Northumbrians declared for him; and Ethelwald having thus connected himself with the Danish tribes, went beyond sea, whence he returned with a great body of these banditti. On his return, he was joined by the Danes of East Anglia and Mercia. Ethelwald, at the head of the rebels, made an irruption into the counties of Gloucester, Oxford, and Wilts; and having ravaged the country, retired with his booty before the king could approach him. Edward, however, took care to revenge himself, by conducting his forces into East Anglia, and ravaging it in like manner. He then gave orders to retire; but the Kentish men, greedy of more plunder, staid behind, and took up their quarters at Bury. Here they were assaulted by the Danes; but the Kentishmen made such an obstinate defence, that though their enemies gained the victory, it was bought by the loss of their bravest men, and, among the rest, of the usurper Ethelwald himself.

The king, now freed from the attempts of so dangerous a rival, concluded an advantageous peace with the East Angles. He next set about reducing the Northumbrians; and for this purpose equipped a fleet, hoping that thus they would be induced to remain at home to defend their own country, without attempting to invade his territories. He was disappointed in his expectations. The Northumbrians were more eager to plunder their neighbours than to secure themselves. Imagining that the whole of Edward's forces were embarked on board his fleet, they entered his territories with all the troops they could raise. The king, however, was better prepared for them than they had expected. He attacked them on their return at Tetenhall in the county of Stafford, put them to flight, recovered all the booty, and pursued them with great slaughter into their own country.

The rest of Edward's reign was a scene of continued and successful action against the Northumbrians, East Angles, the Danes of Mercia, and those who came from their native country in order to invade England. He put his kingdom in a good posture of defence, by fortifying the towns of Chester, Eddesbury, Warwick, Cherbury, Buckingham, Towcester, Maldon, Huntingdon, and Colchester. He vanquished Thurketill a Danish chieftain, and obliged him to retire with his followers into France. He subdued the East Anglians, Northumbrians, and several tribes of the Britons; and even obliged the Scots to make submissions. He died in 925, and was succeeded by Athelstan his natural son.

51 Athelstan. This prince, notwithstanding his illegitimate birth, ascended the throne without much opposition, as the legitimate children of Edward were too young to rule a nation so much liable both to foreign invasions and domestic troubles as England at present was. One Alfred, however, a nobleman of considerable power, entered into a conspiracy against him. It is said, that this nobleman was seized upon strong suspicions, but without any certain proof. He offered to swear to his innocence before the pope; and in those ages it was supposed that none could take a false oath in presence of such a sacred person, without being visited by an immediate judgment from God. Alfred was accordingly conducted to Rome, and took the oath required of him before Pope John. The words were no sooner pronounced, than he fell into convulsions, of which he England. expired in three days. The king, fully convinced of his guilt, confiscated his estate, and made a present of it to the monastery of Malmesbury.

This accident proved the means of establishing the authority of Athelstan in England. But finding the Northumbrians bore the English yoke with impatience, he gave Sithric, a Danish nobleman, the title of king of Northumberland; and in order to secure his friendship, gave him his own sister Editha in marriage. This was productive of bad consequences. Sithric died the year after his marriage with Editha; upon which Anlaf and Godfrid, Sithric's sons by a former marriage, assumed the sovereignty without waiting for Athelstan's consent. They were, however, soon obliged to yield to the superior power of that monarch. The former fled to Ireland; and the latter to Scotland, where he was protected by Constantine king of that country. The Scottish monarch was continually importuned by Athelstan to deliver up his guest, and even threatened with an invasion in case he did not comply. Constantine, detesting this treachery, advised Godfrid to make his escape. He did so, turned pirate, and died soon after. Athelstan, however, resenting this conduct of Constantine, invaded his kingdom, and reduced him, it is said, so low, that he was obliged to make the most humble submissions. This, however, is denied by all the Scottish historians.

Constantine, after the departure of Athelstan, entered into a confederacy with Anlaf, who subsisted by his piracies, and with some of the Welsh princes who were alarmed at the increase of Athelstan's power. All these confederates made an irruption into England at once; but Athelstan meeting them at Brumsbury in Northumberland, gave them a total overthrow. Anlaf and Constantine made their escape with difficulty, leaving the greatest part of their men dead on the field of battle. After this period, Athelstan enjoyed his crown in tranquillity. He died in 941, after a reign of 16 years. He passed a remarkable law, for the encouragement of commerce: viz. that a merchant, who had made three long sea voyages on his own account, should be admitted to the rank of a thane or gentleman.

52 Defeats his enemies.

Athelstan was succeeded by his brother Edmund. On his accession, he found the kingdom disturbed by the restless Northumbrians, who watched for every opportunity of rising in rebellion. They were, however, soon reduced; and Edmund took care to ensure the peace of the kingdom, by removing the Danes from the towns of Mercia where they had been allowed to settle, because it was found that they took every opportunity to introduce foreign Danes into the kingdom. He also conquered Cumberland from the Britons. This country, however, he bestowed upon Malcolm king of Scotland, upon condition that he should do homage for it, and protect the north of England from all future incursions of the Danes.

53 Edmund.

Edmund was unfortunately murdered in Gloucester, by one Leolf a notorious robber. This man had been formerly sentenced to banishment; yet had the boldness to enter the hall where the king himself dined, and to sit at table with his attendants. Edmund immediately ordered him to leave the room. The villain refused to obey; upon which the king leaped upon him,

54 Murdered by Leolf.

England. him, and seized him by the hair. Leolf then drew a dagger, and gave the king a wound, of which he instantly died, A. D. 946, being the sixth year of his reign.

55 Edred. As the children of Edmund were too young at the time of his decease, his brother Edred succeeded to the throne. The beginning of his reign, as well as those of his predecessors, was disturbed by the rebellions and incursions of the Northumbrian Danes, who looked upon the succession of every new king to be a favourable opportunity for shaking off the English yoke. On the appearance of Edred with an army, however, they immediately submitted: but before the king withdrew his forces, he laid waste their territories as a punishment for their offence. He was no sooner gone, than

56 Subdues the Northumbrians. they rose in rebellion a second time. They were again subdued; and the king took effectual precautions against their future revolts, by placing English garrisons in all their towns, and appointing an English governor to watch their motions, and suppress their in-

57 Celibacy of the clergy introduced. surrections on the first appearance. In the reign of Edred, celibacy of the clergy began to be preached up under the patronage of St DUNSTAN. This man had obtained such an ascendant over Edred, who was naturally superstitious, that he not only directed him in affairs of conscience, but in the most important matters of state. He was placed at the head of the treasury; and being thus possessed of great power at court, he was enabled to accomplish the most arduous undertakings. He professed himself a partisan of the rigid monastic rules; and having introduced celibacy among the monks of Glastenbury and Abingdon, he endeavoured to render it universal among the clergy throughout the kingdom. The monks in a short time generally embraced the pretended reformation; after which they inveighed bitterly against the vices and luxury of the age. When other topics of defamation were wanting, the marriages of clergymen became a sure object of invective. Their wives received the appellation of *concubines* or some other more opprobrious name. The secular clergy, on the other hand, who were numerous and rich, defended themselves with vigour, and endeavoured to retaliate upon their adversaries. The people were thrown into the most violent ferments; but the monks, being patronised by King Edred, gained ground greatly upon their opponents. Their progress, however, was somewhat retarded by the king's death, which happened in 955, after a reign of nine years. He left children; but as they were infants, his nephew Edwy, son to Edmund, was placed on the throne.

58 Edwy. The new king was not above 16 or 17 years of age at the time of his accession. His reign is only remarkable for the tragical story of his queen Elgiva. She was a princess of the royal blood, with whom Edwy was deeply enamoured. She was his second or third cousin, and therefore within the degrees of affinity prohibited by the canon law. Edwy, however, hearkening only to the dictates of his passion, married her, contrary to the advice of the more dignified ecclesiastics. The monks on this occasion were particularly violent; and therefore Edwy determined not to second their ambitious projects. He soon found reason to repent his having provoked such dangerous enemies. On his coronation day, while his nobility were indulging themselves in riotous mirth in a great hall where they had assembled, Edwy withdrew to another apartment to enjoy the company of his beloved queen and her mother. Dunstan guessed the reason of his absence. With unparalleled impudence, he burst into the queen's apartment; and upbraiding Edwy with his lasciviousness, as he termed it, pushed him back to the hall where the nobles were assembled. The king determined to resent such a daring insult. He required from Dunstan an account of his administration of the treasury during the late reign. The monk, probably unable to give a just account, refused to give any; upon which Edwy accused him of malversation in his office, and banished him the kingdom. England.

This proved the worst step that could possibly have been taken. Dunstan was no sooner gone than the whole nation was in an uproar about his sanctity and the king's impiety. These clamours, as they had been begun by the clergy, so they were kept up and increased by them, till at last they proceeded to the most outrageous violence. Archbishop Odo sent a party of soldiers to the palace. They seized the queen, and burned her face with a red-hot iron, in order to destroy her beauty by which she had enticed her husband; after which they carried her by force into Ireland, there to remain in perpetual exile. The king, finding it in vain to resist, was obliged to consent to a divorce from her, which was pronounced by Archbishop Odo. A catastrophe still more dismal awaited Elgiva. She had been cured of her wounds, and had even found means to efface the scars with which her persecutors had hoped to destroy her beauty. She then came to England, with a design to return to the king, whom she still considered as her husband. Unfortunately, however, she was intercepted by a party of soldiers sent for that purpose by the primate. Nothing but her most cruel death could now satisfy that wretch and his accomplices. She was hamstringed at Gloucester, and expired in a few days. 59 Tragical death of the queen.

The minds of the English were at this time so much sunk in superstition, that the monstrous inhumanity above mentioned was called a judgment from God upon Edwy and his spouse for their dissolute life, i. e. their love to each other. They even proceeded to rebellion against their sovereign; and having raised to the throne Edgar, the younger brother of Edwy, at that time only 13 years of age, they soon put him in possession of Mercia, Northumberland, and East Anglia. Edwy being thus confined to the southern counties, Dunstan returned, and took upon him the government of Edgar and his party; but the death of Edwy soon removed all difficulties, and gave Edgar peaceable possession of the government.

60 Edgar. The reign of Edgar proved one of the most fortunate mentioned in the ancient English history. He took the most effectual methods both for preventing tumults at home and invasions from abroad. He quartered a body of disciplined troops in the north, in order to repel the incursions of the Scots, and to keep the Northumbrians in awe. He built a powerful navy; and that he might keep the seamen in the practice of their duty, as well as present a formidable armament to his enemies, he commanded the fleet from time to time to make the circuit of his dominions.

England.

The greatneſs of King Edgar, which is very much celebrated by the Engliſh hiſtorians, was owing to the harmony which reigned between him and his ſubjects; and the reaſon of this good agreement was, that the king ſided with Dunſtan and the monks, who had acquired a great aſcendant over the people. He enabled them to accompliſh their favourite ſcheme of diſpoſſeſſing the ſecular canons of all the monaſteries; and he conſulted them not only in eccleſiaſtical but alſo in civil affairs. On theſe accounts, he is celebrated by the monkiſh writers with the higheſt praiſes; though it is plain, from ſome of his actions, that he was a man who could be bound neither by the ties of religion nor humanity. He broke into a convent, and carried off by force, and ravithed, a nun called *Edilda*. His ſpiritual inſtructor, Dunſtan, for this offence, obliged the king, not to ſeparate from his miſtreſs, but to abſtain from wearing his crown for ſeven years!

61 His licentious amours.

Edgar, however, was not to be ſatisfied with one miſtreſs. He happened once to lodge at the houſe of a nobleman who had a very beautiful daughter. Edgar inflamed with deſire at the ſight of the young lady, without ceremony aſked her mother to allow her to paſs a night with him. She promiſed compliance; but ſecretly ordered a waiting-maid, named *Elfleda*, to ſteal into the king's bed when the company were gone, and to retire before day-break. Edgar, however, detained her by force, till day-light diſcovered the deceit. His love was now transferred to the waiting-maid; who became his favourite miſtreſs, and maintained a great aſcendant over him till his marriage with Elfrida.

62 His marriage with Elfrida.

The circumſtances of this marriage were ſtill more ſingular and criminal than thoſe above mentioned. Elfrida was daughter and heireſs to Olgar earl of Devonſhire. She was a perſon of ſuch exquiſite beauty, that her fame was ſpread all over England, though ſhe had never been at court. Edgar's curioſity was excited by the accounts he had heard of her, and therefore formed a deſign of marrying her. He communicated his intention to Earl Athelwold his favourite; and ordered him, on ſome pretence or other, to viſit the earl of Devonſhire, and bring him a certain account concerning Elfrida. Athelwold went as he was deſired; but fell ſo deeply in love with the lady himſelf, that he reſolved to ſacrifice his fidelity to his paſſion. He returned to Edgar, and told him, that Elfrida's charms were by no means extraordinary, and would have been totally overlooked in a woman of inferior ſtation. After ſome time, however, turning the converſation again upon Elfrida, he told the king that he thought her parentage and fortune made her a very advantageous match; and therefore, if the king gave his conſent, he would make propoſals to the earl of Devonſhire on his own behalf. Edgar conſented, and Athelwold was married to Elfrida.—After his marriage, he uſed his utmoſt endeavours to keep his wife from court, that Edgar might have no opportunity of obſerving her beauty. The king, however, was ſoon informed of the truth; and told Athelwold, that he intended to pay him a viſit in his caſtle, and be made acquainted with his new-married wife. The earl could make no objections; only he deſired a few hours to prepare for the viſit. He then confeſſed the whole to Elfrida, and begged of her to appear before the king as much to the diſadvantage as poſſible. Inſtead of this, ſhe dreſſed herſelf to the greateſt advantage. Edgar immediately conceived a violent paſſion for her; and, in order to gratify it, ſeduced Athelwold into a wood under pretence of hunting, where he ſtabbed him with his own hand, and afterwards married his widow.

England.

The reign of Edgar is remarkable among hiſtorians for the encouragement he gave to foreigners to reſide at his court and throughout the kingdom. Theſe foreigners, it is ſaid, corrupted the former ſimple manners of the nation. Of this ſimplicity, however, there ſeems to be no great reaſon to boaſt; ſeeing it could not preſerve them from treachery and cruelty, the greateſt of all vices: ſo that their acquaintance with foreigners was certainly an advantage to the people, as it tended to enlarge their views, and cure them of thoſe illiberal prejudices and ruſtic manners to which iſlanders are often ſubject.—Another remarkable incident, is the extirpation of wolves from England. The king took great pleaſure in hunting and deſtroying theſe animals himſelf. At laſt he found that they had all taken ſhelter in the mountains and foreſts of Wales. Upon this he changed the tribute impoſed upon the Welſh princes by Athelſtan, into an annual tribute of 300 wolves heads; and thus produced ſuch diligence in hunting them, that the animal has never ſince appeared in England.

63 Wolves extirpated from England.

Edgar died in 957, after a reign of 16 years. He left a ſon named *Edward*, whom he had by his firſt wife the daughter of Earl Ordmer; and another, named *Ethelred*, by Elfrida. The mental qualifications of this lady were by no means anſwerable to the beauty of her perſon. She was ambitious, haughty, treacherous, and cruel. The principal nobility, therefore, were greatly averſe from the ſucceſſion of her ſon Ethelred, which would unavoidably throw too much power into the hands of his mother, as he himſelf was only ſeven years of age. Edward, afterwards ſurnamed the *Martyr*, was therefore pitched upon: and was certainly the moſt proper perſon, as he was 15 years of age, and might ſoon be able to take the government into his own hands. Elfrida oppoſed his advancement with all her might: but Dunſtan overcame every obſtacle, by anointing and crowning the young prince at Kingſton; upon which the whole kingdom ſubmitted without farther oppoſition.

64 Edward the martyr.

The only remarkable occurrence in this reign was the complete victory gained by the monks over the ſecular clergy, who were now totally expelled from the convents. Though this had been pretty nearly accompliſhed by Edgar, the ſecular clergy ſtill had partiſans in England who made conſiderable oppoſition: but theſe were all ſilenced by the following miracles. In one ſynod, Dunſtan, finding the majority of votes againſt him, roſe up, and declared that he had that inſtant received from heaven a revelation in favour of the monks. The whole aſſembly was ſo much overawed by this intelligence, that they proceeded no farther in their deliberations. In another ſynod, a voice iſſued from the crucifix, acquainting the members, that the eſtabliſhment of the monks was founded on the will of heaven, and could not be oppoſed without impiety. But the third miracle was ſtill more alarming. In another

65 Miracles of St Dunſtan.

England. other ſynod the floor of the hall ſank, and great numbers of the members were killed or bruiſed by their fall. It was remarked that Dunſtan had that day prevented the king from attending the ſynod, and that the beam on which his own chair ſtood was the only one which did not ſink. Theſe circumſtances, inſtead of making him ſuſpected as the author of the miracle, were regarded as proofs of the interpoſition of Providence in his favour.

Edward lived four years after he was raiſed to the throne, in perfect innocence and ſimplicity. Being incapable of any treacherous intention himſelf, he ſuſpected none in others. Though his ſtepmother had oppoſed his ſucceſſion, he had always behaved towards her with the greateſt reſpect; and expreſſed on all occaſions the moſt tender affection for his brother Ethelred. Being one day hunting in the neighbourhood of the caſtle where Elfrida reſided, he paid her a viſit unattended by any of his retinue. After mounting his horſe with a deſign to return, he deſired ſome liquor
66 to be brought him. But while he was holding the cup
The king murdered. to his head, a ſervant of Elfrida ſtabbed him behind. The king, finding himſelf wounded, clapped ſpurs to his horſe; but ſoon becoming faint by the loſs of blood, he fell from the ſaddle, and his foot being entangled in the ſtirrup, he was dragged along till he expired. His body was found and privately interred at Wereham by his ſervants. The Engliſh had ſuch compaſſion for this amiable prince, that they beſtowed on him the appellation of *Martyr*, and even fancied that miracles were wrought at his tomb. Elfrida built monaſteries, and ſubmitted to many penances, in order to atone for her guilt; but, even in that barbarous age, ſhe could never regain the good opinion of the public.

67 Ethelred. After the murder of Edward, his brother Ethelred ſucceeded to the throne without oppoſition. As he was a minor when he was raiſed to the throne, and, even when he came to man's eſtate, never diſcovered any vigour or capacity of defending the kingdom againſt invaders, the Danes began to renew their incurſions. Before they durſt attempt any thing of importance, however, they firſt made a ſmall incurſion by way of
68 trial. In the year 981, they landed in Southampton
England invaded and ruined by the Danes. from ſeven veſſels; and having ravaged the country, they retired with impunity, carrying a great booty along with them. In 987, they made a ſimilar attempt on the weſt coaſt, and were attended with the like ſucceſs. Finding that matters were now in a favourable ſituation for their enterpriſes, they landed in Eſſex under the command of two chieftains; and, having defeated and killed Brithnot duke of that county, laid waſte all the neighbouring provinces. In this extremity, Ethelred, ſurnamed, on account of his prepoſterous conduct, the *Unready*, bribed the enemy with 10,000l. to depart the kingdom. This advice was given by Siricius archbiſhop of Canterbury, and ſome of the degenerate nobility; and was attended with the ſucceſs that might have been expected. The Danes appeared next year off the eaſtern coaſt. But, in the mean time, the Engliſh had determined to aſſemble at London a fleet capable of repulſing the enemy. This failed of ſucceſs through the treachery of Alfric duke of Mercia. Having been formerly baniſhed the kingdom, and found great difficulty in getting himſelf reſtored to his former dignity, he truſted thenceforth, not to his ſervices or the affections of his countrymen, but to the influence he had over his vaſſals, and to the public calamities. Theſe laſt he determined always to promote as far as he could: becauſe in every revolution his aſſiſtance would be neceſſary, and conſequently he muſt received a continual acceſſion of power. The Engliſh had formed a plan for ſurrounding and deſtroying the Daniſh fleet in the harbour; but Alfric not only gave the enemy notice of this deſign, but alſo deſerted with his ſquadron the night before the engagement. The Engliſh by this means proved unſucceſsful; and Ethelred, in revenge, took Alfgar, Alfric's ſon, and ordered his eyes to be put out. This piece of cruelty could be productive of no good effect. Alfric had become ſo powerful, that, notwithſtanding his treachery, it was found impoſſible to deprive him of the government of Mercia. England.

In 993, the Danes under the command of Sweyn their king, and the Norwegians conducted by Olave king of that country, ſailed up the Humber, and deſtroyed all around them. A powerful army was aſſembled to oppoſe theſe invaders; but through the treachery of the three leaders, all men of Daniſh extraction, the Engliſh were totally defeated. Encouraged by this ſucceſs, the Danes entered the Thames in 94 veſſels, and laid ſiege to London. The inhabitants, however, made ſuch a brave defence, that the beſiegers were finally obliged to give over the attempt. Out of revenge for this diſappointment, they laid waſte Eſſex, Suſſex, and Hampſhire. In theſe counties they procured horſes; by which means they were enabled to penetrate into the more inland parts, and threatened the kingdom with total ſubjection. Ethelred and his nobles had now recourſe to their former expedient. They ſent ambaſſadors to the two northern kings, to whom they promiſed ſubſiſtence and tribute, provided they would, for the preſent, put an end to their ravages, and ſoon after depart the kingdom. They agreed to the terms, and peaceably took up their quarters at Southampton. Olave even paid a viſit to Ethelred, and received the rite of confirmation from the Engliſh biſhops. The king alſo made him many preſents; and Olave promiſed never more to infeſt the Engliſh territories; which promiſe it is ſaid he afterwards religiouſly obſerved.

After the departure of Olave with his Norwegians, Sweyn, though leſs ſcrupulous than the king of Norway, was obliged to leave the kingdom alſo. But this ſhameful compoſition procured only a ſhort relief to the nation. The Danes ſoon after appeared in the Severn; and having ravaged Wales as well as Cornwall and Devon, they ſailed round, and, entering the mouth of the Tamar, completed the ruin of theſe two counties. Then, returning to the Briſtol channel, and penetrating into the country by the Avon, they overran all that country, and carried fire and ſword even into Dorſetſhire. In 998, they changed the ſeat of war; and, after ravaging the iſle of Wight, they entered the Thames and Medway, where they laid ſiege to Rocheſter and defeated the Kentiſh men in a great battle. After this victory, the whole province of Kent was made a ſcene of ſlaughter and devaſtation. The extremity of theſe miſeries forced the Engliſh into counſels for common defence both by ſea and land: but the weakneſs of the king, the diviſions among the nobility, the treachery of ſome, the cowardice of others,

&c

England. the want of concert in all, fruſtrated every endeavour; and their fleets and armies either came too late to attack the enemy, or were repulſed with diſhonour. The Engliſh, therefore, devoid both of prudence and unanimity in council, had recourſe to the expedient which by experience they had found to be ineffectual. They offered the Danes a large ſum if they would conclude a peace and depart the kingdom. Theſe ravagers continually roſe in their demands; and now required the payment of 24,000l. which the Engliſh ſubmitted to give. The departure of the Danes procured them a temporary relief; which they enjoyed as if it was to be perpetual, without making any effectual preparations for giving them a more vigorous reception upon their next return.

Beſides the receiving this ſum, the Danes were at preſent engaged by another motive to depart from England. They were invited over by their countrymen in Normandy, who at this time were hard preſſed by Robert king of France, and who found it difficult to defend their ſettlements againſt him. It is probable alſo, that Ethelred, obſerving the cloſe connection of all the Danes with one another, however they might be divided in government or ſituation, was deſirous of procuring an alliance with that formidable people. For this purpoſe, being at preſent a widower, he made his addreſſes to Emma, ſiſter to Richard II. duke of Normandy. He ſoon ſucceeded in his negotiations; the princeſs came over to England, and was married to the king in the year 1001.

69 Marriage of the king with the princeſs of Normandy.

Though the Danes had been for a long time eſtabliſhed in England, and though the ſimilarity of their language with the Saxon had invited them to an early coalition with the natives; thay had as yet found ſo little example of civilized manners among the Engliſh, that they retained all their ancient ferocity, and valued themſelves only on their national character of military bravery. The Engliſh princes had been ſo well acquainted with their ſuperiority in this reſpect, that Athelſtan and Edgar had been accuſtomed to keep in pay large bodies of Daniſh troops, who were quartered about the country, and committed many violences upon the inhabitants. Theſe mercenaries had attained to ſuch a height in luxury, according to the old Engliſh writers, that they combed their hair once a-day, bathed themſelves once a-week, changed their clothes frequently; and by all theſe arts of effeminacy, as well as by their military character, had rendered themſelves ſo agreeable to the fair ſex, that they debauched the wives and daughters of the Engliſh, and had diſhonoured many families. But what moſt provoked the inhabitants was, that, inſtead of defending them againſt invaders, they were always ready to betray them to the foreign Danes, and to aſſociate themſelves with every ſtraggling party which came from that nation. England.

70 Danes maſſacred.

The animoſities between the native Engliſh and the Danes who inhabited among them, had from theſe cauſes riſen to a great height; when Ethelred, from a policy commonly adopted by weak princes, took the cruel reſolution of maſſacring the Danes throughout the kingdom. On the 13th of November 1002, ſecret orders were diſpatched to commence the execution everywhere on the ſame day; and the feſtival of St Brice, which fell on a Sunday, the day on which the Danes uſually bathed themſelves, was choſen for this purpoſe. Theſe cruel orders were executed with the utmoſt exactneſs. No diſtinction was made betwixt the innocent and the guilty; neither ſex nor age was ſpared; nor were the cruel executioners ſatisfied without the tortures, as well as death, of the unhappy victims. Even Gunilda, ſiſter to the king of Denmark, who had married Earl Paling, and had embraced Chriſtianity, was, by the advice of Edric earl of Wilts, ſeized and condemned to death by Ethelred, after ſeeing her huſband and children butchered before her face. This unhappy princeſs foretold, in the agonies of deſpair, that her murder would ſoon be avenged by the total ruin of the Engliſh nation (A).

71 New invaſion by Sweyn.

The prophecy of Gunilda was exactly fulfilled. In 1003, Sweyn and his Danes, who wanted only a pretence to renew their invaſions, appeared off the weſtern coaſt, and threatened revenge for the ſlaughter of their countrymen. The Engliſh took meaſures for repulſing the enemy; but theſe were defeated through the treachery firſt of Alfric, and then of Edric, a ſtill greater traitor, who had married the king's daughter, and ſucceeded Alfric in the command of the Britiſh armies. The Danes therefore ravaged the whole country. Agriculture was neglected, a famine enſued, and the kingdom was reduced to the utmoſt degree of miſery. At laſt the infamous expedient of buying a peace was recurred to; and the departure of the Danes was purchaſed, in 1007, at the expence of 30,000l.

The Engliſh endeavoured to employ this interval in making preparations againſt the return of the Danes, which they had reaſon ſoon to expect. A law was made, ordering the proprietors of eight hides of land to provide themſelves of a horſeman and a complete ſuit of armour; and thoſe of 310 hides to equip a ſhip for the defence of the kingdom. By this means a formidable armament was raiſed. There were 243,600 hides in England; conſequently the ſhips equipped muſt be 785. The cavalry was 30,450 men. All hopes of ſucceſs from this equipment, however, were diſappointed by the factions, animoſities, and diſſenſions

(A) On the ſubject of this maſſacre, Mr Hume has the following obſervations: "Almoſt all the ancient hiſtorians ſpeak of this maſſacre of the Danes as if it had been univerſal, and as if every individual of that nation throughout England had been put to death. But the Danes were almoſt the ſole inhabitants in the kingdoms of Northumberland and Eaſt Anglia, and were very numerous in Mercia. This repreſentation of the matter was abſolutely impoſſible. Great reſiſtance muſt have been made, and violent wars enſued: which was not the caſe. This account given by Wallingford, though he ſtands ſingle, muſt be admitted as the only true one. We are told that the name of *Iurdane*, *lord Dane*, for an idle lazy fellow who lives at other people's expence, came from the conduct of the Danes who were put to death. But the Engliſh princes had been entirely maſters for ſeveral generations; and only ſupported a military corps of that nation. It ſeems probable, therefore, that theſe Danes only were put to death."

England. tions of the nobility. Edric had cauſed his brother Brightric to advance an accuſation of treaſon againſt Wolfnoth governor of Suſſex, the father of the famous Earl Godwin; and that nobleman, knowing the power and malice of his enemy, conſulted his own ſafety by deſerting with 20 ſhips to the Danes. Brightric purſued him with a fleet of 80 ſail; but his ſhips being ſhattered in a tempeſt, and ſtranded on the coaſt, he was ſuddenly attacked by Wolfnoth, and all his veſſels were burnt or otherwiſe deſtroyed. The treachery of Edric fruſtrated every plan of future defence; and the whole navy was at laſt ſcattered into the ſeveral harbours.

By theſe fatal miſcarriages, the enemy had leiſure to overrun the whole kingdom. They had now got ſuch a footing, indeed, that they could hardly have been expelled though the nation had been ever ſo unanimous. But ſo far did mutual diffidence and diſſenſion prevail, that the governors of one province refuſed to march to the aſſiſtance of another; and were at laſt terrified from aſſembling their forces for the defence of their own. At laſt the uſual expedient was tried. A peace was bought with 48,000l.; but this did not procure even the uſual temporary relief. The Danes, knowing that they were now maſters of the kingdom, took the money, and continued their devaſtations. They levied a new contribution of 8000l. on the county of Kent alone; murdered the archbiſhop of Canterbury, who had refuſed to countenance this exaction; and the Engliſh nobility ſubmitted everywhere to the Daniſh monarch, ſwearing allegiance to him, and giving hoſtages for their good behaviour. At laſt, Ethelred himſelf, dreading equally the violence of the enemy and the treachery of his own ſubjects, fled into Normandy, whither he had already ſent Queen Emma and her two ſons Alfred and Edward. The duke received his unhappy gueſts with a generoſity which does honour to his memory.

72 Ethelred flies to Normandy.

The flight of King Ethelred happened in the end of the year 1013. He had not been above ſix weeks in Normandy, when he heard of the death of Sweyn, which happened at Gainſborough before he had time to eſtabliſh himſelf in his new dominions. At the ſame time he received an invitation from the prelates and nobility to reſume the kingdom; expreſſing alſo their hopes, that, being now better taught by experience, he would avoid thoſe errors which had been ſo fatal to himſelf and his people. But the miſconduct of Ethelred was incurable; and, on his reſuming the government, he behaved in the very ſame manner that he had done before. His ſon-in-law Edric, notwithſtanding his repeated treaſons, retained ſuch influence at court, that he inſtilled into the king jealouſies of Sigefert and Morcar, two of the chief nobles of Mercia. Edric enticed them into his houſe, where he murdered them; while Ethelred partook of the infamy of this action, by confiſcating their eſtates, and confining the widow of Sigefert in a convent. She was a woman of ſingular beauty and merit; and in a viſit which was paid her, during her confinement, by Prince Edmund the king's eldeſt ſon, ſhe inſpired him with ſo violent an affection, that he releaſed her from the convent, and ſoon after married her without his father's conſent.

73 Returns, but behaves as ill as ever.

In the mean time, Canute, the ſon and ſucceſſor of Sweyn, proved an enemy no leſs terrible to the Engliſh than his father had been. He ravaged the eaſtern coaſt with mercileſs fury; and put aſhore all the Engliſh hoſtages at Sandwich, after having cut off their hands and noſes. He was at laſt obliged, by the neceſſity of his affairs, to return to Denmark. In a ſhort time, however, he returned, and continued his depredations along the ſouthern coaſt. He then broke into the counties of Dorſet, Wilts, and Somerſet; where an army was aſſembled againſt him under the command of Prince Edmund and Duke Edric. The latter ſtill continued his perfidious machinations; and after endeavouring in vain to get the prince into his power, found means to diſſipate the army, and then deſerted to Canute with 40 veſſels. England.

Edmund was not diſheartened by this treachery. He again aſſembled his forces, and was in a condition to give the enemy battle. Ethelred, however, had now ſuch frequent experience of the treachery of his ſubjects, that he had loſt all confidence in them. He remained in London, pretending ſickneſs, but in reality from an apprehenſion that they intended to buy their peace by delivering him into the hands of his enemies. The army called aloud for their ſovereign to march at their head againſt the Danes; and on his refuſal to take the field, they were ſo diſcouraged, that all the preparations which had been made became ineffectual for the defence of the kingdom. Edmund, deprived of all regular reſources for the maintenance of the ſoldiers, was obliged to commit ſimilar ravages to thoſe practiſed by the Danes; and after making ſome fruitleſs expeditions into the north, which had ſubmitted entirely to Canute's power, he returned to London, where he found every thing in confuſion by the death of the king.

Ethelred died in 1016, after an unhappy reign of 35 years; and was ſucceeded by his eldeſt ſon Edmund, ſurnamed *Ironſide* on account of his great ſtrength and valour. He poſſeſſed abilities ſufficient to have ſaved his country from ruin, had he come ſooner to the throne; but it was now too late. He bravely oppoſed the Danes, however, notwithſtanding every diſadvantage; till at laſt the nobility of both nations obliged their kings to come to a compromiſe, and divide the kingdom between them by treaty. Canute reſerved to himſelf Mercia, Eaſt Anglia, and Northumberland, which he had entirely ſubdued. The ſouthern parts were left to Edmund. This prince ſurvived the treaty only about a month; being murdered at Oxford by two of his chamberlains, accomplices of Edric.

74 Edmund Ironſide divides the kingdom with the Danes.

After the death of Edmund, nothing was left for the Engliſh but ſubmiſſion to Canute. The leaſt ſcrupulous of mankind, however, dare not at all times openly commit injuſtice. Canute therefore, before he ſeized the dominions of Edwin and Edward, the two ſons of Edmund, ſuborned ſome of the nobility to depoſe, that, in the laſt treaty with Edmund, it had been verbally agreed, that, in caſe of Edmund's death, Canute ſhould either be ſucceſſor to his dominions, or tutor to his children; for hiſtorians differ with regard to this particular. This evidence, ſupported by the great power of Canute, was ſufficient to get him elected king of England. Immediately after his acceſſion to the throne, he ſent the two ſons of Edmund to the court of Sweden, on pretence of being there educated; but

75 Canute

England. but charged the king to put them to death as ſoon as they arrived. The Swediſh monarch did not comply with this requeſt; but ſent them to Solomon king of Hungary, to be educated in his court. The elder, Edwin, was afterwards married to Solomon's ſiſter: but he dying without iſſue, that prince gave his ſiſter-in-law, Agatha, daughter of the emperor Henry II. in marriage to Edward, the younger brother; and ſhe bore him Edgar Atheling; Margaret, afterwards queen of Scotland; and Chriſtina, who retired into a convent.

Canute was obliged at firſt to make great conceſſions to the nobility: but he afterwards put to death many of thoſe in whom he could not put confidence; and, among the reſt, the traitor Edric himſelf, who was publicly executed, and his body thrown into the Thames.

76 Marries Ethelred's widow. In order to prevent any danger from the Normans, who had threatened him with an invaſion, he married Emma the widow of Ethelred, and who now came over from Normandy; promiſing that he would leave the children he ſhould have by that marriage heirs to the crown after his deceaſe. The Engliſh were at firſt diſpleaſed with Emma for marrying the mortal enemy of her former huſband; but at the ſame time were glad to find at court a ſovereign to whom they were accuſtomed, and who had already formed connections with them: and thus Canute, beſides ſecuring by his marriage the alliance with Normandy, gradually acquired by the ſame means the confidence of his own people.

The moſt remarkable tranſaction in this prince's reign, beſides thoſe mentioned under the article CANUTE, is his expedition to Scotland againſt Malcolm king of that country, whom he forced to do homage for the county of Cumberland, which the Scots at that time poſſeſſed. After this enterpriſe, Canute paſſed four years in peace, and died at Shaftſbury; leaving three ſons, Sweyn, Harold, and Hardicanute. Sweyn, whom he had by his firſt marriage with Alfwen, daughter of the earl of Hampſhire, was crowned in Norway; Hardicanute, whom Emma had born, was in poſſeſſion of Denmark; and Harold, who was of the ſame marriage with Sweyn, was at that time in England.

77 Harold. Harold ſucceeded to the crown of England; though it had been ſtipulated that Emma's ſon, Hardicanute, ſhould be heir to that kingdom. This advantage Harold obtained by being on the ſpot, and getting poſſeſſion of his father's treaſures, while Hardicanute was at a diſtance. As Hardicanute, however, was ſupported by Earl Godwin, a civil war was likely to enſue, when a compromiſe was made; by which it was agreed, that Harold ſhould enjoy London, and all the provinces north of the Thames, while the poſſeſſion of the ſouth ſhould remain to Hardicanute: and till that prince ſhould appear and take poſſeſſion of his dominions, Emma fixed her reſidence at Wincheſter, and ruled her ſon's part. Harold reigned four years; during which time, the only memorable action he performed was a moſt infamous piece of treachery.—Alfred and Edward, the two ſons of Emma by Ethelred, paid a viſit to their mother in England. But, in the mean time, Earl Godwin being gained over by Harold, a plan was laid for the deſtruction of the two princes. Alfred was accordingly invited to London by Harold,

78 His treachery and cruelty.

with many profeſſions of friendſhip; but when he had reached Guildford, he was ſet upon by Godwin's vaſſals: about 600 of his train were murdered in the moſt cruel manner; he himſelf was taken priſoner, his eyes were put out, and he was conducted to the monaſtery of Ely, where he died ſoon after. Edward and Emma, appriſed of the fate which awaited them, fled beyond ſea, the former into Normandy, the latter into Flanders; while Harold took poſſeſſion of all his brother's dominions without oppoſition.—He died in April 1039. England.

Hardicanute ſucceeded his brother Harold without oppoſition. His government was extremely violent and tyrannical. However, it was but of ſhort duration. He died, in 1041, of a debauch at the marriage of a Daniſh lord. After his death, a favourable opportunity was offered to the Engliſh for ſhaking off the Daniſh yoke. Sweyn, king of Norway, the eldeſt ſon of Canute, was abſent; and as the two laſt kings had died without iſſue, there appeared none of that race whom the Danes could ſupport as ſucceſſor to the throne. For this reaſon, the eyes of the nation were naturally drawn towards Prince Edward, who happened to be at court when the king died. There were ſome reaſons, however, to fear, that Edward's ſucceſſion would be oppoſed by Earl Godwin, who was by far the moſt powerful nobleman in the kingdom. A declared animoſity ſubſiſted between Edward and Godwin, on account of the hand which the latter had in the murder of his brother Alfred; and this was thought to be an offence of ſo grievous a nature, that Edward could never forgive it. But here their common friends interpoſed; and repreſenting the neceſſity of their good correſpondence, obliged them to lay aſide their animoſities, and to concur in reſtoring liberty to their native country. Godwin only ſtipulated, that Edward, as a pledge of his ſincere reconciliation, ſhould promiſe to marry his daughter Editha. This propoſal was agreed to; Edward was crowned king of England, and married Editha as he had promiſed. The marriage, however, proved rather a ſource of diſcord than otherwiſe between the king and Godwin. Editha, though a very amiable woman, could never obtain the confidence and affection of her huſband. It is even ſaid that during the whole courſe of her life he abſtained from all matrimonial converſe with her; and this ridiculous behaviour was highly celebrated by the monkiſh writers of the age, and contributed to the king's acquiring the title of Saint and Confeſſor.

79 Edward the Confeſſor.

Though the neglect of his daughter could not fail to awaken Godwin's former enmity againſt King Edward, it was neceſſary to chooſe a more popular ground before he could vent his complaints againſt the king in a public manner. He therefore choſe for his theme the influence which the Normans had on the affairs of government; and declared oppoſition took place between him and theſe favourites. In a ſhort time, this animoſity openly broke out with great violence. Euſtace count of Boulogne having paid a viſit to the king, paſſed by Dover on his return. One of his train being refuſed acceſs to a lodging which had been appointed for him, attempted to make his way by force, and wounded the maſter of the houſe in the conteſt. The townſmen revenged this inſult by the death of the ſtranger; the count and his train took arms, and murdered

80 Variance of the king and earl Godwin.

England. murdered the townſman in his houſe. A tumult enſued; near 20 perſons were killed on each ſide; and Euſtace being overpowered with numbers, was at laſt obliged to fly. He complained to the king; who gave orders to Earl Godwin, in whoſe government Dover lay, to puniſh the inhabitants. But this nobleman refuſed to obey the command, and endeavoured to throw the whole blame on Count Euſtace and his followers. The king was diſpleaſed; and threatened to make him feel the utmoſt effects of his reſentment, in caſe he finally refuſed to comply. Upon this, Godwin aſſembled a powerful army, on pretence of repreſſing ſome diſorders on the frontiers of Wales; but, inſtead of this, marched directly to Glouceſter, where the king at that time was without any military force, as ſuſpecting no danger.

Edward, perceiving his danger, applied to Siward duke of Northumberland, and Leofric duke of Mercia, two very powerful noblemen. They haſtened to him with ſuch followers as they could aſſemble, iſſuing orders at the ſame time for all the forces under their reſpective governments to march without delay to the defence of the king. Godwin, in the mean time, ſuffered himſelf to be deceived by negociations, till the king's army became ſo powerful, that he was not able to cope with it. He was therefore obliged to fly with his family to Flanders. Here he was protected by Baldwin earl of that country, together with his three ſons, Gurth, Sweyn, and Toſti; the laſt of whom had married Baldwin's daughter. Harold and Leofwin, two other ſons of Godwin, took ſhelter in Ireland.

81 Godwin flies to Flanders.

After the flight of Earl Godwin, he was proceeded againſt as a traitor by King Edward. His eſtates, and thoſe of his ſons, were confiſcated; his governments given to others; Queen Editha was confined in a monaſtery; and the great power of this family, which had become formidable to the crown itſelf, ſeemed to be totally overthrown. Godwin, however, ſoon found means to retrieve his affairs. Having hired ſome ſhips, and manned them with his followers, he attempted to make a deſcent at Sandwich. The king, informed of his preparations, equipped a fleet which Godwin could not reſiſt, and he therefore retreated into the Flemiſh harbours. On his departure, the Engliſh diſmiſſed their armament. This Godwin had expected, and therefore kept himſelf in readineſs for the favourable opportunity. He immediately put to ſea, and ſailed to the iſle of Wight, where he was joined by Harold with a ſquadron which he had collected in Ireland. Being thus maſter of the ſea, Godwin entered the harbours on the ſouthern coaſt; ſeized all the ſhips; and being joined by great numbers of his former vaſſals, he ſailed up the Thames, and appeared before London.

82 Returns, and is reconciled with the king.

The approach of ſuch a formidable enemy threw every thing into confuſion. The king alone ſeemed reſolute to defend himſelf to the laſt extremity; but the interpoſition of many of the nobility, together with the ſubmiſſions of Godwin himſelf, at laſt produced an accommodation. It was ſtipulated, that Godwin ſhould give hoſtages for his good behaviour, and that all the foreigners ſhould be baniſhed the kingdom; after which, Edward, ſenſible that he had not power ſufficient to detain the earl's hoſtages in England, ſent them over to his kinſman the young duke of Normandy. England.

Soon after this reconciliation, Godwin died as he was ſitting at table with the king. He was ſucceeded in the government of Weſſex, Suſſex, Kent, and Eſſex, and the office of ſteward of the houſehold, a place of great power, by his ſon Harold. The ſon was no leſs ambitious than his father had been; and as he was a man of much greater abilities, he became a more dangerous enemy to Edward than even Godwin had been. Edward knew no better expedient to prevent the increaſe of Harold's power, than by giving him a rival. This was Algar ſon of Leofric duke of Mercia, whom he inveſted with the government of Eaſt Anglia, which had formerly belonged to Harold. The latter however, after ſome broils, finally got the better of his rival, and baniſhed him the kingdom. Algar returned ſoon after with an army of Norwegians, with whom he invaded Eaſt Anglia; but his death in a ſhort time freed Harold from all further apprehenſions from that quarter. His power was ſtill further increaſed in a ſhort time after by the acceſſion of his brother Toſti to the government of Northumberland; and Edward now declining in years, and apprehenſive that Harold would attempt to uſurp the crown after his death, reſolved to appoint a ſucceſſor. He therefore ſent a deputation into Hungary, to invite over his nephew, Edward, ſon to his elder brother, who was the only remaining heir of the Saxon line. That prince accordingly came over with his children, Edgar Atheling, Margaret, and Chriſtina; but died a few days after his arrival. His death threw the king into greater perplexity than ever. Being reſolved to exclude Harold if poſſible, he ſecretly caſt his eye on his kinſman William duke of Normandy; a perſon of whoſe power, character, and capacity, he had juſtly a very high opinion. This advice had formerly been given him by Robert archbiſhop of Canterbury, who was himſelf a Norman, and had been baniſhed along with the reſt upon the return of Earl Godwin. But Edward finding that the Engliſh would more eaſily acquieſce in the reſtoration of the Saxon line, had in the mean time invited his brother's deſcendants from Hungary, as already mentioned. The death of his nephew, and the inexperience and unpromiſing qualities of young Edgar, made him reſume his former intentions in favour of the duke of Normandy, though his averſion to hazardous enterpriſes engaged him to poſtpone the execution, and even to keep his purpoſe concealed from all his miniſters.

83 Hiſtory of Harold aſpires to the crown.

Harold in the mean time increaſed his popularity by all poſſible means, in order to prepare his way for being advanced to the throne after the death of Edward, which now ſeemed to be faſt approaching. He had no ſuſpicion of the duke of Normandy as a rival; but as he knew that a ſon and grandſon of the Earl Godwin were in the hands of that prince as hoſtages, he feared that they might be made uſe of as checks upon his ambition, in caſe he attempted afterwards to aſcend the throne. He therefore prevailed upon Edward to releaſe theſe hoſtages unconditionally; and having obtained his conſent, he ſet out for Normandy himſelf, attended by a numerous retinue. He was driven by a tempeſt on the territory of Guy count of

England. Ponthieu, who detained him priſoner, and demanded an exorbitant ſum for his ranſom. Harold found means to acquaint William with his ſituation. The duke of Normandy, deſirous of gaining Harold over to his party, commanded Guy to reſtore his priſoner to his liberty. Upon this Harold was immediately put into the hands of the Norman ambaſſador, who conducted him to Rouen. William received him with great demonſtrations of reſpect and friendſhip; but ſoon took an opportunity of acquainting him with his pretenſions to the crown of England, and aſked his aſſiſtance in the execution of his ſcheme. Harold was ſurpriſed with this declaration of the duke; but being entirely in his power, he feigned a compliance with his deſires, and promiſed to ſecond to the utmoſt of his ability the will of King Edward. William, to ſecure him as much as poſſible to his intereſt, promiſed him his daughter in marriage, and required him to take an oath that he would fulfil his promiſes. Harold readily complied; but to make the oath more binding, William privately conveyed under the altar where the oath was taken relicks of ſome of the moſt revered martyrs; and when Harold had taken the oath, he ſhowed him the relicks, and admoniſhed him to obſerve religiouſly ſuch a ſolemn engagement.

Harold was no ſooner ſet at liberty, than he found himſelf maſter of caſuiſtry ſufficient to excuſe the breaking of his oath, which had been extorted from him, and which, if kept, might be attended with the ſubjection of his country to a foreign power. He continued to practiſe every art to increaſe his popularity; and about this time, two accidents enabled him to add much to that character which he had already ſo well eſtabliſhed. The Welſh had for ſome time made incurſions into the Engliſh territories, and had lately become ſo troubleſome, that Harold thought he could not do a more acceptable piece of ſervice to the public, than undertake an expedition againſt theſe invaders. Having therefore prepared ſome light-armed foot to purſue the natives into their fortreſſes, ſome cavalry to ſecure the open country, and a ſquadron of ſhips to attack the ſea-coaſts, he employed all theſe forces againſt the enemy at once; and thus reduced them to ſuch diſtreſs, that they were obliged to purchaſe peace by ſending their prince's head to Harold, and ſubmitting to the government of two Welſh noblemen appointed by Edward.

The other incident was no leſs honourable to Harold. Toſti his brother had been created duke of Northumberland; but being of a violent tyrannical temper, had treated the inhabitants with ſuch cruelty, that they roſe in rebellion againſt him, and drove him from his government. Morcar and Edwin, two brothers, grandſons of the great Duke Leofric, joined in the inſurrection; and the former being elected duke, advanced with an army to oppoſe Harold, who had been commiſſioned by the king to reduce and puniſh the Northumbrians. Before the armies engaged, Morcar endeavoured to juſtify his conduct, and repreſented to Harold, that Toſti had behaved in ſuch a manner, that no one, not even a brother, could defend him without participating of the infamy of his conduct: that the Northumbrians were willing to ſubmit to the king, but required a governor that would pay ſome attention to their privileges; and they truſted that Harold would not defend in another that violent conduct from which his own government had always kept at ſo great a diſtance. This ſpeech was accompanied by ſuch a detail of well ſupported facts, that Harold abandoned his brother's cauſe; and returning to Edward, perſuaded him to pardon the Northumbrians, and confirm Morcar in his government. He even married the ſiſter of that nobleman; and by his intereſt procured Edwin the younger brother to be choſen governor of Mercia. Toſti, in a rage, departed the kingdom, and took ſhelter in Flanders with Baldwin his father-in-law; while William of Normandy ſaw that now he had nothing to expect from Harold, who plainly intended to ſecure the crown for himſelf. England.

84 Harold ſucceeds Edward the Confeſſor.

Edward died in 1067, and was ſucceeded by Harold with as little oppoſition as though he had been the lawful heir. The very day after Edward's death, he was anointed and crowned by the archbiſhop of York. The whole nation ſeemed joyfully to ſwear allegiance to him. But he did not long enjoy the crown, to obtain which he had taken ſo much pains, and which he ſeemed to have ſuch capacity for wearing. His brother Toſti, provoked at his ſucceſs, ſtirred up againſt him every enemy he could have any influence with. The duke of Normandy alſo was enraged to the laſt degree at the perfidy of Harold; but before he commenced hoſtilities, he ſent an embaſſy to England, upbraiding the king with his breach of faith, and ſummoning him to reſign the kingdom immediately. Harold replied, that the oath, with which he was reproached, had been extorted by the well grounded fear of violence, and for that reaſon could never be regarded as obligatory: that he never had any commiſſion either from the late king or the ſtates of England, who alone could diſpoſe of the crown, to make any tender of the ſucceſſion to the duke of Normandy; and if he, a private perſon, had aſſumed ſo much authority, and had even voluntarily ſworn to ſupport the duke's pretenſions, the oath was unlawful, and it was his duty to take the firſt opportunity of breaking it: that he had obtained the crown by the unanimous ſuffrages of the people; and ſhould ſhow himſelf totally unworthy of their favour, did he not ſtrenuouſly maintain thoſe liberties with which they had entruſted him; and that the duke, if he made any attempt by force of arms, ſhould experience the power of an united nation, conducted by a prince, who, ſenſible of the obligations impoſed on him by his royal dignity, was determined, that the ſame moment ſhould put a period to his life and to his government.

This anſwer was according to William's expectations; and therefore he had already made preparations for invading England. He was encouraged and aſſiſted in this enterpriſe by Howel count of Britanny, Baldwin earl of Flanders, the emperor Henry IV. and Pope Alexander II. The latter declared Harold a perjured uſurper; denounced excommunication againſt him and his adherents; and the more to encourage William in his enterpriſes, ſent him a conſecrated banner, and a ring with one of St Peter's hairs in it. Thus he was enabled to aſſemble a fleet of 3000 veſſels, on board of which were embarked 60,000 men, choſen from among thoſe numerous ſupplies which were ſent him from all quarters. Many eminent perſonages were enliſted under

England. der his banners. The moſt celebrated were Euſtace count of Boulogne, Aimeri de Thouars, Hugh d'Eſtaples, William d'Evreux, Geoffroy de Rotrou, Roger de Beaumont, William de Warenne, Roger de Montgomeri, Hugh de Grantmeſnil, Charles Martel, and Geoffroy Gifford.

In order to embarraſs the affairs of Harold the more effectually, William alſo excited Toſti, in concert with Halfager king of Norway, to infeſt the Engliſh coaſts. Theſe two having collected a fleet of 350 ſhips, ſailed up the Humber, and diſembarked their troops, who began to commit great depredations. They were oppoſed by
85 Morcar earl or duke (B) of Northumberland, and Ed-
Defeats the Danes. win earl of Mercia, who were defeated. Harold, on the news of this invaſion, aſſembled a conſiderable army, engaged the enemy at Standford, and after a bloody battle entirely defeated them. Toſti and Halfager were killed in the action, and all the fleet fell into the hands of the victors; but Harold generouſly allowed Olave the ſon of Halfager to depart with 20 veſſels.

The king of England had ſcarce time to rejoice on account of his victory, when news were brought him that the Normans were landed in Suſſex. Harold's victory had conſiderably weakened his army. He loſt many of his braveſt officers and ſoldiers in the action; and he diſguſted the reſt, by refuſing to diſtribute the Daniſh ſpoils among them. He haſtened, however, by quick marches, to repel this new invader; but though he was reinforced at London and other places with freſh troops, he found himſelf weakened by the deſertion of his old ſoldiers, who, from fatigue and diſcontent, ſecretly withdrew from their colours. Gurth, the brother of Harold, a man of great conduct as well as bravery, became apprehenſive of the event; and entreated the king to avoid a general engagement for ſome time, or at leaſt not to hazard his perſon. But though this advice was in itſelf evidently proper, and enforced by all the arguments which Gurth could ſuggeſt, Harold continued deaf to every thing that could
86 be ſaid. Accordingly, on the 14th of October 1066,
Is defeated and killed by William of Normandy. the two armies engaged near Haſtings, a town of Suſſex. After a moſt obſtinate and bloody battle †, the Engliſh were entirely defeated, Harold and his two brothers killed, and William left maſter of the kingdom of England.

† See *Haſtings*.

Nothing could exceed the terror of the Engliſh upon the news of the defeat and death of Harold. As ſoon as William paſſed the Thames at Wallingford, Stigand, the primate, made ſubmiſſions to him in the name of the clergy; and before he came within ſight of London, all the chief nobility, and even Edgar Atheling himſelf, who, being the rightful heir to the
87 throne, had juſt before been declared king, came and
William the Conqueror. ſubmitted to the conqueror. William very readily accepted of the crown upon the terms that were offered him; which were, that he ſhould govern according to the eſtabliſhed cuſtoms of the country. He could indeed have made what terms he pleaſed; but, though really a conqueror, he choſe rather to be thought an elected king. For this reaſon he was crowned at Weſtminſter by the archbiſhop of York, and took the oath adminiſtered to the former kings of England; namely, that he would protect and defend the church, obſerve England. the laws of the realm, and govern the kingdom with impartiality.

88 The Engliſh hiſtorians complain of the moſt grie-The Engliſh vous oppreſſion by William and his Normans. Whe-grievously ther by his conduct the conqueror willingly gave the oppreſſed. Engliſh opportunities of rebelling againſt him, in order to have a pretence for oppreſſing them afterwards, is not eaſy to ſay; but it is certain that the beginning of his reign cannot juſtly be blamed. The firſt diſguſt againſt his government was excited among the clergy. William could not avoid the rewarding of thoſe numerous adventurers who had accompanied him in his expedition. He firſt divided the lands of the Engliſh barons who had oppoſed him, among his Norman barons; but as theſe were found inſufficient, he quartered the reſt on the rich abbeys, of which there were many in the kingdom, until ſome other opportunity of providing for them offered itſelf.

Though this laſt ſtep was highly reſented by the clergy, it gave very little offence to the laity. The whole nation, however, was ſoon after diſguſted, by ſeeing all the real power of the kingdom placed in the hands of the Normans. He diſarmed the city of London, and other places which appeared moſt warlike and populous, and quartered Norman ſoldiers wherever he dreaded an inſurrection. This was indeed acting as a conqueror, and not as an elected king; but the event ſhowed the neceſſity of ſuch precautions. The king having thus ſecured, as he imagined, England from any danger of a revolt, determined to pay a viſit to his Norman dominions. He appointed his brother Odo, biſhop of Bayeux, and William Fitz-Oſborne, regents in his abſence; and to ſecure himſelf yet farther, he reſolved to carry along with him ſuch of the Engliſh nobility as he put the leaſt confidence in.

Having taken all theſe methods to enſure the tranquillity of his new kingdom, William ſet ſail for Normandy in March 1067; but his abſence produced the moſt fatal conſequences. Diſcontents and murmurings were multiplied everywhere; ſecret conſpiracies were entered into againſt the government; hoſtilities were commenced in many places; and every thing ſeemed to threaten a ſpeedy revolution. William of Poictiers, a Norman hiſtorian, throws the blame entirely on the Engliſh. He calls them a fickle and mutinous race, while he celebrates with the higheſt encomiums the juſtice and lenity of Odo's and Fitz-Oſborne's adminiſtration. On the other hand, the Engliſh hiſtorians tell us, that theſe governors took all opportunities of oppreſſing the people, either with a view to provoke them to rebellion, or in caſe they tamely ſubmitted to their impoſitions, to grow rich by plundering them. Be this as it will, however, a ſecret conſpiracy was formed among the Engliſh for a general maſſacre of the Normans, like what had formerly been made of the Danes. This was proſecuted with ſo much animoſity, that the vaſſals of the earl Coxo put him to death becauſe he refuſed to head them in the enterpriſe. The conſpirators had already taken the reſolution, and fixed the day for their intended maſſacre, which was to be on Aſh-Wedneſday, during the time of divine ſer-

(B) Anciently theſe two titles were ſynonymous.

England. vice, when all the Normans would be unarmed as penitents, according to the diſcipline of the times. But the preſence of William diſconcerted all their ſchemes. Having got intelligence of their bloody purpoſe, he haſtened over to England. Such of the conſpirators as had been more open in their rebellion, conſulted their ſafety by flight; and this ſerved to confirm the proofs of an accuſation againſt thoſe who remained. From this time the king not only loſt all confidence in his Engliſh ſubjects, but regarded them as inveterate and irreconcileable enemies. He had already raiſed ſuch a number of fortreſſes in the country, that he no longer dreaded the tumultuous or tranſient efforts of a diſcontented multitude. He determined therefore to treat them as a conquered nation. The firſt inſtance of this treatment was his revival of the tax of Danegelt, which had been impoſed by the Daniſh conquerors, and was very odious to the people. This produced great diſcontents, and even inſurrections. The inhabitants of Exeter and Cornwall revolted; but were ſoon reduced, and obliged to implore the mercy of the conqueror. A more dangerous rebellion happened in the north; but this was alſo ſoon quaſhed, and the Engliſh became ſenſible that their deſtruction was intended. Their eaſy ſubmiſſion after the battle of Haſtings had inſpired the Normans with contempt; their commotions afterwards had rendered them objects of hatred; and they were now deprived of every expedient which could make them either regarded or beloved by their ſovereign. Many fled into foreign countries; and among the reſt Edgar Atheling himſelf, who made his eſcape to Scotland, and carried thither his two ſiſters Margaret and Chriſtina. They were well received by Malcolm, who ſoon after married Margaret the elder ſiſter, and alſo received great numbers of other exiles with the utmoſt kindneſs.

The Engliſh, though unable to make any reſiſtance openly, did not fail to gratify their reſentment againſt the Normans in a private manner. Seldom a day paſſed, but the bodies of aſſaſſinated Normans were found in the woods and highways, without any poſſibility of bringing the perpetrators to juſtice. Thus, at length, the conquerors themſelves began again to wiſh for tranquillity and ſecurity; and ſeveral of them, though entruſted with great commands, deſired to be diſmiſſed the ſervice. In order to prevent theſe deſertions, which William highly reſented, he was obliged to allure others to ſtay by the largeneſs of his bounties. The conſequences were, freſh exactions from the Engliſh, and new inſurrections on their part againſt their cruel maſters. The Norman power, however, was too well founded to be now removed, and every attempt of the Engliſh to regain their liberty ſerved only to rivet their chains the more firmly. The county of Northumberland, which had been moſt active in theſe inſurrections, now ſuffered moſt ſeverely. The whole of it was laid waſte, the houſes were burned, the inſtruments of agriculture deſtroyed, and the inhabitants forced to ſeek new places of abode. On this occaſion it is ſaid that above 100,000 perſons periſhed either by the ſword or famine; and the country is ſuppoſed, even to this day, to retain the marks of its ancient depopulation. The eſtates of all the Engliſh gentry were next confiſcated, and beſtowed on the Normans. By this means all the ancient and honourable families were reduced to beggary; and the Engliſh found themſelves totally excluded from every road that led either to honour or preferment. England.

By proceeding in this manner, William at laſt broke the ſpirit of the Engliſh nation, and received no farther trouble from them. In 1076, however, he found that the latter part of his life was likely to be unhappy through diſſenſions in his own family. He had four ſons, Robert, Richard, William, and Henry, beſides ſeveral daughters. Robert, his eldeſt ſon, ſurnamed *Curthoſe*, from the ſhortneſs of his legs, was a prince who inherited all the bravery and ambition of his family. He had formerly been promiſed by his father the government of the province of Maine in France, and was alſo declared ſucceſſor to the dukedom of Normandy. He demanded from his father the fulfilment of theſe promiſes; but William gave him a flat denial, obſerving, that "it was not his cuſtom to throw off his clothes till he went to bed." Robert declared his reſentment; and openly expreſſed his jealouſy of his two brothers William and Henry, (for Richard was killed, in hunting, by a ſtag). An open rupture was ſoon commenced. The two young princes one day took it into their heads to throw water on their elder brother as he paſſed through the court after leaving their apartment. Robert conſtrued this frolic into a ſtudied indignity; and having theſe jealouſies ſtill farther inflamed by one of his favourites, he drew his ſword, and ran up ſtairs with an intent to take revenge. The whole caſtle was quickly filled with tumult, and it was not without ſome difficulty that the king himſelf was able to appeaſe it. But he could not allay the animoſity which from that moment prevailed in his family. Robert, attended by ſeveral of his confederates, withdrew to Rouen that very night, hoping to ſurpriſe the caſtle; but his deſign was defeated by the governor. The popular character of the prince, however, engaged all the young nobility of Normandy, as well as of Anjou and Britanny, to eſpouſe his quarrel; even his mother is ſuppoſed to have ſupported him in his rebellion by ſecret remittances. The unnatural conteſt continued for ſeveral years; and William was at laſt obliged to have recourſe to England for ſupport againſt his own ſon. Accordingly, he drew an army of Engliſhmen together; he led them over to Normandy, where he ſoon compelled Robert and his adherents to quit the field, and was quickly reinſtated in all his dominions. Robert then took ſhelter in the caſtle of Gerberoy, which the king of France had provided for him, where he was ſhortly after beſieged by his father. As the garriſon was ſtrong, and conſcious of their treaſon, they made a gallant defence; and many ſkirmiſhes and duels were fought under its walls. In one of theſe the king and his ſon happened to meet; but being both concealed by their helmets, they attacked each other with mutual fury. The young prince wounded his father in the arm, and threw him from his horſe. The next blow would probably have put an end to his life, had he not called for aſſiſtance. Robert inſtantly recollected his father's voice, leaped from his horſe, and raiſed him from the ground. He proſtrated himſelf in his preſence, aſked pardon for his offences, and promiſed for the future a ſtrict adherence to his duty. The king was not ſo eaſily appeaſed; and perhaps his reſentment was heightened by

89 Diſſenſions in William's family.

England. by the disgrace of being overcome. He therefore gave his malediction to his son; and returned to his own camp on Robert's horse, which he had assisted him to mount. After some recollection, however, he was reconciled to Robert, and carried him with him into England.

William returned in 1081; and being now freed from his enemies both at home and abroad, began to have more leisure to attend to his own domestic affairs. For this purpose the *Doomsday-Book* was composed by his order, of which an account is given under that article. He reserved a very ample revenue for the crown; and in the general distribution of land among his followers, kept possession of no fewer than 1400 manors in different parts of the country. No king of England was ever so opulent; none was able to support the splendor and magnificence of a court to such a degree; none had so many places of trust and profit to bestow; and consequently none ever had such implicit obedience paid to his commands. He delighted greatly in hunting; and to indulge himself in this with the greater freedom, he depopulated the county of Hampshire for 30 miles, turning out the inhabitants, destroying all the villages, and making the wretched outcasts no compensation for such an injury. In the time of the Saxon kings, all noblemen without distinction had a right to hunt in the royal forests; but William appropriated all these to himself, and published very severe laws to prohibit his subjects from encroaching on this part of his prerogative. The killing of a boar, a deer, or even a hare, was punished with the loss of the delinquent's eyes; at the time when the killing of a man might be atoned for by paying a moderate fine or composition.

As the king's wealth and power were so great, it may reasonably be supposed that the riches of his ministers were in proportion. Odo, bishop of Bayeux, William's brother, was become so rich, that he resolved to purchase the papacy. For this purpose, taking the opportunity of the king's absence, he equipped a vessel in the isle of Wight, on board of which he sent immense treasures, and prepared for his embarkation. He was detained, however, by contrary winds; and, in the mean time, William, being informed of his designs, resolved to prevent the exportation of so much wealth from his dominions. Returning therefore from Normandy, where he was at that time, he came to England the very instant his brother was stepping on board. He immediately ordered him to be made prisoner: but his attendants, respecting the bishop's ecclesiastical character, scrupled to execute his commands; so that the king was obliged to seize him with his own hand. Odo appealed to the Pope: but the king replied, that he did not seize him as bishop of Bayeux, but as earl of Kent; and, in that capacity, he expected, and would have, an account of his administration. He was therefore sent prisoner to Normandy; and, notwithstanding all the remonstrances and threats of Pope Gregory, was detained in custody during the remainder of William's reign.

90 Death of the queen; Soon after this, William felt a severe blow in the death of Matilda his queen; and, almost at the same time, received information of a general insurrection in Maine, the nobility of which had always been averse to his government. Upon his arrival on the continent, he found that the insurgents had been secretly assisted and excited by the king of France, who took all opportunities of lessening the Norman power, by creating dissensions among the nobles. His displeasure on this account was very much increased, by notice he received of some railleries thrown out against him by the French monarch. It seems that William, who was become corpulent, had been detained in bed some time by sickness; and Philip was heard to say, that he only lay in of a big belly. This so provoked the English monarch, that he sent him word, he would soon be up, and would, at his churching, present such a number of tapers as would set the kingdom of France in a flame. England.

To perform this promise, he levied a powerful army; and, entering the Isle of France, destroyed every thing with fire and sword. He took the town of Mante, and reduced it to ashes. But a period was soon put to the conquests and to the life of this great warrior by an accident. His horse happening to put his fore feet on some hot ashes, plunged so violently, that the rider was thrown forward, and bruised his belly on the pommel of the saddle. Being now in a bad habit of body, as well as somewhat advanced in years, he began to be apprehensive of the consequences, and ordered himself to be carried in a litter to the monastery of St Gervaise. Finding his illness increase, and being sensible of the approach of death, he discovered at last the vanity of all human grandeur; and was struck with remorse for those many cruelties and violences of which he had been guilty. He endeavoured to make compensation by presents to churches and monasteries, and gave orders for the liberation of several English noblemen. He was even prevailed upon, though not without reluctance, to release his brother Odo, against whom he was very much incensed. He left Normandy and Maine to his eldest son Robert. He wrote to Lanfranc the primate of England, desiring him to crown William king of England. To Henry he bequeathed nothing but the possessions of his mother Matilda; but foretold, that one day he would surpass both his brothers in power and opulence. He expired on the 9th September 1087, in the 63d year of his age, in the 21st of his reign over England, and 54th of that over Normandy. 91 And of the king.

92 William Rufus. William, surnamed *Rufus*, from his red hair, was in Normandy at the time of his father's illness. He no sooner received the letter for Lanfranc, than, leaving his father in the agonies of death, he set out for England; where he arrived before intelligence of the decease of the Conqueror had reached that kingdom. Being sensible that his brother Robert, as being the eldest son, had a preferable title to himself, he used the utmost dispatch in getting himself firmly established on the throne. The English were so effectually subdued, that they made no opposition; but the Norman barons were attached to Robert. This prince was brave, open, sincere, and generous; and even his predominant fault of indolence was not disagreeable to those haughty barons, who affected an almost total independence of their sovereign. The king, on the other hand, was violent, haughty, and tyrannical. A powerful conspiracy was therefore carried on against William; and Odo, bishop of Bayeux, undertook to conduct it. Many of the most powerful nobility were concerned; and

England. as the conſpirators expected to be in a ſhort time ſupported by powerful ſuccours from Normandy, they retired to their caſtles, and put themſelves in an offenſive poſture.

William, ſenſible of his danger, engaged the Engliſh on his ſide, by promiſing ſome mitigation of their hardſhips, and liberty to hunt in the royal foreſts. Robert, in the mean time, through his natural indolence, neglected to give his allies proper aſſiſtance. The conſpirators were obliged to ſubmit. Some of them were pardoned; but moſt of them confiſcated, and their eſtates beſtowed on the barons who had continued faithful to the king.

93 Proves a tyrant.

William, freed from this danger, thought no more of his promiſes to the Engliſh. He proved a greater tyrant than his father; and, after the death of Lanfranc, who had been his preceptor, and kept him within ſome bounds, he gave full ſcope to his violent and rapacious diſpoſition. Not content with oppreſſing the laity, he invaded the privileges of the church; which, in thoſe days, were held moſt ſacred. He ſeized the temporalities of all the vacant biſhoprics and abbeys, and openly put to ſale thoſe ſees and abbeys which he thought proper to diſpoſe of.

94 Attempts the conqueſt of Normandy.

Theſe proceedings occaſioned great murmurs among the eccleſiaſties, which were quickly ſpread through the nation, but the terror of William's authority preſerved the public tranquillity. In 1090, the king thought himſelf ſtrong enough to attempt the conqueſt of Normandy, which at that time was in the greateſt confuſion through the indolent and negligent adminiſtration of Robert. Several of the barons had revolted, and theſe revolts were encouraged by the king of France. Robert alſo imagined he had reaſon to fear the intrigues of his other brother Henry, whom for 3000 merks he had put in poſſeſſion of *Cottentin*, near a third part of the duchy of Normandy. He therefore threw him into priſon; but finding himſelf threatened with an invaſion from the king of England, he gave Henry his liberty, and even made uſe of his aſſiſtance in ſuppreſſing the inſurrections of his rebellious ſubjects. William, however, was no ſooner landed in Normandy, than the nobility on both ſides interpoſed, and a treaty of peace was concluded. In this treaty Henry finding his intereſts entirely neglected, retired to St Michael's Mount, a ſtrong fortreſs on the coaſt of Normandy, and infeſted the neighbourhood with his incurſions. He was beſieged by his two brothers, and obliged to capitulate in a ſhort time; after which, being deprived of all his dominions, he wandered about for ſome time with very few attendants, and often in great poverty.

The peace with Robert was of no long duration. In the interval ſome hoſtilities with Scotland ſucceeded, and theſe terminated in the death of Malcolm king of that country; after which new broils enſued with Normandy. The rapacious temper of William prompted him to encroach upon his brother's territories, and the ſame rapacity prompted him to uſe a very extraordinary expedient in order to accompliſh his deſigns. Having gone over to Normandy to ſupport his partiſans, he ordered an army of 20,000 men to be raiſed in England, and conducted to the ſea-coaſt as if they were to be immediately embarked: but when they came there, inſtead of embarking, they were forced to pay the king ten ſhillings a man; after which they were diſmiſſed to their ſeveral counties. With this money William engaged the king of France to depart from the protection of Robert; and alſo bribed many of the Norman barons to revolt. He was called from Normandy, however, by an irruption of the Welſh; and having repulſed them, he was prevented from attempting other enterpriſes by a conſpiracy of his barons. England.

95 Purchaſes the duchy for 10,000 merks.

In 1096, however, the ſuperſtition of Robert put the king of England in poſſeſſion of thoſe dominions which he had not been able to conquer by force of arms. The cruſades were now commenced, and Robert was deſirous of undertaking an expedition into the Holy Land. As money for this purpoſe was wanting, he mortgaged his dominions to his brother for 10,000 merks. The king raiſed the money by violent extortions on his ſubjects; forcing even the convents to melt their plate, in order to furniſh the quota demanded of them. He was then put in poſſeſſion of Normandy and Maine; and Robert with a magnificent train ſet out for the Holy Land.

After the death of Lanfranc, the king had retained in his own hands the revenues of Canterbury, as he had done thoſe of many other biſhoprics; but falling into a dangerous illneſs, he was ſeized with remorſe; and the clergy repreſented to him that he was in danger of eternal perdition if he did not make atonement for thoſe impieties and ſacrileges of which he had been guilty. He therefore inſtantly reſolved to ſupply the vacancy of Canterbury: he ſent for Anſelm, a Piedmonteſe by birth, abbot of Bec in Normandy, who was much celebrated for his piety and devotion. The abbot refuſed the dignity with great earneſtneſs; fell on his knees, wept, and intreated the king to change his purpoſe; and when he found him obſtinate in forcing the paſtoral ſtaff upon him, he kept his fiſt ſo hard clenched, that it required the utmoſt violence of the byſtanders to open it, and force him to receive that enſign of his ſpiritual dignity. William ſoon after recovered his health, and with it his violence and rapacity. As he now ſpared the church no more than before, a quarrel with Anſelm ſoon enſued; and this was the more dangerous to the king, on account of the great character for piety which the primate had acquired by his zeal againſt abuſes of all kinds, particularly thoſe of dreſs and ornament. 1096 His quarrel with the primate.

At this time there was a mode which prevailed not only in England, but throughout Europe, both among men and women, of giving an enormous length to their ſhoes, drawing the toe to a ſharp point, and affixing to it the figure of a bird's bill, or ſome ſuch ornament, which was turned upwards, and which was often ſuſtained by gold or ſilver chains tied to the knee. The eccleſiaſtics took exception at this ornament, which they ſaid was an attempt to belie the Scripture, where it is affirmed, that no man can add a cubit to his ſtature; and they not only declaimed againſt it with vehemence, but aſſembled ſome ſynods, in which the faſhion was abſolutely condemned. Such, however, are the contradictions in human nature, that all the influence of the clergy, which at that time was ſufficient to ſend vaſt multitudes of people into Aſia to butcher one another, was not able to prevail againſt thoſe long-pointed ſhoes. The faſhion, contrary to what hath happened to almoſt all others, maintained its ground for ſeveral centuries; and even Anſelm found his endeavours

England. deavours againſt it ineffectual. He was more ſucceſsful in decrying the long hair and curled locks then worn by the courtiers. He refuſed the aſhes on Aſh-Wedneſday to ſuch as were ſo accoutred; and his authority and eloquence had ſuch influence, that the young men univerſally abandoned that ornament, and appeared in the cropt hair recommended to them by the ſermons of the primate. For this reformation Anſelm is highly celebrated by his hiſtorian Eadmer, who was alſo his companion and ſecretary.

When William's profaneneſs returned with his health, he was engaged in almoſt perpetual conteſts with this auſtere prelate *. Theſe were pretty well ſettled, when the king, who had undertaken an expedition into Wales, required Anſelm to furniſh him with a certain number of ſoldiers. The primate regarded this as an invaſion of the rights of the church; and therefore, though he durſt not refuſe compliance, ſent the men ſo miſerably accoutred, that the king was exceedingly diſpleaſed, and threatened him with a proſecution. Anſelm demanded reſtitution of all his revenues which the king had ſeized, and appealed to the pope. The quarrel, however, ran ſo high, that the primate found it dangerous to remain in England. He deſired and obtained the king's permiſſion to retire beyond ſea. His temporalities were confiſcated immediately on his departure; but Pope Urban received him as a martyr in the cauſe of religion, and even threatened the king with ſentence of excommunication. William, however, proceeded in his projects of ambition and violence, without regarding the threats of the pope; who he knew was at that time too much engaged with the cruſades to mind any other buſineſs. Though his acquiſition of Maine and Normandy had brought him into perpetual conteſts with the haughty and turbulent barons who inhabited thoſe countries, and raiſed endleſs tumults and inſurrections; yet William ſeemed ſtill intent on extending his dominions either by purchaſe or conqueſt. William earl of Poictiers and duke of Guienne had reſolved upon an expedition to the Holy Land; and, for this purpoſe, had put himſelf at the head of a vaſt multitude, conſiſting, according to ſome hiſtorians, of 60,000 horſe, and a much greater number of foot. Like Robert of Normandy, he offered to mortgage his dominions for money ſufficient to conduct this multitude into Aſia. The king accepted his offer; and had prepared a fleet and army to take poſſeſſion of theſe dominions, when an unfortunate accident put an end to his projects and his life. He was engaged in hunting, the ſole amuſement, and indeed the principal occupation, of princes in thoſe rude times. Walter Tyrrel, a French gentleman remarkable for his ſkill in archery, attended him in this recreation, of which the new foreſt was the ſcene. William had diſmounted after a chace; and Tyrrel, impatient to ſhow his dexterity, let fly an arrow at a ſtag which ſuddenly ſtarted before him. The arrow glanced from a tree, and ſtruck the king to the heart. He inſtantly fell down dead; and Tyrrel, terrified at the accident, clapt ſpurs to his horſe, haſtened to the ſea-ſhore, and embarked for France, where he joined the cruſade that was ſetting out from that country. This happened on the 2d of Auguſt 1100, after the king had reigned 13 years, and lived about 40. His body was found in the woods by the country-people, and buried without ceremony at Wincheſter. England.

97 Who leaves the kingdom.

98 Death of the king.

After the death of William, the crown of right devolved to Robert his eldeſt brother; for William had no legitimate children. But what Robert had formerly loſt by his indolence, he was again deprived of by his abſence at the holy war. Prince Henry was in the foreſt with William Rufus at the time the latter was killed. He no ſooner heard the important news, than he hurried to Wincheſter, and ſecured the royal treaſure. William de Breteuil, keeper of the treaſure, arrived almoſt the ſame inſtant, and oppoſed his pretenſions; telling him, that the treaſure belonged to his elder brother, who was now his ſovereign, and for whom he was determined to keep it. But Henry, drawing his ſword, threatened him with inſtant death if he dared to diſobey him; and others of the late king's retinue, who came every moment to Wincheſter, joining the prince's party, he was obliged to deſiſt. Henry loſt no time in fully accompliſhing his purpoſe. In leſs than three days he got himſelf crowned king of England by Maurice biſhop of London. Preſent poſſeſſion ſupplied every deficiency of title; and no one dared to appear in defence of the abſent prince.

99 Prince Henry uſurps the crown.

The beginning of King Henry's reign promiſed to be favourable to the Engliſh liberty; owing chiefly to his fear of his brother. To conciliate the affections of his ſubjects, he paſſed a charter calculated to remove many of the grievous oppreſſions which had been complained of during the reigns of his father and brother. He promiſed, that at the death of any abbot or biſhop, he never would ſeize the revenues of the ſee or abbey during the vacancy, but would leave the whole to be reaped by the ſucceſſor; and that he would never let to farm any eccleſiaſtical benefice, or diſpoſe of it for money. To the laity he promiſed, that, upon the death of any earl, baron, or military tenant, his heir ſhould be admitted to the poſſeſſion of his eſtate, on paying a juſt and lawful relief; without being expoſed to thoſe enormous exactions which had been formerly required. He remitted the wardſhip of minors; and allowed guardians to be appointed, who ſhould be anſwerable for the truſt. He promiſed not to diſpoſe of any heireſs in marriage but by advice of all the barons; and if any baron intended to give his daughter, ſiſter, niece, or kinſwoman in marriage, it ſhould only be neceſſary for him to conſult the king, who promiſed to take no money for his conſent, nor ever to refuſe permiſſion, unleſs the perſon to whom it was propoſed to marry her ſhould happen to be his enemy. He granted his barons and military tenants the power of bequeathing by will their money or perſonal eſtates; and if they neglected to make a will, he promiſed that their heirs ſhould ſucceed to them. He renounced the right of impoſing moneyage, and of levying taxes at pleaſure, on the farms which the barons kept in their own hands. He made ſome general profeſſions of moderating fines; he offered a pardon for all offences; and remitted all debts due to the crown. He alſo required, that the vaſſals of the barons ſhould enjoy the ſame privileges which he granted to his own barons; and he promiſed a general confirmation and obſervance of the *laws of King Edward* *. To give greater authenticity to theſe conceſſions, a

copy

England. copy of the charter was lodged in some abbey of each county.

King Henry, farther to increase his popularity, degraded and committed to prison Ralph Flambard bishop of Durham, who had been the chief instrument of oppression under his brother. He sent for Anselm who was then at Lyons, inviting him to return and take possession of his dignities. Anselm returned; but when Henry proposed to him to do the same homage to him which he had done to his brother, the king met with an absolute refusal. During his exile, Anselm had assisted at the council of Bari; where, besides fixing the controversy between the Greek and Latin churches concerning the procession of the Holy Ghost, the right of election to church-preferments was declared to belong to the clergy alone, and spiritual censures were denounced against all ecclesiastics who did homage to laymen for their fees and benefices, and on all laymen who exacted it. The rite of homage † by the feudal customs was, that the vassal should throw himself on his knees, put his joined hands between those of his superior, and should in that posture swear fealty to him. But the council declared it execrable, that pure hands, which could create God, and offer him up for the salvation of mankind, should be put, after this humiliating manner, between profane hands, which, besides being inured to rapine and bloodshed, were employed day and night in impure purposes and obscene contacts. To this decree therefore Anselm appealed; and declared, that so far from doing homage for his spiritual dignity, he would not even communicate with any ecclesiastic who paid that submission, or who accepted of investitures from laymen. Henry durst not insist; and therefore desired that the controversy might be suspended, and that messengers might be sent to Rome to accommodate matters with the Pope, and to obtain his confirmation of the laws and customs of England.

101 Quarrels with the primate.

† See Feodal *Tenure*.

Henry now took another step which seemed capable of confirming his claims to the crown without any danger of a rival. The English remembered with regret their Saxon monarchs, when they compared the liberty they enjoyed under them with the tyranny of the Normans. Some descendants of that favourite line still remained; and among the rest, Matilda, the niece of Edgar Atheling. Upon her the king fixed his eyes as a proper consort, by whose means the breach between the Saxons and Normans might be cemented. A difficulty, however, occurred, because she had been educated in a nunnery. The affair was examined by Anselm in a council of prelates and nobles summoned at Lambeth. Matilda there proved, that she had put on the veil, not with a design of entering into a religious life, but merely in imitation of a custom familiar to the English ladies, who protected their chastity from the brutal violence of the Normans by taking shelter under that habit, which amid the horrid licentiousness of the times was yet generally revered. The council, sensible that even a princess had otherwise no security for her honour, admitted this reason as valid. They pronounced that Matilda was still free to marry; and her nuptials with Henry were celebrated by Anselm with great solemnity and pomp.

102 He marries Matilda.

While Henry was thus rendering himself popular at home, his brother Robert, who had loitered away a twelvemonth in Italy, where he married Sibylla daughter of the count of Conversana, arrived in England, in 1101, in order to put in his late and ineffectual claim to the crown. His fame, however, on account of the exploits he had performed in Palestine, was so great, that even yet he was joined by many noblemen of the first rank, and the whole nation seemed prepossessed in his favour. But Henry, having paid his court to Anselm, by his means retained the army in his interests, and marched with them to Portsmouth, where Robert had landed his forces a few days before. The armies lay for some time in sight of each other; when an accommodation was effected through the mediation of Anselm and other great men. By this treaty it was agreed, that Robert should resign his pretensions to England, and receive in lieu of them an annual pension of 3000 marks; that if either of the princes died without issue, the other should succeed to his dominions; that the adherents of each should be pardoned, and restored to all their possessions either in Normandy or England; and that neither Robert nor Henry should thenceforth encourage, receive, or protect the enemies of each other.

England. 103 Crown of England claimed by Robert.

The two princes separated with mutual marks of friendship; but next year, Henry, under various pretences, confiscated the estates of almost all the noblemen who had favoured his brother's pretensions. Robert, enraged at the fate of his friends, ventured to come to England in order to remonstrate with his brother in person. But he met with such a bad reception, that, apprehending his liberty to be in danger, he was glad to make his escape by resigning his pension.

This infringement of the treaty was followed the ensuing year by an invasion of Normandy, at the desire of Robert's own subjects, whom he was totally incapable of governing *. The event of this war was the defeat and captivity of Robert, who was henceforth deprived not only of all his dominions, but of his personal liberty. He lived 28 years a prisoner, and died in the castle of Cardiff in Glamorganshire. It is even said by some, that he was deprived of his sight by a red-hot copper bason applied to his eyes, and that King Henry appeased his conscience by founding the monastery of Reading.

104 Normandy invaded by Henry.

* See *Normandy*.

The conquest of Normandy was completed in 1106; and next year the controversy between the king and primate, concerning the investitures of clergymen and their doing homage to princes, was resumed. The king was very sensible that it was not his interest to quarrel with such a powerful body as the clergy were at that time; and on the other hand, he fully understood the necessity of guarding the prerogatives of the crown from their encroachments. While, therefore, he avoided an open rupture with Anselm, he obstinately refused to give up the privileges which had been enjoyed by his predecessors. On the first arrival of Anselm, the king had avoided the dispute in the manner already mentioned. A messenger was dispatched to Rome, in order to compromise matters with the pope. The messenger returned with an absolute refusal of the king's demands. One of the reasons given by the pope on this occasion was expressed in the following words: "It is monstrous that a son should pretend to beget his father, or a man to create his God: priests are called

105 Quarrels with the primate.

England. called *gods* in ſcripture, as being the vicars of God: and will you, by your abominable pretenſions to grant them their inveſtiture, aſſume the right of creating them?" Henry was not yet convinced; but as he was determined to avoid, or at leaſt to delay, the coming to any dangerous extremity with the church, he perſuaded Anſelm, that by farther negotiation he ſhould be able to compound matters with the pope. Meſſengers were therefore diſpatched to Rome a ſecond time from the king; and alſo from Anſelm, who wanted to be fully aſſured of the pope's intentions. They returned with letters wrote in the moſt arrogant and poſitive manner, both to the king and primate. The king ſuppreſſed the letter ſent to himſelf; and perſuaded the three biſhops, by whom it was ſent, to aſſert, upon their epiſcopal faith, that the pope had aſſured them of his private good intentions towards King Henry, and of his reſolution not to reſent any future exertion of his prerogative in granting inveſtitures; though he himſelf ſcrupled to give this aſſurance under his hand, leſt other princes ſhould copy the example and aſſume a like privilege. Anſelm's two meſſengers, who were monks, affirmed that it was impoſſible this ſtory could have any foundation; but their word was not deemed equivalent to that of three biſhops; and the king, as if he had finally gained his cauſe, proceeded to fill the ſees of Hereford and Saliſbury, and to inveſt the new biſhops in the uſual manner. Anſelm, however, gave no credit to the aſſertions of the king's meſſengers; and therefore refuſed not only to conſecrate them, but even to communicate with them; and the biſhops themſelves, finding they were become univerſally odious, returned the enſigns of their ſpiritual dignity.

The quarrel continued between the king and primate, till the latter, ſenſible of his dangerous ſituation, deſired leave to make a journey to Rome, in order to lay the caſe before the pope. This permiſſion was eaſily obtained; but no ſooner was the primate gone, than Henry confiſcated all his revenues, and ſent another meſſenger to negociate with the pope. The new meſſenger told his holineſs, that his maſter would ſooner part with his crown than the right of granting inveſtitures. "And I (replied the pope) would rather loſe my head than allow him to retain it." This quarrel now became very dangerous to the king; as he was threatened by the pope with excommunication, which would have been attended with terrible conſequences. At laſt, however, a compromiſe was made in the following manner. Before biſhops took poſſeſſion of their dignities, they had formerly been accuſtomed to paſs through two ceremonials: They received, from the hands of the ſovereign, a ring and croſier as the ſymbols of their office, and this was called their *inveſtiture*: they alſo made thoſe ſubmiſſions to the prince, which were required of the vaſſals by the rites of the feudal law, and which received the name of *homage*. The pope, therefore, was for the preſent contented with Henry's reſigning his right of granting inveſtitures, by which the ſpiritual dignity was ſuppoſed to be conferred; and he allowed the biſhops to do homage for their temporal properties and privileges. After this, the pope allowed Anſelm to communicate with the prelates who had already received inveſtitures from the crown; and he only required of them ſome ſubmiſſions for their paſt conduct. He alſo granted to Anſelm a plenary power of remedying every diſorder, which he ſaid might ariſe from the barbarouſneſs of the country. About the ſame time the marriage of prieſts was prohibited; and even laymen were not allowed to marry within the ſeventh degree of affinity. By this contrivance the pope augmented the profits which he reaped from granting diſpenſations, and likewiſe thoſe from divorces. For as the art of writing was then rare, and pariſh-regiſters were not regularly kept, it was not eaſy to aſcertain the degrees of affinity even among people of rank; and any man who had money to pay for it, might obtain a divorce, on pretence that his wife was more nearly related to him than was permitted by the canons. A decree was alſo publiſhed, prohibiting the clergy to wear long hair; and the king, though he would not reſign his prerogatives to the church, very willingly cut his hair in the form which was required of him, obliging all the courtiers at the ſame time to follow his example. England.

From the time of this compromiſe, which happened in 1107, to the year 1120, nothing remarkable happened except ſome ſlight commotions in Normandy: but this year, Prince William, the king's only ſon, was unfortunately drowned off the coaſt of Normandy; and Henry was ſo much affected, that he is ſaid never afterwards to have ſmiled or recovered his wonted cheerfulneſs. It is very doubtful, however, whether the death of this prince was not an advantage to the Britiſh nation, ſince he was often heard to expreſs the utmoſt hatred to the natives; inſomuch that he had threatened, that when he came to the throne, he would make them draw the plough, and would turn them into beaſts of burden. Theſe prepoſſeſſions he inherited from his father; who, though he was wont, when it might ſerve his purpoſes, to value himſelf on his birth as a native of England, ſhowed, in the courſe of his government, an extreme prejudice againſt that people. All hopes of preferment to eccleſiaſtical as well as civil dignities were denied to the Engliſh during this whole reign; and any foreigner, however ignorant or worthleſs, was ſure to have the preference in every competition. The charter formerly mentioned, which the king granted at the beginning of his reign, was no more thought of; and the whole fell ſo much into neglect and oblivion, that in the following century, when the barons, who had heard an obſcure tradition of it, deſired to make it the model of the great charter which they exacted from King John, they could only find one copy of it in the whole kingdom; while the grievances, propoſed to be redreſſed by it, continued ſtill in their full extent. 126 Prince William drowned.

As Henry had now no legitimate children except Matilda, whom in 1110 he had betrothed, though only eight years of age, to the emperor of Germany, he was induced to marry a ſecond time in hopes of having ſons. He made his addreſſes accordingly to Adelais the daughter of Godfrey duke of Lovaine, and niece to Pope Calixtus; a young princeſs of an amiable perſon. But Adelais brought him no children: and in 1135, the king died in Normandy, from eating too plentifully of lampreys; having lived 67 years, and reigned 35. 127 Death of King Henry.

By the will of King Henry, his daughter Matilda became heireſs of all his dominions. She had been

England. married, after her firſt huſband's death, to Geoffrey Plantagenet, eldeſt ſon of the count of Anjou, by whom ſhe had a ſon named *Henry;* but as Geoffrey had given umbrage to the king of England in ſeveral inſtances, no notice was taken of him in the will. The nobility had already ſworn fealty to her; and the foremoſt to ſhow this mark of ſubmiſſion to the king's will had been Stephen, ſon of the count of Blois (who had married Adela the daughter of William the Conqueror). He had been married to Matilda, daughter and heireſs of Euſtace count of Boulogne; who brought him, beſides that feudal ſovereignty of France, a vaſt property in England, which in the diſtribution of lands had been conferred by the Conqueror on the family of Boulogne. By this marriage Stephen acquired a new connection with the royal family of England: for Mary, his wife's mother, was ſiſter to David the preſent king of Scotland, and to Matilda the firſt wife of Henry and mother of the empreſs. The king alſo, imagining that by the aggrandizement of Stephen he ſtrengthened the intereſt of his own family, had enriched him with many poſſeſſions; but inſtead of this, it appeared by the event that he had only put it more and more in his power to uſurp the throne.

108 Stephen uſurps the throne.

No ſooner was Henry dead, than Stephen haſtened from Normandy into England. The citizens of Dover and Canterbury, appriſed of his purpoſe, ſhut their gates againſt him; but when he arrived at London, ſome of the lower claſs of people, inſtigated by his emiſſaries, immediately proclaimed him king. The archbiſhop of Canterbury refuſed to give him the royal unction; but this difficulty was got over by Stephen's brother, the biſhop of Wincheſter. Hugh Bigod, ſteward of the houſehold, made oath before the primate, that the late king, on his death-bed, had diſcovered a diſſatisfaction with his daughter Matilda, and had expreſſed his intention of leaving the count of Boulogne heir to all his dominions; and the biſhop either believing, or pretending to believe, this teſtimony, gave Stephen the royal unction. Very few of the nobility attended his coronation; but none oppoſed his uſurpation, however unjuſt or flagrant.

Stephen, in order to eſtabliſh himſelf on the throne as firmly as poſſible, paſſed a charter, in which he made liberal promiſes to all ranks of men. To the clergy he promiſed, that he would ſpeedily fill all the vacant benefices, and never would levy any of the rents during the vacancy. To the nobility he gave liberty to hunt in their own foreſts; and to the people he promiſed to remit the tax of danegelt, and to reſtore the laws of Edward the Confeſſor. He ſeized the king's treaſure at Wincheſter, amounting to 100,000l.; with part of which money he hired mercenary ſoldiers from the continent; and with another part procured a bull from the pope, confirming his title to the Engliſh throne.

Matilda, in the mean time, endeavoured to recover her juſt rights, of which Stephen had deprived her; but for ſome time ſhe met with no ſucceſs either in England or Normandy. Her huſband Geoffrey himſelf was obliged to conclude a peace with Stephen, on condition of the king's paying him during that time an annual penſion of 5000l.

Robert earl of Glouceſter was the firſt who ſhook the power of Stephen. He was natural ſon to the late king; a man of great honour and ability, and was very much attached to the intereſts of Matilda. When Stephen uſurped the throne, he offered to do him homage, and take the oath of fealty; but with an expreſs condition, that the king ſhould maintain all his ſtipulations, and never invade any of Robert's rights or dignities. With this condition Stephen was obliged to comply, on account of the great power of that nobleman, though he knew that it was meant only to afford him a favourable opportunity of revolting when occaſion ſerved. The clergy imitated Robert's example; and annexed to their oath of allegiance the following condition, namely; that they were only bound as long as the king defended the eccleſiaſtical liberties, and ſupported the diſcipline of the church. The barons, in return for their ſubmiſſion, exacted terms of ſtill more pernicious tendency. Many of them required to have the right of fortifying their caſtles, and putting themſelves in a poſture of defence; and with this exorbitant demand the king was forced to comply. All England was immediately filled with theſe fortreſſes; which the noblemen garriſoned either with their vaſſals, or with licentious ſoldiers, who flocked to them from all quarters. The whole kingdom now became a ſcene of rapine and devaſtation. Wars were carried on by the nobles in every quarter; the barons even aſſumed the right of coining money, and of exerciſing, without appeal, every act of juriſdiction; and the inferior gentry, as well as the people, finding no defence from the laws, during this total diſſolution of ſovereign authority, were obliged, for their immediate ſafety, to pay court to ſome neighbouring chieftain, and to purchaſe his protection, both by ſubmitting to his exactions, and by aſſiſting him in his rapine upon others.

England. 109 Diſtracted ſtate of the kingdom.

In 1137, the earl of Glouceſter having projected an inſurrection, retired beyond ſea, ſent the king a defiance, and ſolemnly renounced his allegiance. The next year David king of Scotland appeared with an army in defence of his niece's title; and penetrating into Yorkſhire, committed the greateſt devaſtations. He was defeated, however, with great ſlaughter, at Northallerton, by ſome of the northern barons, who had raiſed a powerful army; and this ſucceſs ſo much overawed the malecontents in England, that Stephen's power might have received ſome ſtability, had he not unfortunately engaged himſelf in a conteſt with the clergy. He had already ſeen the miſchief ariſing from the liberty he had granted of fortifying ſo many caſtles in different parts of the kingdom. He therefore determined to abridge this liberty as much as poſſible; and for that purpoſe he began with the caſtles erected by the clergy, who ſeemed to have leſs right to theſe military ſecurities than the barons. Taking advantage therefore of a fray which had ariſen at court between the retinue of the biſhop of Saliſbury and the earl of Britanny, he ſeized the biſhops both of Saliſbury and Lincoln, threw them into priſon, and obliged them to deliver up the caſtles which they had lately erected. This produced ſuch a violent commotion, that the opportunity ſeemed favourable to the pretenſions of Matilda. On the 22d of September 1139, ſhe landed in England with Robert earl of Glouceſter, attended only by 140 knights; but her partizans daily increaſed, and ſhe was ſoon in a condition to face

110 Matilda lands in England.

Stephen

England. Stephen with equal forces in the field. Numberleſs encounters happened, the detail of which could afford very little entertainment to the reader. War was ſpread through every quarter; and the turbulent barons having, in a great meaſure, ſhaken off all reſtraint of government, and now obtained the ſanction of fighting in the cauſe of their country, redoubled their oppreſſions, tyrannies, and devaſtations. The caſtles of the nobility became receptacles of licenſed robbers; who, ſallying forth day and night, ſpoiled the open country, plundered the villages, and even cities. They tortured the captives to make them reveal their treaſures, ſold their perſons to ſlavery; and ſet fire to the houſes, after they had pillaged them of every thing valuable. In conſequence of this deſtruction, the land was left untilled; the inſtruments of huſbandry were abandoned; and a grievous famine reduced the nation to the moſt deplorable ſtate that can be imagined.

111 Stephen defeated and taken priſoner. After a multitude of indeciſive conflicts, a battle enſued which ſeemed likely to enſure the public peace for ſome time. Stephen had marched his forces to relieve the city of Lincoln; the earl of Glouceſter led a body of troops to aſſiſt thoſe of Matilda's party, who were beſieging that place. The two armies engaged on the 2d of February within ſight of the city, and a deſperate battle enſued. At laſt Stephen's army was defeated. He himſelf was for ſome time left without attendants; and fought on foot in the midſt of his enemies, aſſaulted by multitudes, and reſiſting all their efforts with aſtoniſhing intrepidity. Being hemmed in on every ſide, he forced a way for ſome time with his battle-axe; but that breaking, he drew his ſword, and with it furiouſly aſſailed his antagoniſts for ſome time longer. But at length the ſword alſo flying in pieces, he was obliged to ſurrender himſelf a priſoner. He was conducted to Glouceſter; and though at firſt treated with reſpect, he was in a ſhort time, upon ſome ſuſpicions, thrown into irons.

112 Matilda crowned. About a month after, Matilda was crowned at Winchester with great ſolemnity; but ſoon ſhowed herſelf totally incapable of governing ſuch a turbulent nation. She determined to repreſs the power of the nobles, who had now left only the ſhadow of authority to their ſovereign. But being deſtitute of policy or prudence ſufficient to accompliſh ſo difficult an undertaking, a conſpiracy was ſoon formed againſt her, and the biſhop of Wincheſter detached a party of his friends and vaſſals to block up the city of London where the queen reſided. At the ſame time meaſures were taken to inſtigate the Londoners to a revolt, and to ſeize the queen's perſon. Matilda, having timely notice of this conſpiracy, fled to Wincheſter. Here ſhe was ſoon after beſieged by the biſhop: but the town being diſtreſſed by famine, ſhe with difficulty made her eſcape; while her brother the earl of Glouceſter, endeavouring to follow, was taken priſoner, and exchanged for Stephen.

113 Stephen reſtored. Matilda was now obliged to take ſhelter in Oxford, while Stephen reaſcended the throne. The civil war broke out with redoubled fury. Many battles were fought, and both parties were involved in many diſtreſſes. Matilda eſcaped from Oxford at a time when the fields were covered with ſnow, by being dreſſed all in white, with four knights her attendants dreſſed in the ſame colour. Another time Stephen was ſurpriſed by the earl of Glouceſter at Wilton, and made his eſcape with the utmoſt difficulty. At laſt Matilda was obliged to quit the kingdom; and the death of the earl of Glouceſter ſoon after ſeemed to give a fatal blow to her intereſts. In 1153, however, Prince Henry, Matilda's ſon by her ſecond huſband Geoffrey, came over to England, in order once more to diſpute Stephen's pretenſions to the crown. After ſome ſucceſs on his firſt landing, he was oppoſed by Stephen with a powerful army, and matters ſeemed likely to come to the deciſion of a general engagement. But while the two armies continued within a quarter of a mile of each other, a treaty was ſet on foot by the interpoſition of William earl of Arundel, for terminating the diſpute in an amicable manner. The death of Euſtace, Stephen's ſon, whom he had deſigned for the throne, which happened during the courſe of the treaty, facilitated its concluſion. It was agreed, that Stephen ſhould reign during his life, and that juſtice ſhould be adminiſtered in his name; that Henry, on Stephen's death, ſhould ſucceed to the kingdom; and that William, Stephen's ſon, ſhould inherit Boulogne and his patrimonial eſtate. This treaty filled all Europe with joy; and after the barons had ſworn to it, Henry left England, and Stephen returned to the peaceable enjoyment of his throne. His reign, however, was but of ſhort continuance; his death happening on the 25th of October 1154. 114 His death.

Henry was on the continent beſieging a caſtle of one of the mutinous barons, when news was brought him of Stephen's death. But, as he was ſenſible of the goodneſs of his title, he did not abandon his enterpriſe till the place was reduced. He then ſet out on his journey, and was received in England with the utmoſt joy. 115 Henry II. The firſt acts of his reign ſeemed to promiſe a happy and proſperous adminiſtration. He inſtantly diſmiſſed the mercenary ſoldiers who had committed the greateſt diſorders throughout the nation. He ordered all the caſtles which had been erected ſince the death of Henry I. to be demoliſhed, except a few which he retained in his own hands for the protection of the kingdom. The adulterated coin which had been ſtruck during the reign of Stephen was cried down, and new money ſtruck of the right value and ſtandard. He reſumed many of thoſe benefactions which had been made to churches and monaſteries in the former reigns. He gave charters to ſeveral towns, by which the citizens claimed their freedom and privileges independent of any ſuperior but himſelf. Theſe charters were the ground-work of the Engliſh liberty; for thus a new order, namely, the more opulent of the people, began to claim a ſhare in the adminiſtration, as well as the nobility and clergy. Thus the feudal government was at firſt impaired; and liberty began to be more equally diffuſed throughout the nation.

Henry II. on his acceſſion to the Engliſh throne, found himſelf poſſeſſed of very extenſive dominions on the continent. In the right of his father, he poſſeſſed Anjou, Touraine, and Maine; in that of his mother, Normandy; in that of his wife, Guienne, Poictou, Xaintonge, Auvergne, Perigord, Angoumois, and the Limouſin. Soon after, he annexed Britanny to his other ſtates, by marrying his ſon, who was yet a child, to the heireſs of Britanny, who was a child

England. also, and was already in poſſeſſion of the ſuperiority over that province. Theſe territories compoſed above a third of the French monarchy, and were by far the moſt opulent part of it; ſo that Henry, though vaſſal to the king of France, was greatly ſuperior to him in power; and when England was added to all theſe, the French king had great reaſon to apprehend ſome diſaſter to himſelf and family. The king of England, however, reſided at too great a diſtance to be able to employ this formidable power with ſucceſs againſt the French monarch. He ſoon became a kind of ſtranger in his continental dominions; and his ſubjects there conſidered their allegiance as more naturally due to their ſuperior lord, who lived in their neighbourhood, and who was acknowledged to be the ſupreme head of their nation. Their immediate lord was often at too great a diſtance to protect them; and a commotion in any part of Henry's extenſive dominions gave great advantages againſt him. The wiſe and vigorous adminiſtration of Henry, however, counterbalanced in a great meaſure theſe diſadvantages; and he maintained a ſurpriſing tranquillity throughout his extenſive dominions during the greateſt part of his reign.

Henry found no great difficulty in circumſcribing the power of the barons; but when he attempted to do the ſame thing with the clergy, he met with the moſt violent oppoſition. That body had carried their independence on the civil power ſo far, that now they ſeemed to aim at nothing leſs than a liberty to commit all manner of crimes with impunity. During the reign of Stephen, they had extorted an immunity from all but eccleſiaſtical penalties*; and that grant they were reſolved to maintain for the future. It may eaſily be ſuppoſed, that a law which thus ſcreened their wickedneſs, contributed to increaſe it; and we accordingly find upon record, not leſs than 100 murders committed by men in holy orders, in the ſhort period ſince the king's acceſſion, not one of which was puniſhed even with degradation, while the biſhops themſelves ſeemed to glory in this horrid indulgence. The king did not make any attempts againſt them during the life of Theobald archbiſhop of Canterbury, who was a man of a mild character, and beſides had great merit; becauſe, during the former reign, he had refuſed to put the crown on the head of Euſtace, Stephen's ſon. He died in 1162; and the king, after his death, advanced to the ſee of Canterbury Thomas à Becket, his chancellor, on whoſe compliance he thought he might entirely depend.

* See (Benefit of) *Clergy*.

116 Monſtrous wickedneſs of the clergy.

117 Conteſts of the king with Thomas à Becket.

The new archbiſhop was the firſt man of Engliſh pedigree, who, ſince the Norman conqueſt, had riſen to any conſiderable ſtation. Before his inſtalment in the ſee of Canterbury, Becket had been exceedingly complaiſant, good-humoured, and agreeable to his maſter; and had alſo been accuſtomed to live very freely. But no ſooner was he inveſted with this high dignity, than he totally altered his conduct, and put on all thoſe airs of affected and oſtentatious humility which could recommend him to the ſuperſtitious and ignorant multitude in that age. The firſt ſtep taken by this hypocrite after his advancement, was to reſign the office of chancellor. This he did without conſulting the king: the reaſon he gave was, that henceforth he muſt detach himſelf from ſecular affairs, and be ſolely employed in the duties of his ſacred function; but in reality, that he might break off all connection with Henry. As he knew that the king intended to abridge the eccleſiaſtical power, he thought the beſt method would be to become himſelf the aggreſſor. He therefore ſummoned the earl of Clare to ſurrender the barony of Tunbridge: which, ever ſince the Conqueſt, had remained in the family of that nobleman; but which, as it had formerly belonged to the ſee of Canterbury, the primate pretended that his predeceſſors were prohibited by the canons from alienating.—William de Eynsford, a military tenant of the crown, was patron of a living which belonged to a manor that held of the archbiſhop of Canterbury; and Becket, without regard to William's right, preſented, on a new and illegal pretence, one Laurence to that living, who was violently expelled by Eynsford. Upon this Eynsford was excommunicated. He complained to the king, that he, who held *in capite* of the crown, ſhould, contrary to the practice eſtabliſhed by the Conqueror and maintained ever ſince by his ſucceſſors, be ſubjected to that terrible ſentence, without the previous conſent of the ſovereign. Henry, by a meſſenger, commanded Becket to abſolve Eynsford. The haughty primate anſwered, that it belonged not to the king to inform him whom he ſhould abſolve, and whom excommunicate; but, after all, he was obliged to comply with the king's orders, though with the worſt grace imaginable. England.

As Henry perceived that the crown was now in danger, through the ſuperſtition of the people, of falling totally under the power of the clergy, he reſolved to exert himſelf to the utmoſt againſt their ſcandalous uſurpations. Among their other inventions to obtain money, they had now inculcated the neceſſity of penance as an atonement for ſin; and having again introduced the practice of paying them large ſums as an equivalent for theſe penances, the ſins of the people had thus become a revenue to the prieſts; and the king computed, that, by this invention alone, they levied more money from his ſubjects than what flowed by all the funds and taxes into the royal exchequer. To eaſe the people of ſo heavy and arbitrary an impoſition, the king required, that a civil officer of his appointment ſhould be preſent in all eccleſiaſtical courts, and ſhould for the future give his conſent to every compoſition made for ſpiritual offences. About this time alſo the king had an opportunity of proceeding againſt the clergy on another footing. A clerk in Worceſterſhire, having debauched a gentleman's daughter, murdered her father. The king required that the clerk ſhould be delivered up to the magiſtrate. Becket pleaded the privileges of the church; confined the criminal in the biſhop's priſon, leſt he ſhould be ſeized by the king's officers; and maintained that no greater puniſhment could be inflicted on him than degradation. The king then required, that, immediately after he was degraded, he ſhould be tried by the civil powers; but the primate aſſerted, that it was iniquitous to try a man twice upon the ſame accuſation, and for the ſame crime. Upon this, Henry ſummoned an aſſembly of all the prelates in England; and put to them this deciſive queſtion, Whether or not they were willing to ſubmit to the ancient laws and cuſtoms of the kingdom? The biſhops unanimouſly replied, that they were willing, *ſaving their own order*. The king was provoked

England. provoked to the laſt degree at this equivocal anſwer. He left the aſſembly with evident marks of diſpleaſure; and required the primate inſtantly to ſurrender the caſtles of Eye and Berkham. The other prelates were terrified; but Becket continued inflexible: however, he was at laſt prevailed upon, by the interpoſition of Philip the pope's legate and almoner, to retract the ſaving clauſe, and promiſe without any reſerve to obſerve the ancient cuſtoms.

The king was not now to be ſatisfied with general promiſes from the clergy: he was determined that the ancient laws and cuſtoms ſhould be defined, as well as the privileges of the clergy. He therefore ſummoned another great council of the clergy and nobility at Clarendon, to whom he ſubmitted this important affair. A number of regulations was there drawn up, which were afterwards well known by the title of the *Conſtitutions of Clarendon*. By theſe it was enacted, that clergymen accuſed of any crime ſhould be tried in the civil courts; that laymen ſhould not be tried in ſpiritual courts, except by legal and reputable witneſſes; that the king ſhould ultimately judge in eccleſiaſtical and ſpiritual appeals; that the archbiſhops and biſhops ſhould be regarded as barons, and obliged to contribute to the public expences like other perſons of their rank; that the goods forfeited to the king ſhould not be protected in churches or church-yards by the clergy; and that the ſons of villeins ſhould not take orders without the conſent of their lord. Theſe, with ſome others of leſs conſequence, to the number of 16, were ſubſcribed by all the biſhops preſent, and even by Becket himſelf; who, however, at firſt, ſhowed ſome reluctance.

Nothing now remained but to get the conſtitutions ratified by the pope; but in this the king was diſappointed. The pope rejected them with the utmoſt indignation; and, out of 16, admitted only ſix, which he thought were not important enough to deſerve cenſure.—Becket was now mortified to the higheſt degree. He retracted his conſent to the conſtitutions, redoubled his auſterities, and even refuſed to execute any part of his ſacerdotal function till he had obtained abſolution from his holineſs. Henry, conſidering theſe humilities as inſults offered to himſelf, deſired the pope to ſend him a legate. He did ſo; but annexed a clauſe to his commiſſion, by which he was prohibited from acting againſt the archbiſhop of Canterbury. The king ſent back the commiſſion to the pope; and being now exaſperated beyond all patience, commenced furious proſecutions againſt Becket. He firſt ſued him for ſome lands belonging to his primacy; and Becket being detained by ſickneſs from coming into court, his non-attendance was conſtrued into diſreſpect. The primate afterwards defended his cauſe in perſon; but all his goods and chattels were confiſcated, and the biſhop of Winchester was obliged to pronounce the ſentence. Another ſuit was commenced againſt him for 300l. which he had levied on the honours of Eye and Berkham, and the primate agreed to give ſecurities for the payment of the ſum. The next day a third ſuit was commenced againſt him for 1000 marks, which the king had lent him upon ſome former occaſion: and immediately following theſe, a ſtill greater demand was made; namely, that Becket ſhould give an account of the money he had received and expended during the time he was chancellor. The England. money was computed at no leſs than 40,000 marks; and the primate, unable either to give an account, or find ſecurities, took the following extraordinary method of evading the king's deſigns. He arrayed himſelf in his epiſcopal veſtments; and with the croſs in his hand, went forward to the palace. Having entered the royal apartments, he ſat down, holding up the croſs as his banner and protection. The king, who ſat in an inner apartment, ordered by proclamation all the prelates and nobility to attend him; to whom he loudly complained of Becket's inſolence. The whole council joined in condemning this inſtance of his unaccountable pride; and determined to expoſtulate with him about his inconſiſtency concerning the conſtitutions of Clarendon. But all their meſſages, threats, and arguments, were in vain. Becket put himſelf, in the moſt ſolemn manner, under the protection of the ſupreme pontiff, and appealed to him againſt any penalty which his iniquitous judges might think proper to inflict. Then leaving the palace, he aſked the king's immediate permiſſion to quit Northampton; but being refuſed, he ſecretly withdrew in diſguiſe, and at laſt found means to croſs over to the continent. 118 Becket flies to the continent.

Becket was received with the greateſt marks of eſteem, firſt by the king of France (who hated Henry on account of his great power), and then by the pope, whoſe cauſe he had ſo ſtrenuouſly defended in England. Henry at the ſame time ſent ambaſſadors to the pope, who were treated with coolneſs and contempt, while Becket was honoured with the greateſt marks of diſtinction. Theſe favours beſtowed upon an exile and a perjured traitor (for ſuch had been Becket's ſentence of condemnation in England), irritated the king to ſuch a degree, that he reſolved to throw off at once all dependence upon the pope. He accordingly iſſued out orders to his juſticiaries; inhibiting, under ſevere penalties, all appeals to the pope or the archbiſhop; and forbidding any of them to receive mandates from them, or to apply to their authority. He declared it treaſonable to bring over from either of them any interdict upon the kingdom. This he made punihable in ſecular clergymen by the loſs of their livings, and by caſtration; in regulars, by the amputation of their feet; and in laymen, by death. On the other hand, the pope and the archbiſhop did not fail to iſſue forth their fulminations in ſuch a manner as to ſhake the very foundation of the king's authority. Becket excommunicated by name all the king's chief miniſters who had been concerned in ſequeſtrating the revenues of his ſee, and all who obeyed or favoured the conſtitutions of Clarendon. He even threatened to excommunicate the king if he did not ſpeedily repent; and had not the pope himſelf been threatened every day with the machinations of an antipope, whoſe pretenſions he was afraid the king of England might ſupport, the ſentence of excommunication would certainly have been denounced.

At firſt, Henry paid little regard to theſe fulminations; but afterwards, when he found that his authority over his ſubjects began to decline on that account, and that his rivals on the continent were endeavouring to diſturb the tranquillity of his dominions, he began ſincerely to deſire a reconciliation. This the pope and

Becket

England. Becket alſo became deſirous of, becauſe they ſaw that their utmoſt endeavours were inſufficient to draw Henry's ſubjects into a revolt againſt him. The treaty of accommodation, however, was often broken off, through the extreme jealouſy of each of the parties; but at length, by the mediation of the pope's legate, all differences were adjuſted, and Becket was reinſtated in the ſee of Canterbury.

119 Is reſtored, and behaves with his former inſolence.

On the recovery of his dignity, the primate behaved with all his uſual arrogance. Inſtead of retiring quietly to his dioceſe when he landed in England, he made a progreſs through Kent with all the ſplendor and magnificence of a ſovereign pontiff. As he approached Southwark, the clergy, the laity, and all ranks of people, come forth to meet him, and celebrated his triumphal entry with hymns of joy. Being thus confident of the ſupport of the people, he reſolved to make his enemies feel the ſevereſt effects of his vengeance. He ſuſpended the archbiſhop of York, who had crowned Henry's eldeſt ſon in his abſence. He excommunicated the biſhops of London and Saliſbury, with ſome of the principal nobility and prelates who had aſſiſted at the coronation. One man he excommunicated for having ſpoken againſt him, and another for having cut off the tail of one of his horſes. The excommunicated and degraded prelates immediately made their complaints to the king; and he having dropped ſome paſſionate expreſſions, intimating a deſire to have Becket's life taken away, the ſuppoſed will of the king was inſtantly accompliſhed; nor could the king's expreſs orders to the contrary arrive time enough to hinder the execution of this fatal purpoſe. See BECKET.

120 Grief of the king for his death.

The king was thrown into the utmoſt conſternation on hearing of Becket's murder. He knew that the primate's death would accompliſh what his moſt violent oppoſition during his life could never have done, and therefore he gave himſelf up to ſorrow: for three days he even refuſed all nouriſhment; till at laſt his courtiers were obliged to break in upon his ſolitude, and induce him to acquieſce in an event which could not poſſibly be recalled. The pope was with ſome difficulty made ſenſible of the king's innocence; but refuſed to grant him a pardon, except on condition that he ſhould make every future ſubmiſſion and perform every injunction the holy ſee thought proper to demand. When things were thus adjuſted, the aſſaſſins who had murdered Becket were allowed to retire in ſafety to the enjoyment of their former dignities; and the king, with a view to divert the minds of the people to a different object, undertook an expedition into Ireland, and totally reduced that iſland. See IRELAND.

121 Diſſenſions in Henry's family.

The king was ſcarcely freed from the war with Ireland, and the dangerous controverſy in which he had engaged with the church of Rome, when he found himſelf involved in the moſt unnatural conteſts with his children, to whom he had always behaved in the moſt tender and affectionate manner. He had ordered Henry his eldeſt ſon to be anointed king; and had deſtined him for his ſucceſſor in the kingdom of England, the duchy of Normandy, and the counties of Anjou, Maine, and Touraine; territories which lay contiguous, and which might thus eaſily lend their aſſiſtance to one another. Richard his ſecond ſon was inveſted in the duchy of Guienne and county of Poictou: Geoffrey, his third ſon, inherited, in right of his wife, the duchy of Britanny: and the new conqueſt of Ireland was deſtined for the appendage of John his fourth ſon, for whom he had negociated a marriage with Adelais the only daughter of Humbert count of Savoy and Maurienne; and with whom he was to receive as a dowry very conſiderable demeſnes in Piedmont, Savoy, Breſſe, and Dauphiny. This greatneſs of Henry's family alarmed the king of France; and he therefore excited young Prince Henry to demand of his father, either the immediate reſignation of the crown of England, or the duchy of Normandy. The king refuſed to comply with ſuch an extravagant demand; upon which the prince made his eſcape to Paris, where he was protected by the French king. This happened in 1173; and the ſame year, Queen Eleanor, finding that ſhe was now grown very diſagreeable to the king, communicated her diſcontent to her two younger children Geoffrey and Richard, whom ſhe engaged alſo to demand the territories aſſigned them, and then fly to the court of France. The queen herſelf was meditating an eſcape to the ſame court, and had put on man's apparel for that purpoſe, when ſhe was ſeized and confined by Henry's order. The licentious barons in the mean time wiſhed for a change of government; hoping to have liberty, under young and inexperienced princes, to commit thoſe rapines and violences which they could not do with ſafety when governed by ſuch a prudent and vigilant king as Henry. In the midſt of this univerſal defection, however, the Engliſh monarch ſtill retained his uſual intrepidity, and prepared with as much vigour as poſſible for the conteſt. As he could depend on the fidelity of very few of his nobility, he was obliged to enliſt in his ſervice a number of deſperate ruffians called *Brabençons*, and ſometimes *Routiers* or *Cottereaux*, though for what reaſon is not mentioned in hiſtory. Theſe banditti were very numerous during the times of the feudal government, when many private wars were carried on between the nobles; and 20,000 of theſe, with a few forces furniſhed by his faithful barons, compoſed the whole of Henry's army on this occaſion.

122 Queen Eleanor confined.

With this force the king of England totally overthrew the ſchemes of his enemies on the continent; but being very deſirous of putting an end to the war, he this very year (1173) agreed to a conference with the king of France. At this interview, Henry offered his children the moſt advantageous terms. He inſiſted only on retaining the ſovereign authority in all his dominions. To Henry he offered half the revenues of the crown of England, with ſome places of ſurety in that kingdom; or if he choſe rather to reſide in Normandy, half the revenues of that duchy, with all thoſe of Anjou. He made a like offer to Richard in Guienne; he promiſed to reſign all Britanny to Geoffrey; and if theſe conceſſions were not deemed ſufficient, he agreed to add to them whatever the pope's legates, who were preſent, ſhould require of him. The conference, however, was broken off by the violence of the earl of Leiceſter; who not only reproached Henry in the moſt indecent manner, but even put his hand to his ſword, as if he intended to attempt ſome violence againſt him.

England. In the mean time, the moſt of the Engliſh nobility united in oppoſition againſt their ſovereign; and an irruption at this time by the king of Scotland aſſiſted their rebellious ſchemes. The earl of Leiceſter ſoon after invaded Suffolk at the head of a body of Flemings; but they were repulſed with great ſlaughter and the earl himſelf was taken priſoner. Soon after, William king of Scotland, who had been repulſed, and agreed to a ceſſation of arms, broke the truce, and invaded England with an army of 80,000 men, committing the moſt terrible devaſtations. Henry in the mean time, to reconcile himſelf thoroughly to the church, performed the penances at the tomb of Thomas à Becket which he had formerly promiſed to do. As ſoon as he came within ſight of the church of Canterbury, he alighted from his horſe, walked barefoot towards the town, and proſtrated himſelf before the ſhrine of the ſaint. He remained a whole day in prayer and faſting, watched the holy relics all night, made a grant of 50l. a-year to the convent for a conſtant ſupply of tapers to illuminate the ſhrine; and not ſatisfied with theſe ſubmiſſions, he aſſembled a chapter of monks, diſrobed himſelf before them, put a ſcourge into each of their hands, and preſented his bare ſhoulders to their ſtrokes. Next day he received abſolution; and, departing for London, had the agreeable news of the defeat and captivity of William king of Scotland, which happened on the very day of his abſolution.

123 King of Scotland defeated and taken priſoner.

This victory proved deciſive in Henry's favour. The Engliſh barons who had revolted, or were preparing for a revolt, inſtantly delivered up their caſtles to the victor, and the kingdom was in a few weeks reſtored to perfect tranquillity. Prince Henry, who was ready to embark with a great army to join the Engliſh rebels, abandoned all thoughts of the enterpriſe. Soon after a treaty was concluded with the king of France; in which Henry granted his children much leſs advantageous terms than he had offered them before. The principal were, ſome penſions for their ſupport, caſtles for their reſidence, and an indemnity to all their adherents. The greateſt ſufferer by this war was William king of Scotland. He was compelled to ſign a treaty, by which he obliged himſelf to do homage to Henry for the kingdom of Scotland. It was agreed, that his barons and biſhops ſhould do the ſame; and that the fortreſſes of Edinburgh, Stirling, Berwick, Roxburgh, and Jedburgh, ſhould be delivered into the hands of the conqueror till the articles were performed. This treaty was executed moſt punctually and rigorouſly on the 10th of Auguſt 1175. The king, barons, and prelates of Scotland, did homage to Henry in the cathedral of York; the greateſt humiliation to which the Scottiſh nation had ever been ſubjected.

124 Owns himſelf Henry's vaſſal.

125 New diſſenſions in Henry's family.

Henry was now freed from all troubles, either at home or abroad, for five years; during which time he made ſeveral ſalutary laws for the good of his kingdom. But, in 1180, the ambitious ſpirits of his children involved him in freſh calamities. Richard, who had been inveſted by his father with the ſovereignty of Guienne, refuſed to do homage to his elder brother, as King Henry had required him to do. Young Henry and Geoffrey, uniting their arms, invaded their brother's dominions; and while the king was endeavouring to compoſe their differences, he found himſelf conſpired againſt by them all. The conſpiracy, however, was defeated by the death of Prince Henry in 1183. He had retired to Martel, a caſtle near Turenne, where he was ſeized with a fever; and perceiving the approaches of death, he was at laſt ſtruck with remorſe for his undutiful behaviour towards his father. He ſent a meſſenger to the king, who was not far diſtant; expreſſed his contrition for his faults; and intreated the favour of a viſit, that he might at leaſt die with the ſatisfaction of having received his forgiveneſs. The king, who had ſo often experienced his ſon's ingratitude and violence, apprehended that his ſickneſs was entirely a feint, and dared not truſt himſelf in the prince's hands. But ſoon after, receiving certain intelligence of his death, and proofs of his ſincere repentance, the good old king was affected with the deepeſt ſorrow. He thrice fainted away; he accuſed his own hard-heartedneſs in refuſing the dying requeſt of his ſon; and he lamented that he had deprived the prince of the laſt opportunity of making atonement for his offences. England.

Prince Henry, who died in the 28th year of his age, left no poſterity. His brother Richard ſucceeded to his dominions, and ſoon diſcovered as turbulent a ſpirit as that which had actuated his brother. He refuſed to give up Guienne, which Henry had deſigned for his fourth ſon John; and even made preparations for carrying on war againſt his father, and brother Geoffrey. Henry ſent for Eleanor his queen, the heireſs of Guienne; to whom Richard, either dreading an inſurrection in her favour, or out of a ſenſe of duty, willingly yielded up the territory, and retired peaceably to his father's court. This breach, however, was no ſooner made up, than Geoffrey demanded Anjou to be added to his dominions in Britanny. This the king refuſed; upon which he fled to the court of France, and prepared to levy an army againſt his father. Henry, however, was freed from the danger which threatened him from that quarter, by his ſon's death, who was killed in a tournament at Paris. The loſs of this prince gave few, except the king himſelf, any uneaſineſs; for he was univerſally hated, and went among the people by the name of the *Child of Perdition*. The widow of Geoffrey, ſoon after his deceaſe, was delivered of a ſon, who received the name of *Arthur*, and was inveſted in the duchy of Britanny, under the guardianſhip of his grandfather, who, as duke of Normandy, was alſo ſuperior lord of that territory. Philip, as lord paramount, diſputed for ſome time his title to this wardſhip; but was obliged to yield to the inclinations of the Bretons, who preferred the government of Henry. Some other cauſes inflamed the diſſenſion between theſe two monarchs, and Philip once more ſeduced Richard from his duty. He inſiſted, that his marriage with Adelais, Philip's ſiſter, ſhould be immediately completed, and threatened to enforce his pretenſions with a formidable army. This occaſioned another conference between Giſors and Trie, the uſual place of meeting, under a vaſt elm that is ſaid to have ſhaded more than an acre. In the midſt of this conference the archbiſhop of Tyre appeared before the aſſembly in the moſt miſerable habit, and begged aſſiſtance againſt the infidels, who, under Saladin, had almoſt totally expelled the Chriſtians from Aſia. His intelligence

England. gence appeared so very dismal, that the kings of France and England laid aside their animosity. Both of them immediately took the cross; but Richard, who had long wished to have all the glory of such an expedition to himself, could not bear to have even his father for a partner in his victories. He therefore entered into a confederacy with the king of France; so that Henry found himself at last obliged to give up all thoughts of the crusade, in order to defend himself against this unnatural combination. The event of the war proved very unfortunate for Henry, who lost several towns, and narrowly escaped falling into the hands of the enemy himself. At last a treaty was concluded at the intercession of the duke of Burgundy, the count of Flanders, and the archbishop of Rheims; but upon terms very humiliating to the king of England. It was agreed that Richard should marry the princess Adelais, and be crowned king of England during the lifetime of his father; that Henry, should pay 20,000 marks to the king of France, as a compensation for the charges of the war; that his own barons should engage to make him observe this treaty, and in case of violating it, to join Philip and Richard against him; and that all his vassals who had espoused the cause of Richard should receive an indemnity for their offence. These terms, mortifying as they were, Henry bore with patience; but when, upon receiving a list of the barons that were to be pardoned, he found his own son John, who was his favourite, among them, he could no longer support his grief. He broke out into the most lamentable expressions of despair; cursed the day in which he received his miserable being; and bestowed on his ungrateful children a malediction which he could never afterwards be prevailed upon to retract. Soon after, he fell into a lingering fever occasioned by his grief; and of this he died on the 6th of July 1189, in the 58th year of his age and 35th of his reign. His natural son Geoffrey, who alone had behaved dutifully towards him, attended his corpse to the nunnery of Fontevrault, where it lay in state in the abbey-church. Next day Richard, who came to visit the dead body of his father, was struck with horror at the sight. At his approach, the blood was seen to gush out at the mouth and nostrils of the corpse; and this accident was, by the superstition of the times, interpreted as the most dreadful rebuke. Richard could not endure the sight. He exclaimed that he was his father's murderer; and expressed a strong, though too late, sense of his undutiful conduct.

126 His extreme grief and death.

127 Richard I.

Richard succeeded to the throne without opposition immediately after his father's death; and, on his accession, set his mother Eleanor (who had been again confined) at liberty. A romantic desire for strange adventures, and an immoderate zeal for the external rites of religion, were the ruling passions of the times. By the first of these Richard was inflamed to the highest degree, and therefore behaved as if the whole design of his government had been to attempt the recovery of the Holy Land from the Infidels. The superstition of the people showed itself in a most violent and tragical manner on the very day of the king's coronation. The Jews were the objects of universal hatred, so that Richard had issued out orders forbidding any of them from appearing at his coronation. But some of them bringing him large presents from their nation, presumed, notwithstanding these orders, to approach the hall in which the king dined. Being discovered, they were exposed to the insults and injuries of the bystanders; in consequence of which they fled, and were pursued by the people. A report was spread, that the king had given orders to massacre all the Jews. This supposed command was executed in the most cruel manner. Multitudes were slaughtered in the city of London; and this example was followed in most of the cities in England. Five hundred Jews had retired into York castle for safety: but finding themselves unable to defend the place, they murdered their wives and children; threw the dead bodies over the wall against their enemies who attempted to scale it; and then, setting fire to the houses, perished in the flames. The gentry in the neighbourhood, who were all indebted to the Jews, ran to the cathedral where their bonds were kept, and made a solemn bonfire of them before the altar. England.

128 Massacre of the Jews.

129 Richard's preparations for his journey into Palestine.

Richard immediately began to take measures for his expedition into Palestine. His father had left him 100,000 marks; and this sum he augmented by all expedients he could think of, however pernicious to the public, or dangerous to the royal authority. He set up to sale the revenues and manors of the crown, and several offices of the greatest trust and power. Liberties, charters, castles, were given to the best bidders. His friends warned him of the danger attending this venality; but he told them he would sell the city of London itself, if he could find a purchaser. Numerous exactions were also practised upon all ranks and stations; menaces, promises, and expostulations, were used to fright the timid, and allure the avaricious. A zealous preacher of those times was emboldened to remonstrate against the king's conduct; and advised him to part with his three daughters, which were pride, avarice, and sensuality. To this Richard readily replied, "You counsel right, my friend; and I have already provided husbands for them all. I will dispose of my pride to the templars; my avarice to the monks; and as for my sensuality, the clergy shall share that among them." At length the king having got together a sufficient supply for his undertaking, and even sold his superiority over Scotland for a moderate sum, set out for the Holy Land; whither he was impelled by repeated messages from the king of France, who was ready to embark in the same enterprise.

An account of Richard's exploits in this expedition is given under the articles EGYPT, SICILY, CYPRUS, &c.—Having at last concluded a truce with Saladin, he set out on his return for England. He was, however, at a loss how to proceed. He durst not return by the way he came, as this would put him in the power of the king of France, between whom and the king of England an irreconcilable enmity had taken place. No way therefore was left but by going more to the north; for which reason he took shipping for Italy, but was wrecked near Aquileia. From thence he travelled towards Ragusa, and resolved to make his way through Germany in the habit of a pilgrim. But his expences and liberalities having betrayed him, notwithstanding this disguise, he was arrested by Leopold duke of Austria, who commanded him to be loaded with shackles. This prince had served under Richard

130 Taken prisoner on his return.

England. at the ſiege of Acre (the ancient Ptolemais), where having received ſome diſguſt, he took this baſe method of revenging himſelf. Henry VI. emperor of Germany, was then equally an enemy to Richard on account of his having married Berengaria the daughter of Tancred king of Sicily. He therefore required the royal captive to be delivered up to him, and ſtipulated a large ſum of money to the duke as a reward for his ſervice.

The kingdom of England in the mean time was in great confuſion. Richard had left it under the direction of Hugh biſhop of Durham, and Longchamp biſhop of Ely. The tempers of theſe prelates being very different, an animoſity between them ſoon took place. Longchamp at laſt arreſted his colleague, and obliged him to reſign his power in order to obtain his liberty. The king, by many letters, commanded Longchamp to replace his coadjutor, but to no purpoſe. When the ſituation of the king became uncertain, Longchamp tyrannized to ſuch a degree, that John the king's brother thought proper to oppoſe him. He then left the kingdom; and upon this the archbiſhop of Rouen was made juſticiary in his room. The king of France being informed of theſe diſſenſions, ſtrove to increaſe them as much as poſſible; and had even almoſt prevailed upon John to throw off his allegiance, by promiſing to put him in poſſeſſion of all Richard's continental dominions.

131 Treachery of John the king's brother.

When the Engliſh firſt received the news of Richard's captivity, a general indignation was excited through the whole nation. The greateſt, and almoſt the only traitor in the kingdom, was the king's own brother John. On the very firſt invitation from the court of France, he went abroad, and held a conſultation with Philip, the object of which was the perpetual ruin and captivity of his unhappy brother. He promiſed to deliver into Philip's hands a great part of Normandy; and, in return, he received the inveſtiture of all Richard's tranſmarine dominions: it is even ſaid, that he did homage to the French king for the crown of England.

In conſequence of this treaty, Philip invaded Normandy, and made conſiderable progreſs in the conqueſt of it. He was, however, at laſt repulſed by the earl of Leiceſter, who was now returned from the Holy Land; and a truce was concluded, on condition of paying the French king 20,000 merks, and putting four caſtles into his hands by way of ſecurity for the payment.—John, who had come over to England, met with ſtill leſs ſucceſs in his enterpriſes. He was only able to make himſelf maſter of the caſtles of Windſor and Wallingford; but when he came to London, and demanded the kingdom as heir to this brother, of whoſe death he pretended to have received certain intelligence, he was rejected by all the barons, and meaſures were taken to oppoſe and ſubdue him. The defence of the kingdom was ſo well provided for, that John after ſome fruitleſs efforts, was obliged to conclude a truce with his opponents; and, before the expiration of it, he thought proper to retire to France, where he openly acknowledged his alliance with Philip.

All the efforts of Richard's enemies proved ineffectual to detain him in captivity. He was brought before the diet of the empire at Worms, where the emperor Henry brought againſt him a charge of many crimes and miſdemeanours: but to this the king replied with ſo much ſpirit and eloquence, that the German princes exclaimed loudly againſt the conduct of the emperor; the pope threatened him with excommunication; and Henry, who had hearkened to the propoſals of the king of France and Prince John, found that it would be impoſſible for him to execute his and their baſe purpoſes, and detain the king of England any longer in captivity. He therefore concluded a treaty with him for his ranſom; and agreed to reſtore him to his liberty for 150,000 merks, about 100,000l. of our money, of which 100,000 merks were to be paid immediately, and 67 hoſtages delivered for the remainder. England

132 Richard releaſed from captivity.

The money for the king's ranſom was moſt cheerfully raiſed by the Engliſh. The churches and monaſteries melted down their plate to the amount of 30,000 merks; the biſhops, abbots, and monks, paid a fourth part of their yearly rent; the parochial clergy contributed a tenth part of their tythes; and the requiſite ſum being thus collected, Queen Eleanor and Walter archbiſhop of Rouen ſet out with it for Germany, paid the money to the emperor and duke of Auſtria at Mentz, delivered them hoſtages for the remainder, and freed Richard from his captivity. His eſcape was very critical. Henry had been detected in the aſſaſſination of the biſhop of Liege, and in an attempt of the like nature on the duke of Louvaine; and finding himſelf extremely obnoxious to the German princes on account of theſe odious practices, he had determined to ſeek ſupport from an alliance with the French king, and to detain Richard in perpetual captivity, notwithſtanding the ſum he had already received for his ranſom. He therefore gave orders that Richard ſhould be purſued and arreſted; but the king making all imaginable haſte, had already embarked at the mouth of the Scheldt, and was out of ſight of land when the emperor's meſſengers reached Antwerp. The king of France no ſooner heard of Richard's deliverance, than he wrote to John his confederate in theſe terms: "Take care of yourſelf: the devil is broke looſe."

133 Returns to England

The king of England returned from captivity on the 20th of March 1194, and was received with the utmoſt joy by his ſubjects. He had been but one day landed, when his treacherous brother John came to make his ſubmiſſion. At the interceſſion of Queen Eleanor he was received into favour. "I forgive him (ſaid the king), and hope I ſhall as eaſily forget his offences as he will my pardon." Richard was impatient to revenge himſelf on the king of France, and therefore inſtantly made war upon him. But though both kings were inflamed with the moſt violent reſentment againſt each other, they found it impoſſible to engage their powerful barons heartily in their cauſe. The war, therefore, produced no remarkable event; and, in 1195, was concluded by a truce for five years. On ſome ſlight occaſion it was ready to break out anew, when the pope's legate interpoſed, and a treaty was about to be concluded. King Richard in the mean time was wounded by an arrow at the ſiege of Chalus, a caſtle of Limoges. The wound was not in itſelf dangerous; but being unſkilfully treated, a mortification enſued, and the king expired on the 6th of April 1199, in the 10th year of his reign and 42d of

134 His death

England. his age. By his will he left the kingdom to his brother John, but diſtributed a fourth part of his treaſure among his ſervants.

135 John ſucceeds to the crown.

John ſucceeded to the crown of England without oppoſition, but ſoon found his affairs embarraſſed on the continent. The king of France, who, during the life of King Richard, had always ſupported the pretenſions of John, now gave a like ſupport to the claims of Prince Arthur the ſon of Geoffrey, who, though only 12 years of age, promiſed to be deſerving of the kingdom. But in this matter the king of France ſhowed ſo much regard to his own intereſt, that Conſtantia, the mother of the young prince, thinking that her ally deſigned to keep for himſelf the provinces which he pretended to conquer for Arthur, ſubmitted herſelf and her ſon to John, who detained them in Mans; and thus became undiſputed maſter of the whole empire.

136 His bad qualities.

The new king was weak, tyrannical, cruel, and treacherous. In ſhort, he ſeemed to be endowed with almoſt every bad quality that can fall to the ſhare of man. His conduct, therefore, ſoon rendered him univerſally odious. Imagining himſelf now ſecure on the ſide of France, he indulged his paſſion for Iſabella, the daughter and heireſs of the count of Angouleme, with whom he was much enamoured. His queen, the heireſs of the family of Glouceſter, was ſtill alive; and Iſabella was married to the count de la Marche, though, by reaſon of her youth, the marriage had not been conſummated. John perſuaded the count de Angouleme to carry off his daughter from her huſband; at the ſame time that he procured, under ſome pretence or other, a divorce from the queen. Thus he incurred the diſpleaſure of the pope, and alſo of the count de la Marche, and a powerful confederacy was formed againſt him.

As John had neither courage nor policy ſufficient to keep his barons in awe, he took a method for that purpoſe equally baſe and cruel. This was by hiring a ſet of ruffians, whom he called his *champions*, to fight duels with them, in caſes where they required to clear themſelves from any charge by fighting a duel, according to the cuſtom of thoſe times. Thus he propoſed to get rid of his refractory barons; but they, deſpiſing opponents who were ſo far below their rank, refuſed to fight with them, and a dangerous combination was formed among the barons againſt him.

137 Murders his nephew.

The murder of Prince Arthur rendered John ſtill more generally deteſted. The young prince with his mother had fled to the court of France, where they were received with the greateſt kindneſs, and found their intereſts more vigorouſly ſupported than before. Their enterpriſes were attended with conſiderable ſucceſs, when Arthur himſelf had the misfortune to be taken priſoner. All the other captives were ſent to England; but the prince was ſhut up in the caſtle of Falaiſe, and from that time was never heard of. It was univerſally believed that John had murdered him with his own hand; and this inflamed the general reſentment againſt him to ſuch a degree, that he ſoon after loſt all his French provinces. In 1205, the duchy of Normandy itſelf was alſo conquered by Philip, and John was forced to fly with diſgrace to England.

The king was reſolved to wreak his vengeance upon the barons, who, he pretended, had deſerted his ſtandard in Normandy. For this reaſon, he levied large England. ſums on their eſtates; in order, as he ſaid, to undertake an expedition to the continent. This expedition, however, he ſeveral times capriciouſly deferred; and once having ventured out to ſea, returned again without making the ſmalleſt attempt. At laſt, he landed at Rochelle, and burnt the city of Angiers; but hearing that the enemy were preparing to oppoſe him, he returned without attempting any thing elſe.

This irreſolute and cowardly behaviour of John made him contemptible in the eyes of his ſubjects; but the Norman princes had ſo far extended the prerogatives of the Engliſh crown, that the barons, however diſcontented, durſt not yet attempt to change the form of government. John, by entering into a controverſy with the church, completed his ruin. The clergy, who for ſome time had acted as a community totally indepen- pope. dent of the civil power, had their elections of each other generally confirmed by the pope, to whom alone they owned ſubjection. The election of archbiſhops, however, had been a ſubject of continual diſpute between the ſuffragan biſhops and the Auguſtine monks. In the mean time the archbiſhop of Canterbury died; and the Auguſtine monks, in a very private manner, elected Reginald, their ſuperior, in his place. The biſhops exclaimed againſt this election, as a manifeſt innovation of their privileges; and a furious theological conteſt was likely to enſue. John very imprudently took a ſide in this controverſy, and eſpouſed the cauſe of the ſuffragan biſhops; in conſequence of which, John de Grey biſhop of Norwich was choſen. The cauſe was appealed to Rome; and Pope Innocent III. ſeizing with avidity an opportunity of extending his power, commanded the monks to chooſe Cardinal Stephen Langton, an Engliſhman, then at the court of Rome. The power of nominating an archbiſhop of Canterbury (a perſon of almoſt equal authority with the king), was an acquiſition that would effectually give the court of Rome an unlimited authority over England. John therefore was reſolved not to ſubmit to this impoſition; but he had not judgment ſufficient to conduct him. He violently expelled the monks from their convent, and ſeized upon their revenues. The pope perceiving, from this abſurd conduct, that John was unequal to the taſk he had undertaken, after ſome intreaties, threatened to put the whole kingdom under an interdict. The prelates threw themſelves on their knees before the king, and in the moſt earneſt manner intreated him to avoid the reſentment of the holy tribunal, by receiving the primate, and reſtoring the monks to their convent. John, however, broke out into the moſt violent invectives. He ſwore by *God's teeth* (his uſual oath), that if the kingdom was put under an interdict, he would baniſh the whole body of the clergy, and confiſcate all their poſſeſſions. The pope at laſt, finding he might do it with ſafety, iſſued forth this terrible ſentence, ſo much dreaded by the whole nation. A ſtop was immediately put to divine ſervice, and the adminiſtration of all the ſacraments except baptiſm. The church-doors were ſhut, and the images of the ſaints laid on the ground. The dead were refuſed Chriſtian burial; and were thrown into ditches and on the highways, without any funeral ſolemnity. Marriage was celebrated in the churchyards, and the people prohibited the uſe of meat as in

138 His conteſt with the

139 The kingdom laid under an interdict.

England.

in times of public penance. They were debarred from all pleasure; even from shaving their beards, saluting each other, or paying any regard to their apparel. The clergy deplored the unhappy state of the nation in the most lamentable manner; while John, in revenge, imprisoned all their concubines, and treated the adherents of Langton with the utmost rigour.

140 The king excommunicated, and the kingdom given to Philip of France.

The furious and imprudent efforts of John proved totally ineffectual. He had scarce a friend left in the whole nation; and therefore, in 1209, the pope denounced a sentence of excommunication against him. This was soon followed by another still more terrible; namely, the absolving all the subjects of the king of England from their allegiance, and declaring every one to be excommunicated who had any commerce with him at his table, council, or even in private conversation. The king, rendered quite furious by these repeated indignities, wreaked his vengeance on his unhappy subjects, whose affections he ought rather to have attempted to conciliate. The pope, therefore, proceeded to execute the full measure of his wrath on this devoted prince, by giving away his kingdom to Philip of France. He published a crusade all over Europe against King John; exhorting the nobility, the knights and men of every condition, to take up arms against him, and enlist under the French banner. Philip was not less active on his part. He summoned all the vassals of the crown to attend him at Rouen; and having collected a fleet of 1700 vessels, was ready, in 1213, to invade England.

The pope had now overstretched his power; and had the English nation been governed by a prince of any degree of prudence or resolution, the power of the clergy would in all probability have been totally broken. The people, however superstitious and ready to obey in matters of religion, could not tamely submit to be given away by the pope as slaves from one master to another; and therefore this consideration, added to the natural antipathy subsisting between the French and English, put John, notwithstanding all his offences, at the head of an army of 60,000 men. But the pope was too great a politician to suffer matters to be carried to extremities. He promised himself many more advantages from the submission of John than from an alliance with Philip; and therefore came over in person, or, according to some, sent over his legate, to England, under pretence of conferring with the barons, but in reality to hold a conference with John. He there represented to this forlorn prince, the numbers of the enemy, the hatred of his own subjects, and the secret confederacy there was against him in England. He intimated, that there was but one way to secure him from the impending danger; namely, to put himself under the protection of the pope, who was a merciful father, and still willing to receive a repenting sinner. The abject and irresolute spirit of John submitted to this last piece of arrogance, and he took an oath to obey whatever the pope should command. In consequence of this oath, he took another, the most extraordinary mentioned in the records of history; and

141 John's submission to the pope.

which, as it was taken while he commanded an army of 60,000 men, discovers a meanness of spirit almost incredible. The terms imposed by it were expressed in the following words. "I John, by the grace of God king of England and lord of Ireland, in order to expiate my sins, from my own free will, and the advice of my barons, *give* to the church of Rome, to Pope Innocent and his successors, the kingdom of England, and all other prerogatives of my crown. I will hereafter hold them as the pope's vassal. I will be faithful to God, to the church of Rome, to the pope *my master*, and his successors legitimately elected. I promise to pay him a tribute of 1000 merks; to wit, 700 for the kingdom of England, and 300 for the kingdom of Ireland."

England.

This oath was taken by the king before all the people, kneeling, and with his hands held up between those of the legate. Having then agreed to reinstate Langton in the primacy, he received the crown which he had been supposed to have forfeited; while the legate, to add to his former insolence, trampled under his feet the tribute which John had consented to pay.—The king of France was enraged at this behaviour of the pope; and resolved to execute his project of conquering England, in spite of him and all his censures. His fleet, however, was attacked in their harbours by the English, who took 300 vessels, and destroyed about 100 more; while Philip, finding it impossible to prevent the rest from falling into the hands of the enemy, set fire to them himself, and thus was obliged to give up all hopes of success.

142 The barons attempt to reduce the prerogatives of the crown.

John being thus freed from all danger, continued to follow the same cruel and tyrannical measures which had hitherto rendered him odious to his subjects. His scandalous subjection to the clergy now gave the barons an opportunity of exerting themselves, in order to reduce the enormous prerogatives of the crown. Their designs were greatly facilitated by the concurrence of Langton the primate, who on all occasions showed a sincere regard for the interests of the kingdom. At a synod of his prelates and clergy, convened in St Paul's, on pretence of examining into the losses of some bishops who had been exiled by John, he privately conferred with a number of barons, to whom he expatiated upon the vices and injustice of their sovereign. He showed them a copy of Henry the first's charter; (being the only one in the kingdom, and which had been buried in the rubbish of an obscure mi gallery). Langton exhorted the barons to insist on a renewal of it; and this they solemnly swore to perform. The same agreement was afterwards renewed at a more numerous meeting of barons summoned by Langton at St Edmondsbury. Here it was resolved, that at Christmas they should prefer their common petition in a body, and in the mean time they separated with a design to put themselves in a posture of defence, enlist men, and fortify their castles. In the beginning of January 1215, they repaired to London, accoutred in their military garb and equipage, and presented their petition to the king, alleging that he had promised to grant a confirmation of the laws of Edward the Confessor, at the time he was absolved from his excommunication. John resented their presumption; and required a promise under their hands and seals, that they would never demand, or attempt to extort, such privileges for the future. This they refused with such unanimity and resolution, that the king desired time to consider of their demands. He promised, that, at the festival of Easter, he would give a positive answer to their petition; and offered them the archbishop of Canterbury, the bishop of

England. Ely, and the earl mareſchal, as ſuretics for fulfilling his engagements.

The barons accepted of his ſecurities, and departed peaceably; but John had no deſign of complying with their deſires. He had recourſe to the clergy, whoſe power he had ſeen and felt in ſo many inſtances. He courted their favour, by granting them a charter eſtabliſhing all thoſe rights of which they were already in the poſſeſſion, and which he now pretended to confirm when he had not the liberty to refuſe. To ingratiate himſelf ſtill farther with this body, he took the croſs, and appealed to the pope againſt the uſurpation of the barons. The pope wrote letters to England, reproaching the primate and biſhops with favouring theſe diſſenſions; and commanded them to promote peace between the two parties. He exhorted the barons to conciliate the king, not with menaces, but with humble intreaties; and promiſed, upon their obedience, to interpoſe his own authority in favour of ſuch of their petitions as he ſhould find to be juſt. At the ſame time, he annulled their aſſociation, and forbade them to enter into any confederacy for the future.

The barons paid no regard to the pope's remonſtrances; knowing that the fulminations of the court of Rome would be of little avail, unleſs they were ſeconded by the clergy of England. After waiting till Eaſter, when the king promiſed to return them an anſwer, they met by agreement at Stamford. There they aſſembled a force of above 2000 knights, and a prodigious number of foot. Thence they marched to Brackley, about 15 miles from Oxford, the place where the court then reſided. John, hearing of their approach, ſent the archbiſhop of Canterbury, the earl of Pembroke, and others of his council, to know the particulars of their requeſt, and what thoſe liberties were which they ſo much importuned him to grant. The barons delivered a ſchedule containing the chief articles of their demands, founded on the charters of Henry and Edward; but which were in the higheſt degree diſpleaſing to the king. He burſt into a furious paſſion, aſked the barons why they did not alſo demand his kingdom; and ſwore that he would never comply with ſuch exorbitant demands. The confederates then choſe Robert Fitzwalter for their general; whom they dignified with the title of "Mareſchal of the army of God and of the holy church." They laid ſiege to Northampton, took Bedford, and were joyfully received into London. They wrote letters to all the nobility and gentry who had not yet declared in their favour, threatening their eſtates with devaſtation in caſe of refuſal or delay.

In the mean time the king was left at a place called *Odiham* in Surrey, attended only by ſeven knights. He vainly endeavoured to avert the ſtorm by the mediation of his biſhops and miniſters. He appealed to Langton againſt the barons, not ſuſpecting that he was engaged in the confederacy; and deſired him to fulminate the church cenſures againſt thoſe who had made war upon their lawful prince. Langton declared that he would paſs no cenſure where he found no delinquent; but ſaid, that much might be done if the king would diſmiſs ſome foreign auxiliaries which he had lately brought over. Upon this John diſbanded a great body of Germans and Flemings whom he had hitherto retained in his ſervice, and Langton refuſed to excommunicate a ſingle baron. The king, being now quite defenceleſs, was obliged at laſt to comply with the demands of his ſubjects. A conference was accordingly appointed, and all things were adjuſted for this moſt important treaty. England.

143 They force him to ſign Magna Charta.

The king's commiſſioners met the barons at a place called *Runimede*, between Staines and Windſor; and which is yet held in reverence as the ſpot where the ſtandard of freedom was firſt erected in England. Here the king ſigned the charter called *Magna Charta*: which continues in force to this day, and is ſtill regarded as the great bulwark of Britiſh liberty. See *Magna Charta*.

144 Principal articles of it.

This charter, however, at the time that it was made, ſecured liberty to the clergy, barons, and gentlemen, much more than to the bulk of the people, who did not for a long time obtain any privileges of importance. Freedom of elections was ſecured to the clergy; and it was determined, that fines on them for any offence ſhould be laid on in proportion to their eſtates, and not the value of their benefices. The privileges ſecured to the barons were, either abatements in the rigour of the feudal laws, or relief from arbitrary and ambiguous deciſions before the courts. It was alſo decreed, that barons ſhould recover the lands of their vaſſals, even though forfeited by felony, after having been in the poſſeſſion of the crown for a year and a day; and no tax was to be impoſed without conſent of the great council of the nation, excepting in caſe of the captivity of the king, the knighting of his eldeſt ſon, or marrying his eldeſt daughter. No land belonging to any baron was to be ſeized for a crown debt, unleſs the poſſeſſor had not perſonal property enough to pay it; neither was any vaſſal to be allowed to ſell ſo much of his land as to incapacitate him from performing the neceſſary ſervice to his lord. It was alſo determined, that when the great council of the nation was called, the prelates, earls, and barons, ſhould be ſummoned by a particular writ, and the leſſer barons ſhould receive a ſummons from the ſheriff. In favour of the people it was ſtipulated, that they ſhould have from the barons all the immunities and privileges granted by the king to the former. Merchants were to be allowed to carry on their buſineſs without any arbitrary tolls or impoſitions, and to go out of the kingdom and return at pleaſure. The goods of every freeman were to be diſpoſed of according to his will; or if he died inteſtate, the neareſt heir ſhould ſucceed him. No carts, horſes, or wood, were to be taken by the crown officers without the conſent of the owner. The king's courts were to be ſtationary, and no delay to be made in doing juſtice to every one; no freeman ſhould be taken or impriſoned, diſpoſſeſſed of his free tenement, outlawed or baniſhed, unleſs by the legal judgment of his peers, &c. It was likewiſe ſtipulated, that London ſhould remain in the hands of the barons, and the tower be conſigned to the primate, till the 15th of Auguſt following; or till the articles of the charter ſhould be fulfilled. To give the more ſecurity for this, the king allowed them to chooſe 25 of their own number, to whoſe authority no limits were ſet either in extent or duration. If any complaint were made of a violation of the charter, either by the king or his officers, any four of the barons might admoniſh the king to redreſs the grievance; and if ſatisfaction were not obtained,

England. obtained, they might assemble the whole council of 25; and they, in conjunction with the great council, were empowered to compel him to fulfil the charter. In case of his resistance, they had liberty to levy war against him, attack his castles, and use every kind of violence, except against his person, or those of the queen or children. All men throughout the kingdom were bound, under the penalty of confiscation, to swear obedience to the 25 barons; and the freeholders of each county were to choose 12 knights, whose business it was to report such evil customs as ought to be redressed in terms of Magna Charta.

But although John had thus obliged himself, by writing, to allow liberty to his subjects, he had no mind that they should enjoy it in reality. The sense of his subjection to his own vassals sunk deep in his mind. He became sullen, silent, and reserved. He shunned the society of his former friends; and retired into the isle of Wight, as if to hide his disgrace in solitude; but, in reality, to
145 The king raises an army against his barons. meditate revenge against the barons. He sent to the continent to enlist a large body of mercenary troops, and made complaints to the pope of the insurrections of the barons against him. The pontiff very warmly espoused his cause; a bull was sent over, annulling the whole charter; and at the same time the foreign troops arriving, the king once more found himself in a condition to demand his own terms from his subjects.

The barons had made no preparations for war, not suspecting the introduction of a foreign army. The king, therefore, was for some time undisputed master of the field, and the most horrid cruelties were committed by his army. The nobility who had been most active in procuring the great charter fled with their families to Scotland, where they obtained the protection
146 They offer the kingdom to Louis the French king's son. of King Alexander by doing homage to him. The barons being totally unable to raise an army capable of contending with that of John, applied to their old enemy Philip of France, offering to acknowledge his eldest son Louis for their sovereign, on condition of his protecting them from the fury of John and his mercenaries. The French king accepted their proposal with joy; and twenty-five hostages which he demanded being sent over, began to make the most diligent preparations for this expedition, regardless of the menaces of the pope, who threatened him with excommunication, and actually excommunicated his son Louis some time after.

The first troops who came to the assistance of the barons, were only a body of 7000 men; but, soon after, Louis with a powerful army landed at Sandwich. The first effect of this invasion was, that most of John's foreign troops deserted, refusing to serve against the heir of their monarchy. Many considerable noblemen also deserted his cause, and Louis daily gained ground. This prince advanced to London, where the barons and burghers did him homage, and took the oath of allegiance, after he had sworn to confirm the liberties and privileges of the people. His imprudence, however, in preferring on all occasions his French subjects to the English, soon excited a jealousy against him, which proved very prejudicial to his cause. This jealousy was greatly increased by the death-bed confession of the Count de Melun, one of his courtiers, who declared to those about him, that it was Louis's design to exterminate the English barons as traitors, and to bestow their dignities and estates upon his French subjects, on whose fidelity he could more safely rely. This caused a considerable desertion among Louis's party: so that John once more found himself in a condition to make an effort for his crown. He resolved to penetrate into the heart of the kingdom; and, for this purpose, he departed from Lynn, and took the road towards Lincolnshire at the head of a great body of troops. His road lay along the shore, which was overflowed at high water; but the king, not being apprised of this, or being ignorant of the tides of the place, lost all his carriages, treasure, and baggage by their influx. He himself escaped with the utmost difficulty, and arrived at the abbey of Swinstead; where his grief for the loss he had sustained, and the distracted state of his affairs, threw him into a fever, which soon appeared to be attended with fatal symptoms. He died at Newark in the year 1216, the 51st 147 Death of King John. of his age, and 18th of his reign. He left two legitimate sons: Henry, who succeeded him on the throne, and was about nine years of age; and Richard, who was about seven. He left also three daughters; Jane, married to Alexander king of Scotland; Eleanor, married to the earl of Pembroke; and Isabella, married to the emperor Frederic II.

When John died, the earl of Pembroke was mareschal of England. By this office he was at the head of the army, and of consequence, in times of such turbulence, at the head of the state. He was a nobleman of great honour and fidelity, and had continued faithful to John in his greatest reverses of fortune. He now determined to support the authority of the infant Prince Henry; and therefore carried him immediately to Gloucester, where the ceremony of coronation was performed, in the presence of Gualo the legate and a very few noblemen, by the bishops of Winchester and 148 Henry III. Bath. The young prince was obliged to swear fealty to the pope, and renew the homage which his father had done for the kingdom; after which the earl of Pembroke was chosen protector.

Till the king arrived at the years of maturity, the transactions of his reign can only be considered as the 149 He grants new charters. consequences of the disposition of his tutors. Pembroke caused him grant a new charter of liberties, consisting of the concessions extorted from John, with some alterations; and the next year it was renewed, with the addition of some other articles. Thus these famous charters were brought very nearly to the shape in which they have ever since stood; and they were, during many generations, esteemed the most sacred rampart to national liberty and independence. As they secured the rights of all orders of men, they were anxiously defended by all, and became in a manner the basis of the English monarchy, and a kind of original contract, which both limited the authority of the king, and ensured the conditional allegiance of his subjects. Though often violated, they were still claimed and recalled by the nobility and people; and as no precedents were supposed valid that infringed them, they rather acquired, than lost, authority, from the frequent attempts made against them, in several ages, by regal and arbitrary power.

These charters were made use of by Pembroke as arguments to draw off the malecontent barons from their allegiance to Louis. He represented to them, that, whatever

England. whatever jealouſy they might have entertained againſt the late king, a young prince, the lineal heir of their ancient monarchs, had now ſucceeded to the throne, without ſucceeding either to the reſentments or principles of his predeceſſor: That the deſperate expedient, which they had employed, of calling in a foreign potentate, had, happily for them, as well as for the nation, failed of entire ſucceſs; and it was ſtill in their power, by a quick return to their duty, to reſtore the independence of the kingdom, and to ſecure that liberty for which they ſo zealouſly contended: That, as all paſt offences of the barons were now buried in oblivion, they ought, on their part, to forget their complaints againſt their late ſovereign; who, if he had been anywiſe blameable in his conduct, had left to his ſon the ſalutary warning to avoid his paths, which had led to ſuch fatal extremities: And that, having now obtained a charter for their liberties, it was their intereſt to ſhow, by their conduct, that the acquiſition was not incompatible with their allegiance; and that the rights of the king and people, ſo far from being hoſtile and oppoſite, might mutually ſupport and ſuſtain each other.

150 Decline of Prince Louis's party.

Theſe conſiderations, enforced by Pembroke's known character of conſtancy and fidelity, had a very great influence on the barons. Moſt of them began to negotiate with him, and many actually returned to their duty. At the ſame time Louis continued to diſguſt thoſe of his own party by the preference which he viſibly gave to the French. Though he went over to France, therefore, and brought freſh ſuccours from thence, he found that his party was greatly weaker than before, by the deſertion of his Engliſh confederates; and that the death of King John had, contrary to his expectations, occaſioned the total ruin of his affairs. In a ſhort time Pembroke was ſo much ſtrengthened by deſerters from Louis's party, that he ventured to inveſt Mount Sorel; though upon the approach of the count de Perche with the French army, he deſiſted from that enterpriſe. The French general immediately marched to Lincoln; and, being admitted into the town, laid ſiege to the caſtle, and ſoon reduced it to extremity. Pembroke ſummoned his forces from every quarter, in order to relieve this important place; and he appeared ſo much ſuperior to the French, that they ſhut themſelves up within the city, reſolving to take ſhelter there. But the garriſon of the caſtle, having received a ſtrong reinforcement, made a vigorous ſally upon the beſiegers, while the Engliſh army aſſaulted them from without. The French army was totally routed; the count de Perche with only two perſons more were killed; but many of the chief commanders, and about 400 knights, were made priſoners. On the news of this fatal event, Louis raiſed the ſiege of Dover, and retired to London; where he received intelligence of a new diſaſter, which put an end to all his hopes. A French fleet, which carried a ſtrong reinforcement, had appeared on the coaſt of Kent; where they were attacked and repulſed with conſiderable loſs by Philip d'Albiney. He is ſaid to have gained the victory by the following ſtratagem. Having got the wind of the French, he came down upon them with violence; and throwing on their faces a great quantity of quicklime, which he purpoſely carried on board, they were ſo blinded that they were diſabled from defending themſelves. This misfortune England. ſo diſcouraged the barons who yet adhered to Louis, that they came from every quarter to make their ſubmiſſion to Pembroke: and Louis himſelf, finding his affairs totally deſperate, was glad to make his eſcape from a country where every thing was become hoſtile to him. He therefore concluded a peace with the protector; promiſed to evacuate the kingdom; and only ſtipulated, in return, an indemnity to his adherents, and a reſtitution of their honours and fortunes, together with the free and equal enjoyments of thoſe liberties which had been granted to the reſt of the nation.

151 He leaves the kingdom.

When the king grew up, he was found to be very unfit for the government of ſuch a turbulent people as the Engliſh at that time were. Though his temper was mild and humane, he was alſo very weak, fickle, and irreſolute. He diſguſted the people by the careſſes he beſtowed on foreigners; and this diſguſt roſe once to ſuch a height, that the barons refuſed to aſſemble in the general council of the nation, or parliament, at his deſire. When commanded to do ſo, they ſent a meſſage to Henry, deſiring him to diſmiſs his foreigners; otherwiſe they would drive both him and them out of the kingdom, and put the crown on the head of one who was more worthy to wear it. The facility of Henry's temper alſo induced him to heap riches upon his foreign favourites in a manner which he could by no means afford: this often brought him into very great ſtraits; and to relieve himſelf, he was obliged to have recourſe to many arbitrary meaſures, which he could not otherwiſe have choſen. Nothing, however, of very great moment happened till the year 1255, when the pope found means to embark Henry in a ſcheme for the conqueſt of Naples, or Sicily on this ſide the Fare, as it was called; an enterpriſe which not only brought much diſhonour on the king, but involved him for ſome years in very great expence and trouble. The court of Rome ſome time before had reduced the kingdom of Sicily to the ſame ſtate of feudal vaſſalage which he pretended to exerciſe over England; but Mainfroy, an uſurper, under pretence of governing the kingdom for the lawful heir, had ſeized the crown, and was reſolved to reject the pope's authority. As the pope found that his own force alone was not ſufficient to gain his point, he had recourſe to Richard the king of England's brother, who had been created earl of Cornwall, and had ſuch talents for amaſſing money, that he was reckoned the richeſt prince in Chriſtendom. To him the pope offered the kingdom of Sicily, upon the ſingle condition of his conquering it from the uſurper. Richard was too wiſe to accept this offer; upon which the pope applied to Henry, and offered him the crown of Sicily for his ſecond ſon Edmund. Henry, dazzled by this propoſal, without reflecting on the conſequences, or without conſulting his brother or the parliament, gave the pope unlimited credit to expend whatever ſums he thought neceſſary for completing the conqueſt of Sicily. In conſequence of this unlimited grant, his holineſs determined to exert his apoſtolical authority to the utmoſt, in extorting money from the Engliſh. A cruſade was publiſhed, requiring every one who had taken the croſs againſt the infidels, or even vowed to advance money for that purpoſe, to ſupport the war againſt Mainfroy, whom he accuſed as being a more terrible

152 The pope undertakes the conqueſt of Sicily for Henry's ſon.

153 Intolerable extortions by his holineſs.

English. enemy to the Chriſtian faith than any Saracen. A tenth on all the eccleſiaſtical benefices in England was levied for three years; and orders were given to excommunicate the biſhops who did not make punctual payment. A grant was made to the king of the goods of inteſtate clergymen, as well as of the revenues of vacant benefices and thoſe of non-reſidents. Theſe taxations, however grievous, were ſubmitted to with little murmuring; but another ſuggeſted by the biſhop of Hereford excited the moſt violent clamours. This I relate, who at that time reſided at the court of Rome, drew bills on all the abbots and biſhops of the kingdom, to the amount of no leſs than 150,540 marks, which he granted to Italian merchants in conſideration of the money they had advanced or pretended to advance for the ſupport of the Sicilian war. As it was apprehended that the Engliſh clergy would not eaſily ſubmit to ſuch an extraordinary demand, a commiſſion was given to Ruſtand, the pope's legate, to uſe his authority. An aſſembly of the prelates and abbots was accordingly ſummoned; who, on hearing the propoſal ſanctified with the names both of the pope and king, were ſtruck with the utmoſt ſurpriſe and indignation. A violent altercation took place; during which the legate told them, that all eccleſiaſtical benefices were the property of the pope, and that he might diſpoſe of them as he pleaſed. The affair ended, however, in the ſubmiſſion of the clergy: but the barons ſtill continued refractory, and for ſome time anſwered the king's demands of ſupplies with expoſtulations; urging the king's partiality to foreigners, and the various injuries the nation had ſuſtained from the ſervants of the crown. The great council of the nation, which had lately obtained the name of *parliament*, was therefore diſſolved, and another called, but with as little ſucceſs as before. The king, however, had involved himſelf in ſo much debt, that a large ſupply was become abſolutely neceſſary; and as that could by no means be obtained from parliament, he was now reduced to the humiliating expedient of going about among ſuch of his ſubjects as he thought moſt attached to him, and begging aſſiſtance from them at their own houſes. At length his barons, perceiving the exigences to which he was reduced, ſeemed willing to afford him aid; and, upon his promiſing to grant them a plenary redreſs of grievances, a very liberal ſupply was obtained, for which he renewed their charter with more than uſual ſolemnity. All the prelates and abbots were aſſembled with burning tapers in their hands; the magna charta was read in their preſence; and they denounced ſentence of excommunication upon all who ſhould infringe upon its deciſions. They then put out their tapers on the ground, and exclaimed, "May every ſoul that proves falſe to this agreement ſo ſtink and corrupt in hell." The king ſubjoined, "So help me God, I will inviolably keep all theſe things, as I am a man, as I am a Chriſtian, as I am a knight, and as I am a king crowned and anointed."

[153] Henry ſolemnly renews Magna Charta.

No ſooner had the king received the ſupplies of which he ſtood ſo much in need, than he forgot all his engagements, put his confidence entirely in foreign counſellors, and evaded or broke through in numberleſs inſtances the charters he had given. This conduct rendered him ſo obnoxious to the barons, that Simon Mountfort earl of Leiceſter, a man of a very violent and ambitious temper, determined to attempt a revolution in the government. He formed a powerful confederacy againſt the king, and the deſigns of the conſpirators were effectually put in execution in the year 1258. Henry had ſummoned a parliament in expectation of receiving ſupplies for his Sicilian project; when the barons appeared in the hall, clad in complete armour, with their ſwords by their ſides. The king, ſtruck with this unuſual appearance, aſked them what was their purpoſe, and whether they pretended to make him their priſoner? Roger Bigod, earl mareſchal, anſwered in name of the reſt, that he was not their priſoner; that they even intended to grant him large ſupplies, in order to fix his ſon on the throne of Sicily; that they only expected ſome return for this expence and ſervice; and that as the king had frequently made ſubmiſſions to the parliament, had acknowledged his paſt errors, and had ſtill allowed himſelf to be carried into the ſame path, which gave them ſuch reaſon of complaint, he muſt now yield to more ſtrict regulations, and confer authority on thoſe who were able and willing to redreſs the public grievances. Henry inſtantly aſſured them of his intentions to grant them all poſſible ſatisfaction; and for that purpoſe ſummoned another parliament at Oxford, to digeſt the new plan of government, and to elect proper perſons who were to be entruſted with the chief authority. This aſſembly, afterwards called the *mad parliament*, went very expeditiouſly to work on the buſineſs of reformation. Twenty-four barons were appointed, with ſupreme authority, to reform the abuſes of the ſtate; and Leiceſter was placed at their head. Their firſt ſtep was to order four knights to be choſen out of each county, who ſhould examine into the ſtate of their reſpective conſtituents, and ſhould attend at the enſuing parliament to give information of their complaints. They ordained that three ſeſſions of parliament ſhould be regularly held every year; that a new high ſheriff ſhould be elected annually; that no wards nor caſtles ſhould be entruſted to foreigners, no new foreſts made, nor the revenues of any counties let to farm.

[154] He breaks his engagements, which occaſions a revolution.

[155] Bad conduct of the new rulers.

Theſe conſtitutions were ſo juſt, that ſome of them remain to this day. But the parliament having once obtained the ſovereign power, took care not to part with it again. They not only protracted the time of their ſitting under various pretences; but at laſt had the effrontery to impoſe an oath upon every individual of the nation, declaring an implicit obedience to all the ſtatutes executed or to be yet executed by the barons who were thus appointed as rulers. They not only abridged the authority of the king, but the efficacy of parliament alſo; giving up to 12 perſons the whole parliamentary power between each ſeſſion.—Their uſurpations were firſt oppoſed by the knights of the ſhire, whom they themſelves had appointed. Theſe had for ſome time begun to be regularly aſſembled in a ſeparate houſe, to conſider of the national grievances; the firſt of which was the conduct of the 24 rulers. They repreſented, that though the king had performed all that was required of him, the barons had hitherto done nothing on their part that ſhowed an equal regard for the people; that their own intereſt and power ſeemed the only aim of all their decrees; and they even called upon the king's eldeſt ſon Prince Edward,

England. Edward to interpoſe his authority, and ſave the ſinking nation.

156 Oppreſſed by Prince Edward.

The prince was at this time about 22 years of age, and by his active and reſolute conduct had inſpired the nation with great hopes. He told thoſe who made the application to him, that he had ſworn to the late conſtitutions; and, on that account, though they were contrary to his own private opinions, he was reſolved not to infringe them. At the ſame time, however, he ſent a meſſage to the barons, requiring them to bring their undertaking to an end, or otherwiſe to expect the moſt vigorous reſiſtance to their uſurpations. On this the barons were obliged to publiſh a new code of laws, which, though it contained ſcarce any thing material, yet, it was ſuppoſed, would for a while dazzle the eyes of the people, until they could take meaſures to eſtabliſh their authority upon ſurer foundations. In this manner, under various pretences, they continued their power for three years; while the whole nation loudly condemned their treachery, and the pope himſelf at laſt abſolved the king and his ſubjects from the oath they had taken to obey their injunctions. Soon after this, a parliament was called, and the king reinſtated in his former authority. The barons were obliged to ſubmit for a time; but the earl of Leiceſter having joined the Welſh, who at this time made an irruption into England, the kingdom was reduced to the moſt deplorable ſituation. The puſillanimity of the king prevented any proper or judicious method from being purſued for extricating the people from their diſtreſſes; and at laſt a treaty was concluded with the barons on the moſt diſadvantageous terms that can be imagined. They were reſtored to the ſovereignty of the kingdom, took poſſeſſion of all the royal caſtles and fortreſſes, and even named the officers of the king's houſehold. They ſummoned a parliament to meet at Oxford, in order more fully to ſettle the plan of government; and by this aſſembly it was enacted that the authority of the 24 barons ſhould continue not only during the life of King Henry, but alſo during that of Prince Edward.

157 Who is defeated and taken priſoner, with the king and his brother.

Theſe ſcandalous conditions would have been eaſily complied with by King Henry; but they were utterly rejected by Prince Edward, and a civil war immediately enſued. The prince was at firſt ſucceſsful; but, through his impetuoſity, occaſioned the loſs of a great battle, in which his father and uncle were taken priſoners, and he himſelf was obliged ſoon after to ſurrender to the earl of Leiceſter. The king was now reduced to the moſt deplorable ſituation. His partiſans were totally diſarmed, while thoſe of the earl of Leiceſter ſtill kept themſelves in an offenſive poſture. Leiceſter ſeized the eſtates of no fewer than 18 barons; engroſſed to himſelf the ranſom of all the priſoners; monopolized the ſale of wood to foreign markets; and at laſt ordained that all power ſhould be exerciſed by nine perſons, who were to be choſen by three others, or the majority of them; and theſe three were the earl of Leiceſter himſelf, the earl of Glouceſter, and the biſhop of Chicheſter.

158 Firſt Houſe of Commons.

The miſerable ſituation to which the kingdom was now reduced, proved at laſt the means of ſettling the government on a more proper foundation. Leiceſter, in order to ſecure himſelf, was obliged to have recourſe to an aid, till now entirely unknown in England, namely, that of the body of the people. He called a parliament, where, beſides the barons of his own party, and ſeveral eccleſiaſtics who were not proper tenants of the crown, he ordered returns to be made of two knights from every ſhire; and alſo deputies from the boroughs, which had been hitherto conſidered as too inconſiderable to be allowed any ſhare in the legiſlation. This parliament was called on the 20th of January 1265: and here we find the firſt outline of an Engliſh Houſe of Commons; an inſtitution which has ever ſince been conſidered as the bulwark of Britiſh liberty. England.

The new parliament was far from being ſo compliant to Leiceſter as he had deſired or expected. Many of the barons who had hitherto ſtedfaſtly adhered to his party were diſguſted with his boundleſs ambition; and the people, who found that a change of maſters was not a change from miſery to happineſs, began to wiſh for the re-eſtabliſhment of royal authority. Leiceſter at laſt, to make a merit of what he could not prevent, releaſed Prince Edward from his confinement, and had him introduced at Weſtminſter-hall, where his freedom was confirmed by the unanimous voice of the barons. But though Leiceſter had all the popularity of reſtoring the prince, he was yet politic enough to keep him guarded by his emiſſaries, who watched all his actions. At laſt, however, he found means to make his eſcape in the following manner. The duke of Glouceſter, being diſguſted with Leiceſter, retired from court, and went to his eſtates on the borders of Wales. His antagoniſt purſued him thither: and to give the greater authority to his arms, carried the king and prince of Wales along with him. This furniſhed young Edward with the opportunity he had ſo long deſired. Being furniſhed by the earl of Glouceſter with a horſe of extraordinary ſwiftneſs, he took leave of his attendants, who were in fact his guards, but were not able to come up with him. They purſued him, however, for ſome time; but the appearance of a body of troops belonging to Glouceſter ſoon put an end to their purſuit.

159 Prince Edward recovers his liberty.

The prince no ſooner recovered his liberty, than the royaliſts joined him from all quarters, and an army was ſoon procured which Leiceſter could not withſtand. This nobleman now found himſelf in a remote quarter of the kingdom; ſurrounded by his enemies; and debarred from all communication with his friends by the river Severn, whoſe bridges Edward had broken down. In this extremity, he wrote to his ſon to haſten to his aſſiſtance from London, with a conſiderable body which he had under his command. With this view his ſon advanced to Kenilworth; but here he was ſurpriſed, and his army entirely diſperſed by Prince Edward. The young prince, immediately after this victory, advanced againſt Leiceſter himſelf; who, ignorant of the fate of his ſon's army, had paſſed the Severn in boats. He was by no means able to cope with the royaliſts; his men being inferior both in numbers and reſolution to their antagoniſts. His army was defeated with great ſlaughter. Leiceſter himſelf was ſlain, though he called out for quarter, together with his eldeſt ſon Henry, and about 160 knights and other gentlemen. The old king had been purpoſely placed by the rebels in the front of the battle, where he was wounded, and in great danger of being killed; but, crying out, "I am Henry of Winchеſter your king," he was ſaved and put in a place of ſecurity by his ſon, who

160 Earl of Leiceſter defeated and killed.

England. who had flown to his aſſiſtance. The body of Leiceſter being found among the dead, was barbarouſly mangled by one Roger Mortimer; and then ſent to his widow, as a teſtimony of the royal party's barbarity and ſucceſs.

This victory, gained at Evelham, proved deciſive in favour of the royal party. Almoſt all the caſtles, garriſoned by the barons, haſtened to make their ſubmiſſions, and opened their gates to the king. The Iſle of Axholme alone, and that of Ely, truſting to the ſtrength of their ſituation, ventured to make reſiſtance; but were at laſt reduced, as well as the caſtle of Dover, by the valour and activity of Prince Edward. Adam de Gourdon, a courageous baron, maintained himſelf ſome time in the foreſts of Hampſhire, committing depredations in the neighbourhood; and obliged the prince to lead a body of troops into that country againſt him. Edward attacked the camp of the rebels; and being tranſported by the ardour of action, leaped over the trench with a few followers, and encountered Gourdon himſelf in ſingle combat. The victory was long diſputed between theſe two valiant combatants; but ended at laſt in the prince's favour, who wounded his antagoniſt, threw him from his horſe, and took him priſoner. He not only granted him his life; but introduced him that very night to the queen at Guildford, procured his pardon, and was ever after faithfully ſerved by him.

In 1271, Prince Edward, having ſettled the affairs of the kingdom, undertook an expedition to the Holy Land, where he ſignalized himſelf by many acts of valour. The king's health declined viſibly after the departure of his ſon; and at laſt, worn out with cares and the infirmities of age, he expired at St Edmonſbury on the 16th of November 1272, in the 64th year of his age and the 56th of his reign.

161 Death of Henry III.

Prince Edward had reached Sicily in his return from the Holy Land, when he received an account of his father's death; at which he expreſſed much concern. As he knew that England was at that time in a ſtate of perfect tranquillity, he was in no haſte to return, but ſpent near a year in France before he made his appearance in England. He was received by his ſubjects with the utmoſt joy, and crowned at Weſtminſter by Robert archbiſhop of Canterbury on the 19th of Auguſt 1274. He immediately applied himſelf to the correcting of thoſe diſorders which the civil commotions, and weak adminiſtration of his father, had introduced. A ſyſtem of ſtrict juſtice, bordering on ſeverity, was introduced and kept up through the whole of this reign. The Jews were the only part of his ſubjects whom Edward oppreſſed. Many arbitrary taxes were levied upon them; 280 of them were hanged at once for adulterating the coin; the goods of the reſt were confiſcated, and all of them baniſhed the kingdom.

162 Edward I.

163 Conquers Wales.

In 1276, the king undertook an expedition againſt Lewellyn prince of Wales, who had refuſed to do homage for his crown. The conqueſt of that country was not fully accompliſhed till the year 1283; after which the principality of Wales was annexed to the crown of England, and thenceforth gave a title to the king's eldeſt ſon *.—In 1286, the ſettlement of Wales appeared ſo complete, that the king went abroad in order to make peace between Alfonſo king of Arragon and Philip le Bel king of France, who had a difference about the kingdom of Sicily. He ſucceeded in his negotiations; but, ſtaying abroad three years, he found that many diſorders had been introduced in his abſence. Many inſtances of robbery and violence had broke out in all parts of England; but the corruption of the judges, by which the fountains of juſtice were poiſoned, was of ſtill more dangerous conſequence. Edward, in order to remedy this prevailing abuſe, ſummoned a parliament, and brought the judges to a trial; where all of them except two, who were clergymen, were convicted of this flagrant iniquity, were fined, and depoſed from their office. The amount of the fines levied upon them is of itſelf a ſufficient proof of their guilt, being above 100,000 marks; an immenſe ſum in thoſe days, ſufficient to defray the expences of a war betwixt two great nations. The king afterwards made all the new judges ſwear that they would take no bribes; but the depoſing and fining the old ones was the more effectual remedy. England

* See *Wales*.

In 1291, King Edward began to meditate the conqueſt of Scotland, which employed him during the reſt of his life; but which, though that kingdom was by him reduced to the greateſt diſtreſs, he was never able to accompliſh †. At the ſame time, he was engaged in expenſive conteſts with France; and theſe multiplied wars and preparations for war, by obliging him to have frequent recourſe to parliamentary ſupplies, became the remote cauſes of great and important changes in the government. The parliament was new-modelled into the form which has continued ever ſince. As a great part of the property of the kingdom, by the introduction of commerce and improvements in agriculture, was transferred from the barons to the lower claſs of people, ſo their conſent was thought neceſſary for raiſing the ſupplies. For this reaſon, the king iſſued writs to the ſheriffs, enjoining them to ſend to parliament, along with two knights of the ſhire, two deputies from each borough within their county; and theſe provided with ſufficient powers from their conſtituents to grant ſuch demands as they ſhould think reaſonable for the ſafety of the ſtate. The charges of theſe deputies were to be borne by the boroughs which ſent them; and ſo far were they from conſidering this deputation as an honour, that nothing could be more diſpleaſing to any borough than to be thus obliged to ſend a deputy, or to any individual than to be thus choſen. The authority of theſe commoners, however, increaſed through time. Their union gave them weight; and it became cuſtomary among them, in return for the ſupplies which they granted, to prefer petitions to the crown for the redreſs of thoſe grievances under which the nation was ſuppoſed to labour. The more the king's neceſſities increaſed, the more he found it neceſſary to give them an early redreſs; till, from requeſting, the commons proceeded to requiring; and having all the property of the nation, they by degrees began alſo to be poſſeſſed of the power.

† See *Scotland*.

164 Attempts the conqueſt of Scotland.

165 New-models the parliament.

Edward I. died of a dyſentery at Carliſle on the 7th of July 1307, as he was leading a great army into Scotland, againſt the inhabitants of which he had vowed the moſt dreadful vengeance. He was ſucceeded by his ſon Edward II. whom he had charged with his dying breath to proſecute the war againſt Scotland, and never to deſiſt till he had finally ſubdued the

166 Dies and is ſucceeded by Edw. II.

England. kingdom. But the new king was of a very different diſpoſition from his father. The Scots gradually recovered their power; and in 1314 gave the Engliſh ſuch a terrible defeat at Bannockburn, that for many years no ſuperiority of numbers could encourage them to look the Scots in the face. See SCOTLAND.

167 Diſcontents of his ſubjects. The reign of Edward II. affords no particulars of great moment. Being a prince of a weak underſtanding, though endued with no remarkable bad qualities, his reign was one continued ſeries of quarrels with his turbulent ſubjects. His favourites were the moſt general cauſes of diſcontent. The firſt of theſe was one Piers Gaveſton, the ſon of a Gaſcon knight of ſome diſtinction, who had honourably ſerved the late king, and who, in reward for his ſervices, had obtained an eſtabliſhment for his ſon in the family of the prince of Wales.—To be the favourite of any king whatever, is no doubt in itſelf a ſufficient offence to the reſt of the courtiers. Numberleſs faults were therefore found with Gaveſton by the Engliſh barons. When the king went over to France to eſpouſe the princeſs Iſabella, to whom he had been long contracted, Gaveſton was left guardian of the realm, with more ample powers than had uſually been conferred in ſuch a caſe. But when the queen, who was of an imperious and intriguing ſpirit, arrived, Gaveſton had the misfortune to fall under her diſpleaſure alſo, on account of the aſcendency he had acquired over the king. A conſpiracy was therefore ſoon formed againſt the favourite; at the head of which were the queen, and the earl of Lancaſter, couſin-german to the king, and the moſt opulent and powerful nobleman in England. The king, unable to reſiſt ſuch a combination, was at laſt obliged to baniſh Gaveſton; but recalled him ſome time after. This was ſufficient to ſpread an alarm over the whole kingdom: a civil war enſued; and the nobility having got Gaveſton into their hands, ſoon freed themſelves of any farther apprehenſions from him, by putting him to death.

After the unfortunate defeat at Bannockburn, King Edward choſe a new favourite named *Hugh le Deſpenſer*. He was a young man of a noble Engliſh family, ſome merit, and very engaging accompliſhments. His father was a perſon of a much more reſpectable character than the ſon; but the being admitted to a ſhare of King Edward's favour was a ſufficient crime. The king imprudently diſpoſſeſſed ſome lords of their eſtates, in order to beſtow them upon this favourite; and this was a ſufficient pretence for openly attacking both the father and ſon. The earls of Lancaſter and Hereford flew to arms. Sentence was procured from parliament of perpetual exile againſt the two Spenſers, with a forfeiture of all their eſtates. At laſt the king took the field at the head of 30,000 men, and preſſed the earl of Lancaſter ſo cloſely, that he had not time to collect his forces together; and, flying from one place to another, he was at laſt ſtopped in his way towards Scotland, and made priſoner. He was immediately condemned by a court-martial; and executed on an eminence near Pomfret, with circumſtances of the greateſt indignity.

Spenſer now triumphed for ſome time over his enemies; moſt of the forfeitures were ſeized for his uſe, and he is ſaid to have been guilty of many acts of rapine and injuſtice. But he was ſoon oppoſed by a more formidable enemy. Queen Iſabella fled to France, and refuſed to return to England till Spenſer was removed from the royal preſence, and baniſhed the kingdom. Thus ſhe made herſelf popular in England, where Spenſer was univerſally diſliked; and ſhe had the pleaſure of enjoying the company of a young nobleman named *Mortimer*, upon whom ſhe had lately placed her affections. The queen's court, therefore, became a ſanctuary for all the malecontents who were baniſhed their own country, or who choſe to come over. When ſhe thought matters were ripe for her purpoſe, ſhe ſet ſail from Dort harbour, accompanied by 3000 armed men. She landed without oppoſition on the coaſt of Suffolk, on the 24th of September 1326; and ſhe no ſooner appeared, than there ſeemed to be a general revolt in her favour. The unfortunate king found the ſpirit of diſloyalty ſpread over the whole kingdom. He had placed ſome dependence on the garriſon of Briſtol, which was under the command of the elder Spenſer; but they mutinied againſt their governor; and that unfortunate favourite was delivered up, and condemned by the tumultuous barons to the moſt ignominious death. He was hanged on a gibbet in his armour; his body was cut in pieces and thrown to the dogs; and his head was ſent to Wincheſter, where it was ſet on a pole, and expoſed to the inſults of the populace. Young Spenſer did not long ſurvive his father. He was taken, with ſome others who had followed the fortunes of the wretched king, in an obſcure convent in Wales. The queen had not patience to wait the formality of a trial; but ordered him to be immediately led forth before the inſulting populace, and ſeemed to take a ſavage pleaſure in beholding his diſtreſs. He was executed on a gibbet 50 feet high; his head was ſent to London, where it was received by the citizens with brutal triumph, and fixed on the bridge.

England. 168 Inſurrection againſt him by the Queen.

In the mean time the king, who hoped to find refuge in Wales, was quickly diſcovered, and delivered up to his adverſaries, who inſulted him in the groſſeſt manner. He was conducted to the capital amidſt the inſults and reproaches of the people, and confined in the tower. A charge was ſoon exhibited againſt him; in which no other crimes but his incapacity to govern, his indolence, his love of pleaſure, and his being ſwayed by evil counſellors, were objected againſt him. His depoſition, however, was quickly voted by parliament; he was aſſigned a penſion for his ſupport; his ſon Edward, a youth of 14, was choſen to ſucceed him, and the queen was appointed regent during the minority. The depoſed monarch did not long ſurvive the loſs of his crown. He was at firſt conſigned to the cuſtody of the earl of Lancaſter; but this nobleman ſhowing ſome marks of reſpect and pity, he was taken out of his hands, and delivered over to the lords Berkeley, Mautravers, and Gournay, who were entruſted alternately, each for a month, with the charge of guarding him. While he was in Berkeley's cuſtody, he was ſtill uſed with ſome degree of humanity; but when the turn of Mautravers and Gournay came, every ſpecies of indignity was practiſed upon him, as if they had deſigned to accelerate his death by the bitterneſs of his ſufferings. It is reported, that one day when

169 Edward depoſed;

Edward

England. Edward was to be ſhaved, they ordered cold and dirty water to be brought from a ditch for that purpoſe; and when he deſired it to be changed, and was ſtill denied his requeſt, he burſt into tears and exclaimed, That in ſpite of their inſolence he would be ſhaved with clean and warm water. As his perſecutors, however, ſaw that his death might not arrive, even under every cruelty they could practiſe, and were daily afraid of a revolution in his favour, they determined to rid themſelves of their fears by deſtroying him at once. Mortimer, therefore, ſecretly gave orders to the two keepers, who were at his devotion, inſtantly to diſpatch the king; and theſe ruffians contrived to make the manner of his death as cruel and barbarous as poſſible. Taking advantage of Berkeley's ſickneſs, in whoſe cuſtody he then was, and who was thereby incapacitated from attending his charge, they came to Berkeley-caſtle, and put themſelves in poſſeſſion of the king's perſon. They threw him on a bed, and held him down with a table which they had placed over him. They then ran a horn pipe up his body, through which they conveyed a red-hot iron; and thus burnt his bowels without diſfiguring his body. By this infernal contrivance they expected to have their crime concealed: but the horrid ſhrieks of the king, which were heard at a diſtance from the caſtle, gave a ſuſpicion of the murder; and the whole was ſoon after divulged by the confeſſion of one of the accomplices. Gournay and Mautravers were held in deteſtation by all mankind; and when the enſuing revolution deprived their protectors of power, they found it neceſſary to fly the kingdom. Gournay was afterwards ſeized at Marſeilles, delivered over to the ſeneſchal of Guienne, and put on board a ſhip with a view of carrying him over to England; but he was beheaded at ſea, by ſecret orders, as was ſuppoſed, of ſome nobles and prelates in England, anxious to prevent any diſcovery which he might make of his accomplices. Mautravers concealed himſelf for ſome years in Germany; but having found means of rendering ſome ſervices to Edward III. he ventured to approach his perſon, threw himſelf on his knees before him, and received a pardon.

170 And cruelly murdered.

171 Sovereign power aſſumed by the queen and Mortimer.

By the death of Edward II. the government fell entirely into the hands of the queen and her paramour Mortimer. The parliament, which raiſed young Edward to the throne, had indeed appointed 12 perſons as his privy-council, to direct the operations of government. Mortimer excluded himſelf, under a ſhow of moderation; but at the ſame time ſecretly influenced all the meaſures that came under their deliberation. As this influence began very ſoon to be perceived, and the queen's criminal attachment to Mortimer was univerſally known, theſe governors ſoon became very obnoxious to the people. The firſt ſtroke given to Mortimer's power was during an irruption of the Scots, when the favourite prevented the young king from attacking the enemy. Though it is very probable that the Engliſh army would have been deſtroyed by making an attack on an army ſituated in ſuch an advantageous poſt as the Scots at that time occupied, Mortimer incurred great blame on that account. He was accuſed of having allowed the Scots to make their eſcape; and the general diſguſt on this account was increaſed by his concluding a peace with that kingdom, wherein the Engliſh renounced all title to the ſovereignty of Scotland for the ſum of 30,000 marks. Soon after Mortimer ſeized and executed the earl of Kent, brother to the late king; who, ſuppoſing Edward II. to be ſtill alive, had formed a deſign of reinſtating him in his kingdom. The execution was ſo ſudden, that the young king had not time even to interpoſe in his behalf; and Mortimer ſoon after ſeized this nobleman's eſtate for his own uſe, as he did alſo the immenſe fortunes of the Spenſers. England.

Edward, finding the power of Mortimer a continual reſtraint upon himſelf, reſolved to ſhake off an authority that was likewiſe grown odious to the whole nation. The queen and Mortimer had for ſome time choſen the caſtle of Nottingham for their reſidence. It was ſtrictly guarded, the gates were locked every night, and the keys carried to the queen. It was therefore agreed between the king and ſome of the barons, who ſecretly entered into his deſigns, to ſeize upon them in this fortreſs. Sir William Eland the governor was induced to admit them through a ſubterraneous paſſage, which had been formerly contrived for an outlet, but was now choked up with rubbiſh, and known only to one or two. Through this paſſage the noblemen in the king's intereſt entered the caſtle in the night-time; and Mortimer, without having it in his power to make any reſiſtance, was ſeized in an apartment adjoining to that of the queen. The parliament, which was then ſitting, condemned him, without either permitting him to make his defence, or examining a ſingle witneſs againſt him. He was hanged on a gibbet at a place called *Elmes*, about a mile from London. A ſimilar ſentence was paſſed againſt ſome of his adherents, particularly Gournay and Mautravers, who found an opportunity of eſcaping as above mentioned. The queen, who was perhaps the moſt culpable of the whole, was ſcreened by the dignity of her ſtation. She was, however, depoſed from all ſhare of power; and confined for life to the caſtle of Riſings, with a penſion of 3000 pounds a-year. From this confinement ſhe was never ſet free, though the king paid her an annual viſit of ceremony. She lived 25 years after her depoſition.

172 Mortimer executed.

Edward III. proved the greateſt warrior that ever ſat on the Engliſh throne. He firſt attempted to raiſe Edward Baliol to the ſovereignty of Scotland; but this he found impoſſible fully to accompliſh. Edward next formed a project of invading and conquering France, to the ſovereignty of which he pretended a right. His firſt expectations were attended with ſo little ſucceſs, that on his return to England he found the nation very much diſcontented, and himſelf haraſſed by his numerous creditors, without any ſufficient reſource for paying them. Being determined, however, not to bear any blame himſelf if he could throw it anywhere elſe, he took the firſt opportunity of wreaking his vengeance upon his ſubjects. Finding therefore the tower of London negligently guarded on his arrival, he impriſoned the conſtable and all his inferior officers, treating them with the greateſt ſeverity. He then fell upon the ſheriffs and collectors of the revenue, whom he diſmiſſed from their employments, and appointed an inquiry into their conduct to be made by perſons who, knowing the king's humour, were ſure to find every one guilty who came before them. The keeper of the privy-ſeal, the chief-juſtice, the mayor of London,

173 Edward invades France unſucceſsfully.

174 His ſeverity behaviour on his return.

England. the biſhops of Chicheſter and Litchfield, with the chancellor and treaſurer, were depoſed and impriſoned.

175 Is oppoſed by the archbiſhop of Canterbury; In this career of reſentment and cruelty, however, he found himſelf oppoſed by the archbiſhop of Canterbury, whom he had appointed to collect the taxes laid on for the ſupport of the French war. That prelate happening to be abſent at the time of the king's arrival, did not immediately feel the effects of his reſentment. Being informed, however, of the humour in which his ſovereign was, he iſſued a ſentence of excommunication againſt all who, on any pretence whatever, ſhould exerciſe violence againſt the perſons or eſtates of clergymen, or who infringed thoſe privileges ſecured by the great charter, or who accuſed a prelate of treaſon, or any other crime, in order to bring him under the king's diſpleaſure. A regular combination was formed againſt the king by the clergy, with the primate at their head; who, to excite the indignation of the people as much as poſſible, reported, that the king intended to recal the general pardon and the remiſſion to old debts which had been granted, and to impoſe new and arbitrary taxes without conſent of parliament. The archbiſhop alſo, in a letter to the king, informed him, that there were two powers by which the world was governed, viz. the holy pontifical apoſtolical dignity and the regal authority; of which the clerical power was evidently the ſupreme, as the prieſts were to anſwer even for the conduct of kings at the laſt judgment; and were beſides the ſpiritual fathers of all the faithful, kings and princes not excepted; having, beſides, a heavenly charter, entitling them to direct their wills and actions, and to cenſure their tranſgreſſions. On this the king reſolved to mortify him, by ſending no ſummons to him when the parliament was called: but the prelate, undaunted by this mark of reſentment, appeared before the gates of the parliament-houſe with his croſier in his hand, demanding admittance as the firſt peer of the realm. This application was rejected for two days, but at laſt complied with; and the parliament now ſeemed inclined to abridge the king's authority conſiderably.

176 And obliged at laſt to ſubmit: They began with obſerving, that as the great charter had been violated in many points, particularly by the illegal impriſonment of many freemen and the ſeizure of their goods, it was neceſſary to confirm it anew, and to oblige all the chief officers of the law and others to ſwear to the obſervance of it. It was alſo required, that whenever any of the great offices became vacant, the king ſhould fill them up by the advice of his council and the conſent of ſuch barons as ſhould at the time be found to reſide in the neighbourhood of the court. They enacted alſo, that on the third day of every ſeſſion the king ſhould reſume all ſuch offices into his own hand, excepting thoſe of the juſtices of the two benches and the barons of exchequer; that the miniſters ſhould for the time be reduced to private perſons; that they ſhould in that condition anſwer before parliament to any accuſation preferred againſt them; and that, if they were found in any reſpect guilty, they ſhould be finally deprived of their offices, and others appointed in their ſtead. In return for ſuch ample conceſſions, the king was offered a grant of 20,000 ſacks of wool; and ſuch was his urgent neceſſity, that he was compelled to accept of it even upon theſe terms. Still, however, he determined to adhere to his engagements no longer than till England. this neceſſity was removed. Though the agreement, therefore, was ratified in full parliament, he ſecretly entered a proteſt, that, as ſoon as his convenience permitted, he would from his own authority revoke what had been extorted from him. This proteſt was afterwards confirmed by a public edict; in which he aſſerted, that that ſtatute had been made contrary to law; that it was prejudicial to the prerogatives of the crown, which he had only diſſembled when he ſeemed to ratify it; and that in his own breaſt he had never aſſented to it: and declared, that from thenceforth it had

177 But regains his power. no force or authority. This exertion of arbitrary power, which it might have been imagined would have occaſioned a prodigious clamour, was not taken notice of by any of the ſubſequent parliaments; ſo that in the courſe of two years Edward had entirely regained his authority, and obtained a repeal of the obnoxious

178 Performs great exploits in France. ſtatute juſt mentioned. Having thus ſettled matters to his ſatisfaction, the king reſumed his expedition againſt France, where he gained great advantages. In his abſence the Scots invaded England; but were entirely defeated at Durham, and their king himſelf taken priſoner. The Engliſh king in the mean time continued his victories on the continent; in which he was greatly aſſiſted by Edward ſurnamed the *Black Prince*, the greateſt hero recorded in the Engliſh annals. But for the wars of Edward III. and the exploits of this famous prince, ſee the articles SCOTLAND and FRANCE. The Black Prince died on the 8th of June 1376, and the king ſurvived only about a year. He expired on

179 Richard II the 21ſt of June 1377, and was ſucceeded by his ſecond ſon Richard.

As the new king was only eleven years old when he aſcended the throne, the government was veſted in the hands of his three uncles, the dukes of Lancaſter, York, and Glouceſter. The different diſpoſitions of theſe noblemen, it was thought, would cauſe them check the deſigns of each other. Lancaſter was neither popular nor enterpriſing; York was indolent and weak; and Glouceſter turbulent, popular, and ambitious. Diſcontents firſt aroſe among the common people. They had now acquired a ſhare of liberty ſufficient to inſpire them with a deſire for more, and this deſire was greatly increaſed by the diſcourſes of one John Ball a ſeditious preacher. He went about the country, and inculcated on his audience, that mankind were all derived from one common ſtock; and that all of them had equal right to liberty and the goods of nature, of which they had been deprived by the ambition of a few inſolent rulers.

Theſe doctrines were greedily ſwallowed by the populace, who were farther inflamed by a new impoſition of three groats a-head upon every perſon in the kingdom above 15 years of age. This had been granted as a ſupply by parliament, and was no doubt neceſſary on account of the many expenſive wars in which the kingdom was engaged; but its apparent injuſtice, in laying no more burden upon the rich than the poor, excited the utmoſt reſentment of the people. The manner, too, of collecting this tax, ſoon furniſhed them with an occaſion of revolt. It began in Eſſex, where a report was induſtriouſly ſpread that the peaſants were to be deſtroyed, their houſes burned, and their farms plundered. A blackſmith, well known by the name

of

England.

of *Wat Tyler*, was the firſt that excited them to arms. The tax-gatherers coming to this man's houſe while he was at work, demanded payment for his daughter. This he refuſed, alleging that ſhe was under the age mentioned in the act. One of theſe fellows offered to produce a very indecent proof to the contrary, and at the ſame time laid hold of the maid. This the father reſenting, immediately knocked out the ruffian's brains with his hammer. The byſtanders applauded the action; and exclaimed that it was high time for the people to take vengeance on their tyrants, and to vindicate their native liberty. The whole country immediately took arms, and the inſurgents ſoon amounted to about 100,000 men. They advanced to Blackheath, where they ſent a meſſage to the king, who had taken ſhelter in the tower, deſiring a conference with him. The king was deſirous of complying with their demands, but was intimidated by their fierce behaviour. In the mean time, they entered the city, burning and plundering the houſes of ſuch as were obnoxious for their power or riches. Their animoſity was particularly levelled againſt the lawyers, to whom they ſhowed no mercy. The king at laſt, knowing that the tower was not able to reſiſt their aſſaults, went out among them, and deſired to know their demands. To this they made a very humble remonſtrance; requiring a general pardon, the abolition of ſlavery, freedom of commerce in the market-towns, and a fixed rent inſtead of thoſe ſervices required by the tenure of villenage. The king granted all theſe requeſts; and charters were made out by which the grant was ratified. In the mean time, however, another body of theſe inſurgents had broke into the tower, and murdered the chancellor, the primate, and the treaſurer, with ſome other officers of diſtinction. They then divided themſelves into bodies, and took up their quarters in different parts of the city. At the head of one of theſe was Wat Tyler, who led his men into Smithfield, where he was met by the king, who invited him to a conference under pretence of hearing and redreſſing his grievances. Tyler ordered his companions to retire till he ſhould give them a ſignal, and boldly ventured to begin a conference with the king in the midſt of his retinue. His demands were, That all ſlaves ſhould be ſet free; that all commonages ſhould be open to the poor as well as to the rich; and that a general pardon ſhould be paſſed for the late outrages. Whilſt he made theſe demands, he now and then lifted up his ſword in a menacing manner: which inſolence ſo raiſed the indignation of William Walworth lord mayor of London, that, without conſidering the danger to which he expoſed his majeſty, he ſtunned Tyler with a blow of his mace; while one of the king's knights riding up, diſpatched him with his ſword. The mutineers, ſeeing their leader fall, prepared themſelves to take revenge. Their bows were already bent for execution; when Richard, though not yet 16 years of age, rode up to the rebels, and with admirable preſence of mind cried out: "What, my people, will you kill your king? Be not concerned for the loſs of your leader. I myſelf will now be your general. Follow me into the field, and you ſhall have whatever you deſire." The multitude immediately deſiſted, and followed the king into the fields, where he granted them the ſame charters that he had before granted to their companions. Theſe charters, however, were ſoon after revoked, and the common people reduced to the ſame ſituation in which they had formerly been.

England.

150 Dangerous inſurrection by Wat Tyler.

151 He is killed.

The courage, addreſs, and preſence of mind, which the king had diſcovered in quelling ſuch a dangerous tumult, gave great hopes to the nation: but, in proportion as Richard advanced in years, theſe hopes were blaſted; and his want of capacity, or at leaſt of ſolid judgment, appeared in every enterpriſe he attempted. The king had unluckily loſt the favour of the common people after the inſurrection juſt mentioned. He allowed the parliament to revoke the charters of enfranchiſement and pardon which had been granted; ſome of the ringleaders in the late diſorders had been ſeverely puniſhed, and ſome even put to death without any form of proceſs or trial. Thus the popular leaders were greatly exaſperated by this cruelty, though probably the king did not follow the dictates of his own mind ſo much in it as the advice of his counſellors. But having thus loſt the favour of one party, he quickly after fell under the diſpleaſure of the other alſo. Suppoſing himſelf to be in too great ſubjection to his uncles, particularly the duke of Glouceſter, he attempted to ſhake off the yoke, by raiſing others to ſuch a degree of power as might enable them to rival them. His firſt favourite was Robert de Vere earl of Oxford, a young man of an agreeable perſon, but diſſolute in his behaviour, who ſoon acquired an abſolute aſcendant over him. So much was he determined to ſhow his attachment to this nobleman, that he firſt created him marquis of Dublin, a title never known in England before; then duke of Ireland; transferring to him the entire ſovereignty of that iſland by patent for life. He gave him in marriage his couſin-german, the daughter of the earl of Bedford; but ſoon after permitted him to divorce her for another lady with whom he had fallen in love. This nobleman ſoon became the diſpenſer of all the king's favours to ſuch a degree, that a conſpiracy was formed againſt him; at the head of which were, Mowbray earl of Nottingham, Fitz Alan earl of Arundel, Piercy earl of Northumberland, Montacute earl of Saliſbury, and Beauchamp earl of Warwick. Vere was impeached in parliament; and though nothing of moment was even alleged againſt him, he was condemned and deprived of his office. They next proceeded to attack the royal authority itſelf. Under pretence that the king was yet unable to govern the kingdom, though at that time 21 years of age, they appointed a commiſſion of 14 perſons to whom the ſovereignty was to be transferred for a year. This meaſure was driven forward by the duke of Glouceſter, and none but his own faction were admitted as members of the committee. The king could not without regret perceive himſelf thus totally deprived of authority. He firſt endeavoured to gain over the parliament to his intereſts, by influencing the ſheriffs of each county, who were then the only returning officers. This meaſure failing, he next applied to the judges. They declared, that the commiſſion which had deprived the king of his authority was unlawful, and that thoſe who procured or adviſed it were puniſhable with death. Their ſentence was quickly oppoſed by declarations from the lords. The duke of Glouceſter armed his partiſans, and appeared at Haringay park near Highgate,

152 The king loſes the favour of the people.

153 His exceſſive favour for the earl of Oxford.

154 A conſpiracy againſt the king.

England. Highgate, at the head of a body of men ſufficient to intimidate the king and all his adherents. Theſe inſurgents, ſenſible of their own power, began by demanding of the king the names of thoſe who had adviſed him to his late raſh meaſures. A few days afterwards they appeared armed in his preſence, and accuſed by name the archbiſhop of York, the duke of Ireland, the earl of Suffolk, and Sir Robert Treſilian, one of the judges who had declared in his favour, together with Sir Nicholas Bember, as public and dangerous enemies to the ſtate. The duke of Ireland fled into Cheſhire, where he attempted to raiſe a body of forces; but was quickly obliged to fly into Flanders, on the arrival of the duke of Glouceſter with a ſuperior army. Soon after, the king was obliged to ſummon a parliament, where an accuſation was drawn up againſt five of his counſellors. Of theſe only Sir Nicholas Bember was preſent; and he was quickly found guilty, condemned, and executed, together with Sir Robert Treſilian, who had been diſcovered and taken during the interval. Lord Beauchamp of Holt was ſoon after condemned and executed; and Sir Simon Burley, who had been appointed the king's governor, ſhared the ſame fate, though the queen continued for three hours on her knees before the duke of Glouceſter, imploring his pardon.

Such unparalleled inſolence and barbarity in a ſubject could not go unpuniſhed. In 1389, the king at an extraordinary council of the nobility aſſembled after Eaſter, to the aſtoniſhment of all preſent, deſired to know his age. Being told that he was turned of two and twenty, he alleged that it was then time for him to govern without help; and that there was no reaſon why he ſhould be deprived of thoſe rights which the meaneſt of his ſubjects enjoyed. The lords anſwered in ſome confuſion, that he had certainly an undiſputed right to take upon himſelf the government of the kingdom. "Yes (replied the king), I have long been under the government of tutors; and I will now firſt ſhow my right to power by their removal." He then ordered Thomas Arundel, whom the commiſſioners had lately appointed chancellor, to give up the ſeals; which he next day delivered to William Wickham biſhop of Wincheſter. He next removed the duke of Glouceſter, the earl of Warwick, and other lords of the oppoſition, from the council; and all the great officers of the houſehold, as well as the judges, were changed.

185 The king takes the power into his own hands.

The king being thus left at liberty to govern as he thought proper, for ſome time behaved in ſuch a manner as to gain the affections of the people. It does not appear indeed that he ever gave much cauſe of complaint; but it was impoſſible for any prince in thoſe days to keep himſelf ſecure on the throne but by a very ſevere and vigorous adminiſtration. The duke of Glouceſter, perceiving that Richard was not of a warlike diſpoſition, frequently ſpoke with contempt of his perſon and government, and deliberated concerning the lawfulneſs of throwing off all allegiance to him. The king being informed of his conduct by ſpies appointed for that purpoſe, at laſt formed a reſolution of ridding himſelf of Glouceſter and his faction at once. He therefore ordered that nobleman to be immediately arreſted and ſent over to Calais, where there was no danger of his being reſcued by his numerous adherents. The earls of Arundel and Warwick were ſeized at the ſame time; and a new parliament, which the king knew would be perfectly obedient to his will, was ſummoned to Weſtminſter. Here the commiſſion of 14, who had uſurped on the royal authority, was annulled for ever; all thoſe acts which had condemned his former miniſters were repealed; and the general pardon which the king had formerly given when he aſſumed the government into his own hands, was revoked. Several of Glouceſter's party were condemned and executed, and at laſt that nobleman himſelf was called for to take his trial as well as the reſt; but he had before been privately diſpatched in priſon. England. 186 Duke of Glouceſter murdered.

After the deſtruction of the duke of Glouceſter and the heads of his party, a miſunderſtanding aroſe among the noblemen who had joined in the proſecution. The duke of Hereford appeared in parliament, and accuſed the duke of Norfolk of having ſpoken ſeditious words againſt his majeſty in a private converſation. Norfolk denied the charge, gave Hereford the lie, and offered to prove his innocence by ſingle combat. The challenge was accepted; but on the day appointed for the duel, the king would not ſuffer the combatants to engage, but commanded both of them to leave the kingdom. The duke of Norfolk he baniſhed for life, but the duke of Hereford only for ten years. The former retired to Venice, where in a ſhort time he died of a broken heart. Hereford behaved in a reſigned and ſubmiſſive manner; which ſo pleaſed the king, that he conſented to ſhorten the time of his baniſhment four years: he alſo granted him letters patent, enſuring him of the enjoyment of any inheritance which ſhould fall to him during his abſence; but upon the death of his father the duke of Lancaſter, which happened ſhortly after, Richard revoked thoſe letters, and kept the eſtate to himſelf. 187 Dukes of Hereford and Norfolk baniſhed.

This laſt injury inflamed the reſentment of Hereford to ſuch a degree, that he formed a deſign of dethroning the king. He was a great favourite both with the army and people; he was immenſely rich, and connected by blood or alliance with all the great families of the nation. The king at the ſame time, it is ſaid, gave himſelf up to an idle, effeminate life; and his miniſters following his example, the national honour was loſt. The number of malecontents daily increaſed, and only waited for the abſence of the king, in order to put their ſchemes in execution; and this opportunity ſoon offered. 188 Hereford forms a ſcheme of dethroning the king.

The earl of March, preſumptive heir to the crown, having been appointed the king's lieutenant in Ireland, was ſlain in a ſkirmiſh with the natives of that country; which ſo incenſed Richard, that, unmindful of his precarious ſituation at home, he went over to Ireland with a conſiderable army, in order to revenge his death in perſon. The duke of Lancaſter (for that was the title which Hereford aſſumed on the death of his father) hearing of the king's abſence, inſtantly embarked at Nantz; and with a retinue only of 60 perſons in three ſmall veſſels, landed at Ravenſpur in Yorkſhire. The earl of Northumberland, who had long been a malecontent, together with Henry Piercy his ſon, who from his ardent valour was ſurnamed *Hotſpur*, immediately joined him with their forces; and the people flocked to him in ſuch numbers, that in a few days his army amounted to 60,000 men.

Richard,

England. Richard, in the mean time, continued in perfect ſecurity in Ireland for ſome time. Contrary winds for three weeks together prevented his receiving any news of the rebellion which was begun in his native dominions. He landed therefore at Milford Haven without ſuſpicion, attended by a body of 20,000 men; but immediately found himſelf oppoſed by a power which he could by no means reſiſt. His army gradually deſerted him, till at laſt he was obliged to acquaint the duke, that he would ſubmit to whatever terms he pleaſed to preſcribe. The duke did not think proper to enter into any treaty with the king; but carried him to London, where he was confined cloſe priſoner in the Tower, formally depoſed by parliament, or rather by the duke of Lancaſter, and at laſt put to death. The manner of his death is variouſly related. According to ſome, eight or nine ruffians were ſent to the caſtle of Pomfret, whither the unhappy prince had been removed, in order to diſpatch him. They ruſhed unexpectedly into his apartment; but Richard, knowing their deſign, reſolved to ſell his life as dear as poſſible. He wreſted a pole-axe from one of the murderers, with which he killed four of them; but was at length overpowered and killed. Others relate that he was ſtarved in priſon; and that, after he was denied all nouriſhment, he prolonged his life 14 days, by feeding on the ſtocks of his bed. He died in the year 1399, in the 34th year of his age, and 23d of his reign.—It was during the reign of Richard II. that Wickliff, the noted reformer, publiſhed his doctrines in England. See WICKLIFF.

189 Richard depoſed and murdered.

190 Duke of Lancaſter's claim to the crown.

After ſentence of depoſition had been pronounced on Richard by both houſes of parliament, the throne being then vacant, the duke of Lancaſter ſtepped forth; and having croſſed himſelf on the forehead and on the breaſt, and called on the name of Chriſt, gave in his claim to the throne in the following words, which we ſhall give in the original language. "In the name of Fadher, Son, and Holy Ghoſt, I Henry of Lancaſter, challenge this rewme of Ynglonde, and the croun, with all the membres and the appurtenances; als I that am deſcendit by right line of the blode, coming fro the gude King Henry therde, and throge that right that God of his grace hath ſent me, with help of kyn, and of my frendes to recover it; the which rewme was in poynt to be ondone by defaut of governance, and ondoying of the gude laws."

The right which the duke here claimed by deſcent from Henry III. proceeded on a falſe ſtory, that Edmund earl of Lancaſter, ſon of Henry III was really the elder brother of Edward I.; but that, by reaſon of ſome deformity in his perſon, he had been poſtponed in the ſucceſſion, and Edward the younger brother impoſed on the nation in his ſtead. The preſent duke of Lancaſter inherited from Edmund, by his mother, the right which he now pretended to the crown; though the falſehood of the ſtory was ſo generally known, that he thought proper to mention it only in general terms.—No oppoſition, however, was made to the validity of this title in parliament; and thus commenced the differences between the houſes of York and Lancaſter, which were not terminated but by many bloody and ruinous wars.

191 Henry IV.

The reign of Henry IV. was little elſe than a continued ſeries of inſurrections. In the very firſt parliament he called, no fewer than 40 challenges were given and accepted by different barons; and though Henry had ability and addreſs enough to prevent theſe duels from being fought, it was not in his power to prevent continual inſurrections and combinations againſt himſelf. The moſt formidable one was conducted by the earl of Northumberland, and commenced A. D. 1402. The occaſion of it was, that Henry denied the earl liberty to ranſom ſome Scots priſoners which had been taken in a ſkirmiſh with that nation. The king was deſirous of detaining them in order to increaſe his demands upon Scotland in making peace; but as the ranſom of priſoners was in that age looked upon as a right belonging to thoſe who had taken them, the earl thought himſelf grievouſly injured. The injury appeared ſtill the greater, becauſe Northumberland conſidered the king as indebted to him both for his life and crown. He reſolved therefore to dethrone Henry; and to raiſe to the throne young Mortimer, who was the true heir to the crown, as being the ſon of Roger Mortimer earl of March, whom Richard II. had declared his ſucceſſor. For this purpoſe, he entered into an alliance with the Scots and Welſh, who were to make an irruption into England at the ſame time that he himſelf was to raiſe what forces he could in order to join them. But when all things were prepared for this inſurrection, the earl found himſelf unable to lead on the troops, by a ſudden fit of illneſs with which he was ſeized at Berwick. On this, young Piercy (ſurnamed *Hotſpur*) took the command; and marched towards Shrewſbury, in order to join the Welſh. But the king had happily a ſmall army with which he intended to have acted againſt the Scots; and knowing the importance of celerity in civil wars, inſtantly hurried down, that he might give battle to the rebels. He approached Shrewſbury before a junction with the Welſh could be effected; and the impatience of Piercy urged him to an engagement, which at that time he ought to have declined. The evening before the battle, he ſent a manifeſto to Henry; in which he renounced his allegiance, ſet the king at defiance, and enumerated all the grievances of which he imagined the nation might juſtly complain. He reproached him (and very juſtly) with his perjury; for Henry, on his firſt landing in England, had ſworn upon the goſpels, before the earl of Northumberland, that he had no other intention but to recover poſſeſſion of the duchy of Lancaſter, and that he would ever remain a faithful ſubject to King Richard. He aggravated his guilt, in firſt dethroning and then murdering that prince; and in uſurping on the title of the houſe of Mortimer; to whom, both by lineal ſucceſſion and by declarations of parliament, the throne, then vacant by Richard's death, did of right belong. Several other heavy charges were brought againſt him; which, at that time, could be productive of no other effect than to irritate the king and his adherents to the utmoſt.

England.

192 Inſurrection of the earl of Northumberland.

The armies on each ſide were in number about 12,000; ſo that they were not unmanageable by their commanders; and as both leaders were men of known bravery, an obſtinate engagement was expected. The battle was fought on the 20th of July 1403; and we can ſcarce find in thoſe ages any other in which the ſhock was ſo terrible and conſtant. At laſt Piercy being killed by an unknown hand, the victory was decided in

193 His ſon defeated and killed at Shrewſbury.

England. in favour of the royaliſts. There are ſaid to have fallen on that day near 2300 gentlemen, and 6000 private men, of whom near two thirds were of Piercy's army.

The earl of Northumberland having recovered from his ſickneſs, and levied an army, was on his march to join his ſon; but being oppoſed by the earl of Weſtmorland, and hearing of the defeat at Shrewſbury, he diſmiſſed his forces, and came with a ſmall retinue to the king at York. He pretended that his ſole intention was to mediate between the contending parties; and the king thought proper to accept of his apology, and grant him a pardon for his offence. The other rebels were treated with equal lenity; and none of them, except the earl of Worceſter and Sir Richard Vernon, who were regarded as the chief authors of the inſurrection, periſhed by the hands of the executioner. This lenity, however, was not ſufficient to keep the kingdom quiet; one inſurrection followed another almoſt during the whole of this reign; but either through Henry's vigilance, or the bad management of the conſpirators, they never could unite their forces in ſuch a manner as was neceſſary for bringing their projects to bear.

194 Archbiſhop of York executed.

This reign is remarkable for the firſt capital puniſhment inflicted on a clergyman of high rank. The archbiſhop of York having been concerned in an inſurrection againſt the king, and happening to be taken priſoner, was beheaded without either indictment, trial, or defence; nor was any diſturbance occaſioned by this ſummary execution. But the moſt remarkable tranſaction of this reign was, the introduction of that abſurd and cruel practice of burning people on account of their religion. Henry, while a ſubject, was thought to have been very favourable to the doctrines of Wickliff; but when he came to the throne, finding his poſſeſſion of it very inſecure, he thought ſuperſtition a neceſſary implement of his authority, and therefore determined by all means to pay court to the clergy. There were hitherto no penal laws againſt hereſy; not indeed through the toleration of the court of Rome, but through the ſtupidity of the people, who could not perceive the abſurdities of the eſtabliſhed religion. But when the learning and genius of Wickliff had once broken the fetters of prejudice, the eccleſiaſtics called aloud for the puniſhment of his diſciples; and Henry, who was very little ſcrupulous in his conduct, reſolved to gratify them. He engaged parliament to paſs a law for this purpoſe: it was enacted, that when any heretic, who relapſed, or refuſed to abjure his opinions, was delivered over to the ſecular arm by the biſhop or his commiſſaries, he ſhould be committed to the flames before the whole people. This weapon did not remain long unemployed in the hands of the clergy. William Sautré, rector of St Oſithes in London, had been condemned by the convocation of Canterbury; his ſentence was ratified by the houſe of peers; the king iſſued his writ for the execution; and the unhappy man was burnt alive in the year 1401. The doctrines of Wickliff, however, ſeem to have already gained ground very conſiderably in England. In 1405, the commons, who had been required to grant ſupplies, propoſed in plain terms to the king to ſeize all the temporalities of the church, and employ them as a perpetual fund to ſerve the exigencies of the ſtate. They inſiſted that the clergy poſſeſſed a third of the lands of the kingdom; and they contributed nothing to the public burdens; and that their exorbitant riches tended only to diſqualify them from performing their miniſterial functions with proper zeal and attention. When this addreſs was preſented, the archbiſhop of Canterbury, who then attended the king, objected that the clergy, though they went not in perſon to the wars, ſent their vaſſals and tenants in all caſes of neceſſity; while at the ſame time, they themſelves who ſtaid at home were employed night and day in offering up their prayers for the happineſs and proſperity of the ſtate. The ſpeaker anſwered with a ſmile, that he thought the prayers of the church but a very ſlender ſupply. The archbiſhop, however, prevailed in the diſpute; the king diſcouraged the application of the commons; and the lords rejected the bill which the lower houſe had framed for deſpoiling the church of her revenues. The commons were not diſcouraged by this repulſe. In 1410, they returned to the charge with more zeal than before. They made a calculation of all the eccleſiaſtical revenues, which, by their account, amounted to 485,000 marks a-year, and included 18,400 ploughs of land. They propoſed to divide this property among 15 new earls, 1500 knights, 6000 eſquires, and 100 hoſpitals; beſides 20,000l. a-year, which the king might keep for his own uſe: and they inſiſted that the clerical functions would be better performed than at preſent, by 15,000 pariſh prieſts, at the rate of 7 marks a-piece of yearly ſtipend. This application was accompanied with an addreſs for mitigating the ſtatutes enacted againſt the Wickliffites or Lollards, ſo that the king knew very well from what ſource it came. He gave the commons, however, a ſevere reply; and further to ſatisfy the church that he was in earneſt, ordered a Lollard to be burnt before the diſſolution of parliament.

195 Burning of heretics introduced.

The king had been for ſome time ſubject to fits, which continued to increaſe, and gradually brought him to his end. He expired at Weſtminſter in 1413, in the 46th year of his age, and the 13th of his reign. 196 Henry V.
He was ſucceeded by his ſon Henry V. whoſe martial talents and character had at firſt occaſioned unreaſonable jealouſies in the mind of his father, ſo that he thought proper to exclude him from all ſhare of public buſineſs. The active ſpirit of Henry being thus reſtrained from its proper exerciſe, broke out in every kind of extravagance and diſſipation. It is even reported, that, when heated with liquor, he ſcrupled not to accompany his riotous aſſociates in attacking the paſſengers on the ſtreets and highways, and robbing them of their goods. No ſooner, however, did he aſcend the throne, than he called together his former companions, acquainted them with his intended reformation, exhorted them to imitate his example; but ſtrictly prohibited them, till they had given proofs of their ſincerity in this particular, to appear any more in his preſence: after which, he diſmiſſed them with liberal preſents. His father's wiſe miniſters, who had checked his riots, found that they had, unknown to themſelves, been paying the higheſt court to their ſovereign; and were received with all the marks of favour and confidence. The chief juſtice, who had formerly impriſoned the prince himſelf, and therefore trembled to approach the royal preſence, met with

praiſes

England. praiſes inſtead of reproaches for his paſt conduct, and was exhorted to perſevere in the ſame rigorous and impartial execution of the laws. The king was not only anxious to repair his own miſconduct, but alſo to make amends for thoſe iniquities into which policy or neceſſity of affairs had betrayed his father. He expreſſed the deepeſt ſorrow for the fate of the unhappy King Richard, and even performed his funeral obſequies with pomp and ſolemnity, and heaped favours upon all thoſe who had ſhown themſelves attached to him. He took into favour the young earl of March, though his competitor for the throne; and gained ſo far on his gentle and unambitious nature, that he remained ever after ſincerely attached to him. The family of Piercy was reſtored to its fortune and honours; and the king ſeemed deſirous to bury all diſtinctions in oblivion. Men of merit were preferred, whatever party they had been of; all men were unanimous in their attachment to Henry; and the defects of his title were forgotten amidſt the perſonal regard which was univerſally paid him.

197 Enforces the laws againſt heretics.

The only party which Henry was not able to overcome was the new ſect of Lollards, or reformers of religion. Theſe were now gaining ſuch ground in England, that the Romiſh clergy were greatly alarmed, and Henry was determined to execute the laws upon them. The head of that party at preſent was Sir John Oldcaſtle, Lord Cobham; a nobleman who had diſtinguiſhed himſelf by his valour and military talents on many occaſions, and acquired the eſteem both of the late and preſent king. His high character and zeal for the new ſect pointed him out to Arundel archbiſhop of Canterbury as a proper object of eccleſiaſtical fury, and therefore he applied to Henry for permiſſion to indict him. The king deſired him firſt to try gentle methods, and undertook to converſe with Lord Cobham himſelf upon religious ſubjects. He did ſo, but could not prevail, and therefore abandoned Cobham to his enemies. He was immediately condemned to the flames: but having found means to make his eſcape, he raiſed an inſurrection; which was ſoon ſuppreſſed, without any other conſequence than that of bringing a ſtain on the ſect to which he belonged. Cobham himſelf made his eſcape, but four years afterwards was taken and executed as a traitor. Immediately after, the moſt ſevere laws were paſſed againſt the Lollards. It was enacted, that whoever was convicted of Lollardy, beſides ſuffering capital puniſhment according to the laws formerly eſtabliſhed, ſhould alſo forfeit his lands and goods to the king; and that the chancellor, treaſurer, juſtices of the two benches, ſheriffs, juſtices of the peace, and all the chief magiſtrates in every city and borough, ſhould take an oath to uſe their utmoſt endeavours for the extirpation of hereſy.

Notwithſtanding theſe terrible laws, the very parliament which enacted them, namely that of 1414, when the king demanded a ſupply, renewed the offer formerly preſſed upon Henry IV. and intreated the king to ſeize all the eccleſiaſtical revenues, and convert them to the uſe of the crown. The clergy were greatly alarmed. They could offer the king nothing of equal value. They agreed, however, to confer on him all the priories alien, which depended on capital abbeys in Normandy, and which had been bequeathed to them when that province was united to England. The moſt effectual method, however, of warding off the blow at preſent was by perſuading the king to undertake a war with France, in order to recover the provinces in that kingdom which had formerly belonged to England. This was agreeable to the dying injunction of Henry IV. He adviſed his ſon never to let the Engliſh remain long in peace, which was apt to breed inteſtine commotions; but to employ them in foreign expeditions, by which the prince might acquire honour, the nobility in ſharing his dangers might attach themſelves to his perſon, and all the reſtleſs ſpirits find occupation for their inquietude. The natural diſpoſition of Henry ſufficiently inclined him to follow this advice, and the civil diſorders of France gave him the faireſt proſpect of ſucceſs. Accordingly, in 1415, 198 France invaded. the king invaded France at the head of 30,000 men. The great progreſs he made there is related at length under the article FRANCE. He had eſpouſed the king's daughter, and conquered the greateſt part of the kingdom. His queen was delivered of a ſon named *Henry*, whoſe birth was celebrated by the greateſt rejoicings both at London and Paris; and the infant prince ſeemed to be univerſally regarded as heir to both monarchies. But Henry's glory, when it ſeemed to be approaching the ſummit, was blaſted at once by death, and all his mighty projects vaniſhed. He was ſeized with a fiſtula, a diſtemper which at that time the phyſicians had not ſkill enough to cure; and he expired on the 31ſt 199 Death of Henry V. of Auguſt 1422, in the 34th year of his age, and the 10th of his reign.

200 Henry VI.

Henry VI. ſucceeded to the throne before he was quite a year old, and his reign affords only the moſt diſmal accounts of misfortunes and civil wars. His relations very ſoon began to diſpute about the adminiſtration during the minority. The duke of Bedford, one of the moſt accompliſhed princes of the age, was appointed by parliament protector of England, defender of the church, and firſt counſellor to the king. His brother, the duke of Glouceſter, was fixed upon to govern in his abſence, while he conducted the war in France; and in order to limit the power of both brothers, a council was named, without whoſe advice and approbation no meaſure could be carried into execution.

The kingdom of France was now in the moſt deſperate ſituation. The Engliſh were maſters of almoſt the whole of it. Henry VI. though but an infant, was ſolemnly inveſted with regal power by legates from Paris; ſo that Charles VII. of France ſucceeded only to a nominal kingdom. With all theſe great advantages, however, the Engliſh daily loſt ground; and in the year 1450 were totally expelled from France *. It * See *France*. may eaſily be imagined, that ſuch a train of bad ſucceſs would produce diſcontents among the rulers at home. The duke of Glouceſter was envied by many on account of his high ſtation. Among theſe was Henry Beaufort, biſhop of Wincheſter, great uncle to the king, and the legitimate ſon of John of Gaunt brother to Richard II. The prelate, to whom the care of the king's education had been committed, was a man of great capacity and experience, but of an intriguing and dangerous diſpoſition. He had frequent diſputes with the duke of Glouceſter, over whom he gained ſeveral advantages on account of his open temper. The duke of Bed-

England. ford employed both his own authority and that of parliament to reconcile them, but in vain; their mutual animoſities ſerved for ſeveral years to embarraſs government, and to give its enemies every advantage. The ſentiments of the two leaders were particularly divided with regard to France. The biſhop laid hold of every proſpect of accommodation with that country; and the duke of Glouceſter was for maintaining the honour of the Engliſh arms, and regaining whatever had been loſt by defeats or delay. Both parties called in all the auxiliaries they could. The biſhop reſolved to ſtrengthen himſelf by procuring a proper match for Henry, at that time 23 years old; and then bringing over the queen to his intereſts. Accordingly, the earl of Suffolk, a nobleman whom he knew to be ſtedfaſt in his attachments, was ſent over to France, apparently to ſettle the terms of a truce which had then been begun, but in reality to procure a ſuitable match for the king.

201 Married to Margaret of Anjou.

The biſhop and his friends had caſt their eyes on Margaret of Anjou, daughter of Regnier, titular king of Sicily, Naples, and Jeruſalem; but without either real power or poſſeſſions. She was conſidered as the moſt accompliſhed princeſs of the age, both in mind and perſon; and it was thought would, by her own abilities, be able to ſupply the defects of her huſband, who appeared weak, timid, and ſuperſtitious. The treaty was therefore haſtened on by Suffolk, and ſoon after ratified in England. The queen came immediately into the biſhop's meaſures: Glouceſter was deprived of all real power, and every method taken to render him odious to the public. One ſtep taken for this purpoſe was to accuſe his ducheſs of witchcraft. She was charged with converſing with one Roger Bolingbroke, a prieſt and reputed necromancer; and alſo with one Mary Gourdemain, who was ſaid to be a witch. It was aſſerted that theſe three in conjunction had made an image of the king in wax, which was placed before a gentle fire: and as the wax diſſolved, the king's ſtrength was expected to waſte; and upon its total diſſolution, his life was to be at an end. This accuſation was readily believed in that ſuperſtitious age. The priſoners were pronounced guilty; the ducheſs was condemned to do penance and ſuffer perpetual impriſonment; Bolingbroke the prieſt was hanged, and the woman burnt in Smithfield.

The biſhop, called alſo the *Cardinal*, of Winchеſter, was reſolved to carry his reſentment againſt Glouceſter to the utmoſt. He procured a parliament to be ſummoned, not at London, which was too well affected to the duke, but at St Edmundſbury, where his adherents were ſufficiently numerous to overawe every opponent. As ſoon as Glouceſter appeared, he was accuſed of treaſon and thrown into priſon; and on the day on which he was to make his defence, he was found dead in his bed, though without any ſigns of violence upon his body.

202 Duke of Glouceſter murdered.

The death of the duke of Glouceſter was univerſally aſcribed to the cardinal of Winchеſter, who himſelf died ſix weeks after, teſtifying the utmoſt remorſe for the bloody ſcene he had acted. What ſhare the queen had in this tranſaction, is uncertain: but moſt people believed that without her knowledge the duke's enemies durſt not have ventured to take away his life. The king himſelf ſhared in the general ill-will, and he never had the art to remove the ſuſpicion. His incapacity alſo began every day to appear more clearly, and a pretender to the throne ſoon made his appearance. England.

203 Duke of York's title to the crown.

In the year 1450, Richard duke of York began to think of preferring his claims to the crown. All the males of the houſe of Mortimer were extinct; but Anne, the ſiſter of the laſt earl of March, having eſpouſed the earl of Cambridge, who had been beheaded for treaſon in the reign of Henry V. had tranſmitted her latent, but not yet forgotten claim, to her ſon Richard. This prince, deſcended by his mother from Philippa, only daughter of the duke of Clarence, ſecond ſon of Edward III. ſtood plainly in order of ſucceſſion before the king; who derived his deſcent from the duke of Lancaſter, third ſon of that monarch. The duke was a man of valour and abilities, as well as of ſome ambition; and he thought the weakneſs and unpopularity of the preſent reign afforded a favourable opportunity to aſſert his title. The enſign of Richard was a white roſe, that of Henry a red one; and this gave names to the two factions, who were now about to drench the kingdom in blood.

204 Duke of Suffolk baniſhed,

After the cardinal of Winchеſter's death, the duke of Suffolk, who alſo had been concerned in the aſſaſſination of Glouceſter, governed every thing with uncontrollable ſway. His conduct ſoon excited the jealouſy of the other nobility, and every odious or unſucceſsful meaſure was attributed to him. The duke, however, imagining that his crimes were of ſuch a nature as could not be proved, boldly called upon his enemies to ſhow an inſtance of his guilt. The houſe of commons immediately opened againſt him a charge of corruption, tyranny, and treaſon. He was accuſed of being the cauſe of the loſs of France; of perſuading the French king, with an armed force, to invade England; and of betraying the ſecrets of ſtate. The popular reſentment againſt him was ſo ſtrong, that Henry, in order to ſecure him as much as poſſible, ſentenced him to five years baniſhment. This was conſidered by his enemies as an eſcape from juſtice. The captain of a ſhip was therefore employed to intercept him in his paſſage to France. He was ſeized near Dover, his head ſtruck off on the ſide of a long-boat, and his body thrown into the ſea.

205 And murdered.

206 Inſurrection of Jack Cade.

The complaints againſt Henry's government were heightened by an inſurrection headed by one John Cade, a native of Ireland. He had been obliged to fly over into France for his crimes: but, on his return, ſeeing the people prepared for violent meaſures, he aſſumed the name of *Mortimer;* and, at the head of 20,000 Kentiſh men, advanced towards Blackheath. The king ſent a meſſage to demand the cauſe of their riſing in arms. Cade in the name of the community anſwered, That their only aim was to puniſh evil miniſters, and procure a redreſs of grievances for the people. On this a body of 15,000 troops was levied; and Henry marched with them in perſon againſt Cade, who retired on his approach, as if he had been afraid of coming to an engagement. He lay in ambuſh, however, in a wood; not doubting but he ſhould be purſued by the king's whole army: but Henry was content with ſending a detachment after the fugitives, and returned to London himſelf; upon which Cade iſſued from his ambuſcade, and cut the detachment in pieces.

Soon

England. Soon after, the citizens of London opened their gates to the victor; and Cade, for ſome time, maintained great order and regularity among his followers. He always led them out into the fields in the night-time, and publiſhed ſeveral edicts againſt plunder and violence of any kind. He was not, however, long able to keep his people in ſubjection. He beheaded the treaſurer Lord Say, without any trial; and ſoon after, his troops committing ſome irregularities, the citizens reſolved to ſhut their gates againſt him. Cade endeavouring to force his way, a battle enſued, which laſted all day, and was ended only by the approach of night. The archbiſhop of Canterbury, and the chancellor, who had taken refuge in the tower, being informed of the ſituation of affairs, drew up, during the night, an act of amneſty, which was privately diſperſed among the rebels. This had ſuch an effect, that in the morning Cade found himſelf abandoned by his followers; and retreating to Rocheſter, was obliged to fly alone into the woods. A price being ſet on his head by proclamation, he was diſcovered and ſlain by one Alexander Eden; who, in recompenſe for this ſervice, was made governor of Dover caſtle.

207 Duke of York ſuſpected by the court.

The court now began to entertain ſuſpicions that the inſurrection of John Cade had not happened merely in conſequence of his own machinations and ambition, but that he had been inſtigated thereto by the duke of York, who, as we have already ſeen, pretended a right to the crown. As he was about this time expected to return from Ireland, and a report took place that he was now to aſſert his ſuppoſed right by force of arms, orders were iſſued in the king's name to deny him entrance into England. This was prevented by his appearing with no more than his ordinary attendants; but though he thus eſcaped the danger for the preſent, he inſtantly ſaw the neceſſity of proceeding in ſupport of his claim. His partizans were inſtructed to diſtinguiſh between his right by ſucceſſion and by the laws of the kingdom. The adherents of Lancaſter maintained, that though the advancement of Henry IV. might be looked upon as irregular, yet it was founded upon general conſent; or, even allowing it to have been at firſt invalid, it had now been for a long time eſtabliſhed, and acquired ſolidity of conſequence; nor could the right of ſucceſſion at any rate be pleaded for the purpoſe of overthrowing the general peace and tranquillity of the kingdom. The principles of liberty as well as the maxims of true policy had been injured by the houſe of York; while the public were bound to thoſe of Lancaſter, no leſs by political than moral duty, in conſequence of the oaths of fealty that had been ſo often ſworn to them; the duke of York himſelf having repeatedly ſworn allegiance to them, and thus indirectly renounced thoſe claims which he now brought forward to diſturb the public tranquillity. On the part of the duke of York, it was replied, that the good of the people required the maintenance of order in the ſucceſſion of princes; that, by adhering conſtantly to this rule, a number of inconveniences would be prevented which muſt otherwiſe enſue; and though that order had been broken through in the caſe of Henry IV. it was never too late to remedy any pernicious precedent. It would indeed be a great encouragement to uſurpers, if the immediate poſſeſſion of power, or their continuance in it for a few years, could convert them into legal princes; and the people muſt be in a very miſerable ſituation, if all reſtraints on violence and ambition were taken off, and full liberty given to every innovator to make what attempts he pleaſed. They did not indeed deny that time might confer ſolidity on a government originally founded in uſurpation; but a very long courſe of years was not only required for this purpoſe, but a total extinction of thoſe who had any juſt title. The depoſition of Richard II. and advancement of Henry IV. were not legal acts, but the effects of mere levity in the people; in which the houſe of York had acquieſced from neceſſity, and not from any belief of the juſtice of their cauſe; nor could this be ever interpreted into any renunciation of their pretenſions; neither could the reſtoration of the true order of ſucceſſion be conſidered as an encouragement to rebellion and turbulence, but the correction of a former abuſe by which rebellion had been encouraged. Beſides, the original title of Henry IV. was founded entirely on preſent convenience; and even this was now entirely ſhifted to the houſe of York. The preſent prince was evidently incapable of governing the kingdom by reaſon of his imbecility; ſo that every thing was governed either by corrupt miniſters or an imperious queen, who engaged the nation in foreign connections entirely contrary to its intereſts; while, on the other hand, the true heir of the crown was a prince of approved judgment and experience, and a native of England, who, by his reſtoration, would undoubtedly correct all thoſe abuſes of which there was now ſuch juſt reaſon to complain.

208 Arguments for and againſt the houſes of York and Lancaſter.

In this diſpute it was evident that the houſe of York had the better in point of argument: nevertheleſs, as a prince of the houſe of Lancaſter was in immediate poſſeſſion of the throne, and could by no means be charged with any crime, the cauſe of the former was leſs generally intereſting; eſpecially as it muſt always have been uncertain, *à priori*, whether the duke of York would have governed any better than King Henry. After his return from Ireland, however, the former uſed all his power and influence to foment the diſcontents which had for ſome time prevailed in the kingdom; and the conduct of the next parliament manifeſted the ſucceſs of his intrigues. A violent attack was made upon ſuch noblemen as were known to be moſt in favour with the king. The houſe of commons preſented a petition againſt the duke of Somerſet, the ducheſs of Suffolk, the biſhop of Cheſter, Lord Dudley, and ſeveral others of inferior rank; praying not only that the king would remove them from his council, but that he would prohibit them from coming within twelve miles of the court. Henry, not daring to refuſe this petition altogether, conſented to baniſh all thoſe of inferior rank, whom the commons had ſpecified, but only for a year; and this too on condition that he had no uſe for their aſſiſtance in quelling any rebellion. But he rejected a bill for attainting the late duke of Suffolk, and propoſed ſome other meaſures which ſeemed to militate againſt the court, though it had paſſed both the houſe of lords and the houſe of commons.

209 The duke of York foments diſſenſions between the king and parliament.

Encouraged by this diſagreement between Henry

England.

and his parliament, the duke of York raiſed an army of 10,000 men, with whom he marched towards London, demanding a reformation in matters of government, and the removal of the duke of Somerſet. This firſt enterpriſe, however, proved unſucceſsful; the gates of the city were ſhut againſt him, and he was purſued by the king at the head of a ſuperior army. On this he retired into Kent; and as there was a number of his own friends in the army of the king, a conference took place, in which Richard ſtill inſiſted upon the removal of the duke of Somerſet, and his ſubmitting to be tried in parliament. This requeſt, was in appearance complied with, and Somerſet arreſted: the duke of York was then perſuaded to wait upon the king in his royal pavilion; but, on repeating his charge againſt the duke, he was ſurpriſed to ſee the latter come out from behind the curtain, and offer to maintain his innocence. Richard perceiving that he had not ſufficient intereſt to ruin his adverſary, pretended to be ſatisfied, and retired to his ſeat at Wigmore in Wales; and during the time he reſided there, a better opportunity was given him of accompliſhing his deſigns than he could have hoped for. The king fell into a kind of lethargic diſorder, which increaſed his natural imbecility to ſuch a degree, that he could no longer retain a ſhadow of royalty. Richard now had intereſt enough to get himſelf appointed protector, with power to hold parliaments at pleaſure; with which high office he was no ſooner inveſted, than he turned out all the Lancaſtrian party from their offices, and ſent the duke of Somerſet to the tower; but on the recovery of the king, which happened in no long time after, he himſelf was diſmiſſed from his employment, the duke of Somerſet releaſed, and the adminiſtration once more put into his hands. On this the duke of York levied an army, merely as he pretended, to enforce the reformation of government and the removal of the duke of Somerſet. Thus Henry, though ſore againſt his will, was obliged to face him in the field. A battle enſued at St Alban's; in which the royaliſts were defeated, and the duke of Somerſet, the chief partiſan of their cauſe, killed in the action. The king himſelf was wounded, and took ſhelter in a cottage near the field of battle; where he was taken priſoner, but was afterwards treated with great reſpect and kindneſs by the duke of York.

210 Richard raiſes an army;

211 But is obliged to retire.

212 He is appointed protector in conſequence of the king's illneſs.

213 Is depoſed and levies an army.

214 Hiſtory of the civil war between Henry and the duke of York.

Henry, though he was now only a priſoner treated with the forms of royalty, was nevertheleſs pleaſed with his ſituation; but his queen, a woman of a bold and maſculine ſpirit, could not bear to have only the appearance of authority, while others enjoyed all the real power. She therefore excited the king once more to aſſert his right by force of arms; and after ſeveral manœuvres, the duke of York was obliged to retire from court. A negotiation for peace was at firſt ſet on foot, but the mutual diſtruſts of both parties ſoon broke it off. The armies met at Bloreheath on the borders of Staffordſhire, on the 23d of September 1459; and the Yorkiſts at firſt gained ſome advantages. But when a more general engagement was about to enſue, a body of veterans who ſerved under the duke of York deſerted to the king; and this ſo intimidated the duke's party, that they ſeparated the next day without ſtriking a blow. The duke of York fled to Ireland; and the earl of Warwick, one of his ableſt and beſt ſupporters, eſcaped to Calais, with the government of which he had been entruſted during the late protectorſhip. England.

The York party, though thus in appearance ſuppreſſed, only waited a favourable opportunity of retrieving their affairs. Nor was this opportunity long wanting. Warwick having met with ſome ſucceſſes at ſea, landed in Kent; and being there joined by other barons, marched up to London amidſt the acclamations of the people. The city immediately opened its gates to him, and he ſoon found himſelf in a condition to face the royal army. An engagement enſued at Northampton on the 10th of July 1460; in which the royaliſts were entirely defeated, and the king again taken priſoner. The duke of York then openly laid claim to the crown; and on this occaſion the firſt inſtance of a ſpirit of national liberty is ſaid to have appeared in the houſe of lords. The cauſe of Henry and the duke of York was ſolemnly debated; and the latter, though a conqueror, did not abſolutely gain his cauſe. It was determined that Henry ſhould poſſeſs the throne during his life; and that the duke of York ſhould be appointed his ſucceſſor, to the utter excluſion of the prince of Wales, who was then a child.

Though the royal party now ſeemed deſtitute of every reſource, the queen ſtill retained her intrepidity. She fled into Wales, where ſhe endeavoured to raiſe another army. The northern barons, provoked at the ſouthern ones for ſettling the government and ſucceſſion to the crown without their conſent, ſoon furniſhed her with an army of 20,000 men. Another battle was fought near Wakefield Green, on the 24th of December 1460. The Yorkiſts were defeated, and the duke himſelf was killed in the action. His head was afterwards cut off by the queen's orders, and fixed on one of the gates of York, with a paper-crown, in deriſion of his pretended title. His ſon the earl of Rutland, a youth of 17, was taken priſoner, and killed in cold blood by Lord Clifford, in revenge for his father's death, who had fallen in the battle of St Alban's.

215 Duke of York killed.

After this victory, Margaret marched towards London, in order to ſet the king at liberty; but the earl of Warwick, who now put himſelf at the head of the Yorkiſts, led about the captive king, in order to give a ſanction to his proceedings. He engaged the queen's forces at St Alban's; but through the treachery of Lord Lovelace, who deſerted during the heat of the engagement with a conſiderable body of forces, Warwick was defeated, and the king fell once more into the hands of his own party.

The ſubmiſſion of the city of London ſeemed now to be the only thing wanting to complete the queen's ſucceſs; but Warwick had ſecured it in his intereſts, and the citizens refuſed to open their gates to the queen. In the mean time, young Edward, eldeſt ſon of the late duke of York, put himſelf at the head of his father's party. He was now in the bloom of youth, remarkable for the beauty of his perſon and his bravery, and was a great favourite of the people. He defeated Jaſper Tudor earl of Pembroke, at Mortimer's croſs in Herefordſhire. The earl himſelf was taken priſoner, and immediately beheaded by Edward's orders.

England.

216 Edward IV.

ders. After this, he advanced to London; and being joined by the remainder of Warwick's army, he ſoon obliged Margaret to retire, entered the city amidſt the acclamations of the people, and was crowned king on the 5th of March 1461.

Nothwithſtanding all her misfortunes, however, Margaret ſtill continued undaunted. She retired to the north, where ſhe was ſoon joined by ſuch numbers, that her army amounted to 60,000 men. She was oppoſed by young Edward and Warwick at the head of 40,000; and both armies met near Touton in the county of York, on the 29th of March 1461. A bloody battle enſued, in which the queen's army was totally defeated; and as Edward, prompted by his natural cruelty, had ordered no quarter to be given, 40,000 of the Lancaſtrians were ſlain in the field or in the purſuit. Edward is ſaid to have gained this victory by means of a violent ſtorm of ſnow, which blew full in the face of the queen's army, and ſo blinded them that they could ſcarcely make any uſe of their arms. After this diſaſter the queen fled to Scotland with her huſband and ſon; and notwithſtanding all the misfortunes ſhe had already met with, reſolved once more to enter England at the head of 5000 men granted her by the king of France. But even here ſhe was attended by her uſual bad fortune. Her little fleet was diſperſed by a tempeſt, and ſhe herſelf eſcaped with the utmoſt difficulty by entering the mouth of the Tweed. Soon after, a defeat, which her few forces ſuſtained at Hexham, ſeemed to render her cauſe entirely deſperate; and the cruelties practiſed upon all her adherents rendered it very dangerous to befriend her.

217 Affairs of the queen totally ruined.

218 Adventures of the king and queen.

By theſe repeated misfortunes the houſe of Lancaſter was ſo effectually ruined, that Margaret was obliged to ſeparate from her huſband, and both of them to ſhift for themſelves the beſt way they could. The king was ſtill protected by ſome of his friends, who conveyed him to Lancaſhire, where he remained in ſafety for a twelvemonth; but being at laſt diſcovered, he was thrown into the Tower and kept cloſe priſoner. The queen fled with her ſon to a foreſt, where ſhe was ſet upon by robbers, who ſtripped her of her rings and jewels, treating her otherwiſe with the utmoſt indignity. A quarrel which happened among them about the diviſion of the ſpoil afforded her an opportunity of eſcaping from their hands into another part of the foreſt, where ſhe wandered for ſome time without knowing what to do. At laſt, when quite ſpent with hunger and fatigue, ſhe ſaw a robber coming up to her with a drawn ſword in his hand. Finding it altogether impoſſible to eſcape, ſhe ſuddenly took the reſolution of putting herſelf under his protection. Advancing towards him, therefore, and preſenting the young prince, "Here (ſays ſhe), my friend, I commit to your care the ſafety of your king's ſon." This addreſs ſo much ſurpriſed the robber, that, inſtead of offering her any injury, he profeſſed himſelf entirely devoted to her ſervice. After living for ſome time concealed in the foreſt, ſhe was at laſt conducted to the ſea-ſide, where ſhe found a ſhip which conveyed her to Flanders. On her arrival there, ſhe went to her father's houſe, who, though very poor, gave her ſuch entertainment as he could afford; and in this retreat ſhe ſtaid ſome years in expectation of finding an opportunity of retrieving her affairs.

219 The queen retires to Flanders.

Edward, in the mean time, thinking himſelf ſecurely fixed on the throne, gave a looſe to his favourite paſſions; one of which was an immoderate love of women. To divert him from this, the earl of Warwick, to whom he was indebted for his crown, adviſed him to marry. Edward conſented, and ſent him over to the continent to negotiate a match with the princeſs of Savoy. The negotiation proved ſucceſsful; but, in the mean time, the king had privately eſpouſed Elizabeth Woodville, daughter to Sir Philip Woodville, who had married the ducheſs of Bedford after the death of her firſt huſband. Edward had employed his arts of ſeduction againſt this lady in vain before he married her; but unfortunately the match was concluded juſt at the time that the earl of Warwick had proved ſucceſsful in his negotiation with the princeſs of Savoy. The miniſter therefore returned full of indignation againſt his ſovereign: and Edward, forgetting how great cauſe he had to be offended, determined to remove him entirely from his councils. Warwick was likewiſe diſguſted by the favour ſhown to the queen's party; which, though certainly a piece of very commendable policy in Edward, was entirely diſagreeable to the ambitious diſpoſition of that nobleman. A plan of revenge was therefore thought of; and a moſt powerful combination was formed againſt Edward: to accompliſh which, Warwick not only employed his own influence, which was very extenſive, but likewiſe that of the duke of Clarence, Edward's brother, to whom the earl had allied himſelf by giving him his daughter in marriage; after which he perſuaded him to embrace his cauſe. Some circumſtances which took place about this time alſo favoured the ſcheme. The inhabitants about St Leonard's in Yorkſhire complained, that the duties levied for that inſtitution, and which had been originally appointed for pious purpoſes, were ſecreted by the managers, who refuſed to contribute their part. As the clergy were concerned in this affair, they attempted to ſilence their antagoniſts by eccleſiaſtical fulminations againſt them; upon which the latter took up arms, fell upon the officers of the hoſpital, and having maſſacred them, proceeded towards York, to the number of 15,000. In the firſt ſkirmiſh, they had the misfortune to loſe their leader, who was inſtantly executed. The rebels, however, ſtill continued in arms, and in a ſhort time appeared in ſuch numbers as to become formidable to government. Henry earl of Pembroke was ſent againſt them with a body of 5000 men; and having taken Sir Henry Nevil, one of the leaders of the inſurgents, priſoner, inſtantly put him to death; but this was ſoon revenged by a ſimilar execution on himſelf, who happened to be defeated and taken priſoner a ſhort time after. This defeat had been occaſioned by a diſagreement betwixt the earls of Pembroke and Devonſhire; in conſequence of which the latter had gone off with his troops, leaving Pembroke to ſhift for himſelf the beſt way he could. The king, enraged at this, cauſed Devonſhire to be executed in a like ſummary manner: but this was of no ſervice to his cauſe; a new body of inſurgents appeared under Sir Robert Welles, ſon to a nobleman of that name. The latter, in order to ſecure himſelf from all ſuſpicions of diſloyalty, fled to a monaſtery; but he was ſoon enticed from thence and put to death by the inſidious promiſes of King Edward, whoſe treachery was equal to his cruelty. His

220 Warwick diſguſted by Edward.

221 The king's brother joins in the conſpiracy againſt him.

222 An inſurrection in Yorkſhire.

England. son soon after shared the same fate, being defeated and taken prisoner by Edward, who instantly ordered him to be beheaded, along with Sir Thomas Launde and other persons of distinction.

223 Warwick and Clarence join the insurgents.

Notwithstanding such an appearance of a general insurrection, the king had so little suspicion of the loyalty of Warwick and Clarence, that he employed them in raising troops to quell the insurgents. Instead of executing their commission with fidelity, however, they joined the malcontents with all the forces they could raise; but being quite disconcerted by the defeat and death of Sir Robert Welles, they retired to Lancashire, in hopes of being joined by Lord Stanley, who had married the earl of Warwick's sister. Being disappointed in this, they were obliged to disband their army, and fly into Devonshire, whence they set sail for Calais. Upon their arrival on the continent, matters seemed not to be much mended: the deputy-governor, whom Warwick had left, refused him admittance; nor would he even allow the duchess of Clarence to land, though she had been delivered of a son on board only a very few days before, and was at that time extremely ill. Being well acquainted, however, with the uncertainty of the affairs of England at that time, he afterwards made an apology to Warwick for this behaviour. The latter pretended to be easily reconciled; but immediately left the place, having seized some Flemish vessels which he found lying in the neighbourhood.

224 Reconciliation betwixt Warwick and the queen.

As a very close alliance subsisted between Warwick and the duke of Burgundy, the king of France became uneasy; and therefore, as soon as the earl landed in his dominions, received him with the greatest marks of esteem. The reconciliation betwixt him and the unfortunate Queen Margaret now seemed to be natural, though, considering all circumstances, this must have formerly appeared in a manner impossible. The earl's father had been put to death by the orders of Margaret; and Warwick, in return, had twice taken prisoner King Henry, banished the queen, and put to death almost all their faithful adherents. By the mediation of the French monarch, however, all differences were accommodated. A fleet was prepared to reconduct them to England; and seizing a proper opportunity, they landed at Dartmouth with a small body of troops, while Edward was in the north suppressing an insurrection which had lately appeared there. Warwick was attended with astonishing success on his arrival in England, and in less than six days saw himself at the head of 60,000 men. Edward was now obliged in his turn to fly the kingdom. Having narrowly escaped an attempt made upon his person by the marquis of Montague, he embarked on board a small fleet which lay off Lynn in Norfolk. While at sea, he was chased by some ships belonging to the Hans Towns that were then at war both with France and England; but at length, having escaped all dangers, Edward landed safely in Holland, where he met with but an indifferent reception from the duke of Burgundy, with whom he had lately entered into an alliance.

225 He lands in England.

Warwick in the mean time advanced to London, and once more released and placed on the throne the miserable king Henry VI. A parliament was called, which very solemnly confirmed Henry's title to the throne, and Warwick himself was dignified by the people with the title of the *king-maker*. All the attainders of the Lancastrians were reversed; and every England. one was restored who had lost either honours or fortune by his former adherence to Henry's cause. All the adherents of Edward fled to the continent, or took shelter in monasteries, where they were protected by the ecclesiastical privileges. But Edward's party was not yet destroyed. After an absence of nine months, being seconded by a small body of troops granted him by the duke of Burgundy, he made a descent at Ravenspur in Yorkshire. At first he met with little success; but his army increasing on his march, he was soon in a condition to appear before the capital, which immediately opened its gates.

The unfortunate Henry was thus again plucked from the throne; and the hopes of Warwick were almost totally blasted by the defection of Clarence, Edward's brother. Nothing now remained but to come to an engagement as soon as possible. Warwick knew his forces to be inferior to those of Edward, but placed great dependence on his own generalship. He therefore advanced to Barnet, within ten miles of London, where he resolved to wait the coming of Edward. The latter soon came up with him, and on the 14th of April 1471 a most obstinate and bloody battle was fought. Edward, according to custom, had ordered no quarter to be given; and obtained the victory through a mistake of a body of Warwick's forces, who fell with fury on their own party instead of the enemy. The earl himself was slain, together with his brother, and 10,000 of his bravest followers.

The queen was just then returned with her son from France, where she had been soliciting supplies. She had scarce time to refresh herself from the fatigues of the voyage, when she received the fatal news of the death of Warwick, and the total destruction of her party. All her resolution was not able to support her under such a terrible disaster. Her grief now for the first time, it is said, manifested itself by her tears; and she immediately took sanctuary in the abbey of Beaulieu in Hampshire. Here she still found some friends willing to assist her. Tudor earl of Pembroke, Courtney earl of Devonshire, the lords Wenlock and St John, with some other men of rank, encouraged her yet to hope for success, and promised to stand by her to the last. On this assurance, she resumed her courage; and advancing through the counties of Devon, Somerset, and Gloucester, increased her army every day. At last, however, she was overtaken by Edward with his victorious army at Tewkesbury, on the banks of the Severn. The queen's army was totally defeated; the earl of Devonshire and Lord Wenlock were killed in the field; the duke of Somerset, and about 20 other persons of distinction, who had taken shelter in a church, were surrounded, dragged out, and immediately beheaded; about 3000 of their party fell in battle, and the army was entirely dispersed. Queen Margaret and her son were taken prisoners, and brought to the king, who asked the prince in an insulting manner, how he dared to invade his dominions? The young prince replied, that he came thither to claim his just inheritance; upon which Edward struck him on the face with his gauntlet. The dukes of Clarence and Gloucester, Lord Hastings, and Sir Thomas Gray, taking this blow as a signal for farther violence, hurried the prince into the next apartment, and there dispatched him with their

226 Total destruction of the queen's party.

England. their daggers. Margaret was thrown into the tower along with her huſband Henry, who expired in that confinement a few days after. It was univerſally believed that he was murdered by the duke of Glouceſter, though of this there was no direct evidence. Margaret was ranſomed by the king of France for 50,000 crowns, and died a few years after in a moſt miſerable ſituation.

Edward being now freed from all his enemies, began to inflict puniſhment on thoſe who had formerly appeared againſt him. Among the cruelties he committed, that on his brother the duke of Clarence was the moſt remarkable. The king happening to be one day hunting in the park of Thomas Burdet, a ſervant of the duke, killed a white buck which was a great favourite of the owner. Burdet, vexed at the loſs, broke out into a paſſion, and wiſhed the horns of the deer in the belly of the perſon who adviſed the king to that inſult. For this exclamation Burdet was tried for his life, and executed at Tyburn. The duke of Clarence exclaimed againſt the iniquity of this ſentence; upon which he was arraigned before the houſe of peers, found guilty, and condemned to death. The only favour granted him was to have the choice of his death; and his choice was a very ſingular one, namely, to be drowned in a butt of Malmſey wine; which was accordingly done.—The reſt of this reign affords little elſe than a hiſtory of the king's amours. Among his many miſtreſſes, Jane Shore was the moſt remarkable; (ſee SHORE). The king died on the 9th of April 1482, in the 42d year of his age, and 21ſt of his reign, counting from his firſt aſſuming the crown. Beſides five daughters, he left two ſons; Edward prince of Wales, his ſucceſſor, then in his 13th year; and Richard duke of York in his 9th.

228 Edward V. On the death of Edward IV. the kingdom was divided into new factions. The queen's family, which, during the laſt reign, had come into power, was become obnoxious to the old nobility, who conſidered them as their inferiors. The king had endeavoured to prevent theſe animoſities from coming to a height, by deſiring on his death-bed that his brother Richard duke of Glouceſter ſhould be entruſted with the regency; and recommended peace and unanimity during the minority of his ſon. But the king was no ſooner dead than the former reſentment between theſe parties broke out with violence; and the duke of Glouceſter, who was endued with almoſt every bad quality, reſolved to profit by their contentions. His firſt ſtep was to get himſelf declared protector of the realm; and having arreſted the earl of Rivers, the king's uncle and guardian, he met young Edward in his way from Ludlow caſtle, where the late king had reſided during the latter part of his reign, and reſpectfully offered to conduct him to London. Having thus ſecured the perſon of the king, he next got poſſeſſion of his brother's perſon alſo. The queen had retired with this child into Weſtminſter abbey; and it was not without extreme regret that ſhe delivered him up at the interceſſion of the primate and archbiſhop of York.

229 Duke of Glouceſter declared protector.

In a few days after Glouceſter had made himſelf maſter of the perſons of the two princes, he had them confined in the tower, under pretence of guarding them from danger; and ſoon after ſpread reports of their illegitimacy, and by pretended obſtacles put off the young king's coronation. Lord Stanley firſt began to ſuſpect his deſigns; and communicated his ſuſpicions to Lord Haſtings, who had long been firmly attached to the king's family. Lord Haſtings would not at firſt give credit to this ſurmiſe; but he very ſoon had a fatal proof of the truth of what had been communicated to him. On the 13th of June 1483, he was hurried out of the council-room in the tower by Glouceſter's order, and beheaded on a log of timber. The ſoldiers who carried him off made a buſtle as though an attempt had been made to reſcue him, and one of them diſcharged a blow at Lord Stanley's head with a poleaxe; but he happily eſcaped by ſhrinking under the table. The ſame day were executed the Earl Rivers, and ſome others, who had committed no other crime than being faithful to the young king. England.

The protector now thought he might with ſafety lay claim to the throne. He had previouſly gained over the duke of Buckingham, a nobleman of great influence among the people. He uſed his utmoſt endeavours to inſpire the people with a notion of the illegitimate birth of the late king, and conſequently of his children. Dr Shaw, a popular preacher, was alſo hired to harangue the people to the ſame purpoſe from St Paul's croſs. Having expatiated on the incontinence of the queen, and the illegality of the young king's title, he then made a panegyric on the virtues of the protector. "It is the protector (continued he) who carries in his face the image of virtue, and the marks of a true deſcent. He alone can reſtore the loſt glory and honour of the nation." It was hoped that upon this occaſion ſome of the populace would have cried out, "Long live King Richard!" but the audience remaining ſilent, the duke of Buckingham undertook in his turn to perſuade them. Having expatiated on the calamities of the laſt reign and the illegitimacy of the preſent race, he told the people, that he ſaw only one method of warding off the miſeries which threatened the ſtate, which was by electing the protector; but he ſeemed apprehenſive that he would never be prevailed upon to accept a crown accompanied with ſuch difficulty and danger. He next aſked his auditors, whether they would have the protector for their king? but was mortified to find that a total ſilence enſued. The mayor, who was in the ſecret, willing to relieve him in this embarraſſed ſituation, obſerved, that the citizens were not accuſtomed to be harangued by a man of his quality, and would only give an anſwer to their recorder. This officer, therefore, repeated the duke's ſpeech; but the people continuing ſtill ſilent, "This is ſtrange obſtinacy (cried the duke): we only require of you, in plain terms, to declare, whether or not you will have the duke of Glouceſter for your king; as the lords and commons have ſufficient power without your concurrence?" At this, ſome of the meaneſt apprentices, incited by the ſervants of the protector and Buckingham, raiſed a feeble cry of "God ſave King Richard!" The mob at the door repeated the cry; and throwing up their caps into the air, cried out, "A Richard! A Richard!" After this farce was acted, Buckingham, on the 24th of June 1483, waited on Richard with offers of the crown: but the protector, with hypocritical modeſty, at firſt declined the offer; till being told, that the people, in caſe of his refuſal, muſt look out for one that would be more compliant, he

England. he accepted the government of England and France, with a reſolution, as he ſaid, to defend the one and ſubdue the other.

230 Richard III. The firſt ſtep taken by the new king was to ſend orders to Sir Robert Brackenbury governor of the tower, to put the young princes to death. But this he refuſed; and ſubmiſſively anſwered that he knew not how to embrue his hands in innocent blood. A fit inſtrument for this purpoſe, however, was not long wanting. Sir James Tyrrel readily undertook the office; and Brackenbury was ordered to reſign the keys to him for one night. Tyrrel chooſing three aſſociates, Slater, Deighton, and Foreſt, came in the night-time to the door of the chamber where the princes were lodged; and ſending in the aſſaſſins, bid them execute their commiſſion, while he himſelf ſtaid without. They found the young princes in bed, and fallen into a ſound ſleep. The aſſaſſins ſmothered them with the bolſter and pillows; after which they ſhowed their naked bodies to Tyrrel, who ordered them to be buried at the ſtair-foot under a heap of ſtones (c).

231 Edward V. and his brother murdered.

Richard having thus ſecured himſelf on the throne by the moſt iniquitous methods, attempted to ſtrengthen his intereſt by foreign alliances, and procuring the favour of the clergy at home by great indulgences; but he found his power threatened from a quarter where he leaſt expected an attack. The duke of Buckingham, who had been ſo inſtrumental in raiſing him to the throne, did not think himſelf properly rewarded. He made a demand of ſome confiſcated lands in Hereford, to which his family had an ancient claim. Richard either reluctantly complied with his requeſt, or only granted it in part; ſo that a coolneſs ſoon enſued between them, and in a little time Buckingham came to a reſolution of dethroning the monarch whom he had juſt raiſed. For ſome time he remained in doubt, whether he ſhould aſſume the crown himſelf or ſet up another. At length he determined on the latter; and reſolved to declare for Henry earl of Richmond, who was at that time an exile in Britanny, and was conſidered as the only ſurviving branch of the houſe of Lancaſter. He was one of thoſe who had the good fortune to eſcape the numerous maſſacres of the former reigns; but as he was a deſcendant of John of Gaunt by the female line, he was for that reaſon obnoxious to thoſe in power. He had long lived in exile, and was once delivered over to the ambaſſadors of Edward IV. who were preparing to carry him to England; when the duke of Britanny, who delivered him, repented of what he had done, and took him from the ambaſſadors juſt as they were carrying him on ſhipboard. His right to the crown by ſucceſſion was very doubtful: but the cruel behaviour of Richard inclined the people in general greatly to favour him; and, to give an additional ſtrength to his title, a match was projected betwixt him and the princeſs Elizabeth, the eldeſt daughter of Edward IV. which, by uniting the two rival families, would put an end to thoſe diſſenſions which had ſo long filled the kingdom with bloodſhed and confuſion. Richard, in the mean time, from ſome reaſons which have not been particularized by hiſtorians, began to entertain doubts of the fidelity of Buckingham, and determined to cut him off. For this purpoſe he ſent for him to court: but Buckingham, inſtead of obeying the ſummons, fled into Wales, where he raiſed a conſiderable army, and forthwith ſet out to the eaſtward with a deſign to invade England. Richard haſtened to meet him with what forces he could raiſe; but the march of Buckingham being retarded by a moſt uncommon inundation of the Severn which laſted 10 days, his troops were ſo diſheartened at this event, that they almoſt all deſerted him. The duke was therefore obliged to fly in diſtreſs, and Richard inſtantly ſet a price upon his head. Buckingham was now obliged to truſt his life in the hands of an old ſervant of his own, named *Baniſter;* but this man, tempted by the greatneſs of the reward, betrayed him to the ſheriff of Shropſhire, by whom he was ſeized and conducted to Richard at Saliſbury, who cauſed him to be executed without delay. The earl of Richmond, in the mean time, had ſet ſail from St Maloes with a body of 5000 men: but after his arrival in England, receiving the diſagreeable news of Buckingham's misfortune, he ſet ſail again for Bretagne; while Richard, emboldened by the bad ſucceſs of his enemies, determined to confirm his title to the throne by calling a parliament, which till this time he had not ventured to do. At preſent matters were ſo circumſtanced, that the parliament had no other reſource than to comply with his deſires, and acknowledge his right to the crown. An act was paſſed confirming the illegitimacy of Edward's children; and an attainder was alſo confirmed againſt the earl of Richmond; the duties of tonnage and poundage were granted to the king for life; and his only ſon Edward, then about 12 years of age, was created prince of Wales. In return for theſe conceſſions, Richard paſſed ſeveral popular laws, particularly againſt the extorting of money by benevolences, and ſome others calculated to gain the good will of the oppoſite party. He paid his court alſo to the queen-dowager with ſuch aſſiduity and ſucceſs, that ſhe left her ſanctuary, and put herſelf and her daughters into his hands. The ambition and cruelty of this man indeed are ſaid to have extinguiſhed every ſentiment of natural affection as well as humanity. He had married Anne, the ſecond daughter of the earl of Warwick, and widow of Edward prince of Wales, whom he himſelf had murdered; but having born him but one ſon, who died about this time, he conſidered her as an invincible obſtacle to the accompliſhment of his deſires; for which reaſon it was thought he put an end to her life by poiſon: and as he knew that the projected match between the earl of Richmond and the princeſs Elizabeth could only make the rivalſhip of the former any way formidable, he reſolved to obtain a diſpenſation

232 Buckingham determines to ſupport the claim of the earl of Richmond to the throne.

233 He takes up arms, but is abandoned by his army and put to death.

234 Richmond lands in England, but is obliged to return.

235 Richard's title confirmed by parliament.

England.

(c) Theſe circumſtances are ſaid to have been confeſſed in the ſucceeding reign, though the perpetrators eſcaped puniſhment. The bodies of the two princes were ſought for without any ſucceſs under the reign of Henry VII. but in the time of Charles II. the bones of two perſons anſwering to their age were found in the ſpot where they were ſaid to have been buried; which, being ſuppoſed to be the remains of theſe two unfortunate youths, they were buried under a marble monument in Weſtminſter abbey.

England. tion from the pope for marrying her himſelf. The queen-dowager is even ſaid to have come into this ſcheme, with a view to recover her power; but the princeſs herſelf always rejected his addreſſes with abhorrence. The refuſal of the princeſs occaſioned no ſmall perplexity in Richard; and before he could determine on any proper method of accompliſhing his purpoſe, he received news of Richmond's preparations for landing in England. Theſe being ſoon accompliſhed, Henry ſet ſail from Harfleur in Normandy, and landed without oppoſition, on the 17th of Auguſt 1485, at Milford haven in Wales. Richard, in the mean time, not knowing where the invaſion was to take place, had poſted himſelf at Nottingham; which being almoſt in the centre of the kingdom, was therefore proper for reſiſting any invader. Sir Rice ap Thomas and Sir Walter Herbert were commiſſioned by Richard to oppoſe his rival in Wales; but the former immediately deſerted to him, and the latter made but a very feeble reſiſtance. Richard inſtantly reſolved to meet his antagoniſt, and to riſk every thing on the event of a battle. Richmond, though he had not above 6000 men, and the king near double that number, did not decline the combat; being chiefly encouraged by the promiſes of Lord Stanley to join him with a body of 7000 men, and with whom he hovered at a little diſtance from the intended field of battle, ſeemingly indetermined to join either ſide.

236 Richmond lands in England a ſecond time.

237 Richard defeated and killed.

The king having commanded his army to form themſelves in order of battle, intruſted the van to the duke of Norfolk, while he himſelf, with the crown on his head, took the command of the main body. Lord Stanley in the mean time poſted himſelf on one flank between the two armies, while his brother Sir William took his ſtation directly oppoſite. As his intention of either joining the enemy or keeping neutral during the time of the engagement was now far from being doubtful, Richard ſent him orders to join the main body; which not being complied with, the tyrant determined to put to death Stanley's ſon, who had been left with him as a pledge of his father's fidelity. He was perſuaded, however, to defer the execution till after the engagement, that Stanley might thereby be induced to delay his purpoſe in joining the enemy. This, however did not anſwer the expectation. Soon after the engagement was begun, Stanley deſerted Richard's party, and joining Richmond, entirely decided the fortune of the day. The tyrant perceiving his ſituation to be quite deſperate, and ſeeing his rival at no great diſtance from him, drove up againſt him with fury, in hopes that either Henry's death or his own would decide the victory between them. He killed Sir William Brandon the earl's ſtandard-bearer; he diſmounted Sir John Cheyney; and was within reach of Richmond, when Sir William Stanley breaking in with his troops, Richard was ſurrounded and overwhelmed by numbers. His body was found in the field, covered with dead enemies, and beſmeared with blood. It was thrown careleſsly acroſs a horſe, carried to Leiceſter, amidſt the ſhouts of inſulting ſpectators, and interred in the Gray-Friars church of that place.

The uſurper's crown being found on the field of battle, was placed on the head of the conqueror, while the whole army cried out, "Long live King Henry!" Two days after the battle, Henry gave orders to confine Edward Plantagenet earl of Warwick, and ſon of the unfortunate duke of Clarence; and to releaſe the princeſs Elizabeth, who had been confined in the Tower. He then advanced by ſlow and gradual marches to the city of London, where he was received with the greateſt demonſtrations of joy. He was crowned king of England on the 30th of October 1485; and to heighten the ſplendor on that occaſion, he beſtowed the rank of knights-banneret on 12 perſons, and conferred peerages on three. Jaſper earl of Pembroke, his uncle, he created duke of Bedford; Thomas Lord Stanley his father-in-law, earl of Derby; and Edward Courteney, earl of Devonſhire. At the coronation likewiſe appeared a new inſtitution, which the king had eſtabliſhed for perſonal ſecurity as well as pomp; a band of 50 archers, who were denominated Yeomen of the Guard. But leſt the people ſhould take umbrage at this ſtep, as if it implied a diffidence of his ſubjects, he declared the inſtitution to be perpetual. The ceremony of the coronation was performed by Cardinal Bourchier archbiſhop of Canterbury.—On the 18th of January 1486, he was married to the princeſs Elizabeth; and his marriage was celebrated at London with greater appearance of joy than either his firſt entry or his coronation had been. Henry remarked, with much diſpleaſure, this general favour borne to the houſe of York; and the ſuſpicions ariſing from it, not only diſturbed his tranquillity during the whole of his reign, but bred diſguſt towards his conſort herſelf, and poiſoned all his domeſtic enjoyments.

England. 238 Henry VII

The reign of Henry VII. was for ſeveral years diſturbed by plots and inſurrections. The people, by a long courſe of civil war, had become ſo turbulent and factious, that no governor could rule, nor could any king pleaſe them. The violent animoſity expreſſed by this monarch, however, againſt the houſe of York, may juſtly be conſidered as one of the cauſes of the extreme proneneſs to rebellion manifeſted by his ſubjects. Inſtead of endeavouring to conciliate the affection of the oppoſite party, he always ſtrove to quell them by abſolute force and violence. For this purpoſe he took a journey, ſoon after his acceſſion, to the north of England, where the Yorkiſts were very numerous: hoping to get the better of them by his preſence. In his journey thither, he received intelligence of an inſurrection againſt him by Viſcount Lovel, with Sir Henry Stafford and Thomas his brother, who had raiſed an army, and were marching to beſiege the city of Worceſter, while Lovel approached to aſſiſt them with a body of three or four thouſand men. They were diſperſed, however, by the offer of a general pardon; which induced Lovel to withdraw from his troops, who were thereupon obliged to ſubmit to the king's mercy. The Staffords took ſanctuary in the church of Colnham near Abingdon; but as it was found that this church had not the privilege of protecting rebels, they were taken from thence: the elder was executed at Tyburn; but the younger, pleading that he had been miſled by his brother, received a pardon.

239 His reign diſturbed by frequent rebellions

240 Lovel and Stafford's inſurrection ſuppreſſed

This ſucceſs was ſoon after followed by the birth of a prince; whom Henry named in honour of the celebrated King Arthur, who is ſaid to have been the direct anceſtor of the houſe of Tudor. All this ſucceſs, however, as well as the general ſatisfaction which the birth of a prince deſcended from the houſes both of

241 Prince Arthur born.

England. York and Lancaſter neceſſarily occaſioned, were not ſufficient to reconcile the hearts of the Engliſh to their ſovereign. His extreme ſeverity towards the houſe of York ſtill continued; and unfortunately this was much more beloved by the generality of the nation than that of Lancaſter. Many of the Yorkiſts had been treated with great cruelty, and deprived of their fortunes under pretence of treaſon; a general reſumption had likewiſe been made of the grants made by the princes of the houſe of York. It was likewiſe univerſally believed that the queen herſelf met with harſh treatment, on account of her being one of that unfortunate houſe; and from all theſe circumſtances it was not unreaſonably imagined that his enmity was inveterate and invincible. Hence, notwithſtanding his politic and vigorous adminiſtration, people made no ſcruple of openly expreſſing their diſapprobation of his conduct and government; and one rebellion ſeemed to be extinguiſhed only to give birth to another. The king had, at the commencement of his reign, confined the duke of Clarence's ſon, as has already been mentioned. This unfortunate youth, who had obtained the title of the earl of Warwick, was, through long confinement, entirely unacquainted with the affairs of the world. Simple as he was, however, he was now made uſe of to diſturb the public tranquillity. The queen-dowager was with great reaſon ſuſpected to be at the bottom of this conſpiracy; but not chooſing to interfere openly in the matter herſelf, ſhe employed one Simon a prieſt of Oxford to execute her purpoſes. This man caſt his eyes upon one Lambert Simnel, a baker's ſon in the ſame place, a youth of only 15 years of age; but who, from his graceful appearance and accompliſhments, ſeemed proper for perſonating a man of quality. A report had been ſpread among the people, that Richard duke of York, ſecond ſon of Edward IV. had ſecretly made his eſcape from the cruelty of his uncle, and lay ſomewhere concealed in England. Simon had at firſt inſtructed his pupil to aſſume that name, which he found to be much the object of public affection; but hearing afterwards a new report, that Warwick had eſcaped from the Tower, and obſerving that this news was attended with no leſs general ſatisfaction, he changed the plan of his impoſture, and made Simnel perſonate that unfortunate prince. The pliant youth was therefore directed by his inſtructor to talk upon many occurrences, as happening to him in the court of Edward. But as the impoſtor was not calculated to bear cloſe examination, he was removed to Ireland: and ſo well had he profited by the leſſons given him, that he no ſooner preſented himſelf to the earl of Kildare the deputy, claiming his protection as the unfortunate earl of Warwick, than he began to conſult with ſeveral other noblemen with regard to him. Theſe expreſſed even a ſtronger belief in Simnel's ſtory than the deputy himſelf had done; and in proportion as the ſtory was ſpread abroad, the more credit it obtained. The impoſtor was lodged in the caſtle of Dublin; the inhabitants univerſally took an oath of allegiance to him, as the true deſcendant of the Plantagenets; he was crowned with a diadem taken from the ſtatue of the bleſſed virgin, and proclaimed king by the title of Edward VI.; and the whole kingdom followed the example of the capital.

242 Diſcontents of the people.

243 Impoſture of Lambert Simnel.

Such an unexpected event alarmed Henry ſo much, that he would have gone over to Ireland on purpoſe to quell the rebellion in perſon, had he not been afraid of the machinations of the queen-dowager in his abſence. To prevent any thing of this kind, it was reſolved to confine her for life in a monaſtery; under pretence, however, that it was done on account of her having formerly delivered up the princeſs her daughter to King Richard. The queen murmured againſt the ſeverity of her treatment; but the king perſiſted in his reſolution, and ſhe remained in confinement till the time of her death, which happened ſome years after.

England.

244 The queen-dowager confined.

The next meaſure was to ſhow Warwick to the people. He was taken from the Tower, and led through the principal ſtreets of London; after which he was conducted in ſolemn proceſſion to St Paul's, where great numbers were aſſembled to ſee him. Still, however, they proceeded in Dublin to honour their pretended monarch; and he was crowned with great ſolemnity in the preſence of the earl of Kildare, the chancellor, and the other officers of ſtate. At laſt being furniſhed by the ducheſs of Burgundy with a body of 2000 veteran Germans under the command of Martin Swart, a brave and experienced officer, he reſolved to invade England. He landed in Lancaſhire, from whence he marched to York, expecting that the country people would riſe and join him on his march. But in this he was deceived: the people were unwilling to join a body of foreigners; and were beſides kept in awe by the great reputation of Henry. Lord Lincoln, therefore, who commanded the rebel army, determined to bring the matter to a ſpeedy iſſue. Accordingly he met the royal army at Stoke in the county of Nottingham. An obſtinate engagement enſued, but at length King Henry obtained a complete victory. Lord Lincoln, with 4000 private men, periſhed in the battle; and Simnel with his tutor Simon were taken priſoners. Simon being a prieſt, could not be tried by the civil power, and was only committed to cloſe confinement. Simnel was pardoned, and made a ſcullion in the king's kitchen, whence he was afterwards advanced to the rank of falconer, in which employment he died.

Henry being now freed from all danger from that quarter, determined to take ample vengeance on his enemies. For this purpoſe he took a journey into the north; but though he found many delinquents, his natural avarice prompted him to exact heavy fines from them rather than to put them to death. His proceedings, however, were extremely arbitrary; the criminals being tried, not by the ordinary judges, but either by commiſſioners appointed for the occaſion, or ſuffering puniſhment by ſentence of a court-martial. Having thus fully eſtabliſhed his authority as far as it could be done by ſuppreſſing and puniſhing domeſtic enemies, he next determined to recommend himſelf to his ſubjects by a report of his military diſpoſition; hoping, that by undertaking, or pretending to undertake, ſome martial enterpriſes, he would thus gain the favour of a people naturally turbulent, and unaccuſtomed to live long at peace with their neighbours. He certainly had not, however, the leaſt intention of proſecuting foreign conqueſts; though, to pleaſe the people, he frequently gave out that he deſigned to invade France, and lay waſte the whole country, rather than not recover his continental poſſeſſions. Under theſe pretences, particularly that of aſſiſting the Bretons, whom the king

245 Henry puniſhes his enemies.

246 Pretends a deſire of atchieving martial exploits

king of France had lately subdued, and who had applied to him for relief, he persuaded his parliament to grant him a considerable supply; but this involved him in some difficulties. The counties of Durham and York, who had always been discontented with Henry's government, and still farther provoked by the oppressions under which they had laboured after the extinction of Simnel's rebellion, opposed the commissioners sent by the king to levy the tax. The latter applied to the earl of Northumberland, requesting his advice and assistance in the execution of their office; but instead of being able to enforce the levying of the tax, he himself was attacked and put to death by the insurgents. This act of violence committed by themselves, seemed to render the insurgents desperate, so that without more ado they prepared to resist the royal power, under the conduct of one Sir John Egremond; but in this ill-conducted and precipitate scheme they met with no success. Henry instantly levied a considerable force, which he committed to the charge of the earl of Surrey; by whom the rebels were quickly defeated, and one of their leaders taken prisoner. Sir John Egremond fled to the duchess of Burgundy, who afforded him protection.

247 Obtains a subsidy on pretence of assisting the inhabitants of Bretagne.

248 An insurrection suppressed.

Thus Henry obtained the subsidy which he had solicited under pretence of invading France, though he would willingly have avoided any expence in preparations for that purpose in order to keep the money in his possession; but as the Bretons had applied to him for assistance, and their distresses became every day more urgent, he found himself obliged to attempt something. With this view he set sail for Calais with an army of 25,000 foot and 1600 horse, of which he gave the command to the duke of Bedford and the earl of Oxford: but notwithstanding this apparent hostile disposition, negotiations for peace had been secretly begun, and commissioners even appointed to consider of the terms, three months before King Henry set out for the continent. As the love of money was the prevailing passion of the English monarch, and the possession of Bretagne was a great object to France, an accommodation soon took place betwixt the contending parties. The king of France engaged to pay Henry near 200,000l. as a reimbursement for the expences of his expedition, and stipulated at the same time to pay him and his heirs an annual pension of 25,000 crowns more.

249 Henry makes a feigned invasion of France.

250 Obtains a sum of money and a annual pension.

Thus the authority of Henry seemed to be so firmly established, as to leave no reason to dread any rival in time to come; but still he found himself mistaken. The duchess of Burgundy, resenting the depression of her family, and exasperated by her frequent miscarriages in the attempts already made, resolved to make a final effort against Henry, whom she greatly hated. For this purpose she propagated a report that her nephew Richard Plantagenet, duke of York, had escaped from the tower where his elder brother was murdered, and that he still lay somewhere concealed. Finding this report eagerly received, she soon found a young man who assumed both his name and character. The person chosen to act this part was the son of one Osbeck, or Warbeck, a converted Jew, who had been in England during the reign of Edward IV. His name was *Peter*; but it had been corrupted after the Flemish manner into *Peterkin*, or *Perkin*. It was by some believed, that Edward, among his other amorous adventures, had a secret correspondence with Warbeck's wife, which might account for the great similarity of features between Perkin and that monarch. The duchess of Burgundy found this youth entirely suited to her purposes. The lessons she gave him were easily learned and strongly retained. His graceful air, his courtly address, his easy manners, and elegant conversation, were capable of imposing upon all but those who were privy to the imposture. The kingdom of Ireland was pitched upon for Perkin's first appearance, as it had been before for that of Simnel. He landed at Cork; and immediately assuming the name of *Richard Plantagenet*, was followed by great numbers of credulous people. He wrote letters to the earls of Desmond and Kildare, inviting them to join his party; he dispersed everywhere the strange intelligence of his escape from his uncle Richard's cruelty; and his story meeting with general credit, he soon became an object of the public favour. All those who were disgusted with the king, prepared to join Perkin; but particularly those who formerly were Henry's favourites, and had contributed to place him on the throne. These, thinking their services had not been sufficiently repaid, now became heads of the conspiracy. Their attempts, however, were all frustrated by the vigilance of the king, and most of the conspirators of any note were publicly executed.

251 Imposture of Perkin Warbeck.

Perkin finding it was in vain to attempt any thing in England, went to the court of James IV. of Scotland. Here he was received with great cordiality; and James carried his confidence in him so far, that he even gave him in marriage Lady Catherine Gordon, daughter to the earl of Huntley, and a near kinswoman of his own. But when he attempted to set him on the throne of England, he found himself totally disappointed; and on the conclusion of peace between the two kingdoms, Perkin was obliged to leave Scotland. From thence he went to Flanders; and meeting with but a cool reception there, he resolved to try the affections of the people of Cornwall, who had lately risen against the king on account of a new tax which had been levied upon them. On his first appearance, Perkin was joined by about 3000 of these people, with which force he laid siege to Exeter. Henry, however, having marched against him with a considerable army, Perkin's heart failed him, though his followers now amounted to 7000; and he took shelter in a monastery. His wife fell into the conqueror's hands; who placed her in a respectable situation near the queen's person, with a suitable pension, which she enjoyed till her death. Perkin being persuaded to deliver himself into the king's hand, was compelled to sign a confession of his former life and conduct; but this was so defective and contradictory, that very little regard was paid to it. His life was granted him; though he was still detained in custody, and keepers were appointed to watch his conduct. From these, however, he broke loose; and flying to the sanctuary of Shyne, put himself into the prior's hands. He was once more prevailed upon to trust himself in the king's hands, and was committed to the tower; but having here entered into a correspondence with the earl of Warwick in order to make their escape, both of them were condemned and executed.

To Henry VII. in a great measure, is owing the

England. present civilized ſtate of the Engliſh nation. He had all along two points principally in view; the one to depreſs the nobility and clergy, and the other to exalt and humanize the populace. In the feudal times every nobleman was poſſeſſed of a certain number of vaſſals, over whom he had, by various methods, acquired an almoſt abſolute power; and, therefore, upon every ſlight diſguſt, he was able to influence them to join him in his revolt or diſobedience. Henry conſidered, that the giving of his barons a power to ſell their eſtates, which were before unalienable, muſt greatly weaken their intereſt. This liberty therefore he gave them; and it proved highly pleaſing to the commons, nor was it diſagreeable to the nobles themſelves. His next ſcheme was to prevent their giving liveries to many hundreds of their dependents, who were thus kept like the ſoldiers of a ſtanding army to be ready at the command of their lord. By an act paſſed in this reign, none but menial ſervants were allowed to wear a livery; and this law was enforced under ſevere penalties.

[251] Engliſh nation civilized by Henry.

With the clergy, Henry was not ſo ſucceſsful. The number of criminals of all kinds who found protection in monaſteries and other places appointed for religious worſhip, ſeemed to indicate little leſs than an abſolute toleration of all kinds of vice. Henry uſed all his intereſt with the pope to get theſe ſanctuaries aboliſhed, but to no purpoſe. All that he could procure was, that if thieves, murderers, or robbers, regiſtered as ſanctuary men, ſhould ſally out and commit freſh offences, and retreat again, in ſuch caſes they might be taken out of the ſanctuary and delivered up to juſtice.

In 1500, the king's eldeſt ſon Arthur was married to the Infanta Catharine of Spain, which marriage had been projected and negotiated ſeven years. But the prince dying in a few months after marriage, the princeſs was obliged to marry his younger brother Henry, who was created prince of Wales in his room. Henry himſelf made all the oppoſition which a youth of 12 years of age is capable of: but as the king perſiſted in his reſolution, the marriage was by the pope's diſpenſation ſhortly after ſolemnized.—In the latter part of this king's reign, his economy, which had always been exact, degenerated into avarice, and he oppreſſed the people in a very arbitrary manner. He had two miniſters, Empſon and Dudley, perfectly qualified to ſecond his avaricious intentions. They were both lawyers, and uſually committed to priſon by indictment ſuch perſons as they intended to oppreſs; from whence they ſeldom got free but by paying heavy fines, which were called mitigations and compoſitions: but by degrees the very forms of law were omitted; and they determined in a ſummary way upon the properties of the ſubjects, and confiſcated their effects to the royal treaſury.—Henry VII. died of the gout in his ſtomach, in the year 1509, having lived 52 years, and reigned 23; and was ſucceeded by his ſon Henry VIII. In Henry VII.'s reign was built a large ſhip of war called the *Great Harry*, which coſt 14,000l. This was, properly ſpeaking, the firſt ſhip in the Engliſh navy. Before this period, when the king wanted a fleet, he had no other expedient than to hire ſhips from the merchants.

252 Death of Henry VII.

253 Henry VIII.

Henry VIII. aſcended the throne when he was about 18 years of age, and had almoſt every advantage which a prince can have on his acceſſion. He had a well-ſtored treaſury, and indiſputed title, and was at peace with all the powers in Europe. Commerce and arts had been ſome time introduced into England, where they met with a favourable reception. The young prince himſelf was beautiful in his perſon, expert in all polite exerciſes, open and liberal in his air, and loved by all his ſubjects. The old king, who was himſelf a ſcholar, had inſtructed him in all the learning of the times, ſo that he was an adept in ſchool-divinity before the age of 18. England.

All theſe advantages, however, ſeemed to have been loſt upon the new king. Being deſtitute of a good heart and ſolid underſtanding, he proved a tyrant. Being always actuated, not by reaſon, but the paſſion which happened to be uppermoſt in his mind, he behaved in the moſt abſurd and contradictory manner; and however fortunate ſome of his meaſures proved at laſt, it is impoſſible that either his motives, or the means he took for the accompliſhment of his purpoſes, can be approved of by any good man.

One of Henry's firſt actions in his royal capacity was to puniſh Empſon and Dudley, who were obnoxious to the populace on account of their having been the inſtruments of the late king's rapacity. As they could not be impeached merely on account of their having ſtrictly executed the will of the king, they were accuſed of having entered into a treaſonable conſpiracy, and of having deſigned to ſeize by force the adminiſtration of government; and though nothing could be more improbable than ſuch a charge, the general prejudice againſt them was ſo great, that they were both condemned and executed.

In 1510, the king entered into a league with Pope Julius II. and Ferdinand king of Spain, againſt Louis XII. of France. In this alliance Henry was the only diſintereſted perſon. He expected nothing beſides the glory which he hoped would attend his arms, and the title of *Moſt Chriſtian King*, which the pope aſſured him would ſoon be taken from the king of France to be conferred upon him. The pope was deſirous of wreſting from Louis ſome valuable provinces which he poſſeſſed in Italy, and Ferdinand was deſirous of ſharing in the ſpoil. Henry ſummoned his parliament; who very readily granted him ſupplies, as he gave out that his deſign was to conquer the kingdom of France, and annex it to the crown of England. It was in vain that one of his old prudent counſellors objected, that conqueſts on the continent would only drain the kingdom without enriching it; and that England, from its ſituation, was not fitted to enjoy extenſive empire. The young king, deaf to all remonſtrances, and hurried away by his military ardour, reſolved immediately to begin the war. But after ſeveral attempts, which were rendered unſucceſsful only by the miſmanagement of thoſe who conducted them, a peace was concluded with France on the 7th of Auguſt 1514.

Henry's arms were attended with more ſucceſs in Scotland; where King James IV. with the greateſt part of the Scots nobility, and 10,000 of the common people, were cut off in the battle of Flowden†. Henry in the mean time, puffed up with his imaginary ſucceſſes againſt France, and his real ones againſt Scotland, †See *Scotland.*

England. land, continued to laviſh his treaſures by expenſive pleaſures, and no leſs expenſive preparations for war. The old miniſters who had been appointed by his father to direct him, were now diſregarded; and the king's confidence was entirely placed in Thomas afterwards Cardinal Wolſey, who ſeconded him in all his favourite purſuits, and who, being the ſon of a private gentleman at Ipſwich, had gradually raiſed himſelf to the firſt employments of the ſtate *. He doth not ſeem to have had many bad qualities beſides his exceſſive pride, which diſguſted all the nobility; but the great ſhare he poſſeſſed in the favour of ſuch an abſolute prince as Henry VIII. put him quite out of the reach of his enemies.

254 Cardinal Wolſey miniſter.

* See *Wolſey*.

255 Arbitrary behaviour of the king.

The king having ſoon exhauſted all the treaſures left him by his father, as well as the ſupplies which he could by fair means obtain from his parliament, applied to Wolſey for new methods of replenithing his coffers. The miniſter's firſt ſcheme was to get a large ſum from the people under the title of *benevolence*; though no title could be more improperly applied, as it was not granted without the greateſt murmurings and complaints. Wolſey even met with oppoſition in the levying of it. In the firſt place, having exacted a conſiderable ſum from the clergy, he next applied himſelf to the houſe of commons; but they only granted him half the ſum he demanded. The miniſter at firſt was highly offended, and deſired to be heard in the houſe; but they replied, that none could be permitted to ſit and argue there except ſuch as were members. Soon after, the king having occaſion for new ſupplies, by Wolſey's advice attempted to procure them by his prerogative alone, without conſulting his parliament. He iſſued out commiſſions to all the counties of England for levying four ſhillings in the pound from the clergy, and three ſhillings and fourpence from the laity. This ſtretch of royal power was ſoon oppoſed by the people, and a general inſurrection ſeemed ready to enſue. Henry endeavoured to pacify them by circular letters; in which he declared, that what he demanded was only by way of benevolence. The city of London, however, ſtill heſitated on the demand; and in ſome parts of the country inſurrections were actually begun. Theſe were happily ſuppreſſed by the duke of Suffolk; but the cardinal loſt ſomewhat of the king's favour on account of the improper advice he had given him. To reinſtate himſelf in his good graces, Wolſey made the king a preſent of a noble palace called *York-place*, at Weſtminſter, aſſuring him that from the firſt he had intended it for the king's uſe. In order to have a pretence for amaſſing more wealth, Wolſey next undertook to found two new colleges at Oxford; and for this purpoſe he received every day freſh grants from the pope and the king. The former imprudently gave him liberty to ſuppreſs ſome monaſteries, and make uſe of their revenues for the erection of his new colleges; but this was a fatal precedent for the pontiff's intereſts, and it taught the king to ſeize on the monaſtic revenues whenever he ſtood in need of money.

For a conſiderable time Wolſey continued to enjoy the king's favour in an extreme degree; and as no monarch was ever more deſpotic than Henry VIII. no miniſter was more powerful than Wolſey. This extraordinary elevation ſerved only to render his fall the more conſpicuous, and himſelf the more miſerable, when it took place: and what was worſe, he had long foreſeen, from what he knew of the king's capricious and obſtinate temper, that it certainly would happen one time or other. The cauſe of his final overthrow was the deſire King Henry began to entertain of having his queen Catharine divorced. The doctrines of the reformation, propagated by Luther in 1517, had gained conſiderable ground in England, and many profeſſed a belief in them, notwithſtanding the ſevere perſecution which had been carried on againſt heretics during ſome of the preceding reigns. The clergy had become ſo exceedingly corrupt, and were immerſed in ſuch monſtrous ignorance, that they were univerſally hated even by their own party; while no regard at all was paid to their deciſions, or rather they were looked upon with the utmoſt abhorrence, by the reformers. Even the papal authority, though ſtill very great, had, in no greater a ſpace of time than ten years (viz. from 1517, when Luther firſt began to attack it, to the preſent year 1527), declined very ſenſibly. The marriage of King Henry, therefore, being looked upon by all parties as in itſelf illegal, and only ſanctified by a diſpenſation from the pope, had been frequently objected to on different occaſions. We are informed by ſome authors, that when Henry VII. betrothed his ſon, at that time only 12 years of age, he evidently ſhowed an intention of taking afterwards a proper opportunity to annul the contract; and that he ordered Prince Henry, as ſoon as he ſhould come of age, to enter a proteſtation againſt the marriage; charging him on his death-bed not to finiſh an alliance ſo unuſual, and liable to ſuch inſuperable objections. Some members of the privy council, particularly Warham the primate, afterwards declared againſt the completion of the marriage; and even after it was completed, ſome incidents which in a ſhort time took place were ſufficient to make him ſenſible of the general ſentiments of the public on that ſubject. The ſtates of Caſtile had oppoſed a marriage betwixt the emperor Charles and the Engliſh princeſs Mary, Henry's daughter, urging among other things the illegitimacy of her birth. The ſame objection afterwards occurred on opening a negotiation with France for a marriage with the duke of Orleans.

England. 256 Cauſe of Wolſey's diſgrace

257 Scruples concerning the legality of Henry's marriage

If theſe accounts are to be depended upon as authentic, we can ſcarce conceive it poſſible but Henry himſelf muſt have been ſomewhat ſtaggered by them; though it is by no means probable that they were his only motives. The queen was ſix years older than the king, her perſonal charms were decayed, and his affection leſſened in proportion. All her children had died in infancy except one daughter, the princeſs Mary above mentioned; and Henry was, or pretended to be, greatly ſtruck with this, as it ſeemed ſomething like the curſe of being childleſs, pronounced in the Moſaic law againſt ſome evil doers. Another point of the utmoſt importance was the ſucceſſion to the crown, which any queſtion concerning the legitimacy of the king's marriage would involve in confuſion. It was alſo ſuppoſed, with great reaſon, that ſhould any obſtacles of this kind occur, the king of Scotland would ſtep in as the next heir, and advance his pretenſions to the crown of England. But above all, it is probable that he was influenced by the love he had now contracted for Anne Boleyn, who had lately been

258 Other reaſons for Henry's deſire of a divorce.

259 He [illegible] Anne Boleyn.

England. been appointed maid of honour to the queen. In this ſtation Henry had frequent opportunities of ſeeing her, and ſoon became deeply enamoured; and finding that his paſſion could not be gratified but by a marriage, it is not to be doubted that he was thus obſtinately ſet upon the divorce; for which purpoſe he ſent his ſecretary to Rome to obtain from Clement a bull for diſſolving his marriage with Catharine. That he might not ſeem to entertain any doubt of the pope's prerogative, he inſiſted only on ſome grounds of nullity in the bull granted by his predeceſſor Julius for the accompliſhment of the marriage. In the preamble to this bull, it had been ſaid, that it was granted only upon the ſolicitation of Henry himſelf; though it was known that he was then a youth under 12 years of age: it was likewiſe aſſerted, that the bull was neceſſary for maintaining the peace between the two crowns; though otherwiſe it is certain that there was no appearance of a quarrel betwixt them. Theſe falſe premiſes ſeemed to afford a very good pretence for diſſolving it; but, as matters then ſtood, the pope was involved in the utmoſt perplexity. Queen Catharine was aunt to the emperor, who had lately made Clement himſelf a priſoner, and whoſe reſentment he ſtill dreaded: and beſides, he could not with any degree of prudence declare the bull of the former pope illicit, as this would give a mortal blow to the doctrine of papal infallibility. On the other hand, Henry was his protector and friend; the dominions of England were the chief reſource from whence his finances were ſupplied; and the king of France, ſome time before, had got a bull of divorce in circumſtances nearly ſimilar. In this exigence he thought the wiſeſt method would be to ſpin out the affair by negotiation; and in the mean time he ſent over a commiſſion to Wolſey, in conjunction with the archbiſhop of Canterbury or any other Engliſh prelate, to examine the validity of the king's marriage and of the former diſpenſation; granting them alſo a proviſional diſpenſation for the king's marriage with any other perſon.

260 Sends to Rome to obtain a divorce.

261 Extreme perplexity of the pope.

The pope's meſſage was laid before the council in England: but they conſidered, that an advice given by the pope in this ſecret manner might very eaſily be diſavowed in public; and that a clandeſtine marriage would totally invalidate the legitimacy of any iſſue the king might have by ſuch a match. In conſequence of this, freſh meſſengers were diſpatched to Rome, and evaſive anſwers returned; the pope never imagining that Henry's paſſion would hold out during the tedious courſe of an eccleſiaſtical controverſy. But in this he was miſtaken. The king of England had been taught to diſpute as well as the pope, and valued himſelf not a little on his knowledge in theology: and to his arguments he added threats; telling him, that the Engliſh were but too well diſpoſed to withdraw from the holy ſee; and that if he continued uncomplying, the whole country would readily follow the example of their monarch, who ſhould always deny obedience to a pontiff that had treated him with ſuch falſehood and duplicity. The king even propoſed to his holineſs whether, if he were not permitted to divorce his preſent queen, he might not have a diſpenſation for having two wives at once?

262 Henry's controverſy with him.

The pope, perceiving the king's eagerneſs, at laſt ſent Cardinal Campegio his legate to London; who with Wolſey, opened a court for trying the legitimacy of the king's marriage with Catharine, and cited the king and queen to appear before them. The trial commenced the 31ſt of May 1529; and both parties preſented themſelves. The king anſwered to his name when called: but the queen, inſtead of anſwering to hers, roſe from her ſeat, and, throwing herſelf at the king's feet, made a very pathetic harangue; which her dignity, her virtue, and misfortunes, rendered ſtill more affecting. She told her huſband, "That ſhe was a ſtranger in his dominions, without protection, without counſel, and without aſſiſtance; expoſed to all the injuſtice which her enemies were pleaſed to impoſe upon her: That ſhe had quitted her native country, without any other reſource than her connections with him and his family; and that, inſtead of ſuffering thence any violence or iniquity, ſhe had been aſſured of having in them a ſafeguard againſt every misfortune: That ſhe had been his wife during 20 years; and would here appeal to himſelf, whether her affectionate ſubmiſſion to his will had not merited other treatment than to be thus, after ſo long a time, thrown from him with indignity: That ſhe was conſcious,—he himſelf was aſſured,—that her virgin honour was yet unſtained when he received her into his bed; and that her connections with his brother had been carried no farther than the mere ceremony of marriage: That their parents, the kings of England and Spain, were eſteemed the wiſeſt princes of their time, and had undoubtedly acted by the beſt advice when they formed the agreement for that marriage, which was now repreſented as ſo criminal and unnatural: And that ſhe acquieſced in their judgment, and would not ſubmit her cauſe to be tried by a court whoſe dependance on her enemies was too viſible ever to allow her any hopes of obtaining from them an equitable or impartial deciſion." Having ſpoken theſe words, the queen roſe, and, making the king a low reverence, left the court; nor would ſhe ever again appear in it. The legate having again ſummoned the queen to appear before them, on her refuſal, declared her contumacious, and the trial proceeded in her abſence. But when the buſineſs ſeemed to be nearly decided, Campegio, on ſome very frivolous pretences, prorogued the court, and at laſt transferred the cauſe before the ſee of Rome.

England. 263 Trial of the king and queen before the pope's legate.

All this time Cardinal Wolſey ſeemed to be in the ſame dilemma with the pope, and indeed much worſe; as he could not boaſt of the ſame independence which his holineſs poſſeſſed. On the one hand, he was very ſolicitous to gratify the king his maſter, who had diſtinguiſhed him by ſo many and extraordinary marks of favour; on the other, he feared to offend the pope, whoſe ſervant he more immediately was, and who likewiſe had power to puniſh his diſobedience. He had long known that this affair was certainly to end in his ruin; and by attempting to pleaſe all parties, he fell under the diſpleaſure of every one; ſo that he was at laſt left without a ſingle friend in the world. The king was diſpleaſed on account of his not entering into his cauſe with the warmth he thought he had reaſon to expect; Anne Boleyn imputed to him the diſappointment of her hopes; while even Queen Catharine and her friends expreſſed the greateſt indignation againſt him on account of the part he had openly taken in the affair of her divorce. In this miſerable ſituation the king

264 Embarraſſment of Cardinal Wolſey.

England. king ſent him a meſſage by the dukes of Norfolk and Suffolk, demanding the great ſeal: the cardinal refuſed to deliver it without a more expreſs warrant; upon which Henry wrote him a letter, and on receipt of this it was inſtantly given up. The ſeal was beſtowed on Sir Thomas More; a man who, beſides elegant literary talents, was poſſeſſed of the higheſt capacity, integrity, and virtue. Wolſey was next commanded to depart from York-place palace which he had built in London; and which, though it belonged to the ſee of York, was now ſeized by the king, and afterwards became the reſidence of the Britiſh ſovereigns, under the name of *Whitehall*. All his furniture and plate, the richneſs of which ſeemed rather proper for a monarch than a ſubject, was ſeized for the king's uſe. He was then commanded to retire to Eſher, a country-ſeat which he poſſeſſed near Hampton court, and there to wait the king's pleaſure. One diſgrace followed another; and his fall was at length completed by a ſummons to London to anſwer a charge of high treaſon. This ſummons he at firſt refuſed to anſwer, as being a cardinal. However, being at length perſuaded, he ſet out on his journey; but was taken ill, and died by the way. See the article WOLSEY.

265 Is diſgraced and proſecuted.

266 All the univerſities of Europe conſulted about the legality of the king's marriage. * See *Cranmer.*

After the death of Wolſey, the king, by the advice of Cranmer *, had the legality of his marriage debated in all the univerſities of Europe; and the votes of theſe were obtained in his favour by dint of money. The diſburſements made on the occaſion have even been preſerved to this day. To a ſubdeacon he gave a crown, to a deacon two crowns, and ſo to the reſt in proportion to the importance of their ſtation or opinion.—Being thus fortified by the opinions of the univerſities, and even of the Jewiſh rabbies (for them alſo he had conſulted), Henry began to think he might ſafely oppoſe the pope himſelf. He began by reviving in parliament an old law againſt the clergy, by which all thoſe who had ſubmitted to the authority of the pope's legate were condemned to ſevere penalties. The clergy, to conciliate the king's favour, were obliged to pay a fine of 118,000 pounds. A confeſſion was likewiſe extorted from them, that the king, and not the pope, was the ſupreme head of the church and clergy of England. An act was ſoon after paſſed againſt levying the firſt-fruits, or a year's rent of all the biſhoprics that fell vacant. After this the king privately married his beloved Anne Boleyn; and ſhe proving with child ſoon after marriage, he publicly owned her for his wife, and paſſed with her through London, with a greater magnificence than had ever been known before. The ſtreets were ſtrewed with flowers, the walls of the houſes hung with tapeſtry, and a univerſal joy ſeemed to be diffuſed among the people. The unfortunate queen Catharine, perceiving all further oppoſition to be vain, retired to Amphthill near Dunſtable, where ſhe continued the reſt of her days in privacy and peace. Her marriage with Henry was at laſt declared invalid, but not till after the latter had been married to Anne Boleyn, though this declaration ought undoubtedly to have preceded it. See BOLEYN.

267 Henry's final quarrel with the pope.

The pope was no ſooner informed of theſe proceedings, than he paſſed a ſentence, declaring Catharine to be the king's only lawful wife; requiring him to take her again, and denouncing his cenſures againſt him in caſe of a refuſal. Henry, on the other hand, knowing that his ſubjects were entirely at his command, reſolved to ſeparate totally from the church of Rome. In the year 1534, he was declared head of the church by parliament; the authority of the pope was completely aboliſhed in England; all tributes formerly paid to the holy ſee were declared illegal; and the king was entruſted with the collation to all eccleſiaſtical benefices. The nation came into the king's meaſures with joy, and took an oath called the *oath of ſupremacy*; all the credit which the popes had maintained over England for ages was now overthrown at once; and none ſeemed to repine at the change, except thoſe who were immediately intereſted by their dependence on Rome. England. 268 Is declared head of the church.

But though the king thus ſeparated from the church of Rome, he by no means adhered to the doctrines of Luther which had been lately publiſhed. He had written a book againſt this celebrated reformer, which the pope pretended greatly to admire; and honoured King Henry, on its account, with the title of "Defender of the faith." This character he ſeemed to be determined to maintain, and therefore perſecuted the reformers moſt violently. Many were burnt for denying the popiſh doctrines, and ſome alſo were executed for maintaining the ſupremacy of the pope. The courtiers knew not which ſide to take, as both the new and old religions were equally perſecuted; and as both parties equally courted the favour of the king, he was by that means enabled to aſſume an abſolute authority over the nation. As the monks had all along ſhown the greateſt reſiſtance to Henry's eccleſiaſtical character, he reſolved at once to deprive them of the power of injuring him. He accordingly empowered Cromwell, ſecretary of ſtate, to ſend commiſſioners into the ſeveral counties of England to inſpect the monaſteries; and to report, with rigorous exactneſs, the conduct and deportment of ſuch as were found there. This employment was readily undertaken by ſome creatures of the court, whoſe names were Layton, London, Price, Gage, Petre, and Belaſis. They are ſaid to have diſcovered monſtrous diſorders in many of the religious houſes; whole convents of women abandoned to all manner of lewdneſs; friars accomplices in their crimes; pious frauds everywhere committed, to increaſe the devotion and liberality of the people; and cruel and inveterate factions maintained between the inhabitants. Thus a general horror was excited againſt theſe communities; and therefore the king, in 1536, ſuppreſſed the leſſer monaſteries, amounting to 376 in number. Their revenues, computed at 32,000 pounds a-year, were confiſcated to the king's uſe; beſides their plate and other goods, computed at 100,000 pounds more. In 1538, the greater monaſteries alſo were demoliſhed. The better to reconcile the people to this great innovation, ſtories were publiſhed, perhaps with aggravations, of the deteſtable lives which the friars led in their convents. The relicks alſo, and other objects of ſuperſtitious veneration, were now brought forth, and became objects of deriſion to the reformers. A great number of theſe are enumerated by Proteſtant writers; ſuch as the parings of St Edmund's toes; ſome of the coals that roaſted St Laurence; the girdle of the virgin Mary, ſhewn in no fewer than eleven different places; two or three heads of St Urſula; the felt of St Thomas of Lancaſter, an infallible cure for the headach; part of St Thomas of Canterbury's ſhirt, much 269 Suppreſſion of the monaſteries.

England. much reverenced among big-bellied women; ſome relicks, an excellent preſervative againſt rain, others againſt weeds in corn, &c. Some impoſtures, however, were diſcovered, which diſplayed a little more ingenuity in the contrivance. At Hales in the county of Glouceſter had been ſhown, during ſeveral ages, the blood of Chriſt brought from Jeruſalem. The veneration for this precious relick may eaſily be imagined; but it was attended with a moſt remarkable circumſtance not obſerved in any other relicks. The ſacred blood was not viſible to any one in mortal ſin, even when ſet before him; nor could it be diſcovered till he had performed good works ſufficient for his abſolution. At the diſſolution of the monaſtery, the whole contrivance was diſcovered. Two of the monks who were let into the ſecret, had taken the blood of a duck, which they renewed every week: they put it into a phial, one ſide of which was thin and tranſparent cryſtal, the other thick and opaque. When any rich pilgrim arrived, they were ſure to ſhow him the dark ſide, till maſſes and offerings had expiated his offences; after which they made him happy, by turning the phial. —A miraculous crucifix had been kept at Boxely in Kent, and bore the appellation of the *rood of grace*. The lips, eyes, and head of the image, moved on the approach of its votaries. Helſey biſhop of Rocheſter broke the crucifix at St Paul's croſs, and ſhowed to all the people the ſprings and wheels by which it had been ſecretly moved. A great wooden idol, called *Darvel Gatherin*, was alſo brought to London and cut in pieces: and, by a cruel refinement of vengeance, it was employed as fuel to burn Friar Foreſt; who was puniſhed for denying the king's ſupremacy, and for ſome pretended hereſies. A finger of St Andrew, covered with a thin plate of ſilver, had been pawned for a debt of 40 pounds; but as the king's commiſſioners refuſed to releaſe the pawn, people made themſelves very merry with the poor creditor on account of his ſecurity. On this occaſion alſo was demoliſhed the noted ſhrine of Thomas à Becket, commonly called *St Thomas of Canterbury* *. The riches of it were inconceivable: when broken down, the gold with which it was adorned filled two large cheſts that eight ſtrong men could ſcarcely carry out of the church. The king, on the whole, ſuppreſſed 645 monaſteries, of which 28 had abbots who enjoyed ſeats in parliament. Ninety colleges were demoliſhed in ſeveral counties; 2374 chantries and free chapels, and 110 hoſpitals. The whole revenue of theſe eſtabliſhments amounted to 161,100 pounds.

* See *Becket*.

It is eaſy to imagine the indignation which ſuch an uninterrupted courſe of ſacrilege and violence would occaſion at Rome. In 1535, the king had executed Biſhop Fiſher, who was created a cardinal while in priſon, and Sir Thomas More, for denying or ſpeaking ambiguouſly about his ſupremacy. When this was reported in Italy, numerous libels were publiſhed all over the country, comparing the king of England to Nero, Domitian, Caligula, and the moſt wicked tyrants of antiquity. Clement VII. died about ſix months after he had threatened the king with a ſentence of excommunication; and Paul III. who ſucceeded him in the papal throne, entertained ſome hopes of an accommodation. But Henry was ſo much accuſtomed to domineering, that the quarrel was ſoon rendered totally incurable. The execution of Fiſher was reckoned ſuch a capital injury, that at laſt the pope paſſed all his cenſures againſt the king, citing him and all his adherents to appear in Rome within 90 days, in order to anſwer for their crimes. If they failed, he excommunicated them; deprived the king of his realm; ſubjected the kingdom to an interdict; declared his iſſue by Anne Boleyn illegitimate; diſſolved all leagues which any Catholic princes had made with him; gave his kingdom to any invader; commanded the nobility to take up arms againſt him; freed his ſubjects from all oaths of allegiance; cut off their commerce with foreign ſtates; and declared it lawful for any one to ſeize them, to make ſlaves of their perſons, and to convert their effects to his own uſe. But though theſe cenſures were then paſſed, they were not openly denounced. The pope delayed the publication till he ſhould find an agreement with England totally deſperate, and till the emperor, who was then hard preſſed by the Turks and the Proteſtant princes of Germany, ſhould be in a condition to carry the ſentence into execution. But in 1538, when news arrived at Rome that Henry had proceeded with the monaſteries as above related, the pope was at laſt provoked to publiſh the cenſures againſt him. Libels were again diſperſed, in which he was anew compared to the moſt furious perſecutors of antiquity, and the preference was now given on their ſide. Henry, it was ſaid, had declared war with the dead, whom the Pagans themſelves reſpected; was at open enmity with heaven; and had engaged in profeſſed hoſtility with all the ſaints and angels. Above all, he was reproached with his reſemblance to the emperor Julian, whom (it was ſaid) he imitated in his apoſtaſy and learning, though he fell ſhort of him in his morals. But theſe terrible fulminations had now loſt their effect. Henry had long ago denied the ſupremacy of the pope, and therefore had appealed from him to a general council; but now, when a general council was ſummoned at Mantua, he refuſed to be ſubject to it, becauſe it was called by the pope, and lay entirely under ſubjection to that ſpiritual uſurper. He engaged his clergy to make a declaration to the like purpoſe, and preſcribed to them many other alterations with regard to their ancient tenets and practices. It was expected that the ſpirit of oppoſition to the church of Rome would have at laſt made him fall in with the doctrines of the reformed; but though he had been gradually changing the theological ſyſtem in which he was educated, ever ſince he came to the years of maturity, he was equally poſitive and dogmatical in the few articles he retained, as though the whole fabric had continued entire and unſhaken: and though he ſtood alone in his opinion, the flattery of courtiers had ſo much inflamed his tyrannical arrogance, that he thought himſelf entitled to regulate by his own particular ſtandard the religious faith of the whole nation. The point on which he chiefly reſted his orthodoxy was the moſt abſurd in the whole popiſh doctrine; namely, that of tranſubſtantiation. All departure from this he held to be a damnable error; and nothing, he thought, could be more honourable for him, than, while he broke off all connections with the Roman pontiff, to maintain, in this eſſential article, the purity of the Catholic faith.

England. 270 The king excommunicated.

271 His abſurd and tyrannical conduct.

In 1539, a parliament was called, which met on the 28th day of April. The chancellor opened this parliament

England. parliament by informing the houſe of lords, that it was his majeſty's earneſt deſire to extirpate from his kingdom all diverſity of opinions with regard to religion; and as this enterpriſe was, he owned, difficult and important, he deſired them to chooſe a committee from among themſelves, who might frame certain articles, and communicate them afterwards to parliament. The lords named the vicar-general Cromwell, now created a peer, the archbiſhops of Canterbury and York, the biſhops of Durham, Carliſle, Worceſter, Bath and Wells, Bangor, and Ely. This ſmall committee itſelf was agitated with ſuch diverſity of opinions, that it could come to no concluſion. The duke of Norfolk then moved, that ſince there was no hope of having a report from the committee, the articles of faith propoſed to be eſtabliſhed ſhould be reduced to ſix, and a new committee be appointed to frame an act with regard to them. As this peer was underſtood to ſpeak the king's mind, his motion was immediately complied with; and, after a ſhort prorogation, the bill of the ſix articles, or the *bloody bill*, as the Proteſtants juſtly termed it, was introduced; and having paſſed the two houſes, received the king's aſſent. By this law the doctrine of the real preſence was eſtabliſhed; the communion in one kind; the perpetual obligation of vows of chaſtity; the utility of private maſſes; the celibacy of the clergy; and the neceſſity of auricular confeſſion. The denial of the real preſence ſubjected the perſon to death by fire, and to the ſame forfeiture as in caſes of treaſon; and admitted not the privilege of abjuring: an unheard-of cruelty, unknown even to the inquiſition itſelf. The denial of any of the other articles, even though recanted, was puniſhable by the forfeiture of goods and chattels, and impriſonment during the king's pleaſure: an obſtinate adherence to error, or a relapſe, was adjudged to be felony, and puniſhable by death. The marriage of prieſts was ſubjected to the ſame puniſhment. Their commerce with women was, for the firſt offence, forfeiture and impriſonment; and for the ſecond, death. Abſtaining from confeſſion, and from receiving the euchariſt at the accuſtomed times, ſubjected the perſon to fine, and to impriſonment during the king's pleaſure; and if the criminal perſevered after conviction, he was puniſhable by death and forfeiture, as in caſes of felony. Commiſſioners were to be appointed by the king for inquiring into theſe hereſies and irregular practices, and the criminals were to be tried by a jury.

272 Law of the ſix articles framed.

The parliament having thus ſurrendered their eccleſiaſtical privileges, next proceeded to ſurrender their civil ones alſo. They gave to the king's proclamations the ſame force as to ſtatutes enacted by parliament, and thus by one blow made a total ſubverſion of the Engliſh conſtitution; and to render the matter worſe, if poſſible, they framed this law as if it were only declaratory, and intended to explain the natural extent of the royal authority.—Notwithſtanding this, however, they afterwards pretended to make ſome limitations in the regal power; and they enacted, that no proclamation ſhould deprive any perſon of his lawful poſſeſſions, liberties, inheritances, &c. nor yet infringe any common law or laudable cuſtom of the realm.

As ſoon as the act of the ſix articles had paſſed, the Catholics were extremely vigilant to inform againſt offenders; and, in a ſhort time, no fewer than 500 perſons were thrown into priſon. But ſome of the chief officers of ſtate remonſtrating againſt the cruelty of puniſhing ſuch a number of delinquents, they were all of them ſet at liberty; and ſoon after this, Henry, as if he had reſolved to give each party the advantage by turns, granted every one permiſſion to have a tranſlation of the Bible, which had been newly made, in his family. England.

In 1540, the king again complained to parliament of the great diverſity of religious tenets which prevailed among his ſubjects; a grievance, he affirmed, which ought the leſs to be endured, becauſe the ſcriptures were now publiſhed in England, and ought univerſally to be the ſtandard of belief to mankind. But he had appointed, he ſaid, ſome biſhops and divines to draw up a liſt of tenets; and he was determined that Chriſt and the truth ſhould have the victory; whence he ſeems to have expected more from this new book of his doctors, than had enſued from the publication of the ſcriptures. Cromwell, as vicar-general, alſo made a ſpeech in the upper houſe; and the peers in return told him, that he deſerved to be vicar-general to the univerſe: To ſuch a degree of mean and ſervile ſubmiſſion was the Engliſh parliament at this time reduced.

This year alſo the king ſuppreſſed the only religious order remaining in England; namely, the knights of St John of Jeruſalem, or the *knights of Malta*, as they are commonly called. This order had by their valour done great ſervice to Chriſtendom; and had very much retarded, at Jeruſalem, Rhodes, and Malta, the rapid progreſs of the barbarians. During the general ſurrender of the religious houſes in England, they had obſtinately refuſed to give up their revenues to the king; and Henry who would endure no ſociety that profeſſed obedience to the pope, was obliged to have recourſe to parliament for the diſſolution of this order. Their revenues were large, and formed a conſiderable addition to the acquiſitions which the king had already made. But he had been ſuch a bad economiſt, that, notwithſtanding the immenſe plunder afforded him by the church, he now demanded from parliament a very conſiderable ſupply. The commons, however, though laviſh of the blood of their fellow-ſubjects, were extremely frugal of their money; and it was not without murmuring that the grant could be obtained, even by this abſolute and dreaded monarch. 273 Suppreſſion of the knights of Malta,

The king all this time continued to puniſh with unrelenting ſeverity the Proteſtants who offended againſt the law of the ſix articles, and the Papiſts who denied his ſupremacy; which gave occaſion to a foreigner at that time to ſay, that thoſe who were againſt the pope were burned, and thoſe who were for him were hanged. The king even ſeemed to diſplay in an oſtentatious manner his tyrannical juſtice and impartiality, which reduced both parties to ſubjection. This year he executed three Proteſtants and three Papiſts coupled together. The latter declared, that the moſt grievous part of their puniſhment was the being coupled to ſuch heretical miſcreants as ſuffered with them.

In 1542, Henry proceeded to the further diſſolution of colleges, hoſpitals, and other foundations of that nature. The courtiers had been dealing with the hoſpitals, preſidents and governors to make a ſurrender of their revenues 274 And of many colleges, &c

England. revenues to the king; and they had ſucceeded with eight. But there was an obſtacle to their farther progreſs: it had been provided by the local ſtatutes of moſt of theſe foundations, that no preſident nor any fellows could make ſuch a deed without the unanimous conſent of all the fellows. This conſent would not have been eaſily obtained; but the parliament proceeded in a ſummary manner to annul all theſe ſtatutes: by which means the revenues of thoſe houſes were expoſed to the rapacity of the king and his favourites. Henry alſo now extorted from many biſhops a ſurrender of their chapter-lands; by which means he pillaged the ſees of Canterbury, York, and London, and enriched his favourites with their ſpoils. He engaged the parliament to mitigate the penalties of the ſix articles, as far as regarded the marriage of prieſts, which was now only ſubjected to a forfeiture of goods, chattels, and lands during life: he was ſtill equally bent on maintaining a rigid purity in ſpeculative principles. He had appointed a commiſſion conſiſting of two archbiſhops and ſeveral biſhops of both provinces, together with a conſiderable number of doctors of divinity; and by virtue of his eccleſiaſtical ſupremacy he had charged them to chooſe a religion for his people. Before the commiſſioners, however, had made any progreſs in this arduous undertaking, the parliament had paſſed a law by which they ratified all the tenets which theſe divines ſhould eſtabliſh with the king's conſent; and thus they were not aſhamed of declaring expreſsly that they took their religion upon truſt, and had no other rule either in religious or temporal concerns than the arbitrary will of their maſter. One clauſe of the ſtatute, however, ſeems to favour ſomewhat of the ſpirit of liberty. It was enacted, that the eccleſiaſtical commiſſioners ſhould eſtabliſh nothing repugnant to the laws and ſtatutes of the realm. But in reality this proviſo was inſerted by the king, to ſerve his own purpoſes. By introducing a confuſion and contradiction into the laws, he became more the maſter of every one's life and property; and as the ancient independence of the church ſtill gave him jealouſy, he was well pleaſed, under colour of ſuch a clauſe, to introduce appeals from ſpiritual to civil courts. For the ſame reaſon he would never promulgate a body of canon law; and he encouraged the judges on all occaſions to interpoſe in eccleſiaſtical cauſes, wherever they thought the law or the prerogative concerned. Being thus armed by the authority of parliament, or rather by their acknowledgment of his ſpiritual ſupremacy, the king employed his commiſſioners to ſelect a ſyſtem of tenets for the aſſent and belief of the nation. A ſmall volume was publiſhed, under the title of *The Inſtitution of a Chriſtian Man*, which was received by the convocation, and made the infallible ſtandard of orthodoxy. In this book the points of juſtification, faith, free-will, good works, and grace, were diſcuſſed in a manner ſomewhat favourable to the opinions of the reformers. The ſacraments, which a few years before were only allowed to be three, were now increaſed to ſeven, conformably to the ſentiments of the Catholics. Throughout the whole of this book the king's caprice is very diſcernible; and the book is in reality to be regarded as his compoſition. For Henry, while he made his opinion a rule for the nation, would himſelf ſubmit to no authority whatever; not even to any which he had formerly eſtabliſhed. The

275 Extreme abſurdity of the king's conduct.

ſame year the people had a farther inſtance of the king's inconſiſtency. He ordered a new book to be compoſed, called *The Erudition of a Chriſtian Man;* and without aſking the conſent of the convocation, he publiſhed by his own authority this new model of orthodoxy. He was no leſs poſitive in his new creed than he had been in the old one; but though he required the faith of the nation to veer about at his ſignal, he was particularly careful to inculcate the doctrine of paſſive obedience in all his books, and he was no leſs careful to retain the nation in the practice. England.

But while the king was thus ſpreading his own books among the people, both he and the clergy ſeem to have been very much perplexed with regard to the ſcriptures. A review had been made by the eccleſiaſtical ſynod of the new tranſlation of the Bible; and Biſhop Gardiner had propoſed, that inſtead of employing Engliſh expreſſions throughout, ſeveral Latin words ſhould ſtill be preſerved, becauſe they contained, as he pretended, ſuch peculiar energy and ſignificance, that they had no correſpondent terms in the Engliſh tongue. Among theſe were *eccleſia*, *pœnitentia*, *pontifex*, *contritus*, &c. But as this mixture would appear extremely barbarous, and was plainly calculated for no other purpoſe than to retain the people in their ancient ignorance, the propoſal was rejected. The knowledge of the people, however, ſeemed to be ſtill more dangerous than their ignorance; and the king and parliament, ſoon after the publication of the ſcriptures, retracted the conceſſion which they had formerly made, and prohibited all but gentlemen and merchants to peruſe them. Even that liberty was not granted without an apparent heſitation, and dread of the conſequences. Theſe perſons were allowed to read, *ſo it be done quietly and with good order*. And the preamble to the act ſets forth, "That many ſeditious and ignorant perſons had abuſed the liberty granted them of reading the Bible; and that great diverſity of opinion, animoſities, tumults, and ſchiſms, had been occaſioned by perverting the ſenſe of the ſcriptures." The maſs book alſo paſſed under the king's examination; but little alteration was yet made in it. Some doubtful or fictitious ſaints only were ſtruck out; and the name of the pope was eraſed. The latter precaution was alſo uſed with every new book that was printed, and even every old one that was ſold. The word *pope* was carefully omitted or blotted out; as if that precaution could aboliſh the term from the language, or cauſe the people forget that ſuch a perſon exiſted. About this time alſo, the king prohibited the acting of plays, interludes, and farces, in deriſion of the popiſh ſuperſtitions; which the Proteſtants had been in uſe to practiſe: and this prohibition was in the higheſt degree pleaſing to the Roman Catholics.

In this tyrannical and headſtrong manner Henry proceeded with regard to eccleſiaſtical affairs. In other reſpects his conduct was equally violent. With regard to his domeſtic concerns, hiſtory ſcarce affords his parallel. We have already taken notice of his extreme love for Anne Boleyn, whom he married, contrary even to his own principles, before the marriage with Catharine was diſſolved. His affection for the former was carried to ſuch a height, that he even procured an act excluding from the ſucceſſion the iſſue of Queen Catharine, in favour of the children of Anne

England.

Anne Boleyn; and failing them to the king's heirs for ever. An oath to this purpoſe was likewiſe enjoined, under penalty of impriſonment during the king's pleaſure, and forfeiture of goods and chattles. All ſlander againſt the king and his new queen or their iſſue was ſubjected to the penalty of treaſon or miſpriſion of treaſon. The reaſon given for this extreme ſeverity toward his own child was, that her mother had obſtinately refuſed to quit the kingdom, notwithſtanding all the methods he could take to induce her to do ſo. The oath was generally taken throughout the kingdom; Sir Thomas More the chancellor, and Fiſher biſhop of Rocheſter, being the only perſons who refuſed; for which both of them were impriſoned, and ſoon after executed. The unfortunate Queen Catharine died, in her retreat at Amphthill, in the year 1536. On her death-bed ſhe wrote a moſt pathetic letter to the king, in which ſhe forgave him all the injuries ſhe had received, and recommended to him in the ſtrongeſt terms their daughter the princeſs Mary. This letter affected Henry ſo much, that he could not read it without tears; but the new queen is ſaid to have exulted in ſuch a manner on hearing of the death of her rival, as was quite inconſiſtent with either decency or humanity. Her triumph, however, was of ſhort duration. Henry had no ſooner poſſeſſed her, ſecure from every diſquieting thought by the death of Queen Catharine, than his paſſion began to decline; and to this her delivery of a dead ſon did not a little contribute; for ſo impetuous and abſurd were his paſſions, and ſuch was his deſire for male iſſue, that the diſappointment in this reſpect alone was ſufficient to alienate his affection from his wife. The levity of her temper, and her extreme gaiety of behaviour, bordering upon licentiouſneſs, as related under the article BOLEYN, alſo gave an opportunity to her enemies of inflaming the king's jealouſy againſt her. The viſcounteſs of Rochford, in particular, a woman of profligate manners, and who was married to the queen's brother, had the cruelty to report to the king that her huſband committed inceſt with his own ſiſter; and, not content with this, ſhe interpreted every inſtance of favour ſhown by her to a man, as proof of a criminal intercourſe between them. At the ſame time it muſt not be forgot, that he who inſiſted on ſuch rigid fidelity from his wives, was himſelf the moſt faithleſs of mankind. He had doubts, it may be allowed, about the legality of his marriage with Queen Catharine, but his doubts were evidently confirmed by the charms of Anne Boleyn. After being ſatiated with the poſſeſſion of her for ſix years, perhaps he really doubted her fidelity; but here again his doubts were confirmed by the beauty of Jane Seymour, with whom he had now fallen in love. It may eaſily be believed, that from this conſideration alone there was no reaſon to hope that ever the unfortunate Anne would be able to exculpate herſelf. Had ſhe really been guilty, her monſter of a huſband might have allowed her to live; but his cruelty was as unbounded and inſatiable as his other perverſe paſſions. She was condemned; and the ſentence pronounced againſt her was, that ſhe ſhould be burned or beheaded at the king's pleaſure. On hearing this dreadful denunciation, ſhe exclaimed, "O Father! O Creator! thou who art the way, the truth, and the life! thou knoweſt that I have not deſerved this fate." She then made the moſt ſolemn proteſtations of innocence before her judges; but theſe, as they had been from the beginning ineffectual, ſo it was not to be ſuppoſed that they could now avail any thing. Anne was beheaded by the executioner of Calais, who was reckoned more expert than any in England; and Henry enjoyed the pleaſure of marrying his beloved Jane Seymour. His ſatisfaction, however, was of no long continuance; for the queen, becoming pregnant immediately after marriage, died in two days after the birth of the child; who being a ſon, was baptized by the name of Edward VI. As this lady had been more beloved by Henry than any of his other wives, his grief for the loſs of her was extreme. However, it did not hinder him from entering very ſoon afterwards into a new matrimonial ſcheme; in which he met with many difficulties. His firſt propoſals were made to the ducheſs dowager of Milan, niece to the emperor and to Catharine his own former queen; but as he had behaved ſo indifferently to the aunt, it is ſcarcely to be ſuppoſed that his addreſſes could prove agreeable to the niece. On this he demanded the ducheſs-dowager of Longueville, daughter of the duke of Guiſe; but on making the propoſal to the French monarch, Francis I. he was informed that the princeſs had been already betrothed to the king of Scotland. Henry, however, would take no refuſal. He had learned that the object of his affection was endowed with many accompliſhments, was very beautiful, and of a large ſize, which laſt property he looked upon to be neceſſary for him who was now become ſomewhat corpulent himſelf. Francis, to prevent any more ſolicitations on this ſubject, ſent the princeſs to Scotland, but at the ſame time made Henry an offer of Mary of Bourbon, daughter of the duke of Vendoſme. This princeſs was rejected by Henry, becauſe he had heard of her being formerly refuſed by the king of Scotland. He was then offered his choice of the two younger ſiſters of the queen of Scotland, both of them being equal in merit as well as ſize to the one whom he had deſired: but Henry, unwilling to truſt to any reports concerning the beauty of theſe ladies, or even to their pictures, propoſed to Francis, that they ſhould have a conference at Calais under pretence of buſineſs, and that the latter ſhould bring with him the two princeſſes of Guiſe with the fineſt ladies of quality in France, that he might make a choice. This indelicate propoſal ſhocked Francis: he returned for anſwer, that he was too much impreſſed with regard for the fair ſex to carry ladies of the firſt quality, like geldings, to a market, to be choſen or rejected according to the humour of the purchaſer. Henry remonſtrated and ſtormed as uſual; but though Francis at this time earneſtly wiſhed to oblige him, he at laſt totally rejected the propoſal. Negotiations were then entered into for a German match; and the princeſs of Cleves was propoſed by Cromwell, on account of the great intereſt her father had with the Proteſtant princes of Germany. Henry had alſo become enamoured of her perſon from a picture of her he had ſeen: but this, though drawn by an eminent artiſt, was unluckily done ſo much to the advantage, that when the negotiation was quite finiſhed, and the bride arrived in England, he loſt all patience, ſwearing that ſhe was a great Flanders mare, and that he could never bear her the ſmalleſt affection. The matter was ſtill worſe, when he found that ſhe could

could speak no language but Dutch, of which he was entirely ignorant. Notwithſtanding all theſe objections, however, he reſolved to complete the marriage, telling Cromwell, that, ſince he had gone ſo far, he muſt now put his neck into the yoke. The reaſon of this was, that the friendſhip of the German princes was now more than ever neceſſary for Henry; and it was ſuppoſed that the affront of ſending the princeſs back to her own country might be reſented. Cromwell, who knew that his own life depended on the event of the matter, was very anxious to learn from the king how he liked his ſpouſe after having paſſed a night with her; but was ſtruck with terror when he replied that he now hated her more than ever; that he was reſolved not to cohabit with her, and even ſuſpected that ſhe was not a virgin; a matter in which he pretended to be a *connoiſſeur*, and about which he was extremely ſcrupulous. In a little time his averſion increaſed to ſuch a degree, that he determined at any rate to get rid of his queen and prime miniſter both at once. Cromwell had long been an object of averſion to the nobility, who hated him on account of his obſcure birth; his father being no other than a blackſmith, though the ſon had obtained the firſt employments in the kingdom. By his office of vicar-general, he had an almoſt abſolute authority over the clergy; he was alſo lord privy-ſeal, lord-chamberlain, and maſter of the wards. He had alſo been inveſted with the order of the garter, and was created earl of Eſſex. This was ſufficient to raiſe the envy of the courtiers: but he had alſo the misfortune to fall under the diſpleaſure of both Proteſtants and Papiſts; the former hating him on account of his concurrence with Henry in their perſecution, and the latter looking upon him as the greateſt enemy of their religion. To theſe unfortunate circumſtances on the part of Cromwell was added the uſual ſituation of Henry himſelf, who had now fallen in love with Catharine Howard, niece to the duke of Norfolk; to enjoy whom, he now determined to divorce Anne of Cleves. By the inſinuations of this lady and her uncle, Cromwell's ruin was accompliſhed; and he was condemned, not only without any trial, but even without examination. The charge was of hereſy and high treaſon; but the inſtances of the latter were quite abſurd and ridiculous. He ſubmitted, however, to his ſentence without murmuring, as knowing that his complaints on this ſubject would be revenged on his ſon. He was terribly mangled by the executioner before his head could be ſtruck off. His death was ſoon followed by the diſſolution of the marriage with the princeſs of Cleves, which was annulled by the conſent of both parties. The princeſs parted from him with great indifference; and accepted of 3000l. a-year as a compenſation. but refuſed to return to her own country after the affront ſhe had received.

285 The marriage annulled, and Cromwell put to death.

286 Henry falls in love with Catharine Howard.

287 Infidelity and death of the new queen.

The king's marriage with Catharine Howard ſoon followed the diſſolution of that with Anne of Cleves; but the event may ſurely be regarded as a providential puniſhment upon this tyrant, whoſe cruelty, luſt, and other bad qualities, can ſcarcely be matched in hiſtory. We have already mentioned his inſinuations againſt the virtue of the unfortunate princeſs of Cleves: theſe were amply repaid by the actual infidelities of his new queen, whom we muſt ſuppoſe he believed to be a pure and perfect virgin at the time he married her. So happy indeed did he imagine himſelf in this new marriage, that he publicly returned thanks for his conjugal felicity, when a moſt unfortunate information concerning the queen's incontinence was given to Cranmer by one of the name of Laſcelles, whoſe ſiſter had been ſervant to the ducheſs-dowager of Norfolk. He not only gave intelligence of her amours before marriage, but affirmed that ſhe had continued the ſame criminal practices ever ſince. Two of her paramours were arreſted, and confeſſed their crimes: the queen herſelf alſo confeſſed guilt before marriage, but denied having ever been falſe to the king's bed; which, however, had very little probability. She was beheaded on Tower-hill, along with the viſcounteſs of Rochford, who had been a confidant in her amours. The latter, as has already been obſerved, was a principal inſtrument in procuring the deſtruction of the unhappy Anne Boleyn, and therefore died unpitied; while the virtuous character of that unfortunate lady received an additional confirmation from the diſcovery of this woman's guilt.

England.

288 Abſurdity of the king

To ſecure himſelf from any farther diſaſters of this kind, Henry paſſed a moſt extraordinary law, enacting, that any one who ſhould know, or ſtrongly ſuſpect, any guilt in the queen, might, within 20 days, diſcloſe it to the king or council, without incurring the penalty of any former law againſt defaming the queen; though at the ſame time every one was prohibited from ſpreading the matter abroad, or even privately whiſpering it to others. It was alſo enacted, that if the king married any woman who had been incontinent, taking her for a true maid, ſhe ſhould be guilty of treaſon if ſhe did not previouſly reveal her guilt to him.

Theſe laws afforded diverſion to the people, who now ſaid that the king muſt look out for a widow; as no reputed maid would ever be perſuaded to incur the penalty of the ſtatute. This in truth happened to be the caſe at laſt; for about a year after the death of Catharine Howard, he married, for his ſixth wife, Catharine Parr, widow of Nevil Lord Latimer. This lady, being ſomewhat inclined to the doctrines of the reformation, and having the boldneſs to tell her huſband her mind upon the ſubject, had like to have ſhared the fate of the reſt. The furious monarch, incapable of bearing the leaſt contradiction, inſtantly complained to Biſhop Gardiner, who inflamed the quarrel as much as poſſible; ſo that at laſt the king conſented that articles of impeachment ſhould be drawn up againſt her. But theſe were rendered abortive by the prudence and addreſs of the queen, as related under the article PARR.

289 Sixth marriage with Catharine Parr, whom he intends alſo to put to death.

290 Monſtrous cruelty of the king.

All this time Henry had tyrannized over his nobility in the moſt cruel manner. The old counteſs of Saliſbury, the laſt of the houſe of Plantagenet, was executed with circumſtances of great cruelty. She had been condemned, as uſual, without any trial; and when ſhe was brought to the ſcaffold, refuſed to lay her head on the block in obedience to a ſentence, to the juſtice of which ſhe had never conſented. She told the executioner, therefore, that if he would have her head, he muſt win it the beſt way he could; and thus ſhe ran about the ſcaffold, purſued by the executioner,

England.

tioner, who aimed many fruitleſs blows at her neck before he was able to put an end to her life. Soon after her, the lord Leonard Grey was likewiſe executed for treaſon, but we have very little account of this tranſaction.

291 Attainder of Norfolk and Surry.

The laſt inſtances of the king's injuſtice and cruelty were the duke of Norfolk and his ſon the earl of Surry. The former had ſerved the king with fidelity, and the latter was a young man of the moſt promiſing hopes. His qualifications, however, were no ſecurity againſt the violence of Henry's temper. He had dropped ſome expreſſions of reſentment againſt the king's miniſters, who had diſplaced him from the government of Boulogne; and the whole family had become obnoxious on account of the late queen Catharine Howard. From theſe motives, orders were given to arreſt both the father and ſon; and accordingly they were arreſted both on the ſame day, and confined to the tower. The ducheſs-dowager of Richmond, Surry's own ſiſter, was among the number of his accuſers; and Sir Richard Southwell alſo, his moſt intimate friend, charged him with infidelity to the king. Surry denied the charge, and challenged his accuſer to a ſingle combat. This favour was denied him; and, notwithſtanding his eloquent and ſpirited defence, he was condemned and executed at Tower-hill.—The duke of Norfolk vainly endeavoured to mollify the king by letters and ſubmiſſions. An attainder was found againſt him, though the only crime his accuſers could allege was, that he had once ſaid that the king was ſickly, and could not hold out long; and that the kingdom was likely to be torn between the contending parties of different perſuaſions. Cranmer, though engaged for many years in an oppoſite party to that of Norfolk, and though he had received many and great injuries from him, would have no hand in ſuch an unjuſt proſecution; but retired to his ſeat at Croydon. The death-warrant, however, was made out, and immediately ſent to the lieutenant of the tower; but a period was put to the cruelties and violence of the king by his death, which happened on the 14th of January 1547, the night before Norfolk was to have been executed.

292 Henry dies, and is ſucceeded by Edward VI.

Henry was ſucceeded by his only ſon Edward, a boy of nine years of age. The moſt remarkable tranſactions of his reign are thoſe with regard to religion. The reſtraint which Henry VIII. had laid upon the Proteſtants was now taken off; and they not only maintained their doctrines openly, but ſoon became the prevailing party. Henry had fixed the majority of his ſon at 18 years of age; and, in the mean time, appointed 16 executors of his will, to whom, during the minority, he entruſted the government of the king and kingdom. This will, he imagined, would be obeyed as implicitly after his death as though he had been alive. But the firſt act of the executors was to chooſe the earl of Hertford, afterwards duke of Somerſet, protector of the realm; and in him was lodged all the regal power, together with a privilege of naming whom he pleaſed for his privy council.

293 Reformation completed.

The duke of Somerſet had long been reckoned a ſecret partiſan of the reformers; and, immediately on his elevation to his preſent high dignity, began to expreſs his intention of reforming the abuſes of the ancient religion. Under his direction and that of Cranmer, therefore, the reformation was carried forward and completed. The only perſon of conſequence who oppoſed the reformers was Gardiner biſhop of Wincheſter; and, to the diſgrace of their own principles, the reformers now ſhowed that they could perſecute as ſeverely as the Papiſts had formerly perſecuted them. Gardiner was committed to the Fleet priſon, where he was treated with great ſeverity. He was afterwards ſent to the tower: and having continued there two years, he was commanded to ſubſcribe ſeveral articles, among which was one confeſſing the juſtice of his own impriſonment. To all the articles but this he agreed to ſubſcribe; but that did not give ſatisfaction. He was then committed to cloſe cuſtody; his books and papers were ſeized; all company was denied him, and he was not even permitted the uſe of pen and ink. The biſhops of Chicheſter, Worceſter, and Exeter, were in like manner deprived of their offices; but the biſhops of Llandaff, Saliſbury, and Coventry, eſcaped by ſacrificing the moſt conſiderable ſhare of their revenues. The libraries of Weſtminſter and Oxford were ordered to be ranſacked, and purged of the Romiſh legends, miſſals, and other ſuperſtitious volumes; in which ſearch, great devaſtation was made even in uſeful literature. Many volumes claſped in ſilver were deſtroyed for the ſake of their rich bindings; many of geometry and aſtronomy were ſuppoſed to be magical, and deſtroyed on that account; while the members of the univerſity, unable to put a ſtop to theſe ravages, trembled for their own ſafety.

294 The reformers perſecute the Catholics.

The reformers, however, were not contented with ſeverities of this kind. A commiſſion was granted to the primate and others, to ſearch after all Anabaptiſts, heretics, or contemners of the new liturgy. Among the numbers who were found guilty upon this occaſion, was one Joan Boucher, commonly called *Joan of Kent*; who was ſo very obſtinate, that the commiſſioners could make no impreſſion upon her. She maintained an abſtruſe metaphyſical ſentiment, that Chriſt, as man, was a ſinful man; but, as the Word, he was free from ſin, and could be ſubject to none of the frailties of the fleſh with which he was clothed. For maintaining this doctrine, the poor woman was condemned to be burnt to death as a heretic. The young king, who it ſeems had more ſenſe than his teachers, refuſed at firſt to ſign the death-warrant: but at laſt, being overcome by the importunities of Cranmer, he reluctantly complied; declaring, that if he did wrong, the ſin ſhould be on the head of thoſe who had perſuaded him to it. The primate, after making another unſucceſsful effort to reclaim the woman from her opinions, committed her to the flames. Some time after, one Van Paris, a Dutchman, was condemned to death for Arianiſm. He ſuffered with ſo much ſatisfaction, that he hugged and careſſed the faggots that were conſuming him.

The reſt of this reign affords only the hiſtory of intrigues and cabals of the courtiers one againſt another. The protector was firſt oppoſed by his own brother admiral Sir Thomas Seymour, who had married Catharine Parr the late king's widow. She died ſoon after the marriage; and he then made his addreſſes to the princeſs Elizabeth, who is ſaid not to have been averſe to the match. His brother the duke, who was at that time in the north, being informed of his

England. his ambitious projects, ſpeedily returned, had him attainted of high treaſon, and at laſt condemned and executed. The duke of Somerſet himſelf, however, was ſome time afterwards deprived of his office by Dudley duke of Northumberland; who at laſt found means to get him accuſed of high treaſon, and executed. Not ſatisfied with the office of protector, which he aſſumed on the death of Somerſet, this ambitious nobleman formed a ſcheme of engroſſing the ſovereign power altogether. He repreſented to Edward, who was now in a declining ſtate of health, that his ſiſters Mary and Elizabeth, who were appointed by Henry's will to ſucceed, in failure of direct heirs, to the crown, had both been declared illegitimate by parliament; that the queen of Scots his aunt ſtood excluded by the king's will; and, being an alien alſo, loſt all right of ſucceeding. The three princeſſes being thus excluded, the ſucceſſion naturally devolved to the marchioneſs of Dorſet, eldeſt daughter of the French queen, Henry's ſiſter, who had married the earl of Suffolk after her firſt huſband's death. The next heir to the marchioneſs was Lady Jane Grey, a lady univerſally reſpected, both on account of the charms of her perſon, and the virtues and endowments of her mind. The king, who was accuſtomed to ſubmit to the politic views of this miniſter, agreed to have the ſucceſſion ſubmitted to council, where Northumberland hoped to procure an eaſy concurrence. The judges, however, who were appointed to draw up the king's letters patent for this purpoſe, warmly objected to the meaſure; and gave their reaſons before the council. They begged that a parliament might be ſummoned, both to give it force, and to free its partiſans from danger: they ſaid that the form was invalid, and would not only ſubject the judges who drew it, but every counſellor who ſigned it, to the pains of treaſon. Northumberland could not brook their demurs; he threatened them with his authority, called one of them a *traitor*, and ſaid he would fight with any man in his ſhirt in ſuch a juſt cauſe as that of Lady Jane's ſucceſſion. A method was therefore found out of ſcreening the judges from danger, by granting them the king's pardon for what they ſhould draw up; and at length the patent for changing the ſucceſſion was completed, the princeſſes Mary and Elizabeth were ſet aſide, and the crown ſettled on the heirs of the dutcheſs of Suffolk (for ſhe herſelf was contented to forego her claim.)

295 Lady Jane Gray declared heir to the crown.

For ſome time the king had languiſhed in a conſumption. After this ſettlement of the crown, his health viſibly declined every day, and little hopes were entertained of his recovery. To make matters worſe, his phyſicians were diſmiſſed by Northumberland's advice, and by an order of council; and he was put into the hands of an ignorant old woman, who undertook in a little time to reſtore him to health. After the uſe of her medicines all his bad ſymptoms increaſed to the moſt violent degree. He felt a difficulty of ſpeech and breathing; his pulſe failed, his legs ſwelled, his colour became livid, and many other ſigns of approaching death made their appearance. He expired at Greenwich on the 6th of July 1553, in the 16th year of his age and 7th of his reign.

296 Death of Edward VI.

After the death of King Edward, very little regard was paid to the new patent by which Lady Jane Grey had been declared heir to the throne. The undoubted title of Mary, notwithſtanding the ſcandalous behaviour of her father and his ſervile parliaments, was acknowledged by the whole nation. Northumberland, however, was reſolved to put the late king's will in execution. He therefore carefully concealed the death of Edward, in hopes of ſecuring the perſon of Mary, who by an order of council had been required to attend her brother during his illneſs; but ſhe being informed of his death, immediately prepared to aſſert her right to the crown. Northumberland then, accompanied by the duke of Suffolk, the earl of Pembroke, and ſome other noblemen, ſaluted Lady Jane Grey queen of England. Jane was in a great meaſure ignorant of theſe tranſactions, and it was with the utmoſt difficulty ſhe was perſuaded to accept of the dignity conferred upon her. At laſt ſhe complied, and ſuffered herſelf to be conveyed to the tower, where it was then uſual for the ſovereigns of England to paſs ſome days after their acceſſion. Mary, however, who had retired to Kenning-hall in Norfolk, in a very few days found herſelf at the head of 40,000 men; and Lady Jane reſigned the ſovereignty in ten days, with much more pleaſure than ſhe had received it. She retired with her mother to their own habitation; and Northumberland finding his affairs quite deſperate, attempted to quit the kingdom. But he was ſtopped by the band of penſioner guards, who informed him that he muſt ſtay to juſtify their conduct in taking arms againſt their lawful ſovereign. He therefore ſurrendered himſelf to Mary; and was ſoon after executed, together with Sir John Gates and Sir Thomas Palmer, two infamous tools of his power. Sentence was alſo pronounced againſt Lady Jane Grey and her huſband Lord Guildford; but without any intention of putting it in execution againſt them at preſent, as their youth and innocence pleaded ſo ſtrongly in their favour, neither of them having yet reached their 17th year.

England.

297 Lady Jane Gray placed on the throne, but is forced to reſign it.

Mary now entered London, and was peaceably ſettled on the throne without any effuſion of blood. The Engliſh, however, ſoon found reaſon to repent their attachment to her cauſe. Though ſhe had at firſt ſolemnly promiſed to defend the religion and laws of her predeceſſor, ſhe no ſooner ſaw herſelf firmly eſtabliſhed on the throne, than ſhe reſolved to reſtore the Popiſh religion, and give back their former power to the clergy. Gardiner, Bonnar, and the other biſhops who had been impriſoned or ſuffered loſs during the laſt reign, were taken from priſon, reinſtated in their ſees, and now triumphed in their turn. On pretence of diſcouraging controverſy, the queen by her prerogative ſilenced all preachers throughout England, except ſuch as ſhould obtain a particular licenſe, and this ſhe was reſolved to give only to thoſe of her own perſuaſion. The greater part of the foreign Proteſtants took the firſt opportunity of leaving the kingdom; and many of the arts and manufactures, which they had ſucceſsfully introduced, fled with them. Soon after, the queen called a parliament, which ſeemed willing to concur in all her meaſures. They at once repealed all the ſtatutes with regard to religion that had paſſed during the reign of Edward VI. and the national religion was again placed on the ſame footing in which it had been at the death of Henry VIII.

295 Mary declared queen.

To ſtrengthen the cauſe of the Catholics, and give the

England. the queen more power to eſtabliſh the religion to which ſhe was ſo much attached, a proper match was to be ſought for her; and it was ſuppoſed that three had already been propoſed as candidates for her favour. Her affection ſeemed to be engaged by the earl of Devonſhire: but as he was rather attached to the princeſs Elizabeth, he received the overtures which were made him from the queen with neglect. The next perſon mentioned as a proper match for her was Cardinal Pole, a man greatly reſpected for his virtues; but as he was now in the decline of life, Mary ſoon dropped all thoughts of that alliance. At laſt ſhe caſt her eye on Philip II. of Spain, ſon to the emperor Charles V. He was then in the 27th year of his age, and conſequently agreeable in that reſpect to Mary, who was in her 48th year; but when her intentions with regard to this match became known, the greateſt alarm took place throughout the whole nation. The commons preſented ſuch a ſtrong remonſtrance againſt a foreign alliance, that the queen thought proper to diſſolve the parliament in order to get quit of their importunity. To obviate, however, all clamour, the articles of marriage were drawn up as favourably as poſſible for the intereſts of England. It was agreed, that though Philip ſhould have the title of king, the adminiſtration ſhould be entirely in the queen; that no foreigner ſhould be capable of holding any office in the kingdom; nor ſhould any innovation be made in the laws, cuſtoms, and privileges of the people; that Philip ſhould not carry the queen abroad without her conſent, or any of her children without the conſent of the nobility. Sixty thouſand pounds a-year were to be ſettled upon her as a jointure; and the male iſſue of this marriage were to inherit Burgundy and the Low Countries as well as the crown of England: and in caſe of the death of Don Carlos, Philip's ſon by his former marriage, without any heir, the queen's iſſue ſhould inherit all the reſt of the Spaniſh dominions alſo.

299 Propoſals of marriage to queen Mary.

300 Alliance with Spain generally diſagreeable.

All theſe conceſſions, however, were not ſufficient to quiet the apprehenſions of the people: they were conſidered merely as words of courſe, which might be retracted at pleaſure; and the whole nation murmured loudly againſt a tranſaction ſo dangerous to its ancient liberty and independence. An inſurrection was raiſed by Sir Thomas Wyatt, a Roman Catholic, at the head of 4000 men, who ſet out from Kent to London, publiſhing a declaration againſt the Spaniſh match and the queen's evil counſellors. Having advanced as far as Southwark, he required that the queen ſhould put the tower of London into his hands; that ſhe ſhould deliver four counſellors as hoſtages; and, in order to enſure the liberty of the nation, ſhould marry an Engliſhman. But his force was at preſent by far too ſmall to ſupport ſuch magnificent pretenſions; and he unluckily waited ſo much time without attempting any thing of importance, that the popular ferment entirely ſubſided, his followers abandoned him gradually, and he was at laſt obliged to ſurrender himſelf to Sir Maurice Berkeley near Temple-bar. His followers were treated with great cruelty: no fewer than 400 of them ſuffered by the hand of the executioner; 400 more were conducted with ropes about their necks into the queen's preſence, and there received their pardon. Wyatt himſelf was condemned and executed.

301 Wyatt's inſurrection.

302 He is condemned and executed with many of his followers.

This rebellion had almoſt proved fatal to the Princeſs Elizabeth, who for ſome time paſt had been treated with great ſeverity by her ſiſter. Mary, who poſſeſſed a moſt malignant and cruel heart, had never forgot the quarrel between their mothers; and when a declaration was made after her own acceſſion, recogniſing Queen Catharine's marriage as legal, ſhe was thus furniſhed with a pretence for accounting Elizabeth illegitimate. She was likewiſe obnoxious on account of her religion, which Elizabeth at firſt had not prudence ſufficient to conceal; though afterwards ſhe learned full well to diſguiſe her ſentiments. But, above all, her ſtanding ſo high in the affection of the earl of Devonſhire, was a crime not to be forgiven; and Mary made her ſenſible of her diſpleaſure by numberleſs mortifications. She was ordered to take place at court after the ducheſs of Suffolk and the counteſs of Lenox; to avoid which, and other indignities, Elizabeth at laſt retired from court altogether into the country. After the ſuppreſſion of Wyatt's rebellion ſhe was committed to the tower, and underwent a ſtrict examination before the council; but as Wyatt had made a declaration on the ſcaffold that ſhe was in no manner of way concerned, the queen found herſelf under a neceſſity of releaſing her. To get rid of ſuch a troubleſome rival, however, ſhe was offered in marriage to the duke of Savoy; and on Elizabeth's declining the propoſal, ſhe was committed cloſe priſoner to Woodſtoke. The rebellion proved fatal, however, to many perſons of diſtinction, and gave the queen an opportunity of manifeſting that unbounded cruelty which reigned in her heart. The tower, and all the priſons in the kingdom, were filled with nobility and gentry, who became objects of royal vengeance, more on account of their credit and intereſt with the people than any concern they were ſuppoſed to have had with Wyatt. Sir Nicholas Throgmorton was tried in Guildhall; but as no ſatisfactory evidence appeared againſt him, the jury gave a verdict in his favour. The queen was ſo much enraged at this diſappointment, that ſhe recommitted him to the tower, ſummoned the jury before the council, and at laſt ſent them all to priſon, fining them afterwards ſome of 1000l. and others of 2000l. each. Sir John Throgmorton, brother to Sir Nicholas juſt mentioned, was condemned and executed upon evidence which had been already rejected as inſufficient. But of all thoſe who periſhed on this occaſion, none excited more univerſal compaſſion than the unfortunate Lady Jane Grey and her huſband Lord Guilford Dudley. They had already received ſentence of death, as has been mentioned; and two days after the execution of Wyatt, they received orders to prepare for eternity. Lady Jane, who had been in expectation of this blow, was no way intimidated, but received the news with the moſt heroic reſolution. The place intended at firſt for their execution was Tower-hill; but the council, dreading the effects of the people's compaſſion for their youth, beauty, and innocence, gave directions that they ſhould be beheaded within the verge of the tower. The duke of Suffolk was ſoon after tried, condemned, and executed; but would have met with more compaſſion, had not his ambition

303 Princeſs Elizabeth harſhly treated.

304 Execution of Lady Jane Grey and her huſband.

England. ambition been the cauſe of his daughter's unhappy fate juſt mentioned. Sir Thomas Grey alſo loſt his life on the ſame account; but the cruel ſpirit of Mary was ſtill unſatisfied; and finding herſelf univerſally odious, that ſhe might free herſelf from any apprehenſions for what was paſt, as well as tyrannize with the more freedom in time to come, ſhe diſabled the people from reſiſtance, by ordering general muſters, and cauſing the commiſſioners ſeize their arms and lay them up in forts and caſtles.

305 The people diſarmed.

Notwithſtanding this unpopularity, however, the rebellion of Wyatt had ſo ſtrengthened the hands of government, that a parliament was aſſembled in hopes of gratifying the queen's wiſhes in regard to her marriage with Philip of Spain. To facilitate this purpoſe alſo, the emperor of Germany ſent over to England 400,000 crowns to be diſtributed among the members of parliament in bribes and penſions; a practice of which there had hitherto been no example in England. The queen, notwithſtanding her bigotry, reſumed the title of *Supreme Head of the Church*, which ſhe had dropped three months before. Gardiner made a ſpeech, in which he propoſed, that they ſhould inveſt the queen with a legal power of diſpoſing of the crown, and appointing her ſucceſſor; but the parliament, however obſequious in other reſpects, did not chooſe to gratify their ſovereign in a meaſure by which the kingdom of England might become a province of the Spaniſh monarchy. They would not even declare it treaſon to imagine or attempt the death of the queen's huſband during her life-time, though they agreed to ratify the articles of marriage Finding therefore that the parliament even yet was not ſufficiently obſequious, it was thought moſt proper to diſſolve them. Soon after this the marriage with Philip was ſolemnized; but as the latter had eſpouſed his queen merely with a view to become king of England, he no ſooner found himſelf diſappointed in this than he ſhowed a total want of affection for her as a wife. He paſſed moſt of his time at a diſtance from her in the Low Countries; and ſeldom wrote to her except when he wanted money, with which Mary would at all times gladly have ſupplied him even had it been at the expence of her kingdom, if in her power.

306 Marriage with Philip ſolemnized.

307 Proteſtants perſecuted.

The enemies of the ſtate being ſuppoſed to be ſuppreſſed, thoſe of the Proteſtant religion were next perſecuted. The old ſanguinary laws which had been rejected by a former parliament were now revived. Orders were given, that the prieſts and biſhops who had married ſhould be ejected; that the maſs ſhould be reſtored, and the pope's authority eſtabliſhed; and that the church and its privileges, all but their goods and eſtates, ſhould be put on the ſame footing on which they were before the commencement of the reformation. But as the gentry and nobility had already divided the church-lands among them, it was though inconvenient, and indeed impoſſible, to make a reſtoration of theſe. The perſons who chiefly promoted theſe meaſures were Gardiner biſhop of Wincheſter, and Cardinal Pole, who was a kinſman of Henry VIII. but had been long in Italy, and was now returned from it. The latter was for tolerating the Proteſtants; but the former, perceiving that rigorous meaſures would be moſt agreeable to the king and queen, declared himſelf againſt it. He was too prudent, however, to appear in perſon at the head of the perſecution; and therefore conſigned that office to Bonnar biſhop of London, a man of a very abandoned character. The bloody ſcene began by the execution of Hooper biſhop of Glouceſter, and Rogers prebendary of St Paul's. Theſe were quickly followed by others, of whom the principal were Archbiſhop Cranmer, Ridley biſhop of London, and Latimer biſhop of Worceſter *. Theſe perſecutions ſoon became odious to the whole nation, and the perpetrators of them were all willing to throw the blame from themſelves upon others. Philip endeavoured to faſten the whole reproach upon Bonnar; but that biſhop would not take the whole, and therefore retorted on the court. A bold ſtep was now taken to introduce a court ſimilar to the Spaniſh inquiſition, that ſhould be empowered to try heretics, and condemn them without any other law but its own authority. But even this was thought a method too dilatory in the preſent exigence of affairs. A proclamation iſſued againſt books of hereſy, treaſon, and ſedition, declared, that whoſoever had ſuch books in his poſſeſſion, and did not burn them without reading, ſhould ſuffer as a rebel. This was attended with the execution of ſuch numbers, that at laſt the magiſtrates who had been inſtrumental in theſe cruelties refuſed to give their aſſiſtance any longer. It was computed, that during this perſecution, 277 perſons ſuffered by fire, beſides thoſe puniſhed by impriſonments, fines, and confiſcations. Among thoſe who ſuffered by fire were 5 biſhops, 21 clergymen, 8 lay gentlemen, 84 tradeſmen, 100 huſbandmen, 55 women, and 4 children.

England.

* See *Cranmer*, &c.

The only remarkable tranſaction which happened during this reign with regard to the temporal affairs of the kingdom was the loſs of Calais, which had been in the poſſeſſion of the Engliſh for upwards of 200 years †. This loſs filled the whole kingdom with complaints, and the queen with grief. She was heard to ſay, that, when dead, the name of *Calais* would be found engraven on her heart. She did not long ſurvive this loſs; but died in the year 1558, of a lingering illneſs, after a reign of five years four months and eleven days

† See *Calais*

308 Mary dies, and is ſucceeded by Elizabeth.

After the death of Mary, the princeſs Elizabeth ſucceeded to the throne without oppoſition. She was at Hatfield when news of her ſiſter's death were brought her; upon which ſhe haſtened up to London, where ſhe was received with great joy. This princeſs was well qualified for government. She had judgment ſufficient to make choice of proper miniſters, and authority enough to keep her ſubjects in awe. The reſtraints alſo, to which ſhe had been ſubjected during her ſiſter's reign, had taught her ſo well to conceal her ſentiments, that ſhe had become a perfect miſtreſs of diſſimulation; which, though no commendable part of her character, proved occaſionally of great ſervice to her government. She perfected the reformation, and put the religion of England upon the ſame plan which ſubſiſts at preſent. This was accompliſhed without the leaſt difficulty; for the perſecutions in Mary's reign had ſerved only to give the whole nation an averſion for popery. In the time of Edward VI. the people had been compelled to embrace the Proteſtant religion, and their fears induced them to conform; but now, almoſt the whole nation were Proteſtants from inclination. The reformation was confirmed by act of parliament in 1559, and thus

England. thus England was ſeen to change its religion four times in the ſpace of 32 years.

309 Peace with France. During the time that the queen and her counſellors were employed in ſettling the religious affairs of the nation, negotiations were likewiſe carried on for a peace between England and France; which was at laſt concluded on the following terms, viz. that Henry ſhould reſtore Calais at the expiration of eight years; that in caſe of failure, he ſhould pay 500,000 crowns, and Elizabeth's title to Calais ſtill remain; that for the payment of this ſum he ſhould find the ſecurity of eight foreign merchants, not natives of France; and until that ſecurity were provided he ſhould deliver five hoſtages. If during this interval Elizabeth ſhould break the peace with France or Scotland, ſhe ſhould forfeit all title to Calais; but if Henry made war on Elizabeth, he ſhould be obliged to reſtore the fortreſs immediately. This pacification was ſoon followed by an irreconcileable quarrel with Mary queen of Scotland; which was not extinguiſhed but by the death of the Scottiſh princeſs; and that with ſuch circumſtances of accumulated treachery, hypocriſy, and diſſimulation, as have ſtamped an indelible diſgrace on the memory of Elizabeth. See the articles MARY and SCOTLAND.

310 Preparations for war with Spain. Elizabeth having at laſt got rid of her rival in the year 1587, began to make preparations for reſiſting the Spaniſh invaſion. Hearing that Philip was ſecretly fitting out a great navy to attack her, ſhe ſent Sir Francis Drake with a fleet to pillage his coaſts and deſtroy his ſhipping. On this expedition he ſet ſail with four capital ſhips furniſhed by the queen, and 26 others of various ſizes furniſhed him by the merchants of London in hopes of ſharing the plunder.

311 Exploits of Sir Francis Drake. Having learned that a Spaniſh fleet richly laden was lying at Cadiz in readineſs to ſet ſail for Liſbon, he directed his courſe towards the former port, where he boldly attacked the enemy. Six galleys were obliged to take ſhelter under the cannon of the forts; he burned about 100 veſſels laden with ammunition and naval ſtores; and deſtroyed a great ſhip belonging to the marquis de Santa Croce. Thence ſetting ſail for Cape St Vincent, he took by aſſault the caſtle ſituated on that promontory, with three other fortreſſes. Having next inſulted Liſbon, he ſailed to the iſland Tercera, one of the Azores, where, after lying in wait for ſome time, he took a rich prize, and then returned to England; having by this ſhort expedition taught the Engliſh to deſpiſe the huge and unwieldy ſhips of the enemy, and thus prepared them to act with more reſolution againſt the formidable armament that now threatened to invade them.

312 Miſcarriage of Philip's ſcheme of an invaſion. But though the expedition of Sir Francis Drake had retarded the intended invaſion of England for a twelvemonth, it had not by any means induced Philip to abandon his deſign. During that interval he continued his preparations with the greateſt aſſiduity, the more eſpecially as the invaſion of England ſeemed to be a neceſſary preparative for regaining his authority over the Netherlands, the revolted provinces having been ſtrongly ſupported by Elizabeth. The fleet prepared at this time was ſuperior to any thing then exiſting in the world; and no doubt being entertained of its ſucceſs, it was oſtentatiouſly ſtyled the *Invincible Armada*. The miſerable event of this expedition, and the total failure of all the mighty hopes of Philip, are related under the article ARMADA. The ſpirit and courage of the Engliſh were now excited to attempt invaſions in their turn; which they executed in numerous deſcents on the Spaniſh coaſts; though theſe were only temporary, and deſigned not for permanent conqueſt, but to haraſs the enemy. It would be endleſs to relate all the advantages obtained over the enemy at ſea, where the capture of every ſhip muſt have been a ſeparate narrative. It is ſufficient to obſerve, that the ſea-captains of that reign are ſtill conſidered as the boldeſt and moſt enterpriſing ſet of men that England ever produced; and among this number we are to reckon Raleigh and Howard, Drake, Cavendiſh, and Hawkins. The Engliſh navy then began to take the lead; and has ſince continued irreſiſtible in all parts of the ocean. England.

Elizabeth continued to reign with great glory till the year 1603; but all her greatneſs could not prevent her from being extremely miſerable before her death. She had cauſed her greateſt favourite, and probably her lover, the earl of Eſſex †, to be executed. Though this execution could not be called unjuſt, the queen's affection (on being informed that he had at laſt thrown himſelf entirely on her clemency) returned to ſuch a degree, that ſhe thenceforth gave herſelf entirely over to deſpair. She refuſed food and ſuſtenance; ſhe continued ſilent and gloomy; ſighs and groans were the only vent ſhe gave to her deſpondence; and ſhe lay for ten days and nights upon the carpet, leaning on cuſhions, which her maids brought her. Perhaps the faculties of her mind were impaired by long and violent exerciſe; perhaps ſhe reflected with remorſe on ſome paſt actions of her life, or perceived, but too ſtrongly, the decays of nature, and the approach of her diſſolution. She ſaw her courtiers remitting in their aſſiduity to her, in order to pay their court to James the apparent ſucceſſor. Such a concurrence of cauſes was more than ſufficient to deſtroy the remains of her conſtitution; and her end was now viſibly ſeen to approach. Feeling a perpetual heat in her ſtomach, attended with an unquenchable thirſt, ſhe drank without ceaſing, but refuſed the aſſiſtance of her phyſicians. Her diſtemper gaining ground, Cecil and the lord admiral deſired to know her ſentiments with regard to the ſucceſſion. To this ſhe replied, that as the crown of England had always been held by kings, it ought not to devolve upon any inferior character, but upon her immediate heir the king of Scotland. Being then adviſed by the archbiſhop of Canterbury to fix her thoughts upon God, ſhe replied, that her thoughts did not in the leaſt wander from him. Her voice ſoon after left her; ſhe fell into a lethargic ſlumber, which continued ſome hours; and ſhe expired gently without a groan, in the 70th year of her age, and 45th of her reign. She was ſucceeded by James I. king of Scotland; ſince which time, the hiſtory of both England and Scotland is comprehended under the article BRITAIN.

† See *Devereux*.

313 Grief and miſery of Elizabeth.

314 Her death.

315 England, how divided. Since the Norman conqueſt, England has been divided into ſix circuits, each circuit containing a certain number of counties. Two judges are appointed for each circuit, which they viſit in the ſpring and autumn, for adminiſtering juſtice to the ſubjects who are at a diſtance from the capital. In holding the lent (or ſpring) aſſizes, the northern circuit extends only to York and Lancaſter; the aſſizes at Durham, Newcaſtle, Carliſle, and Appleby, being held only in the autumn,

England. autumn, and diſtinguiſhed by the appellation of the *long circuit*. Theſe circuits and counties are:

1. *Home Circuit* contains the counties of Eſſex, Hertford, Kent, Surry, and Suſſex.

2. *Norfolk Circuit* contains thoſe of Bucks, Bedford, Huntingdon, Cambridge, Suffolk, and Norfolk.

3. *Oxford Circuit*. Oxon, Berks, Glouceſter, Worceſter, Monmouth, Hereford, Salop, and Stafford.

4. *Midland Circuit*. Warwick, Leiceſter, Derby, Nottingham, Lincoln, Rutland, and Northampton.

5. *Weſtern Circuit*. Hants, Wilts, Dorſet, Somerſet, Devon, and Cornwall.

6. *Northern Circuit*. York, Durham, Northumberland, Lancaſter, Weſtmorland, and Cumberland.

Middleſex and Cheſhire are not comprehended in the above circuits; the former being the ſeat of the ſupreme courts of juſtice, and the latter a county palatine. There is ſtill a court of chancery in Lancaſter and Durham, with a chancellor; and there is a court of exchequer at Cheſter, of a mixed kind, both for law and equity, of which the chamberlain of Cheſter is judge: there are alſo other juſtices in the counties palatine, to determine civil actions and pleas of the crown.

Beſides the 40 counties into which England is divided, there are counties corporate, conſiſting of certain diſtricts, to which the liberties and juriſdictions peculiar to a county have been granted by charter from the throne. Thus the city of London is a county diſtinct from Middleſex; the cities of York, Cheſter, Briſtol, Norwich, Worceſter, and the towns of Kingſton upon Hull and Newcaſtle upon Tyne, are counties of themſelves, diſtinct from thoſe in which they lie. The ſame may be ſaid of Berwick upon Tweed, which lies in Scotland, and has within its juriſdiction a ſmall territory of two miles on the north ſide of the river. Under the name of a *town*, boroughs and cities are contained: for every borough or city is a town, though every town is not a borough or city.—An account of the Engliſh conſtitution and government is given under the articles KING, LORDS, COMMONS, PARLIAMENT, LAW, LIBERTY, RIGHTS, &c.

516 Religion. The eſtabliſhed religion of England is Epiſcopacy. Since the reign of Henry VIII. the ſovereigns of England have been called, in public writs, the ſupreme heads of the church; but this title conveys no ſpiritual meaning, as it only denotes the regal power to prevent any eccleſiaſtical differences, or, in other words, to ſubſtitute the king in place of the pope before the reformation, with regard to temporalities and the internal economy of the church. The kings of England never intermeddle in eccleſiaſtical diſputes, and are contented to give a ſanction to the legal rights of the clergy.

The church of England, under this deſcription of the monarchical power over it, is governed by two archbiſhops, and 24 biſhops, beſides the biſhop of Sodor and Man, who, not being poſſeſſed of an Engliſh barony, does not ſit in the houſe of peers. See ARCHBISHOP and BISHOP.

England contains about 60 archdeacons. Subordinate to them are the rural deacons, formerly ſtyled *archpreſbyters*, who ſignify the biſhop's pleaſure to his clergy, the lower claſs of which conſiſts of pariſh-prieſts (who are called *rectors* or *vicars*), deacons and curates. See the articles CURATE, DEACON, PARSON, England. and VICAR.

The following is a liſt of the Engliſh biſhoprics, with their revenues, as charged in the king's books; though that ſum is far from being the real annual value of the ſee, yet it aſſiſts in forming a comparative eſtimate between the revenues of each ſee with thoſe of another. 517 Revenues of the clergy.

The eccleſiaſtical government of England is, properly ſpeaking, lodged in the convocation; which is a national repreſentative or ſynod, and anſwers pretty near to the ideas we have of a parliament. They are convoked at the ſame time with every parliament; and their buſineſs is to conſider of the ſtate of the church, and to call thoſe to an account who have advanced new opinions, inconſiſtent with the doctrines of the church of England. Some high-flying clergymen during the reign of Queen Anne, and in the beginning of that of George I. raiſed the powers of the convocation to a height that was inconſiſtent with the principles of religious toleration, and indeed of civil liberty: ſo that the crown was obliged to exert its prerogative of calling the members together, and of diſſolving them; and ever ſince they have not been permitted to ſit for any time, in which they could do buſineſs.

The following table exhibits a view of the population of England, taken from the returns made to the houſe of commons in conſequence of an act of parliament which was paſſed for the purpoſe of aſcertaining the number of inhabitants in the kingdom. From this table it appears that the total number of perſons in England amounts to 8,331,434.

NEW ENGLAND, late a province of the Britiſh empire in America, is bounded on the north by Canada, on the eaſt by Nova Scotia and the Atlantic ocean, on the ſouth by the Atlantic and Long Iſland ſound, and on the weſt by New York. It lies in the form of a quarter of a circle. Its weſt line, beginning at the mouth of Byram river, which empties into Long Iſland ſound at the ſouth-weſt corner of Connecticut, latitude 41°, runs a little eaſt of north, until it ſtrikes the 45th degree of latitude, and then curves to the eaſtward almoſt to the gulf of St Lawrence.

1 When firſt diſcovered.

This country was diſcovered in the beginning of the laſt century, and called *North Virginia*; but no Europeans ſettled there till the year 1608. The firſt colony, which was weak and ill-directed, did not ſucceed; and, for ſome time, there were only a few adventurers who came over at times in the ſummer, built themſelves temporary huts for the ſake of trading with the ſavages, and, like them, diſappeared again for the

New England.

reſt of the year. At laſt ſome Browniſts, headed by Mr Robinſon, whom Neal ſtyles the Father of the Independents, who in 1610 had been driven from England by perſecution, fled to Holland, and ſettled at Leyden; but in 1621 determined, with Mr Brewſter aſſiſtant-preacher to Mr Robinſon, to found a church for their ſect in the new hemiſphere. They therefore purchaſed, in 1521, the charter of the Engliſh North Virginia-company. Forty-one families, making in all 120 perſons, landed in the beginning of a very hard winter, and found a country entirely covered with wood, which offered a very melancholy proſpect to men already exhauſted with the fatigues of their voyage. Near one half periſhed either by cold, the ſcurvy, or other diſtreſs. The courage of the reſt was beginning to fail; when it was revived by the arrival of 60 ſavage warriors, who came to them in the ſpring, headed by their chief. The old tenants aſſigned for ever to the new ones all the lands in the neighbourhood of the ſettlement they had formed, under the name of *New Plymouth*; and one of the ſavages who underſtood a little Engliſh ſtaid to teach them how to cultivate the maize, and inſtruct them in the manner of fiſhing upon their coaſt.

This kindneſs enabled the colony to wait for the companions they expected from Europe with ſeeds, with domeſtic animals, and with every aſſiſtance they wanted. At firſt theſe ſuccours arrived but ſlowly; but the perſecution of the Puritans in England increaſed the number of proſelytes to ſuch a degree in America, that in 1630 they were obliged to form different ſettlements, of which Boſton ſoon became the principal. Theſe firſt ſettlers were not merely eccleſiaſtics, who had been deprived of their preferments on account of their opinions; nor thoſe ſectaries influenced by new opinions, that are ſo frequent among the common people. There were among them ſeveral perſons of high rank, who, having embraced Puritaniſm, had taken the precaution to ſecure themſelves an aſylum in theſe diſtant regions. They had cauſed houſes to be built, and lands to be cleared, with a view of retiring there, if there endeavours in the cauſe of civil and religious liberty ſhould prove abortive.

Raynal's Hiſtory of European Settlements.

The inhabitants of New England lived peaceably for a long time, without any regular form of policy. Their charter had indeed authorized them to eſtabliſh any mode of government they might chooſe; but theſe enthuſiaſts were not agreed among themſelves upon the plan of their republic, and government did not pay ſufficient attention to them to urge them to ſecure their own tranquillity. At length they grew ſenſible of the neceſſity of a regular legiſlation; and this great work, which virtue and genius united have never attempted but with diffidence, was boldly undertaken by blind fanaticiſm. It bore the ſtamp of the rude prejudices

2 First code of laws.

on which it had been formed. There was in this new code a ſingular mixture of good and evil, of wiſdom and folly. No man was allowed to have a ſhare in the government except he were a member of the eſtabliſhed church. Witchcraft, perjury, blaſphemy, and adultery, were made capital offences; and children were alſo puniſhed with death, either for curſing or ſtriking their parents. Marriages, however, were to be ſolemnized by the magiſtrate. The price of corn was fixed at 2s. 11½d. per buſhel. The ſavages who neglected to cultivate their lands were to be deprived of them; and Europeans were forbidden under a heavy penalty to ſell them any ſtrong liquors or warlike ſtores. All thoſe who were detected either in lying, drunkenneſs, or dancing, were ordered to be publicly whipped. But at the ſame time that amuſements were forbidden equally with vices and crimes, one might be allowed to ſwear by paying a penalty of 11¼d. and to break the ſabbath for 2l. 19s. 9½d. Another indulgence allowed was, to atone, by a fine, for a neglect of prayer, or for uttering a raſh oath. But it is ſtill more extraordinary, that the worſhip of images was forbidden to the Puritans on pain of death; which was alſo inflicted on Roman Catholic prieſts, who ſhould return to the colony after they had been baniſhed; and on Quakers who ſhould appear again after having been whipped, branded, and expelled. Such was the abhorrence for theſe ſectaries, who had themſelves an averſion for every kind of cruelty, that whoever either brought one of them into the country, or harboured him but for one hour, was liable to pay a conſiderable fine.

New England.

3 Quakers perſecuted.

Thoſe unfortunate members of the colony, who, leſs violent than their brethren, ventured to deny the coercive power of the magiſtrate in matters of religion, were perſecuted with ſtill greater rigour. This was conſidered as blaſphemy by thoſe very divines who had rather choſen to quit their country than to ſhow any deference to Epiſcopal authority. This ſyſtem was ſupported by the ſeverities of the law, which attempted to put a ſtop to every difference in opinion, by inflicting capital puniſhment on all who diſſented. Thoſe who were either convicted, or even ſuſpected, of entertaining ſentiments of toleration, were expoſed to ſuch cruel oppreſſions, that they were forced to fly from their firſt aſylum, and ſeek refuge in another. They found one on the ſame continent; and as New England had been firſt founded by perſecution, its limits were extended by it.

This intemperate religious zeal extended itſelf to matters in themſelves of the greateſt indifference. A proof of this is found in the following public declaration, tranſcribed from the regiſters of the colony.

4 Law againſt wearing long hair.

"It is a circumſtance univerſally acknowledged, "that the cuſtom of wearing long hair, after the "manner of immoral perſons and of the ſavage In- "dians, can have been introduced into England only "in ſacrilegious contempt of the expreſs command of "God, who declares that it is a ſhameful practice for "any man who has the leaſt care for his ſoul to wear "long hair. As this abomination excites the indig- "nation of all pious perſons; we, the magiſtrates, in "our zeal for the purity of the faith, do expreſsly "and authentically declare, that we condemn the im- "pious cuſtom of letting the hair grow; a cuſtom "which we look upon to be very indecent and diſho- "neſt, which horribly diſguiſes men, and is offenſive "to modeſt and ſober perſons, in as much as it cor- "rupts good manners. We therefore, being juſtly "incenſed againſt this ſcandalous cuſtom, do deſire, "adviſe, and earneſtly requeſt all the elders of our "continent, zealouſly to ſhow their averſion for this "odious practice, to exert all their power to put a "ſtop to it, and eſpecially to take care that the mem- "bers of their churches be not infected with it; in

"order

New England.

" order that thoſe perſons who, notwithſtanding theſe " rigorous prohibitions, and the means of correction " that ſhall be uſed on this account, ſhall ſtill perſiſt in " this cuſtom, ſhall have both God and man at the ſame " time againſt them."

This ſeverity ſoon exerted itſelf againſt the Quakers. They were whipped, baniſhed, and impriſoned. The behaviour of theſe new enthuſiaſts, who in the midſt of tortures and ignominy praiſed God, and called for bleſſings upon men, inſpired a reverence for their perſons and opinions, and gained them a number of proſelytes. This circumſtance exaſperated their perſecutors, and hurried them on to the moſt atrocious acts of violence; and they cauſed five of them, who had returned clandeſtinely from baniſhment, to be hanged. This ſpirit of perſecution was, however, at laſt ſuppreſſed by the interpoſition of the mother-country, from whence it had been brought. Charles II. moved with the ſufferings of the Quakers, put a ſtop to them by a proclamation in 1661; but he was never able totally to extinguiſh the ſpirit of perſecution that prevailed in America.

The colony had placed at their head Henry Vane, the ſon of that Sir Henry Vane who had ſuch a remarkable ſhare in the diſturbances of his country. This obſtinate and enthuſiaſtic young man had contrived to revive the queſtions of grace and free will. The diſputes upon theſe points ran very high; and would probably have plunged the colony into a civil war, if ſeveral of the ſavage nations united had not happened at that very time to fall upon the plantations of the diſputants, and to maſſacre great numbers of them. The coloniſts, heated with their theological conteſts, paid at firſt very little attention to this conſiderable loſs. But the danger at length became ſo urgent and ſo general, that all took up arms. As ſoon as the enemy was repulſed, the colony reſumed its former diſſenſions; and the frenzy which they excited broke out in 1692 in a war, marked with as many atrocious inſtances of violence as any ever recorded in hiſtory.

5 Extraordinary perſecution of witches.

There lived in a town of New England, called *Salem*, two young women who were ſubject to convulſions, accompanied with extraordinary ſymptoms. Their father, miniſter of the church, thought that they were bewitched; and having in conſequence caſt his ſuſpicions upon an Indian girl who lived in his houſe, he compelled her by harſh treatment to confeſs that ſhe was a witch. Other women, upon hearing this, immediately believed, that the convulſions, which proceeded only from the nature of their ſex, were owing to the ſame cauſe. Three citizens, caſually named, were immediately thrown into priſon, accuſed of witchcraft, hanged, and their bodies left expoſed to wild beaſts and birds of prey. A few days after, 16 other perſons, together with a counſellor, who, becauſe he refuſed to plead againſt them, was ſuppoſed to ſhare in their guilt, ſuffered in the ſame manner. From this inſtant, the imagination of the multitude was inflamed with theſe horrid and gloomy ſcenes. Children of ten years of age were put to death; young girls were ſtripped naked, and the marks of witchcraft ſearched for upon their bodies with the moſt indecent curioſity; and thoſe ſpots of the ſcurvy which age impreſſes upon the bodies of old men were taken for evident ſigns of the infernal power. In default of theſe, torments were employed to extort confeſſions dictated by the executioners themſelves. If the magiſtrates, tired out with executions, refuſed to puniſh, they were themſelves accuſed of the crimes they tolerated; the very miniſters of religion raiſed falſe witneſſes againſt them, who made them forfeit with their lives the tardy remorſe excited in them by humanity. Dreams, apparitions, terror, and conſternation of every kind, increaſed theſe prodigies of folly and horror. The priſons were filled, the gibbets left ſtanding, and all the citizens involved in gloomy apprehenſions. The moſt prudent quitted the country ſtained with the blood of its inhabitants; and nothing leſs than the total and immediate ſubverſion of the colony was expected, when, on a ſudden, all eyes were opened at once, and the exceſs of the evil awakened the minds which it had firſt ſtupified. Bitter and painful remorſe was the immediate conſequence; the mercy of God was implored by a general faſt, and public prayers were offered up to aſk forgiveneſs for the preſumption of having ſuppoſed that Heaven could have been pleaſed with ſacrifices with which it could only have been offended.

New England.

Poſterity will probably never know exactly what was the cauſe or remedy of this dreadful diſorder. It had, perhaps, its firſt origin in the melancholy which thoſe perſecuted enthuſiaſts had brought with them from their own country, which had increaſed with the ſcurvy they had contracted at ſea, and had gathered freſh ſtrength from the inconveniences and hardſhips inſeparable from a change of climate and manner of living. The contagion, however, ceaſed like all other epidemical diſtempers, exhauſted by its very communication. A perfect calm ſucceeded this agitation; and the Puritans of New England have never ſince been ſeized with ſo gloomy a fit of enthuſiaſm.

But though the colony has renounced the perſecuting ſpirit which hath ſtained all religious ſects with blood, it has preſerved ſome remains, if not of intoleration, at leaſt of ſeverity, which remind us of thoſe melancholy days in which it took its riſe. Some of its laws are ſtill too ſevere.

New England had, however, ſome remedy againſt bad laws, in the conſtitution of its mother-country, where the people who have the legiſlative power in their own hands are at liberty to correct abuſes; and it has others derived from its ſituation, which open a vaſt field to induſtry and population.

6 Manner of ſettlement in this colony.

The clearing of the lands in this colony is not directed by chance as in the other provinces. This matter from the firſt was ſubjected to laws which are ſtill religiouſly obſerved. No citizen whatever has the liberty of ſettling even upon unoccupied land. The government, deſirous of preſerving all its members from the inroads of the ſavages, and of placing them in a condition to ſhare in the protection of a well-regulated ſociety, hath ordered that whole villages ſhould be formed at once. As ſoon as 60 families offer to build a church, maintain a clergyman, and pay a ſchool maſter, the general aſſembly allot them a ſituation, and permit them to have two repreſentatives in the legiſlative body of the colony. The diſtrict aſſigned them always borders upon the lands already cleared, and generally contains 60,000 ſquare acres. Theſe new people chooſe the ſituation moſt convenient for their habitation,

New England.

tion, which is usually of a square figure. The church is placed in the centre; the colonists divide the land among themselves, and each incloses his property with a hedge. Some woods are reserved for a common; and thus New England is constantly enlarging its territory, though it still continues to make one complete and well constituted province.

7 Division, &c.

The country was divided into four states, which at first had no connexion with one another. The necessity of maintaining an armed force against the savages, obliged them to form a confederacy in 1643, when they took the name of the *United Colonies*. In consequence of this league, two deputies from each establishment used to meet in a stated place to deliberate upon the common affairs of New England, according to the instructions they had received from the assembly by which they were sent. This association laid no constraint upon the right of every individual to act entirely as he pleased, without either the permission or approbation of the mother-country. All the submission required of these provinces was merely to acknowledge the kings of England for their sovereigns. Charles II. wished to make them more dependent. The province of Massachuset's bay, which, though the smallest, was the richest and the most populous of the four, being guilty of some misdemeanour against government, the king seized that opportunity of taking away its charter in 1684: and it remained without one till the revolution; when it received another, which, however, did not answer its claims or expectations. The crown reserved to itself the right of nominating the governor, and appointing to all military employments, and to all principal posts in the civil and juridical departments: it allowed the people of the colony their legislative power, and gave the governor a negative voice and the command of the troops, which secured him a sufficient influence to enable him to maintain the prerogative of the mother-country in all its force. The provinces of Connecticut and Rhode-Island, by timely submission, prevented the punishment which that of Massachusets had incurred, and retained their original charter. That of New-Hampshire had been always regulated by the same mode of administration as the province of Massachusets bay. The same governor presided over the whole colony, but with regulations adapted to the constitution of each province. To the above states, another has been added since the revolution, viz. VERMONT. These states are subdivided into counties, and the counties into townships.

8 Face of the country, mountains, &c.

New England is a high, hilly, and in some parts a mountainous country, formed by nature to be inhabited by a hardy race of free, independent republicans. —The mountains are comparatively small, running nearly north and south in ridges parallel to each other. Between these ridges flow the great rivers in majestic meanders, receiving the innumerable rivulets and larger streams which proceed from the mountains on each side. To a spectator on the top of a neighbouring mountain, the vales between the ridges, while in a state of nature, exhibit a romantic appearance. They seem an ocean of woods, swelled and depressed in its surface like that of the great ocean itself. A richer though less romantic view is presented, when the valleys, by industrious husbandmen, have been cleared of their natural growth; and the fruit of their labour appears in loaded orchards, extensive meadows, covered with large herds of sheep and neat cattle, and rich fields of flax, corn, and the various kinds of grain. These valleys, which have received the expressive name of *interval lands*, are of various breadths, from two to 20 miles; and by the annual inundations of the rivers which flow through them, there is frequently an accumulation of rich, fat soil, left upon their surface when the waters retire.

New England.

There are four principal ranges of mountains, passing nearly from north-east to south-west through New England. These consist of a multitude of parallel ridges, each having many spurs, deviating from the course of the general range; which spurs are again broken into irregular hilly land. The main ridges terminate, sometimes in high bluff heads, near the sea-coast, and sometimes by a gradual descent in the interior part of the country. One of the main ranges runs between Connecticut and Hudson's rivers. This range branches and bounds the vales through which flows the Housatonick river. The most eastern ridge of this range terminates in a bluff head at Meriden; a second ends in like manner at Willingford, and a third at New Haven. In Lyme, on the east side of Connecticut river, another range of mountains commences, forming the eastern boundary of Connecticut vale. This range tends northerly, at the distance, generally, of about 10 or 12 miles east from the river, and passes through Massachusets, where the range takes the name of *Chickabee Mountain*; thence crossing into New Hampshire, at the distance of about 20 miles from the Massachusets line, it runs up into a very high peak, called *Monadnick*, which terminates this ridge of the range. A western ridge continues, and in about latitude 43° 20′ runs up into Sunipee mountains. About 50 miles further, in the same ridge, is Mooscoog mountain. A third range begins near Stonington in Connecticut. It takes its course north-easterly, and is sometimes broken and discontinued; it then rises again, and ranges in the same direction into New Hampshire, where, in latitude 43° 25′, it runs up into a high peak called *Cowsawaskog*. The fourth range has a humble beginning about Hopkinton in Massachusets. The eastern ridge of this range runs north by Watertown and Concord, and crosses Merrimack river at Pantucket Falls. In New Hampshire, it rises into several high peaks, of which the White mountains are the principal. From these White mountains a range continues north-east, crossing the east boundary of New Hampshire, in latitude 44° 30′, and forms the height of land between Kennebek and Chaudiere rivers. These ranges of mountains are full of lakes, ponds, and springs of water, that give rise to numberless streams of various sizes, which, interlocking each other in every direction, and falling over the rocks in romantic cascades, flow meandering into the rivers below. No country on the globe is better watered than New England.

On the sea-coast the land is low, and in many parts level and sandy. In the valleys, between the forementioned ranges of mountains, the land is generally broken, and in many places rocky, but of a strong rich soil, capable of being cultivated to good advantage, which also is the case with many spots even on the tops of the mountains.

The

New England.

The principal river in New England is Connecticut. See CONNECTICUT.

9 Soil, productions, &c.

The ſoil, as may be collected from what has been ſaid, muſt be very various. Each tract of different ſoil is diſtinguiſhed by its peculiar vegetation, and is pronounced good, middling, or bad, from the ſpecies of trees which it produces; and from one ſpecies generally predominating in each ſoil, has originated the deſcriptive names of oak land, birch, beech, and cheſnut lands, pine, barren, maple, aſh, and cedar ſwamps, as each ſpecies happens to predominate. Intermingled with thoſe predominating ſpecies are walnut, firs, elm, hemlock, magnolia, mooſe-wood, ſaſſafras, &c. &c. The beſt lands produce walnut and cheſnut; the next, beech and oak; lands of the third quality produce fir and pitch-pine; the next, whortleberry and barberry buſhes; and the pooreſt produce nothing but marſhy imperfect ſhrubs. Among the flowering trees and ſhrubs in the foreſts are the red-flowering maple, the ſaſſafras, the locuſt-tree, the tulip-tree, honeyſuckle, wild roſe, dogwood, elm, leather-tree, laurel, hawthorn, &c. which in the ſpring of the year give the woods a moſt beautiful appearance, and fill them with a delicious fragrance. Among the fruits which grow wild, are the ſeveral kinds of grapes; which are ſmall, ſour, and thick ſkinned. The vines on which they grow are very luxuriant, often overſpreading the higheſt trees in the foreſts; and without doubt, may be greatly meliorated by proper cultivation. Beſides theſe, are the wild cherries, white and red mulberries, cranberries, walnuts, hazel nuts, cheſnuts, butter nuts, beech nuts, wild plums and pears, whortle-berries, bilberries, gooſeberries, ſtrawberries, &c.

The ſoil in the interior country is calculated for the culture of Indian corn, rye, oats, barley, flax, and hemp (for which the ſoil and climate are peculiarly proper), buck-wheat, beans, peaſe, &c. In many of the inland parts wheat is raiſed in large quantities; but on the ſea-coaſt it has never been cultivated with ſucceſs, being ſubject to blaſts. The fruits which the country yields from culture, are apples in the greateſt plenty; of theſe cyder is made, which conſtitutes the principal drink of the inhabitants; alſo, pears of various ſorts, quinces, peaches (from which is made peach brandy,) plums, cherries, apricots, &c. The culinary plants are ſuch as have already been enumerated. New England is a fine grazing country; the valleys between the hills are generally interſected with brooks of water, the banks of which are lined with a tract of rich meadow or interval land. The high and rocky ground is, in many parts, covered with honeyſuckle, and generally affords the fineſt of paſture. It will not be a matter of wonder, therefore, that New England boaſts of raiſing ſome of the fineſt cattle in the world; nor will ſhe be envied, when the labour of raiſing them is taken into view. Two months of the hotteſt ſeaſon in the year the farmers are employed in procuring food for their cattle; and the cold winter is ſpent in dealing it out to them. The pleaſure and profit of doing this, is however a ſatisfying compenſation to the honeſt and induſtrious farmer.

10 Population, manners, cuſtoms, and diverſions.

New England is the moſt populous part of the United States. It contains at leaſt 823,000 ſouls. One fifth of theſe are ſencible men. New England then, ſhould any great and ſudden emergency require it, could furniſh an army of 164,600 men. The great body of theſe are land-holders and cultivators of the ſoil. The former attaches them to their country; the latter, by making them ſtrong and healthy, enables them to defend it. The boys are early taught the uſe of arms, and make the beſt of ſoldiers. Few countries on earth, of equal extent and population, can furniſh a more formidable army than this part of the union. New England.

New England may, with propriety, be called a nurſery of men, whence are annually tranſplanted, into other parts of the United States, thouſands of its natives. The ſtate of Vermont, which is but of yeſterday, and contains about 100,000 ſouls, has received more inhabitants from Connecticut than from any other ſtate; and yet between the years 1774 and 1782, notwithſtanding her numerous emigrations to Vermont, Suſquehannah, and other places, and the depopulation occaſioned by a ſeven years bloody war, it is found, from an actual cenſus of the inhabitants in the years before-mentioned, that they have increaſed from 197,856, their number in 1774, to 290,150, their number in 1782. Vaſt numbers of the New Englanders, ſince the war, have emigrated into the northern parts of New York, into Kentucky and the Weſtern Territory, and into Georgia; and ſome are ſcattered into every ſtate, and every town of note in the union.

The New Englanders are generally tall, ſtout, and well built. They glory, and perhaps with juſtice, in poſſeſſing that ſpirit of freedom which induced their anceſtors to leave their native country, and to brave the dangers of the ocean and the hardſhips of ſettling in a wilderneſs. Their education, laws, and ſituation, ſerve to inſpire them with high notions of liberty. Their jealouſy is awakened at the firſt motion toward an invaſion of their rights. They are indeed often jealous to exceſs; a circumſtance which is a fruitful ſource of imaginary grievances, and of innumerable groundleſs ſuſpicions and unjuſt complaints againſt government. A law, reſpecting the deſcent of eſtates which are generally held in fee ſimple, which for ſubſtance is the ſame in all the New England ſtates, is the chief foundation and protection of this liberty. By this law, the poſſeſſions of the father are to be equally divided among all the children, excepting the eldeſt ſon, who has a double portion. In this way is preſerved that happy mediocrity among the people, which, by inducing economy and induſtry, removes from them temptations to luxury, and forms them to habits of ſobriety and temperance. At the ſame time, their induſtry and frugality exempt them from want, and from the neceſſity of ſubmitting to any encroachment on their liberties.

In New England, learning is more generally diffuſed among all ranks of people than in almoſt any other part of the globe; ariſing from the excellent eſtabliſhment of ſchools in every townſhip. Another ſource of information to the people is the newſpapers, of which not leſs than 30,000 are printed every week in New England, and circulated in almoſt every town and village in the country. A perſon of mature age, who cannot both read and write, is rarely to be found. By means of this general eſtabliſhment of ſchools, the extenſive circulation of newſpapers, and the conſequent ſpread of learning, every townſhip throughout the country is furniſhed with men capable of conduc-

ting

New England.

ting the affairs of their town with judgment and diſcretion. Theſe men are the channels of political information to the lower claſs of people; if ſuch a claſs may be ſaid to exiſt in New England, where every man thinks himſelf at leaſt as good as his neighbour, and believes that all mankind are, or ought to be, equal. The people from their childhood form habits of canvaſſing public affairs, and commence politicians. This naturally leads them to be very inquiſitive. This deſire after knowledge, in a greater or leſſer degree, prevails throughout all claſſes of people in New England: and from their various modes of expreſſing it, ſome of which are blunt and familiar, bordering on impertinence, ſtrangers have been induced to mention impertinent inquiſitiveneſs as a diſtinguiſhing characteriſtic of New England people.—Each man alſo has his independent ſyſtem of politics; and each aſſumes a dictatorial office. Hence originates that reſtleſs, litigious, complaining ſpirit, which forms a dark ſhade in the character of New Englandmen.

Before the American war, which introduced into New England a flood of corruptions, with many improvements, the Sabbath was obſerved with great ſtrictneſs; no unneceſſary travelling, no ſecular buſineſs, no viſiting, no diverſions, were permitted on that ſacred day. They conſidered it as conſecrated to divine worſhip, and were generally punctual and ſerious in their attendance upon it. Their laws were ſtrict in guarding the Sabbath againſt every innovation. The ſuppoſed ſeverity with which theſe laws were compoſed and executed, together with ſome other traits in their religious character, have acquired, for the New Englanders, the name of a ſuperſtitious bigotted people. But ſuperſtition and bigotry are ſo indefinite in their ſignifications, and ſo variouſly applied by perſons of different principles and educations, that it is not eaſy to determine how far they deſerved that character. Leaving every perſon to enjoy his own opinion in regard to this matter, we will only obſerve, that, ſince the war, a catholic tolerant ſpirit, occaſioned by a more enlarged intercourſe with mankind, has greatly increaſed, and is becoming univerſal; and if they do not break the proper bound, and liberalize away all true religion, of which there is much danger, they will counteract that ſtrong propenſity in human nature, which leads men to vibrate from one extreme to its oppoſite.

There is one diſtinguiſhing characteriſtic in the religious character of this people, which we muſt not omit to mention; and that is, the cuſtom of annually celebrating faſts and thankſgivings. In the ſpring, the ſeveral governors iſſue their proclamations, appointing a day to be religiouſly obſerved in faſting, humiliation, and prayer, throughout their reſpective ſtates, in which the predominating vices, that particularly call for humiliation, are enumerated. In autumn, after harveſt, that gladſome era in the huſbandman's life, the governors again iſſue their proclamations appointing a day of public thankſgiving, enumerating the public bleſſings received in the courſe of the foregoing year. This pious cuſtom originated with their venerable anceſtors, the firſt ſettlers of New England; and has been handed down as ſacred through the ſucceſſive generations of their poſterity. A cuſtom ſo rational, and ſo happily calculated to cheriſh in the minds of the people a ſenſe of their dependence on the great Benefactor of the world for all their bleſſings, it is hoped will ever be ſacredly preſerved.

New England.

The people of New England generally obtain their eſtates by hard and perſevering labour: They of conſequence know their value, and ſpend with frugality. Yet in no country do the indigent and unfortunate fare better. Their laws oblige every town to provide a competent maintenance for their poor; and the neceſſitous ſtranger is protected and relieved from their humane inſtitutions. It may in truth be ſaid, that in no part of the world are the people happier, better furniſhed with the neceſſaries and conveniences of life, or more independent than the farmers in New England. As the great body of the people are hardy independent freeholders, their manners are, as they ought to be, congenial to their employment, plain, ſimple, and unpoliſhed. Strangers are received and entertained among them with a great deal of artleſs ſincerity and friendly unformal hoſpitality. Their children, thoſe imitative creatures, to whoſe education particular attention is paid, early imbibe the manners and habits of thoſe around them; and the ſtranger, with pleaſure, notices the honeſt and decent reſpect that is paid him by the children as he paſſes through the country.

As the people, by repreſentation, make their own laws and appoint their own officers, they cannot be oppreſſed; and living under governments which have few lucrative places, they have few motives to bribery, corrupt canvaſſings, or intrigue. Real abilities and a moral character unblemiſhed are the qualifications requiſite in the view of moſt people for offices of public truſt. The expreſſion of a wiſh to be promoted is the direct way to be diſappointed.

The inhabitants of New England are generally fond of the arts, and have cultivated them with great ſucceſs. Their colleges have flouriſhed beyond any others in the United States. The illuſtrious characters they have produced, who have diſtinguiſhed themſelves in politics, law, divinity, the mathematics and philoſophy, natural and civil hiſtory, and in the fine arts, particularly in poetry, evince the truth of theſe obſervations.

Many of the women in New England are handſome. They generally have fair, freſh, and healthful countenances, mingled with much female ſoftneſs and delicacy. Thoſe who have had the advantages of a good education (and they are conſiderably numerous) are genteel, eaſy, and agreeable in their manners, and are ſprightly and ſenſible in converſation. They are early taught to manage domeſtic concerns with neatneſs and economy. Ladies of the firſt rank and fortune make it a part of their daily buſineſs to ſuperintend the affairs of the family. Employment at the needle, in cookery, and at the ſpinning-wheel, with them is honourable. Idleneſs, even in thoſe of independent fortunes, is univerſally diſreputable. The women in the country manufacture the greateſt part of the clothing of their families. Their linen and woollen cloths are ſtrong and decent. Their butter and cheeſe is not inferior to any in the world.

Dancing is the principal and favourite amuſement in New England; and of this the young people of both ſexes are extremely fond. Gaming is practiſed by none but thoſe who cannot or rather will not find a reputable employment. The gameſter, the horſe-jockey, and the knave, are equally deſpiſed, and their company is

avoided

New England, Engliſh.

avoided by all who would ſuſtain fair and irreproachable characters. The odious and inhuman practices of duelling, gouging, cock-fighting, and horſe-racing, are ſcarcely known here.—The athletic and healthy diverſions of cricket, football, quoits, wreſtling, jumping, foot-races, &c. are univerſally practiſed in the country, and ſome of them in the moſt populous places, and by people of almoſt all ranks. Squirrel-hunting is a noted diverſion in country places, where this kind of game is plenty. Some divert themſelves with fox-hunting, and others with the more profitable ſports of fiſhing and duck-hunting; and in the frontier ſettlements, where deer and fur game abound, the inhabitants make a lucrative ſport of hunting them. In the winter ſeaſon, while the ground is covered with ſnow, which is commonly two or three months, ſleighing is the general diverſion. A great part of the families throughout the country are furniſhed with horſes and ſleighs.

11 Trade.

New England has no one ſtaple commodity. The ocean and the foreſts afford the two principal articles of export. Cod-fiſh, mackarel, ſhad, ſalmon, and other fiſh, whale-oil and whale-bone, maſts, boards, ſcantling, ſtaves, hoops, and ſhingles, have been and are ſtill exported in large quantities. The annual amount of cod and other fiſh for foreign exportation, including the profits ariſing from the whale-fiſhery, is eſtimated at upwards of half a million.—Beſides the articles enumerated, they export from the various parts of New England ſhips built for ſale, horſes, mules, live ſtock, pickled beef and pork, pot-aſh, pearl-aſh, flax-ſeed, butter and cheeſe, rum, &c. The balance of trade, as far as imperfect calculations will enable us to judge, has generally been againſt New England; not from any unavoidable neceſſity, but from her extravagant importations. From a view of the annual imports into New England, it appears that the greateſt part of them conſiſts of the luxuries, or at beſt the diſpenſable conveniences of life; the country affords the neceſſaries in great abundance.

ENGLISH, or the *English Tongue*, the language ſpoken by the people of England, and, with ſome variation, by thoſe of Scotland, as well as part of Ireland, and the reſt of the Britiſh dominions.

The ancient language of Britain is generally allowed to have been the ſame with the Gallic, or French; this iſland, in all probability, having been firſt peopled from Gallia, as both Cæſar and Tacitus affirm, and prove by many ſtrong and concluſive arguments, as by their religion, manners, cuſtoms, and the nearneſs of their ſituation. But now we have very ſmall remains of the ancient Britiſh tongue, except in Wales, Cornwall, the iſlands and highlands of Scotland, part of Ireland, and ſome provinces of France; which will not appear ſtrange, when what follows is conſidered.

Julius Cæſar, ſome time before the birth of our Saviour, made a deſcent upon Britain, though he may be ſaid rather to have diſcovered than conquered it; but about the year of Chriſt 45, in the time of Claudius, Aulus Plautius was ſent over with ſome Roman forces, by whom two kings of the Britons, Togodumnus and Caractacus, were both overcome in battle: whereupon a Roman colony was planted at Malden in Eſſex, and the ſouthern parts of the iſland were reduced to the form of a Roman province: after that, the iſland was conquered as far north as the friths of Dunbarton and Edinburgh, by Agricola, in the time of Domitian; whereupon a great number of the Britons, in the conquered part of the iſland, retired to the weſt part called *Wales*, carrying their language with them. English.

The greateſt part of Britain being thus become a Roman province, the Roman legions, who reſided in Britain for above 200 years, undoubtedly diſſeminated the Latin tongue; and the people being afterwards governed by laws written in Latin muſt neceſſarily make a mixture of languages. This ſeems to have been the firſt mutation the language of Britain ſuffered.

Thus the Britiſh tongue continued, for ſome time, mixed with the provincial Latin, till, the Roman legions being called home, the Scots and Picts took the opportunity to attack and haraſs England: upon which King Vortigern, about the year 440, called the Saxons to his aſſiſtance; who came over with ſeveral of their neighbours, and having repulſed the Scots and Picts, were rewarded for their ſervices with the iſle of Thanet, and the whole county of Kent; but growing too powerful, and not being contented with their allotment, diſpoſſeſſed the inhabitants of all the country on this ſide of the Severn *: thus the Britiſh tongue was in a great meaſure deſtroyed, and the Saxon introduced in its ſtead.

* See *England*, N° 13—42.

What the Saxon tongue was long before the conqueſt, about the year 700, we may obſerve in the moſt ancient manuſcript of that language, which is a gloſs on the Evangeliſts, by Biſhop Edfrid, in which the three firſt articles of the Lord's prayer run thus:

"Uren fader thic arth in heofnas, ſic gehalgud thin noma, ſo cymeth thin ric. Sic thin willa ſue is heofnas, and in eortho," &c.

In the beginning of the ninth century the Danes invaded England; and getting a footing in the northern and eaſtern parts of the country, their power gradually increaſed, and they became ſole maſters of it in about 200 years. By this means the ancient Britiſh obtained a tincture of the Daniſh language; but their government being of no long continuance, did not make ſo great an alteration in the Anglo-Saxon as the next revolution, when the whole land, A. D. 1067, was ſubdued by William the Conqueror, duke of Normandy in France: for the Normans, as a monument of their conqueſt, endeavoured to make their language as generally received as their commands, and thereby rendered the Britiſh language an entire medley.

About the year 900, the Lord's prayer, in the ancient Anglo-Saxon, ran thus:

"Thue ur fader the eart on heofenum, ſi thin nama gehalgod; cume thin rice ſithin will a on eorthan ſwa, ſwo on heofenum," &c.

About the year 1160, under Henry II. it was rendered thus by Pope Adrian, an Engliſhman, in rhyme:

"Ure fader in heaven rich,
"Thy name be halyed ever lich,
"Thou bring us thy michel bleſſe:
"Als hit in heaven y doe,
"Evar in yearth been it alſo," &c.

Dr Hicks gives us an extraordinary ſpecimen of the

English. Engliſh, as ſpoken in the year 1385, upon the very ſubject of the Engliſh tongue.

"As it is knowe how meny maner peple beeth in this lond; ther beeth alſo ſo many dyvers longages and tonges. Notheleſs Walſchemen and Scots that beeth nought medled with other nation, holdeth wel nyh hir firſte longage and ſpeche; but yif the Scottes, that were ſometime confederate and woned with the Pictes, drawe ſomewhat after hir ſpeche; but the Flemynges, that woneth on the weſt ſide of Wales, haveth loſt her ſtrange ſpeche, and ſpeketh Sexonliche now. Alſo Engliſhemen, they had from the bygynnynge thre maner ſpeche; northerne, ſoutherne, and middel ſpeche in the middel of the lond, as they come of thre maner of peple of Germania: notheleſs by commyxtion and meilynge firſt with Danes, and afterwards with Normans, in meny the contrary longage is apayred (*corrupted.*)

"This apayrynge of the burth of the tunge is bycauſe of tweie things; oon is for children in ſcole agenſt the uſuage and maner of all other nations, beeth compelled for to leve hir own longage, and for to conſtrue hir leſſons and here thinges in Frenſche, and ſo they haveth ſethe Normans come firſt into Engelond. Alſo gentlemen children beeth taught to ſpeke Frenſche from the tyme that they beeth roked in here cradel, and kunneth ſpeke and play with a childe's broche; and uplondiſſche men will lykne hymſelf to gentilmen, and fondeth with great beſyneſſe for to ſpeak Frenſche to be told of.—Hit ſeemeth a great wonder how Engliſchemen and hir own longage and tonge is ſo dyverſe of ſown in this oon iland; and the longage of Normandie is comlynge of another lond, and hath oon maner ſoun amonge alle men that ſpeketh hit arigt in Engelond. Alſo of the foreſaid Saxon tonge that is deled (*divided*) a three, and is abide ſcarceliche with fewe uplondiſſche men is greet wonder. For men of the eſt, with men of the weſt, is, as it were, undir the ſame partie of hevene accordeth more in ſownynge of ſpeche, than men of the north with men of the ſouth. Therefore it is that Mercii, that beeth men of myddel Engelond, as it were, parteners of the endes, underſtondeth bettre the ſide longes northerne and ſoutherne, than northerne and ſoutherne underſtondeth either other. —All the longage of the Northumbers and ſpechialliche at York, is ſo ſcharp, ſlitting, and frotynge, and unſchape, that we ſoutherne men may that longage unnethe underſtonde," &c.

In the year 1537, the Lord's prayer was printed as follows: "O oure father which arte in heven, hallowed be thy name: let thy kingdome come, thy will be fulfilled as well in erth as it is in heven; geve us this daye in dayly bred," &c. Where it may be obſerved, that the diction is brought almoſt to the preſent ſtandard, the chief variations being only in the orthography. By theſe inſtances, and many others that might be given, it appears, that the Engliſh Saxon language, of which the Normans deſpoiled us in a great meaſure, had its beauties, was ſignificant and emphatical, and preferable to what they impoſed on us. "Great, verily (ſays Camden), was the glory of our tongue before the Norman conqueſt, in this, that the old Engliſh could expreſs, moſt aptly, all the conceptions of the mind in their own tongue, without borrowing from any." Of this he gives ſeveral examples.

Having thus ſhown how the ancient Britiſh language was in a manner extirpated by the Romans, Danes, and Saxons, and ſucceeded by the Saxon, and after that the Saxon blended with the Norman French, we ſhall now mention two other cauſes of change in the language. The firſt of theſe is owing to the Britons having been a long time a trading nation, whereby offices, dignities, names of wares, and terms of traffic, are introduced, which we take with the wares from the perſons of whom we have them, and form them anew, according to the genius of our own tongue; and beſides this change in the language, ariſing from commerce, Britain's having been a conſiderable time ſubject to the ſee of Rome, in eccleſiaſtical affairs, muſt unavoidably have introduced ſome Italian words among us. Secondly, As to the particular properties of a language, our tongue has undergone no ſmall mutation, or rather has received no ſmall improvement upon that account: for, as to the Greek and Latin, the learned have, together with the arts and ſciences now rendered familiar among us, introduced abundance; nay, almoſt all the terms of art in the mathematics, philoſophy, phyſic, and anatomy; and we have entertained many more from the Latin, French, &c. for the ſake of neatneſs and elegancy; ſo that, at this day, our language, which, about 1800 years ago, was the ancient Britiſh, or Welch, &c. is now a mixture of Saxon, Teutonic, Dutch, Daniſh, Norman, and modern French, embelliſhed with the Greek and Latin. Yet this, in the opinion of ſome, is ſo far from being a diſadvantage to the Engliſh tongue as now ſpoken (for all languages have undergone changes, and do continually participate with each other), that it has ſo enriched it, as now to render it the moſt copious, ſignificant, fluent, courteous, and maſculine language in Europe, if not in the world.

English || Engraving.

ENGRAFTING, in *Gardening*. See GRAFTING, GARDENING *Index*.

ENGRAILED, or INGRAILED, in *Heraldry*, a term derived from the French *greſly*, "hail;" and ſignifying a thing the hail has fallen upon and broke off the edges, leaving them ragged, or with half rounds, or ſemicircles, ſtruck out of their edges.

ENGRAVING, the art of cutting metals and precious ſtones, and repreſenting thereon figures, letters, or whatever device or deſign the artiſt fancies.

Engraving, properly a branch of ſculpture, is divided into ſeveral other branches, according to the matter whereon it is employed, and the manner of performing it. For the rudeſt branch, that of

ENGRAVING on Wood, ſee *WOOD, Engraving on.*

ENGRAVING on Copper, the making, correſpondently to ſome delineated figure or deſign, ſuch concave lines on a ſmooth ſurface of copper, either by cutting or corroſion, as render it capable, when charged properly with any coloured fluid, of imparting by compreſſion an exact repreſentation of the figure or deſign to paper or parchment.

Whether we conſider the art of engraving, with regard to the utility and pleaſure it affords, or the difficulty that attends its execution, we cannot but confeſs, that on every account it deſerves a diſtinguiſhed rank among the polite arts †. It is by means of this art that the cabinets of the curious are adorned with the portraits of the greateſt men of all ages and all nations;

† See *Polite* ARTS, N° 13.

Engraving. tions; that their memories, their moſt remarkable and moſt glorious actions, are tranſmitted to the lateſt poſterity. It is by this art alſo, that the paintings of the greateſt maſters are multiplied to a boundleſs number; and that the lovers of the polite arts, diffuſed over the face of the whole earth, are enabled to enjoy thoſe beauties from which their diſtant ſituations ſeemed to have for ever debarred them; and perſons of moderate fortune are hereby enabled to become poſſeſſed of all the ſpirit, and all the poetry, that are contained in thoſe miracles of art, which ſeemed to have been reſerved for the temples of Italy, or the cabinets of princes. When we reflect, moreover, that the engraver, beſide the beauties of poetic compoſition, and the artful ordinance of deſign, is to expreſs, merely by the means of light and ſhade, all the various tints of colours and clair obſcure; to give a relief to each figure, and a truth to each object; that he is now to paint a ſky ſerene and bright, and then loaded with dark clouds; now the pure tranquil ſtream, and then the foaming, raging ſea; that here he is to expreſs the character of the man, ſtrongly marked in his countenance, and there the minuteſt ornament of his dreſs; in a word, that he is to repreſent all even the moſt difficult objects in nature; we cannot ſufficiently admire the vaſt improvements in this art, and that degree of perfection to which it is at this day arrived. See the article PRINTS.

Engraving is an art, for the greateſt part, of modern invention; having its riſe no earlier than the middle of the 15th century. The ancients, it is true, practiſed engraving on precious ſtones and cryſtals with very good ſucceſs; and there are ſtill many of their works remaining equal to any production of the later ages. But the art of engraving on plates and blocks of wood, to afford prints or impreſſions, was not known till after the invention of painting in oil.

The different modes of engraving are the following:

In ſtrokes cut through a thin wax, laid upon the copper, with a point, and theſe ſtrokes bitten or corroded into the copper with aquafortis. This is called *etching*.

In ſtrokes with the graver alone, unaſſiſted by aquafortis. In this inſtance, the deſign is traced with a ſharp tool, called a *dry point*, upon the plate; and the ſtrokes are cut or ploughed upon the copper with an inſtrument diſtinguiſhed by the name of a *graver*.

In ſtrokes firſt etched and afterwards finiſhed with the graver: by this expedient the two former methods are united.

In dots without ſtrokes, which are executed with the point upon the wax or ground, bitten in with the aquafortis, and afterwards harmonized with the graver, by the means of which inſtrument ſmall dots are made; or with the graver alone, as in the fleſh and finer parts, unaſſiſted with the point.

In dots firſt etched and afterwards harmonized with the dry point, performed by a little hammer, called *opus mallei*, or *the work of the hammer*, as practiſed by Lutma and others.

In mezzotinto, which is performed by a dark barb or ground being raiſed uniformly upon the plate with a toothed tool. The deſign being traced upon the plate, the light parts are ſcraped off by inſtruments for that purpoſe, in proportion as the effect requires.

In aquatinta, a newly invented method of engraving. The outline is firſt etched, and afterwards a ſort of waſh is laid by the aquafortis upon the plate, reſembling drawings in Indian ink, biſter, &c. Engraving

On wood, performed with a ſingle block, on which the deſign is traced with a pen, and thoſe parts which ſhould be white carefully hollowed out; and this block is afterwards printed by the letter-preſs printers, in the ſame manner as they print a book.

On wood, performed with two, three, or more blocks; the firſt having the outlines cut upon it; the ſecond is reſerved for the darker ſhadows; and the third for the ſhadows which terminate upon the lights; and theſe are ſubſtituted in their turn, each print receiving an impreſſion from every block. This mode of engraving is called *chiaro-ſcuro*, and was deſigned to repreſent the drawings of the old maſters.

On wood and on copper: in theſe the outline is engraved in a bold dark ſtyle upon the copper; and two or more blocks of wood are ſubſtituted to produce the darker and lighter ſhadows, as before.

Of all thoſe modes of engraving, the moſt ancient is that on *wood;* or, to ſpeak more properly, the firſt impreſſions on paper were taken from carved wooden blocks. For this invention it appears that we are indebted to the brief-maiers or makers of playing-cards, who practiſed the art in Germany about the beginning of the 15th century. From the ſame ſource may perhaps be traced the firſt idea of moveable types, which appeared not many years after: for theſe brief-maiers did not entirely confine themſelves to the printing and painting of cards, but produced alſo ſubjects of a more devout nature; many of which, taken from holy writ, are ſtill preſerved in different libraries in Germany, with the explanatory text facing the figures; the whole engraved in wood. In this manner they even formed a ſpecies of books; ſuch as, *Hiſtoria ſancti Johannis, ejuſque Viſiones Apocalypticæ; Hiſtoria Veteris et Novi Teſtamenti*, known by the name of the *Poor Man's Bible*. Theſe ſhort mementos were printed only on one ſide; and two of them being paſted together, had the appearance of a ſingle leaf. The earlieſt date on any of theſe wooden cuts is 1423. The ſubject is *St Chriſtopher carrying the Infant Jeſus over the Sea*, preſerved in a convent at Buxheim near Menningen. It is of a folio ſize, illuminated in the ſame manner as the playing cards; and at the bottom is this inſcription, *Chriſtoferi faciem die quacunque tueris. Illa nempe die morte mala non morieris. M.lleſimo CCCC° XX° tertio.*

Upon the invention of moveable types, that branch of the brief-maiers buſineſs, ſo far as it regarded the making of books, was gradually diſcontinued; but the art itſelf of engraving on wood continued in an improving ſtate; and towards the end of the 15th and beginning of the 16th century, it became cuſtomary for almoſt every one of the German engravers on copper to engrave on wood alſo. The works of Albert Durer in this ſtyle of engraving are juſtly held in the higheſt eſteem. Italy, France, and Holland, have produced many capital artiſts of this kind; but for boldneſs and ſpirit, we muſt ſee the prints of Chriſtopher Jegher, who worked under the direction of Rubens, and was without doubt aſſiſted by that great maſter. Strutt's *Hiſt of Engraving.*

The invention of that ſpecies of engraving diſtin-

Engraving. guiſhed by the appellation of *chiaro-ſcuro*, ſeems alſo to be juſtly claimed by the Germans, and firſt practiſed by Mair; one of whoſe prints of this kind is dated 1499. Many excellent works in chiaro-ſcuro have been produced in France; and in Italy it was honoured with the performances of Titian and Parmegiano; but the attempts of Jackſon, Kirkall, and others in England, have not been equally ſucceſsful. A ſet of excellent prints in this way have lately been publiſhed by J. Skippe, Eſq. a connoiſſeur and dillettante.

In Germany, about the year 1450, prints from engraved *copper* firſt made their appearance. The earlieſt date of a copperplate print is indeed only 1461; but however faulty this print may be with reſpect to the drawing, or defective in point of taſte, the mechanical part of the execution of it has by no means the appearance of being one of the firſt productions of the graver. We have alſo ſeveral other engravings, evidently the work of the ſame maſter; in which the impreſſions are ſo neatly taken from the plates, and the engravings ſo clearly printed in every part, that according to all appearance they could not be executed in a much better manner in the preſent day, with all the conveniences which the copperplate printers now poſſeſs, and the additional knowledge they muſt neceſſarily have acquired in the courſe of more than three centuries. Hence we may fairly conclude, that if they were not the firſt ſpecimens of the engraver's workmanſhip, they were much leſs the firſt efforts of the copperplate printer's ability. It is likewiſe to be obſerved, that Martin Schoen, who is ſaid, with great appearance of truth, to have worked from 1460 to 1486, was apparently the ſcholar of Stoltzhirs; for he followed his ſtyle of engraving, and copied from him a ſet of prints, repreſenting the paſſion of our Saviour. Now, allowing Stoltzhirs to have preceded his diſciple only ten years, this carries the era of the art back to 1450, as was ſaid above. There is no ground to ſuppoſe that it was known to the Italians till at leaſt ten years afterwards. The earlieſt prints that are known to be theirs are a ſet of the ſeven planets, and an almanack by way of frontiſpiece; on which are directions for finding Eaſter from the year 1465 to 1517 incluſive: and we may be well aſſured, that the engravings were not antedated, for the almanack of courſe became leſs and leſs valuable every year. In all probability, therefore, theſe prints muſt have been executed in the year 1464, which is only four years later than the Italians themſelves lay any claim to. The three earlieſt Italian engravers are, Finiguerra, Boticelli, and Baldini. If we are to refer theſe prints to any of the three, we ſhall naturally conclude them to be the work of Finiguerra or Baldini; for they are not equal either in drawing or compoſition to thoſe aſcribed to Boticelli, which we know at leaſt were deſigned by him; and as Baldini is expreſsly ſaid to have worked from the deſigns of Boticelli, it will appear moſt probable that they belong to Finiguerra.

Strutt's Hiſt. of Engraving.

With reſpect to the invention of *etching*, it ſeems to be not well known to whom it is to be aſcribed. One of the moſt early ſpecimens is that print by Albert Durer, known by the name of the *Canon*, dated 1518, and thought by ſome, with little foundation, to have been worked on a plate of iron. Another etching by the ſame artiſt is Moſes receiving the Tables of the Law, dated 1524. It was alſo practiſed in Italy ſoon after this by Parmegiano, in whoſe etchings we diſcover the hand of the artiſt working out a ſyſtem as it were from his own imagination, and ſtriving to produce the forms he wanted to expreſs. We ſee the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no inſtruction; and that it was ſomething entirely new to him. If the ſtory is true, that he kept an engraver by profeſſion in his houſe, the novelty of the art is rendered ſo much the more probable. He died in 1540. Engraving.

As to that ſpecies of engraving in which the modes of *etching* and *cutting* with the graver are united, it muſt have been found neceſſary immediately upon the invention of etching; it was, however, firſt carried to perfection by G. Audran, and is now almoſt univerſally practiſed, whether the work is in ſtrokes or in dots.

Engraving in *dots*, the preſent faſhionable method, is a very old invention, and the only mode diſcovered by the Italians. Agoſtino de Muſis, commonly called *Auguſtine of Venice*, a pupil of Marc Antonio, uſed it in ſeveral of his earlieſt works, but confined it to the fleſh, as in the undated print of An Old Man ſeated upon a Bank, with a cottage in the back ground. He flouriſhed from 1509 to 1536. We alſo find it in a print of "A ſingle figure ſtanding, holding a cup and looking upwards," by Giulio Campagnola, who engraved about the year 1516. The back ground is executed with round dots, made apparently with a dry point. The figure is outlined with a ſtroke deeply engraved, and finiſhed with dots, in a manner greatly reſembling thoſe prints which Demarteau engraved at Paris in imitation of red chalk. The hair and beard are expreſſed by ſtrokes. Stephen de Laulne, a native of Germany, followed the ſteps of Campagnola; and many of his ſlight works are executed in dots only. John Boulanger, a French artiſt, who flouriſhed in the middle of the laſt century, and his cotemporary Nicholas Van Plattenberg, improved greatly on this method, and practiſed it with much ſucceſs. It is only, however, of late, that it has been conſidered as an object worthy of general imitation. John Lutma executed this kind of work with a hammer and a ſmall punch or chiſſel.

The method of engraving in *mezzotinto* was invented about the middle of the 17th century; and the invention has generally been attributed to Prince Rupert, though it has alſo been aſſerted that he learnt the ſecret from another. See MEZZOTINTO.

OF the method of engraving in aquatinta, a ſhort and general account has already been given under that word. See AQUATINTA. But as ſome farther information relating to this branch of the art of engraving has fallen in our way, we embrace this opportunity of laying it before our readers.

Engraving in aquatinta, was originally invented by Le Prince, a French artiſt. For a long time, his proceſs was kept ſecret; and his prints, it is ſaid, were at firſt ſold for drawings. As a proof that the art roſe at once to perfection, as has already been mentioned, the prints

Engraving. prints which were executed by him, are ſtill admired as the fineſt and beſt ſpecimens of the art. It appears, however, that he was only acquainted with the powdered grain, and the common method of ſtopping out. The firſt who practiſed this art in England, was Mr Paul Sandby. By him, we are informed, it was communicated to Mr Jukes, whoſe works afford excellent examples to what perfection the art has been carried; and although it is now generally practiſed all over Europe, yet in no country with greater ſucceſs than in Britain.

The principle of this proceſs conſiſts in corroding the copper in ſuch a manner, that an impreſſion from it exhibits the appearance of a tint laid on paper, or a drawing in Indian ink. This is accompliſhed by covering the copper with ſome ſubſtance which aſſumes a granulated form, and prevents the acid from acting where the particles adhere; and thus the copper is only partially corroded. The more minute the particles are, it is obvious the impreſſion from the plate will more nearly reſemble a waſh of Indian ink, or a drawing; but the larger the particles are, the granulation becomes more diſtinct. The powder or granulation is called the *aquatinta grain*. It is produced in two ways.

The proceſs for uſing the powdered grain, which was firſt employed, is the following. The outline being etched on a copper plate, ſome ſubſtance which eaſily melts with heat, adheres to the plate when cold, and reſiſts the action of the aquafortis, is to be finely powdered and ſifted. Beſides aſphaltum, roſin, and gum ſandarac, the ſubſtances which have been mentioned in the article already referred to, Burgundy pitch, gum copal, gum maſtic, as well as ſome other reſins and gum reſins, may be employed. Gum copal, it is obſerved, produces a grain which reſiſts the aquafortis extremely well. Whatever the ſubſtance is which is to be employed, the great object of the artiſt in its application is, to have it equally diſtributed over the plate. This is an eſſential part of the operation, and requires conſiderable attention. The uſual method is, to tie up a quantity of the powder in a piece of muſlin, and to ſtrike it againſt a ſtick held at a conſiderable height above the plate. Thus managed, the powder ſettles equally over it, in the ſame uniform manner that hair powder ſettles on the furniture of an apartment, where the operations of the hair-dreſſer are performed. The plate being thus covered equally with the duſt or powder, it is to be fixed upon it, by the application of a gentle heat, to melt the particles. This is uſually done by holding lighted pieces of brown paper, rolled up, and moving them about till the whole of the powder is melted, which is known by its changing to a brown colour. It is now allowed to cool and after being examined with a magnifying glaſs, if the particles appear to be uniformly diſtributed, the artiſt proceeds to the next part of the proceſs.

Thoſe parts of the deſign or drawing to be engraved, which are perfectly white, are to be obſerved and marked, and the correſponding parts of the plate muſt be covered or ſtopped out. This is beſt done by means of maſtic varniſh, diluted to ſuch a conſiſtence with turpentine as to work freely with the pencil. To give it colour, lamp-black ſhould be mixed with it, that the touches of the pencil may be diſtinctly ſeen. When thoſe parts of the plate which are ſtopped out, are ſufficiently dry, a border of wax is raiſed round the plate, in the ſame manner as in etching, and the aquafortis diluted with water is poured on. This being the moſt precarious part of the proceſs, requires the greateſt experience. When it is ſuppoſed that the aquafortis has remained on the plate for ſuch a length of time, that when an impreſſion is taken, it will produce the lighteſt ſhade in the drawing, it is poured off, and the plate is waſhed with water and dried. The lighteſt tints are then ſtopped out, and the aquafortis is again poured on; and this proceſs is repeated as often as there are tints or ſhades to be produced in the plate. Engraving.

Many plates are entirely etched in this way, by alternately ſtopping out and biting in. It is, however, found to be extremely difficult, and indeed impoſſible, to produce impreſſions of minute and complicated objects with the requiſite degree of delicacy and freedom. To obviate this difficulty, another proceſs has been propoſed, by which the touches are laid on the plate, with equal eaſe and expedition as on drawings with Indian ink. Fine waſhed whitening is mixed with treacle or ſugar, and diluted with water in the pencil, that it may work freely. This is laid on the plate covered with the aquatint ground, in the ſame way as ink on the drawing. When this is dry, the whole of the plate is varniſhed over with a thin turpentine or maſtic varniſh, and when this is dry, the aquafortis is poured on. The varniſh immediately breaks up in thoſe parts of the plate where the treacle mixture was laid, and thus they are expoſed to the action of the acid, while the other parts of the plate remain untouched. Thus the touches or places of the plate where the treacle has been applied, are bit in deeper than the reſt, and have the preciſion of touches done with Indian ink. The plate being thus completely bit in, the bordering wax is removed, by gently heating it with a piece of lighted paper. It is then cleared from the ground, and varniſhed by means of oil of turpentine; and being wiped clean with a rag and a little fine whitening, it is ready for the printer.

But in this method of aquatinting, it is found difficult to produce the neceſſary degree of coarſeneſs or fineneſs in the grain; and plates which are engraved in this manner afford but a ſmall number of impreſſions before they are worn out. On this account it is now more rarely followed.

The other method of producing the aquatint ground, which is moſt generally adopted, is the following. A reſinous ſubſtance, as common reſin, Burgundy pitch, or maſtic, is diſſolved in ſpirits of wine. This ſolution is poured all over the plate, which is inclined, till the whole of the ſuperfluous fluid drains off, and what adheres to the plate becomes quite dry in a few minutes. The plate being then examined with a magnifying glaſs, it will appear that the whole of the ſpirit having evaporated, the reſinous matter is left in a granulated ſtate, or is cracked in every direction, and adheres ſtrongly to the copper. In this way a regular and beautiful grain is eaſily produced, which will be found preferable, at leaſt for moſt purpoſes, to that which is produced by the former method. The grain being thus formed, the other parts of the proceſs are conducted in the ſame manner as before deſcribed.

Such

Engraving. Such are the usual methods of conducting this process. We shall add a few hints which the young artist may find useful in the different parts of it. With regard to the materials which are employed, it is to be observed, that the spirits of wine should be rectified, and of the best quality. Resinous matters, as common resin, Burgundy pitch, and gum mastic, yield grains of a different appearance and form; so that advantage may be taken of this circumstance, by using them sometimes separately, and sometimes mixed in different proportions, according to the views and taste of the artist. Different proportions of resin may be employed, to produce grains of different kinds. When a coarse grain is intended, a greater proportion is to be employed; and when a fine grain is wanted, a smaller proportion of resin only is required. The proper proportions may be ascertained by providing a number of spare pieces of copper; on these the liquid may be poured, and the grain examined, before it is applied to the plate which is to be engraved. After the solution is made, it should remain undisturbed for a day or two, till the impurities of the resin have subsided, and the liquid becomes quite limpid. This is the best method of freeing it from impurities; for if it is strained through linen or muslin, it is mixed with hairs, which are extremely injurious to the grain. It may be added, that the apartment in which the fluid is poured on the plate, should be perfectly still, and entirely free from dust; for if any fall on the plate while it is wet, the grain forms a white spot which cannot be removed. Great care should be observed in cleaning the plate. This is done with a bit of rag and whitening. The smallest stain or particle of grease produces a streak or blemish in the grain. Still, however, with all the attention which can be employed, and with the utmost delicacy in the management, it is necessary to observe, that the process is extremely precarious and uncertain; and even the most experienced artists find themselves frequently subject to very unaccountable accidents.

Artists have frequently complained of the inconvenience from the fumes which proceed from the action of the acid upon the copper, when the plate is large. *Phil. Mag.* vol xxiii. 237. "To remedy this inconvenience, the following arrangement, which seems well calculated to answer the purpose, has been suggested by Mr Cornelius Varley, a young artist who distinguishes himself no less by his mechanical abilities than by the exquisite productions of his pencil in water colours.—Get a frame made of common deal or any kind of wood, three or four inches deep, covered with a plate of glass, and open at one side; and let the side opposite to this have a round opening communicating, by means of a common iron pipe, with the ashpit of any little stove or other fire-place, shut up from all other access of air but what must pass through the pipe. It is obvious that any fumes rising from a copper-plate laid under such a frame will be carried backward into the iron pipe by the current of air required to maintain combustion in the stove, and will by this means be carried up the chimney in place of being allowed to fly about in the apartment. The pipe may be very conveniently used by carrying it down through the table to the floor, and so along to the place where the chimney may chance to stand; and when the frame is not wanted, the pipe at one of the joinings may be made to answer the purpose of a hinge, by which to turn up the frame against the wall where it may be secured, while out of use, by a button or any other contrivance." Engraving.

This method of engraving in aquatinta seems to be chiefly adapted for slight subjects in general, for imitations of sketches, and washed drawings. But for the production of prints from finished pictures, it is by no means calculated; because it is not susceptible of that accuracy in the nice management of the tints which is necessary for this purpose. It is equally unsuitable for book plates; because, without retouching the plates, the number of impressions that can be thrown off is very small. On these accounts, therefore, it is to be considered greatly inferior to the other modes of engraving. But as it is more expeditious, and may be attained with more facility, it is undoubtedly useful when it is confined to those subjects for which it is peculiarly calculated. This rapidity of execution, however, and facility in acquiring the practice of the art, are followed with the unfortunate circumstance, that they favour the production of an indiscriminate multitude of prints which, it is to be feared, may rather tend to vitiate the public taste.

Engraving with the tool was the kind originally practised, and it is yet retained for many purposes. For though the manœuvre of etching be more easy, and other advantages attend it; yet where great regularity and exactness of the stroke or lines are required, the working with the graver is much more effectual: on which account it is more suitable to the precision necessary in the execution of portraits: as there every thing the most minute must be made out and expressed, according to the original subject, without any license to the fancy of the designer in deviating from it, or varying the effect either by that masterly negligence and simplicity in some parts, or those bold sallies of the imagination and hand in others, which give spirit and force to history-painting.

The principal instruments used in engraving with the tool are, gravers, scrapers, a burnisher, an oil-stone, and a cushion for bearing the plates.

Gravers are made in several forms with respect to the points, some being square, others lozenge; the square graver for cutting broad and deep, and the lozenge for more delicate and fine strokes and hatches. La Bosse recommends, as the most generally useful, such as are of a form betwixt the square and lozenge: and he advises, that they should be of a good length; small towards the point, but stronger upwards, that they may have strength enough to bear any stress there may be occasion to lay upon them: for if they be too small and mounted high, they will bend; which frequently causes their breaking, especially if they be not employed for very small subjects.

The burnisher is used to assist in the engraving on some occasions, as well as to polish the plates. It is seven inches in length, and made of fine steel well polished. The burnisher is formed at one end, and a scraper on the other, each about an inch and a half long from the point: betwixt them, about four inches of the instrument is made round, and serves as a handle; and is thicker in the middle than at the necks, where the burnisher and scraper begin, which necks are only one quarter of an inch in diameter. The princi-

pal

Engraving. pal application of it in engraving, beſides its uſe in poliſhing the plates, is to take out any ſcratches or accidental defacings that may happen to the plates during the engraving; or to leſſen the effect of any parts that may be too ſtrongly marked in the work, and require to be taken down.

A cuſhion, as it is called, is likewiſe generally uſed for ſupporting the plate in ſuch a manner, that it may be turned every way with eaſe. It is a bag of leather filled with ſand, which ſhould be of the ſize that will beſt ſuit the plates it is intended to bear. They are round, and about nine inches over, and three inches in thickneſs.

The cuſhion, made as above directed, being laid on the table, the plate muſt be put upon it; and the graver being held in the hand in a proper manner, the point muſt be applied to the plate, and moved in the proper direction for producing the figures of the lines intended: obſerving, in forming ſtraight lines, to hold the plate ſteady on the cuſhion; and where they are to be finer, to preſs more lightly, uſing greater force where they are to be broader and deeper. In making circular or other curve lines, hold your hand and graver ſteadily; and as you work, turn your plate upon the cuſhion againſt your graver, otherwiſe it will be impoſſible for you to make any circular or curved line with that neatneſs and command of hand you by this means may. After part of the work is engraved, it is neceſſary to ſcrape it with the ſcraper or graver, paſſed in the moſt level direction over the plate, to take off the roughneſs formed by the cutting of the graver; but great care muſt be taken not to incline the edge of the ſcraper or tool uſed, in ſuch a manner that it may take the leaſt hold of the copper, as it would otherwiſe produce falſe ſtrokes or ſcratches in the engraving: and that the engraved work may be rendered more viſible, it may afterwards be rubbed over with a roll of felt dipped in oil. In uſing the graver, it is neceſſary to carry it as level as poſſible with the ſurface of the plate; for otherwiſe, if the fingers ſlip betwixt them, the line that will be produced, whether curve or ſtraight, will become deeper and deeper in the progreſs of its formation; which entirely prevents ſtrokes being made at one cut, that will be fine at their extremities, and larger in the middle; and occaſions the neceſſity of retouching to bring them to that ſtate. For this reaſon, it is very neceſſary for thoſe who would learn to engrave in perfection, to endeavour, by frequent trials, to acquire the habit of making ſuch ſtrokes both ſtraight and curving, by lightening or ſinking the graver with the hand, according to the occaſion. If, after finiſhing the deſign, any ſcratches appear, or any part of the engraving be falſely executed, ſuch ſcratches, or faulty parts, muſt be taken out by the burniſher, and further poliſhed, if neceſſary, by the above-mentioned roll.

The plate being thus engraved, it is proper to round off the edges, by uſing firſt a rough file, and afterwards a ſmoother; and to blunt the corners a little by the ſame means: after which, the burniſher ſhould be paſſed over the edges to give it a farther poliſh.

The dry point, or needle, which has been of late much uſed in engraving, is a tool like an etching point, which being drawn hard on the copper, cuts a ſtroke, and raiſes a burr; the burr is ſcraped off, and there remains a ſtroke more ſoft and delicate than can be produced in any other way. Engraving.

In the conduct of the graver and dry point conſiſts all the art; for which there are no rules to be given; all depending on the habitude, diſpoſition, and genius, of the artiſt. However, beſides the explanations already given, ſome general obſervations and directions may not be improper. As the principles of engraving are the ſame with thoſe of painting, a perſon cannot expect to attain any conſiderable degree of perfection in this art who is not a good maſter of deſign; and therefore he ought to be well acquainted both with perſpective and architecture: for the former, by the proper degradations of ſtrong and faint colours, will enable him to throw backwards the figures and other objects of the picture or deſign which he propoſes to imitate; and the latter will teach him to preſerve the due proportion of its ſeveral orders, which the painter often entruſts to the diſcretion of the engraver. In order to preſerve equality and union in his works, the engraver ſhould always ſketch out the principal objects of his piece before he undertakes to finiſh them. In working, the ſtrokes of the graver ſhould never be croſſed too much in a lozenge manner, particularly in the repreſentation of fleſh, becauſe ſharp angles produce the unpleaſing effect of lattice-work, and take from the eye the repoſe which is agreeable to it in all kinds of picturеſque deſigns: we ſhould except the caſe of clouds, tempeſts, waves of the ſea, the ſkins of hairy animals, or the leaves of trees, where this method of croſſing may be admitted. But in avoiding the lozenge, it is not proper to get entirely into the ſquare, which would give too much of the hardneſs of ſtone. In conducting the ſtrokes, the action of the figures, and of all their parts, ſhould be conſidered; and it ſhould be obſerved how they advance towards, or recede from the eye; and the graver ſhould be guided according to the riſings or cavities of the muſcles or folds, making the ſtrokes wider and fainter in the light, and cloſer and firmer in the ſhades. Thus the figures will not appear jagged; and the hand ſhould be lightened in ſuch a manner, that the outlines may be formed and terminated without being cut too hard; however, though the ſtrokes break off where the muſcle begins, yet they ought always to have a certain connection with each other, ſo that the firſt ſtroke may often ſerve by its return to make the ſecond, which will ſhow the freedom of the engraver.

In engraving the fleſh, the effect may be produced in the lighter parts and middle tints by long pecks of the graver, rather than by light lines; or by round dots; or by dots a little lengthened by the graver; or, beſt of all, by a judicious mixture of theſe together.

In engraving the hair and the beard, the engraver ſhould begin his work by laying the principal grounds, and ſketching the chief ſhades in a careleſs manner, or with a few ſtrokes; and he may finiſh it at leiſure with finer and thinner ſtrokes to the extremities. When architecture or ſculpture is to be repreſented, except it be old and ruinous buildings, the work ought not to be made very black; becauſe, as edifices are commonly conſtructed either of ſtone or white marble, the

Engraving. the colour, being reflected on all ſides, does not produce dark or brown ſhades as in other ſubſtances. White points muſt not be put in the pupils of the eyes of figures, as in engravings after paintings; nor muſt the hair or beard be repreſented as in nature, which makes the locks appear flowing in the air; becauſe in ſculpture there can be no ſuch appearances.

In engraving cloths of different kinds, linen ſhould be done with finer and cloſer lines than any other ſorts, and be executed with ſingle ſtrokes. Woollen cloth ſhould be engraved wide, in proportion to the coarſeneſs or fineneſs of the ſtuff, and with only two ſtrokes; and when the ſtrokes are croſſed, the ſecond ſnould be ſmaller than the firſt, and the third than the ſecond. Shining ſtuffs, which are generally of ſilk or ſatin, and which produce flat and broken folds, ſhould be engraved more hard and more ſtraight than others, with one or two ſtrokes, as their colours are bright or brown; and between the firſt ſtrokes other ſmaller muſt be joined, which is called interlining. Velvet and pluſh are expreſſed in the ſame manner, and ſhould always be interlined. Metals, as armour, &c. are alſo repreſented by interlining, or by clear ſingle ſtrokes. In architecture, the ſtrokes which form the rounding object ſhould tend to the point of ſight; and when whole columns occur, it is proper to produce the effect as much as poſſible by perpendicular ſtrokes. If a groſs ſtroke is put, it ſhould be at right angles, and wider and thinner than the firſt ſtroke. In engraving mountains, the ſtrokes ought to be frequently diſcontinued and broken, for ſharp and craggy objects; and they ſhould be ſtraight, in the lozenge manner, and accompanied with long points or dots; and rocks ſhould be repreſented by croſs ſtrokes more ſquare and even. Objects that are diſtant towards the horizon ſhould be kept very tender, and ſlightly charged with black. Waters that are calm and ſtill are beſt repreſented by ſtrokes that are ſtraight, and parallel to the horizon, interlined with thoſe that are finer: omitting ſuch places as, in conſequence of gleams of light, exhibit the ſhining appearance of water; and the form of objects reflected from the water at a ſmall diſtance upon it, or on the banks of the water, are expreſſed by the ſame ſtrokes, retouched more ſtrongly or faintly as occaſion may require, and even by ſome that are perpendicular. For agitated waters, as the waves of the ſea, the firſt ſtrokes ſhould follow the figure of the waves, and may be interlined, and the croſs ſtrokes ought to be very lozenge. In caſcades, the ſtrokes ſhould follow the fall, and be interlined. In engraving clouds, the graver ſhould ſport when they appear thick and agitated, in turning every way according to their form and their agitation. If the clouds are dark, ſo that two ſtrokes are neceſſary, they ſhould be croſſed more lozenge than the figures, and the ſecond ſtrokes ſhould be rather wider than the firſt. The flat clouds, that are loſt inſenſibly in the clear ſky, ſhould be made by ſtrokes parallel to the horizon, and a little waving; if ſecond ſtrokes are required, they ſhould be more or leſs lozenge; and when they are brought to the extremity, the hand ſhould be ſo lightened, that they may form no outline. The flat and clear ſky is repreſented by parallel and ſtraight ſtrokes, without the leaſt turning. In landſcapes, the trees, rocks, earth, and herbage, ſhould be etched as much as poſſible; nothing Engraving. ſhould be left for the graver but perfecting, ſoftening, and ſtrengthening. The dry point produces an effect more delicate than the graver can, and may be uſed to great advantage in linen, ſkies, diſtances, ice, and often in water, eſpecially in ſmall engravings. In moſt things it is proper to etch the ſhadows, only leaving the lighter tints for the dry point, graver, &c.

To imitate *chalk-drawings*, a mixture of varied and irregular dots are uſed, made more or leſs ſoft, ſo as to reſemble the grain produced by the chalks on paper. Every ſtroke of the chalks on paper may be conſidered as an infinite number of adjoining points, which are the ſmall eminences of the grain of the paper touched by the chalk in paſſing over it. When the copperplate has been poliſhed and varniſhed, or properly prepared, as in the common method of engraving, the drawing to be imitated may be counterproved on the varniſh of the plate. If this cannot be conveniently done, black lead pencil, or red chalk, muſt be applied to varniſhed or oiled paper; and by means of this chalk or pencil, all the traces of the original will be tranſmitted to the varniſh. The outlines of the object muſt be formed in the etching by points, whoſe magnitude and diſtance muſt be determined by the quality of the ſtrokes in the original drawing. The artiſt may be provided with pointed inſtruments or needles of various ſizes with ſingle or double points. In forming the light and ſhade, he ſhould diſtinguiſh between thoſe hatches which ſerve to expreſs the perſpective of the object and thoſe which form the ground of it. The principal hatches ſhould be more ſtrongly marked; the middle tints, if etched, ſhould be marked lightly, or they may be left till the varniſh is taken off, and be perfected with a greater degree of ſoftneſs by needles or the point of the graver, as the original may require. There is nothing peculiar in the method of applying the aquafortis in this kind of engraving; but it may be obſerved, that it ſhould not be left ſo long as to corrode the lighter parts too much: if the light parts are ſufficiently corroded, they may be ſtopped up with turpentine varniſh and lamp-black mixed together, and the aquafortis may be applied again to the ſtronger parts; for it will be no detriment to them, if the points which compoſe the ſhade burſt into one another, provided the extreme be avoided. When the work of the aquafortis is finiſhed, and the varniſh taken off the copper, it will be neceſſary in the ſofteſt parts, ſuch as the fleſh, &c. to interſlipple with proper points; as an effect will be thus produced more delicate than it is poſſible to attain with the aquafortis only; and the ſtrongeſt ſhades will require additional ſtrength to be given them with ſmall ſtrokes of the graver. Drawings made with chalks of different colours may be imitated in this manner, if a plate be provided for every colour.—This method of engraving is intended to form a kind of deception, ſo that the connoiſſeur may not be able, on the firſt inſpection, to diſtinguiſh between the original drawing and the engraving made in imitation of it; and it is extremely uſeful, as it ſerves to multiply copies of drawings left by thoſe maſters who excelled in the uſe of chalks, and thus to form and improve young artiſts, who could not have acceſs to the originals in the practice of drawing.

Engraving.

To this account of the hiſtory and practice of the art of engraving, we ſhall annex the following ingenious obſervations by an eminent living artiſt (A). We preſent them to our readers without alteration or abridgement.

On the linear art in general.

WHEN compared with painting, the art of engraving is but a recent invention, being coeval only with that of printing; and like that noble art, it poſſeſſes not only a ſimilar but a greater power, of multiplying and extending the productions of genius over the world; for its language is univerſally underſtood.

It would have been well for the arts, if it could boaſt of a more remote date, as we might then have had many more of the fineſt deſigns of the firſt painters of antiquity, now doomed to oblivion, ſaved from the rude ravages of time.

But this invention ſeemed to be reſerved for the fourteenth century, and its improvements for the age of Louis XIV. an age in which a number of artiſts, who may be ſaid to have invigorated the art, and inveiled it with beauty, aroſe both in France and Italy.

Lines, in the firſt ſtate of the art, like every other purſuit, whoſe excellence is progreſſive, were comparatively rude and unmeaning, and had nothing more to recommend them, than merely repreſenting a particular ſort of markings, or ſlight hatchings with the pen, without any other apparent degree of execution or expreſſion. Although it is our pride to acknowledge, that it has not been a little beholden to the elegant etchings of the great maſters in painting, as well as to their drawings in pen and ink, in its early ſtages, by which means an eminent degree of taſte was introduced into the art, particularly in the department of linear diſpoſition. Amongſt thoſe, the drawings of a Raphael, Michael Angelo, and the learned da Vinci; ſome of which we have occaſionally ſeen and admired. Some by da Vinci were hatched in a ſquare but delicate manner, with a white fluid, on dark coloured paper. Thoſe of Michael Angelo and Raphael inclined more to the lozenge, in black or brown ink. They even carried this ſtyle of hatching with the pencil into their pictures, ſome of which adorn the Vatican; and in the famous cartoons in his majeſty's collection by Raphael. Baccio Bandinelli generally hatched his lines in one direction, particularly a Taking down from the Croſs, which was ſold in London at the ſale of the late Sir Joſhua Reynold's drawings. Vicenzio Dante, hatched in a ſimilar way about the year 1550. Julio Romano uſed alſo to draw in this ſtyle with the pen, ſeverals of which are ſtill to be found in the moſt ſelect cabinets of men of taſte; and for near a century and a half after the invention of etching, it is rare to mention a painter of eminence, who was diſtinguiſhed in drawing, who did not annex this art to that of painting. But with the application of the burin, the art has been gradually improving till the preſent period. (B) Linear engraving is nothing more than drawing elegantly on copper. It became more ſtudied as it was found capable of repreſenting the various appearances of nature. The texture or ſurface of objects became proportionally diſcriminated by ſuch peculiar modifications of the line, as ſeemed moſt ſuitable to the ſubject repreſented, although, at the ſame time, it rendered it much more arduous in the execution. Hence aroſe that diverſity of ſtyle, and that ſcope for ſucceeding excellence, which, by combining elegance with ſimplicity and beauty, diſtinguiſhed thoſe artiſts who have been moſt conſpicuous in its improvement. Engraving.

It has been ſaid, that we are indebted for the origin of this art to an ingenious Florentine, Maſo Finiguerra, the ſculptor. He was ſucceeded by a number of other ingenious men, among whom we rank Botticelli, Andrea Mantigna, and other able deſigners;—and in Germany, Albert Durer, Aldgrave, and Lucas Van Leyden, who ſeverally contributed their labours. But in the fifteenth century, the works of the divine Raphael began to be multiplied by the correct graver of Marc Antonio, an artiſt whoſe prints were the delight of that great painter. Antonio had many imitators, but none who equalled him for juſtneſs of contour, for which his works will be ever highly appreciated among the early productions of the art.—Having had occaſion to mention a few of the principal artiſts who reared the ſcaffolding of this elegant art, we ſhall proceed to thoſe who have ſo much diſtinguiſhed themſelves in finiſhing the ſuperſtructure. Among thoſe, Auguſtino of Venice began to introduce a better diſpoſition of line in his ſhades, as well as the ingenious Bologneſe, Auguſtino Carrachi; whilſt Egedius Sadelaer diſplayed no leſs zeal in Germany. In the ſixteenth century, the art diſplayed ſtill more vigour and taſte, and ſeemed to have but little more wanting; for all that meagre dryneſs of line began to diſappear, which ſo manifeſtly marks the early works of Il Tedeſca, Aldegraff, and other artiſts of a former period. Their works became conſequently more rich in ſtyle, by embracing the beſt productions of the pencil; and as they were applied to a greater number of ideas, they became ſtill more intereſting and ſucceſsful.

Patrons were numerous and liberal; and it is but proper to remark, that the various artiſts, on their part, actuated by a becoming zeal which was highly creditable to themſelves, were indefatigable. This is a circumſtance not leſs worthy of imitation, than the many admirable monuments of the art which they produced. Few but admired the works of Maſſon, Poilly, Nantueil, and Rouſſelet; and ſome time after the death of the ingenious Cornelius Bloemart, who had given a grace to his lines, hitherto unknown at Rome, the matchleſs Audran and Edelinck diſplayed their excellent productions at Paris. But arts are liable to fluctuate; and when the art of engraving began to decline abroad, it gradually diſplayed a high degree of luſtre in our own country; and the variety of ſtyles which has ſince ſprung from the original manner of engraving ſhall be the ſubject of the following ſketch.

We ſhall therefore treat more particularly of the diſpoſition of the lines and their conſequent effects, diſtinguiſhed

(A) Francis Legat, Eſq. hiſtorical engraver to his royal highneſs the prince of Wales, and F. A. S. E.

(B) The author has taken the liberty of here adopting the word *linear*, from its ſtrict analogy to this mode of engraving, and with the approbation of ſome of the firſt profeſſors, both in painting and engraving.

Engraving

tinguiſhed by the terms, *linear expreſſion*, *imitation*, *diſpoſition*, and *harmony*; with a ſtrict inveſtigation of the firſt and moſt approved ſubjects, either in etching or engraving; and of their eſſential beauties, as far as they may tend to illuſtrate the ſubject.

As the great object of this mode of engraving is, to adopt thoſe lines the moſt expreſſive of the form and character of whatever happens to be repreſented, by maturely inveſtigating not only the action but the cauſe and correſpondent effects of the original picture; in order that the artiſt may avail himſelf of all that is moſt beautiful in his tranſlation, and efficient in the aggregate, either with reſpect to the expreſſion, ſpirit, or ſentiment.

On linear expreſſion and diſpoſition.

When hiſtorical ſubjects conſiſt of ſeveral figures, where there is generally a variety of draperies, ſome of them appearing thick and cumberſome, others more thin and flexible, ſitting cloſe and elegant on the limbs, being compoſed of a finer texture, or thread; the coarſer ſtuffs are conſequently more effectually repreſented by a bolder line, as the thinner ſort, by the application of a fine line, gives a more lively repreſentation; a diſcrimination which has been obſerved of late, by the moſt approved modern artiſts in linear engraving. Obſervations of this deſcription, when treated in a liberal manner, not only ſuperadd a degree of truth, but even render the ſubjects ſweeter to the eye of fancy. In the early ſtages of the art, ſome excellent artiſts have been led into particular and limited ſyſtems. In the works of ſuch as have affected to deſcribe every ſubject in the ſame line indiſcriminately, even the arms of the moſt delicate women are often engraven as if perfectly poliſhed, by approaching to a metallic appearance, a mode not uncommon among the ſecond or third claſs of artiſts about the beginning of the laſt century; by which manner, all that ſoftneſs and delicacy was neglected, which is ſo happily effected in the linear productions of Bartolozzi, Morgan, Sharp, Heath and others, at preſent of the firſt maſters in Europe. Thoſe who are acquainted with the works of the ingenious Chaffard, muſt with pleaſure have perceived in his foliage, how even the texture of flowers are imitated from the delicate line-like fibres of which they are compoſed, iſſuing from the ſtem, and ſpreading their ſilken beauties to the ſun: and in this claſs of imitation, the clear tranſparency of glaſs, the rough texture of woollen, the thinneſs of lawn, the flickerings of ſatin, or the lightnings of ſteel, as well as the rude rock, the lucid lake, or the flaſhing of the torrent, are all admirably adapted to linear effect by the almoſt infinite diverſity in their conſtruction, and general conſtituent principles, ſtrictly obſerving on what laws the beauty of lines conſiſts, by ever keeping in view the due balance of taſte, and a noble ſimplicity of ſtyle throughout. It is the buſineſs of the ſkilful artiſt to overpower and ſubdue the difficulties in his profeſſion; for no excellence in art is of cheap or vulgar acquiſition. Let it be remembered that with forming ſteel, even the enchanting graces of the Venus de Medicis were hewn from a rock, and the almoſt breathing Apollo, from a block of Parian ſtone.

An elegant Engliſh poet, in a critical eſſay on poetry, obſerves, that the ſound ſhould ſeem an echo to the ſenſe; ſo ſhould the lines in a fine print ſeem to harmonize with the ſubject, by flowing with the external caſt of the features, and the predominant paſſion expreſſed in the original picture; for the ſame character and diſpoſition of the lines that ſuit the action of the muſcles in one paſſion, will be found to appear more vacant and leſs expreſſive when applied to others, however graceful they may appear. Engraving

As this is a point of view to which the art has never yet been fully extended, perhaps it may meet with ſome degree of attention, as it will be found of utility in forming a principle reſpecting diſpoſition, more particularly in hiſtorical ſubjects, where the paſſions are required to be nicely expreſſed: and although it may admit of ſome ſlight exceptions, it is a principle that will in general be found to be true.

For example, let it be ſuppoſed, that the paſſion of the figure repreſented, is that of joy; the lines ſhould ſeem to expand and ſwell, with every acting muſcle, in the moſt delicate manner poſſible.

But, on the contrary, if the ſubject diſplays deep ſorrow, they ſhould rather incline downward, partaking ſomewhat of the half ſtraight, ſeeming to act apparently in perfect uniſon and conformity with the features of the face, with all due ſubordination to the general effect of light and ſhadow.

Various obſervations may be made in this manner on the principal paſſions expreſſed in the human countenance, which are but few comparatively, even from the ſlighteſt movement to the boldeſt action. We often find, on examining the works of thoſe maſters who are not ſo conſpicuous for great clearneſs of execution, that they have been occupied by the diſpoſition and energy of the lines, as in the magnificent and maſterly prints of the battles of Alexander, from the pictures of Carlo le Brun, engraved by Gerrard Audran; where the executive department is no leſs conſpicuous from the burin of the Chevalier Edelinck in the fine print of the tent of Darius: whilſt Audran diſplays the true ſpirit of art, but rarely avails himſelf of much of the mechanical principles. The field, and tumult of battle, ſeemed admirably calculated to call forth his rapid powers, particularly in works of magnitude.

The leſs active ſcenery of the tent of Darius, was equally appropriated to the ſplendid talents of Edelinck, as he ſeems to have been better qualified to diſplay ſubjects of that nature in general. This is ſufficiently obvious from the beautiful and intereſting groupe of the queen mother, and her illuſtrious family, kneeling at the feet of the conqueror; his impreſſive print of the magdalene, or his moſt admirable portraits of the dignified clergy, diſtinguiſhed authors, and eminent artiſts. Theſe, in point of engraving, are no leſs remarkable for taſte in the execution, than for truth and nature in expreſſion.

In one of the battles of Alexander, the groupe where Porus is wounded and ſupported by the ſoldiers, the rough diſcrimination of line finely accords with that bold deportment of character in the grim viſage of that gigantic prince, whilſt a more delicate line marks the youthful countenance of Alexander; a diſcrimination which is totally loſt in the large Dutch copy by de Vos.

In the ſame print, the figures of Alexander and Clytus, are finely relieved from the diſtant ſcenery by the varied deſcription of engraving on their armour, drapery, and horſes. The latter are managed with ſuch freedom and ſpirit, that it is difficult to ſay whether the horſes or figures ſeem the moſt with maſterly execution; particularly

Engraving. particularly the white war-horſe on the right extremity of the print (c).

Had Audran ſuperadded a ſtill greater portion of the delicacy and clearneſs of handling ſo conſpicuous in Edelinck and other eminent artiſts ſince that period, it would undoubtedly have given an additional beauty to his other tranſcendant acquiſitions; namely the vaſt ſpirit of his lines, and power in drawing.

But it is ſeldom the lot of an individual to combine every excellence. Arts too have their infancy: for they generally require the labour of ages to bring them to maturity and perfection, and it yet remained to unite and ameliorate the poliſh of Edelinck, to the ſpirited ſtyle of Audran. Without prejudice or partiality, a conſiderable degree of this excellence will be found in the beſt works of Britiſh art, as we ſhall hereafter exemplify.

Another fine ſpecimen of lineal engraving, and of a different claſs, is the celebrated ſtorm by Balechow, from a picture of the famous Vernet. In this print he has tranſmitted with the graver a certain fluidity and action in repreſenting the liquid element, to which the art had never before attained. To a grandeur of ſtyle in the bold ſwelling of the waves, he has ſuperadded the utmoſt tranſparency of line; at the ſame time, having attended to all that light reſtleſs ſpray which ſeems ſporting to the gales as they roll along. In a fanciful mood, one might almoſt imagine they heard the motion of the water: ſo finely did this diſcriminating artiſt tranſlate, (if I may be allowed the expreſſion) this admirable picture.

When we conſider the period in which this diſtinguiſhed work was engraved, and that little or nothing had been previouſly done in that department of a ſimilar excellence; it is hoped it will be a ſufficient apology for the degree of admiration here expreſſed: for, as Lord Verulam truly obſerves, "we are too prone to paſs thoſe ladders by which the arts are reared, and generally reflect all the merit to the laſt new performer." We have already obſerved, they are ſeldom reared with rapidity, and oftentimes that which is conſidered an invention, is only a long ſucceſſion of trials and experiments, which have gradually followed each other, and ought rather to be conſidered as a ſeries of human mind than the knowledge of an individual, being the works of ages. In any point of view, the preſent ſubject will ever be conſidered as a high improvement and an elegant acquiſition in the annals of the linear art. But in hiſtorical ſubjects this artiſt is by no means equal in point of taſte or diſcrimination. His print of St Genevive undoubtedly ranks high in the firſt claſſes of engraving. Had his taſte in other reſpects been equal to his powerful clearneſs of execution, it would have been almoſt unparalleled; but it betrays a want of that eſſential, even in his mode of thinking. Patience and labour are everywhere too prevalent. It remained for Woollet to excel both in figures and in landſkip.

In the various ſtyles and modifications of this expreſſive art, from the NEAT to the FEEBLE, and from the BOLD to the EXTRAVAGANT, *Taſte* ſtands ſole arbitreſs: in brief, it is ſhe who diſtributes variety with ſpirit, and conceals the appearance of intricacy and labour; who, by a due modification of line, unites clearneſs to ſoftneſs, arreſting Engraving. the hand of the ſkilful artiſt, from every effort inconſiſtent with her powers; producing at once to the mind all that agreeable finiſhed combination or harmony which ever accompanies and conſtitutes the perfection of true art.

In the execution of ſubjects of imagination, there is a perpetual ſcope for calling forth the fancy of the engraver, as the various combinations of lines are inexhauſtible, uncommon effects, ſuch as aerial ſpirits, or celeſtial beings blended with the light, or ghoſts commingled with the gloom, or fairy elves by moonlight, who trip the ſands, and yet no footing ſeen; or woodnymphs, laving their taper limbs in the limpid element. Such ſubjects, in point of ſtyle, depend entirely upon the beauty, lightneſs, and tranſparency of execution; for thoſe that are merely ornamental or groteſque, demand a ſtyle of a different caſt from that of the ſerious or hiſtorical, as they require a leſs degree of truth even from the burin. In theſe caſes the ſtyle may be as capricious as the ſubjects. Thoſe of Raphael, in the Vatican, diſplay an uncommon degree of taſte, and particularly in the elegant flow of line with which they are compoſed.

In all works of taſte and genius, thoſe which may appear the moſt ſimple at a tranſient glance, will be often found to contain the moſt art on a more mature inveſtigation. The firſt impreſſion may ſtrike the fancy, but the ſecond generally calls up the diſcriminating powers of the judgment.

Arts generally riſe in our eſteem according to the degree of exertion of the mental powers which they require; and, as lines are capable of various ſtyles, thoſe which are moſt congenial to the ſubject repreſented ought to be adhered to in preference to every other conſideration. Teniers, and Gerrard Douw, demand all the fidelity and delicacy of the burin in deſcribing the various draperies and individualities which belong to that claſs of painting; but, in proportion as the contour is compoſed of fewer parts, and the forms more full and elegant, the beautiful flowing qualities of the graver is increaſed, and its lines glide more graceſully over the figures, as may be found in the works of Strange and others from Guido and Corregio. This diſtinction will not appear ſo obvious on a ſuperficial view of the art. But, on a due inveſtigation, it will be found, that not only a different modification of lines is neceſſary to the various claſſes of painting, but that even a different deſcription of ſtyle is requiſite to characterize ſome of the maſters in each particular claſs, from the ſublime and elevated figures of a Raphael and Michael Angelo, to the ſimple cottagers of Adrian Oſtade.

When we take a more comprehenſive view of the art, we often find, that the ſtyles which are adopted in the different countries in Europe by the artiſts where the art has in any degree been cultivated, are generally regulated by the modes of painting, drawing, and even the colouring reſpectively in each, whether hiſtorical, portrait, or landſcape, and is proportionably appretiated according to the effective beauty and elegance of the execution.

(c) Whenever Mr Bartolozzi happened to ſpeak of thoſe prints to me, he always expreſſed himſelf with a great degree of enthuſiaſm, thinking himſelf extremely fortunate in having works of ſuch excellence in his poſſeſſion.

Engraving. It is not improbable that the clear mode, which at preſent conſtitutes the modern German ſchool, is a refinement on the ſimple ſtyle of Cornelius Bloemart.

In Italy, Jachimo Frey, that aſtoniſhing Swiſs, from his maſterly expertneſs in drawing, and a rapid uſe of the etching ſteel and the nitre, almoſt produced an entire revolution in the art. The unprecedented richneſs and eaſe, the freedom and energy of his ſtyle, and the number and magnitude of his works, attracted all Italy, and tended greatly to improve the Roman ſchool. About the year 1672, we find him working jointly with the nervous Dorigny Frezza, and Vanauden Aird. From this ſource we can perceive the ſtyle of Wagner, of Cars in France, and various maſters now living; namely, Franciſco Bartolozzi, Giovanni Volpato, Dominicus Cunigo, and ſome of the early works of the excellent Raphael Morghen.

In many inſtances Frey indicates, that if he had conſidered it of ſufficient conſequence to the art, he could have engraved with more clearneſs, particularly by his curious copy from the celebrated print by Edelinck, of the Madona and Child, with St John and Angels, from Raphael; and although but an imitation of another ſtyle, tends to ſhew the verſatility of his talents), when the judgment is for a while ſuſpended to know which is the original. We find a performance of Frey's, entitled *La Charité Humaine*, dated 1723; a print was afterwards engraved from the ſame ſubject at Paris by Daulle, dated 1763, in which he has rather been too profuſe in the mere mechanical part of the art, and deſtitute of that ardour which a well engraved work ſhould not only inſpire but maintain.

It is not enough for lines to be only well diſpoſed, but alſo full of expreſſion: neither is it enough for a line to be only clearly cut, but it muſt alſo be free; for in a certain free light ſpirited lines convey an idea of animation, and are ſuited to ſubjects of that deſcription, while the long ſweeping and bold lines are better adapted to the ſolemn and majeſtic productions of the pencil.

A fine print, like a miniature picture, ought to be viewed near the eye: as in itſelf, from the nature of the art, will be found a due ſubordination of effect, ever receding from the bold and articulated lines in the fore ground to thoſe which are more evaneſcent and remote.

The graceful birch, the mountain aſh, and the oak, have each their peculiar bark and texture; and theſe, when freely indicated, ſtamp their mark and character moſt completely to the eye. Much of this, as has been formerly mentioned, depends upon, and is regulated by, the peculiar ſtyle of the picture and the ſkill of the engraver.

As lines ſeem to partake of motion, in proportion as they deviate in gentle bendings from the ſtraight and preciſe; even ſo alſo, in the motion of water ſeemingly increaſed, whether they undulate with the ſimpleſt wave, or ſwell with the fierce and tempeſt-curled ſurge. This character is ſufficiently illuſtrated in the works of Balechow and Woollet.

In the late Mr Brown's large print of St John preaching in the wilderneſs, no engraver has ever more fully diſplayed the true ſpirit of Salvator Roſa, particularly in the original mode of treating the rocks, and the bold ſtyle of the ſurrounding ſcenery; in ſhort, in the aggregate it is a chef d'œuvre unparalleled in any country. This is freely acknowledged, not only by every man of taſte, but by the firſt landſcape engravers. (D). Engraving.

But Brown was perhaps leſs happy in the companion to the above, from the celebrated *Both*, by adapting a ſimilar mode to that finiſhed and delicate painter. For the ſtyle ſhould ever vary with the ſubject.

"Whate'er Lorrain light touched with ſoftening hue,
Or ſavage Roſa daſh'd, or learned Pouſſin drew."—
THOMSON'S *Caſtle of Indolence*.

His admirable etchings of the cottager and its companion, and the Celadon and Amelia, are fine ſpecimens of his diſcriminating powers, and characterized with ſo near an approach to truth, that we cannot help exclaiming with the poet,

"He ſees no other, nature's ſelf who ſees."

The engraving of the above ſubjects was finiſhed by the matchleſs Woollet, with the ſame happy taſte. And it muſt be acknowledged that it is but ſeldom that we ſee ſo many excellencies united; for it is equally rare to ſee the fineſt engraving united to the fineſt drawing, as to find it in painting combined with the choiceſt colouring: yet each have their decided faſcinations in the gallery, the cabinet, or the portfolio.

Woollet, whoſe works abound with nerve and intelligence in point of character, his ſtyle of landſcape is delightfully deſcriptive; whether rocks, water, trees, or ſky; as the Niobe, the Ceyx, and Alcyone, and other maſter-pieces from the great Wilſon evince. In the winter ſcene from Smith of Chicheſter, he has admirably contrived to convey the effect of the drifted ſnow, by delicate dotting, and with no leſs preciſion he has deſcribed the tranſparent ice with clear lines. Of trees, he was the firſt that ever faithfully characterized the graceful larch; as may be ſeen in his views of the noblemen's ſeats. In the print of the fiſhery, he is indebted to the maſterly etching of John Brown, particularly the ſhipping, in which there is perhaps no ſubject more artieulate and perſpicuous. The engraving of this ſubject is finiſhed by himſelf. In his figures he was the founder of a ſtyle, moſt happily adapted for modern dreſſes, and hiſtorical portraiture; a ſtyle in which he moved with unrivalled reputation. His print of the death of General Wolfe, painted by Mr Weſt, is an admirable example, and does honour to the Britiſh nation. It occupied him no leſs than four years. The print of the battle at La Hogue is another fine ſpecimen of his knowledge of linear diſcrimination. In ſhort, when we conſider the talents of this artiſt, it is difficult to decide whether he moſt excelled in modern hiſtory or landſcape. The art has to regret that he, who was ſo eminently qualified to adorn any line of the profeſſion, has left no works in ancient hiſtory. We have little doubt from his knowledge, and a real love of the art, he would have left a ſufficient monument in that department alſo, for the pleaſure and contemplation of the

(D) Were I at liberty to mention eminent living artiſts, I would have been induced here among others, to have mentioned the ſubject of the Tempeſt in the Twelfth Night, from the late ingenious Wright of Derby, engraved by Mr Middleman, in the Meſſrs Boydell's large edition of the immortal bard of Avon.

Engraving. the real connoiſſeur and of poſterity. Engraving in this country ſuſtained a heavy loſs when he died; and if the death of ſo excellent an artiſt may be conſidered as a public loſs, it is certainly the more felt with reſpect to Woollet, who died while he was yet improving in that excellence (E).

Chattelaine has been termed a mannerift in his drawings, but he muſt certainly be allowed to be an excellent one: his etchings are variety itſelf. Perhaps in the department of etching no artiſt has ſo happily tranſlated the pictures of Claude de Lorraine as Francis Vivares; that is, with reſpect to aerial perſpective, the peculiar characteriſtic of Claude. But his merits are not confined to this maſter alone; for he followed Ruyſdale, Berghem, Gainſborough, and Cuype, with great ſucceſs. He has ſuch a free delivery of ſtyle, that almoſt every one who examines his works is irreſiſtibly impreſſed with an idea of performing the very ſame. Few artiſts, it has been mentioned, have excelled in the etching department. We cannot, however, omit the name of Peranezzi; who, to originality of ſtyle, which is apparently ſpontaneous, joins a certain grandeur which had never been ſurpaſſed. He has tranſmitted to poſterity ſo ſpirited a repreſentation of the Greek and Roman edifices and ruins, that travellers have often confeſſed that they have raiſed their ideas beyond the magnitude of the ſuperſtructures themſelves. It is certain that in works of this ſtupendous nature, a degree of ruggedneſs in the execution correſponds with the ſublimity of the ſubjects; and thus produces a ſtill greater power over the mind, than if they had been more poliſhed. Some have cenſured his figures, and not without cauſe. This defect has been ingeniouſly palliated by an excellent artiſt, Mr Bartolozzi. "For (ſaid he) if the purchaſers of the works of Peranezzi, get ſo much for their money in the building way, the figures may be ſuppoſed to be given for nothing." Doubtleſs thoſe vaſt piles of periſhing grandeur, were never more judiciouſly preſented to the eye, than by this aſtoniſhing artiſt, or better calculated to affect the mind by calling forth its moſt ſublime ideas.

We have another ſtriking inſtance of ſpirited etching in a different purſuit of the art, in the works of Ridinger, a name which brings along with it all the ſavage ſcenery of nature.

"Aſſembling wolves in raging troops deſcend.
——— They faſten on the ſteed and pierce his mighty heart."

THOMSON'S *Winter*.

For we ſhall ever find ſome peculiar beauty to admire, even in the ſlighteſt productions of genius, as well as in the moſt perfect productions of the burin.

There are few artiſts who do not regret, that etching was unknown to Bolſwert, who has done ſo much without its aid; from which we may eaſily ſuppoſe how much more he could have effected with this charming acquiſition. For the truth of this remark we may appeal to his landſcapes from Rubens, his animated portraits from Vandyke, and his productions from the Flemiſh ſchool of hiſtory, particularly his large print of the taking down from the croſs from Rubens. Engraving.

There is a fine inſtance of linear effect in a print of a Flemiſh converſation piece by Wille. One of the figures is drinking out of a glaſs, and the artiſt has moſt deceptively deſcribed the texture of the drinker's face through the glaſs. In the ſame print, a female figure ſhews great ſkill in this way, even the floor is characterized by lines; and the whole ſtrongly marks the moſt proper mode of treating ſubjects of a mere local nature. The beautiful print of the *Petit Phyſicien*, is alſo an admirable imitation, particularly the little pellucid globule which has juſt mounted from the ſhell. When lines are engraved in a ſquare acute method of croſſing, they generally convey the idea of hardneſs to the ſubject repreſented. The ſcientific Picart ſeems to have been ſo much aware of this, that in a print of his engraving of a large marble groupe of horſes, from the animated chiſſel of Perriere, he adopted this ſtyle in order to heighten the imitation.

Maſon's print of Marſhal Harcourt, is one of the many fine efforts of portrait engraving; and although it was executed at an early period of the art, it abounds with no ſmall degree of taſte. The celebrated print (called the table-cloth) from Titian, of the Laſt Supper, alſo contains a conſiderable degree of linear diſcrimination, although he ſometimes carries it to affectation. He is rather ſingular in his mode of engraving hair. Yet the portraits of Marſhal Harcourt and Briſaſiere the ſecretary may be deemed exceptions.

Wille, by the magic of his tooling, is too apt at times to give his works indiſcriminately the appearance of bronze; and we frequently find the ſame in the figures of Balechow: but it ſeems to have been reſerved for Strange to give the ſoftneſs of carnation to copper; and to Woollet, to give force and clearneſs with diſcriminating taſte. Bartolozzi in his lines elegance delicacy and drawing; while the works of Audran teem with boldneſs and ſimplicity. In the prints of Sir Robert Strange, the greateſt excellence is perhaps his rich and harmonious tones, as well as the whole effect, which is ſupported by an expreſſive ſtyle; which he ſeems in a great meaſure to have invented for his moſt favourite painters, Corregio, Titian, Guido, and Guerchino. The ſoftneſs, the guſto, and the flowing draperies in the works of theſe maſters, were his delight. His ſleeping Cupid from Guido, and the prints of the Venus and Danae from Titian, will ever be eſteemed as *chef d'œuvres* in the linear art.

Having thus attempted to fulfil our original intention of diſcriminating the moſt expreſſive combinations of lines, and of analyzing and illuſtrating their various powers and effects in engraving, we ſhall now conclude theſe obſervations; and if, from the nature of the ſubject, and from the limits of the ſketch, we have failed in marking every brilliant ſtar in the galaxy of the art; it muſt at leaſt be acknowledged, that we have not omitted ſome of thoſe of the firſt magnitude.

Engraving upon Glaſs. See *Glass, Engraving on.*

Engraving

(E) Although we are now contemplating linear engraving, it is but proper here to obſerve, that chalk engraving, mezzotinto, and aquatinta, have alſo made ample improvements in this country, in their various ſtyles of excellence.

Engraving. *Engraving on Precious Stones*, is the repreſenting of figures, or devices, in relievo, or indented, on divers kinds of hard poliſhed ſtones.

The art of engraving on precious ſtones is one of thoſe wherein the ancients excelled; there being divers antique agates, cornelians, and onyxes, which ſurpaſs any thing of that kind the moderns have produced. Pyrgoteles among the Greeks, and Dioſcorides under the firſt emperors of Rome, are the moſt eminent engravers we read of; the former was ſo eſteemed by Alexander, that he forbade any body elſe to engrave his head; and Auguſtus's head, engraven by the latter, was deemed ſo beautiful, that the ſucceeding emperors choſe it for their ſeal.

All the polite arts having been buried under the ruins of the Roman empire, the art of engraving on ſtones met with the ſame fate. It was retrieved in Italy at the beginning of the 15th century, when one John of Florence, and after him Dominic of Milan, performed works of this kind no way to be deſpiſed. From that time, ſuch ſculptures became common enough in Europe, and particularly in Germany, whence great numbers were ſent into other countries: but they came ſhort of the beauty of thoſe of the ancients, eſpecially thoſe on precious ſtones; for, as to thoſe on cryſtal, the Germans, and, after their example, the French, &c. have ſucceeded well enough.

In this branch of engraving, they make uſe either of the diamond or of emery.

The diamond, which is the hardeſt of all ſtones, is only cut by itſelf, or with its own matter. The firſt thing to be done in this branch of engraving is, to cement two rough diamonds to the ends of two ſticks big enough to hold them ſteady in the hand, and to rub or grind them againſt each other till they be brought to the form deſired. The duſt or powder that is rubbed off ſerves afterwards to poliſh them, which is performed with a kind of mill that turns a wheel of ſoft iron. The diamond is fixed in a braſs diſh; and, thus applied to the wheel, is covered with diamond duſt, mixed up with oil of olives; and when the diamond is to be cut facet-wiſe, they apply firſt one face, then another, to the wheel. Rubies, ſapphires, and topazes, are cut and formed the ſame way on a copper wheel, and poliſhed with tripoli diluted in water. As to agates, amethyſts, emeralds, hyacinths, granites, rubies, and others of the ſofter ſtones, they are cut on a leaden wheel, moiſtened with emery and water, and poliſhed with tripoli on a pewter wheel. Lapis-lazuli, opal, &c. are poliſhed on a wooden wheel. To faſhion and engrave vaſes of agate, cryſtal, lapis-lazuli, or the like, they make uſe of a kind of lathe, like that uſed by pewterers, to hold the veſſels, which are to be wrought with proper tools: that of the engraver generally holds the tools, which are turned by a wheel; and the veſſel is held to them to be cut and engraved, either in relievo or otherwiſe; the tools being moiſtened from time to time with diamond duſt and oil, or at leaſt emery and water. To engrave figures or devices on any of theſe ſtones, when poliſhed, ſuch as medals, ſeals, &c. they uſe a little iron wheel, the ends of whoſe axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought cloſer, or ſet further apart, at pleaſure: at one end of the axis are fitted the proper tools, being kept tight by a ſcrew. Laſtly, The wheel is turned by the foot, and the ſtone applied by the hand to the tool, and is ſhifted and conducted as occaſion requires. Engraving || Enharmonic.

The tools are generally of iron, and ſometimes of braſs; their form is various, but it generally bears ſome reſemblance to chiſels, gouges, &c. Some have ſmall round heads, like buttons, others like ferrels, to take the pieces out, and others flat, &c. When the ſtone has been engraven, it is poliſhed on wheels of hair-bruſhes and tripoli.

Engraving on Steel is chiefly employed in cutting ſeals, punches, matrices, and dyes, proper for ſtriking coins, medals, and counters. The method of engraving with the inſtruments, &c. is the ſame for coins as for medals and counters: All the difference conſiſts in their greater or leſs relievo; the relievo of coins being much leſs conſiderable than that of medals, and that of counters ſtill leſs than that of coins.

Engravers in ſteel commonly begin with punches, which are in relievo, and ſerve for making the creux or cavities of the matrices and dyes: though ſometimes they begin with the creux or hollowneſs; but then it is only when the intended work is to be cut very ſhallow. The firſt thing done, is that of deſigning the figures; the next is the moulding them in wax, of the ſize and depth they are to lie, and from this wax the punch is engraven. When the punch is finiſhed, they give it a very high temper, that it may the better bear the blows of the hammer with which it is ſtruck to give the impreſſion to the matrice.

The ſteel is made hot to ſoften it, that it may the more readily take the impreſſion of the punch; and after ſtriking the punch on it in this ſtate, they proceed to touch up or finiſh the ſtrokes and lines, where by reaſon of their fineneſs or the too great relievo they are any thing defective, with ſteel gravers of different kinds; chiſels, flatters, &c. being the principal inſtruments uſed in graving on ſteel.

The figure being thus finiſhed, they proceed to engrave the reſt of the medal, as the mouldings of the border, the engrailed ring, letters, &c. with little ſteel punches, well tempered, and very ſharp.

ENGUICHE', in *Heraldry*, is ſaid of the great mouth of a hunting horn, when its rim is of a different colour from that of the horn itſelf.

ENHARMONIC, in *Muſic*. The Greeks had three different ſpecies of muſic; the *diatonic*, the *chromatic*, and the *enharmonic*. This laſt was eſteemed by much the moſt agreeable and powerful of the three; but the difficulty of its execution rendered its duration ſhort, and latter artiſts were upbraided for having ſacrificed it to their indolence. It proceeded upon leſſer intervals than either the diatonic or chromatic; and as the chromatic ſemitone is ſtill leſs than the diatonic, the *enharmonic* intervals muſt have conſiſted of that ſemitone divided into parts more minute. In Rouſſeau's Muſical Dictionary (at the word *Enharmonique*), the reader may ſee how that interval was found in the tetrachords of the ancients. It is by no means eaſy for modern ears, inured to intervals ſo widely different, to imagine how a piece of muſic, whoſe tranſitions were formed either chiefly or ſolely upon ſuch minute diviſions, could have ſuch wonderful effects; yet the melody of ſpeech, which riſes or falls by intervals ſtill

more

Enhydrus || Ennius.

more minute than the enharmonic, when properly modulated and applied with taſte, has an aſtoniſhing power over the ſoul. As to the modern *enharmonic* ſyſtem, we may likewiſe refer the reader to the ſame work for an account of its nature and uſe; though he will find it accurately and clearly explained by D'Alembert in the Treatiſe of Music given in the preſent work, (art. 144. 145. 146.)

ENHYDRUS, in *Natural Hiſtory*, a genus of ſiderochita or cruſtated ferruginous bodies, formed in large and in great part empty caſes, incloſing a ſmall quantity of an aqueous fluid.

Of this genus there are only two ſpecies: 1. The thick-ſhelled enhydrus, with black, reddiſh-brown, and yellow cruſts. 2. The thinner-ſhelled kind, with yelloviſh-brown and purple cruſts; neither of which ferments with aquafortis or gives fire with ſteel.

ENIGMA. See ÆNIGMA.

ENIXUM, among chemiſts, a kind of natural ſalt, generated of an acid and an alkali.

The ſal enixum of Paracelſus, is the caput mortuum of ſpirits of nitre with oil of vitriol, or what remains in the retort after the diſtillation of this ſpirit; being of a white colour, and pleaſing acid taſte.

ENMANCHE', in *Heraldry*, is when lines are drawn from the centre of the upper edge of the chief to the ſides, to about half the breadth of the chief; ſignifying ſleeved, or reſembling a ſleeve, from the French *manche*.

ENNA, in *Ancient Geography*, a town of Sicily, ſituated on an eminence to the ſouth of the Chryſas; called the *centre of Sicily*. It was famous for a ſacred grove, in which the rape of Proſerpine happened; for a temple of Ceres, thence ſurnamed *Ennæa*, and *Ennenſis*; and for fine ſprings, whence the name (Bochart.)

ENNEAGON, in *Geometry*, a polygon with nine ſides. See POLYGON.

ENNEAHEDRIA, in *Natural Hiſtory*, a genus of columnar, cryſtalliform, and double-pointed ſpars, compoſed of a trigonal column, terminated at each end by a trigonal pyramid.

Of this genus there are ſeveral ſpecies, diſtinguiſhed by the length or ſhortneſs of the column and pyramids, none of which give fire with ſteel, but all of them ferment with aquafortis.

ENNEANDRIA, in *Botany*, (from ἐννέα, *nine*, and ἀνὴρ, a *man* or *huſband*), the name of the ninth claſs in Linnæus's ſexual ſyſtem, conſiſting of plants which have hermaphrodite flowers, with nine ſtamina or male organs. See BOTANY *Index*.

ENNIUS, QUINTUS, an ancient Latin poet, born at Rudii, a town in Calabria. He came firſt to Rome when M. Porcius Cato was queſtor, whom he had inſtructed in the Greek language in Sardinia; and by his genius and behaviour he gained the eſteem of the moſt eminent perſons in the city. According to Horace, Ennius never applied himſelf to writing till he had drank freely of wine. Hence he contracted the gout, of which he died nine years B. C. He was interred in Scipio's ſepulchre; who had a great eſteem and friendſhip for him, and cauſed a ſtatue to be erected to him upon his monument. He endeavoured to introduce the treaſures of the Greek tongue among the Latins, and was the firſt among the Romans who made uſe of heroic verſes. He wrote the *Annals of Rome*; he tranſlated ſeveral tragedies from the Greek, and wrote others, beſide ſeveral comedies. We have only ſome fragments of his works, which were firſt collected by the two Stephens, and afterwards publiſhed at Naples, with a learned commentary, by Jerom Columna, in quarto, 1590; and reprinted at Amſterdam in 1707, in quarto, with additions by Heſſelius.

ENOCH, the ſon of Cain (Gen. iv. 17.), in honour of whom the firſt city taken notice of in Scripture was called *Enoch* by his father Cain, who built it. It was ſituated to the eaſt of the province of Eden.

ENOCH, the ſon of Jared and father of Methuſelah, was born in the year of the world 622. At the age of 65 he begat Methuſelah, and lived 300 years after, and had ſeveral ſons and daughter. Enoch walked with God; and after that he had lived in all 365 years, "he was not, for God took him." Some conſtrue theſe laſt words, as if they intimated that Enoch died a natural death, becauſe in reality he lived not near ſo long as the other patriarchs of thoſe times; as if God, to ſecure him from corruption, had been pleaſed to take him early out of this world. But the generality of the fathers and commentators aſſert that he died not, but was tranſlated out of the ſight of men, in like manner as Elijah was. The apoſtle Paul (Heb. xi. 5.) ſhows very clearly that Enoch was tranſlated, and did not ſee death.

The apoſtle Jude (ver. 14, 15.) cites a paſſage from the book of Enoch, which has very much exerciſed interpreters. The queſtion is, whether the apoſtle took this paſſage out of any particular book written by Enoch, which might be extant in the firſt ages of the church; whether he received it by tradition; or laſtly, by ſome particular revelation. It is thought probable, that he read it in the book we have been ſpeaking of, which, though apocryphal, might contain ſeveral truths that St Jude, who was favoured with a ſupernatural degree of underſtanding, might make uſe of to the edification of the faithful.

The ancients greatly eſteemed the prophecy of Enoch. Tertullian expreſſes his concern that it was not generally received in the world. That father, on the authority of this book, deduces the original of idolatry, aſtrology, and unlawful arts, from the revolted angels, who married with the daughters of men. St Auguſtin allows indeed that Enoch wrote ſomething divine, becauſe he is cited by St Jude; but he ſays it was not without reaſon that this book was not inſerted in the canon which was preſerved in the temple at Jeruſalem. This father ſufficiently inſinuates, that the authority of this book is doubtful, and that it cannot be proved that it was really written by Enoch. Indeed the account it gives of giants engendered by angels, and not by men, has manifeſtly the air of a fable, and the moſt judicious critics believe it ought not to be aſcribed to Enoch.

This apocryphal book lay a long time buried in darkneſs, till the learned Joſeph Scaliger recovered a part of it. Scaliger, Voſſius, and other learned men, attribute this work to one of thoſe Jews who lived between the time of the Babyloniſh captivity and that of Jeſus Chriſt. Others are of opinion, that it was written after the riſe and eſtabliſhment of Chriſtianity, by one

Enormous || Enſemble.

one of thoſe fanatics with whom the primitive church was filled, who made a ridiculous mixture of the Platonic philoſophy and the Chriſtian divinity.

The eaſtern people, who call Enoch by the name of *Edris*, believe that he received from God the gift of wiſdom and knowledge; and that God ſent him 30 volumes from heaven, filled with all the ſecrets of the moſt myſterious ſciences. The Rabbins maintain, that when Enoch was tranſlated to heaven, he was admitted into the number of the angels, and is the perſon generally known by the name of *Michael*.

ENORMOUS, ſomething exceſſive or monſtrous, eſpecially in bulk.—The word is formed of the privative *è*, and *norma*, "rule;" q. d. "void of, or contrary to, rule or meaſure;" *contra normam*. In the corrupt ages of Latinity they uſed *innormis* and *inormis*.

In the French juriſprudence, *leſio enormis*, "enormous damage," is that which exceeds half the value of the thing ſold.

ENOS, the ſon of Seth and father of Cainan, was born in the year of the world 235. Moſes tells us (Gen. iv. 26.), that then, "*men* began to call upon the name of the Lord;" or, as others tranſlate it, that "Enos began to call upon the name of the Lord;" that is to ſay, that he was the inventor of religious rites and ceremonies in the external worſhip which was paid to God. This worſhip was kept up and preſerved in Enos's family, while Cain's family was plunged in all manner of irregularities and impieties. Several Jews are of opinion, that idolatry was at firſt introduced into the world in the time of Enos. They tranſlate the Hebrew thus, "Then men began to profane the name of the Lord." Good men, to diſtinguiſh themſelves from the wicked, began to take upon them the quality of ſons or ſervants of God; for which reaſon, Moſes (Gen. vi. 1, 2.) ſays that *the ſons of God* (that is to ſay, the deſcendants of Enos, who had hitherto preſerved the true religion), ſeeing the daughters of men, that they were fair, took them wives of all which they choſe. Enos died at the age of 905 years, in the year of the world 1140.

ENS, among metaphyſicians, denotes entity, being, or exiſtence: this the ſchools call *ens reale*, and *ens poſitivum*; to diſtinguiſh it from their *ens rationis*, which is only an imaginary thing, or exiſts but in the imagination.

ENS, among chemiſts, imports the power, virtue, and efficacy, which certain ſubſtances exert upon our bodies.

ENS, in *Geography*, a city of Germany, ſituated at the confluence of the Danube and the river Ens, about 80 miles ſouth of Vienna. E. Long. 14. 20. N. Lat. 48. 16.

ENSATÆ, in *Botany*, (from *enſis*, "a ſword"); the name of the ſixth order in Linnæus's natural method, conſiſting of plants with ſword-ſhaped leaves. It contains the following genera, viz. Antholyza, Calliſia, Commelina, Crocus, Eriocaulon, Ferraria, Gladiolus, Iris, Ixia, Moræa, Pontæderia, Siſyrinchium. Tradeſcantia, Wachendorffa, Xyris. See BOTANY *Index*.

ENSEELED, in *Falconry*, is ſaid of a hawk that has a thread drawn through her upper eye-lid, and made faſt under her beak, to take away the ſight.

ENSEMBLE, a French term, ſometimes uſed in our language; literally ſignifying *together* or *one with another*:—being formed from the Latin *in* and *ſimul*.

Enſiformis || Ent.

In architecture, we ſay *the enſemble*, or *tout enſemble*, of a building; meaning the whole work, or compoſition, conſidered together, and not in parts; and ſometimes alſo, the relative proportion of the parts to the whole.—"All thoſe pieces of building make a fine *enſemble*."

To judge well of a work, a ſtatue, or other piece of ſculpture, one muſt firſt examine whether the *enſemble* be good. The *tout enſemble* of a painting, is that harmony which reſults from the diſtribution of the ſeveral objects or figures whereof it is compoſed.—"This picture is good, taking the parts ſeparately; but the *tout enſemble* is bad."

ENSIFORMIS CARTILAGO. See XIPHOIDES.

ENSIGN, in the military art, a banner or colours under which ſoldiers are ranged, according to the different companies or parties they belong to. See FLAG, COLOURS, STANDARD, &c.

The Turkiſh enſigns are horſes tails; thoſe of the Europeans are pieces of taffety, with divers figures, colours, arms, and devices thereon. Xenophon tells us, that the enſign borne by the Perſians was a golden eagle on a white flag; the Corinthians bore the winged horſe, or Pegaſus, in theirs; the Athenians, an owl; the Meſſenians, the Greek letter M; the Lacedæmonians the A. The Romans had a great diverſity of enſigns; the wolf, minotaur, horſe, boar, and at length the eagle, where they ſtopped: this was firſt aſſumed in the ſecond year of the conſulate of Marius *. A military enſign on a medal of a Roman colony denotes it a colony peopled with old ſoldiers.

* See *Eag.*

ENSIGN is alſo the officer that carries the colours, being the loweſt commiſſioned officer in a company of foot, ſubordinate to the captain and lieutenant. It is a very honourable and proper poſt for a young gentleman at his firſt coming into the army: he is to carry the colours both in aſſault, day of battle, &c. and ſhould not quit them but with his life: he is always to carry them himſelf on his left ſhoulder: only on a march he may have them carried by a ſoldier. If the enſign is killed, the captain is to carry the colours in his ſtead.

Naval ENSIGN, a large ſtandard or banner hoiſted on a long pole erected over the poop, and called the *enſign-ſtaff*.—The enſign is uſed to diſtinguiſh the ſhips of different nations from each other, as alſo to characterize the different ſquadrons of the navy. The Britiſh enſign in ſhips of war is known by a double croſs, viz. that of St George and St Andrew, formed upon a field which is either red, white, or blue.

ENSISHEIM, a town of France, in Upper Alſace. It is a pretty little place, well built, and conſiſts of about 200 houſes. E. Long. 7. 30. N. Lat. 47. 58.

ENT, SIR GEORGE, an eminent Engliſh phyſician, born at Sandwich in Kent in 1604. He was educated at Sidney college, Cambridge; and, afterwards travelling into foreign countries, received the degree of doctor of phyſic at Padua. After his return he obtained great practice, was made preſident of the college of phyſicians in London, and at length received the honour of knighthood from King Charles II. He was extremely intimate with Doctor Harvey; whom he

Entablature || Entomology.

he learnedly defended, in a piece entitled *Apologia pro Circulatione Sanguinis, contra Æmilium Pariſanum.* He alſo publiſhed, *Animadverſiones in Malachiæ Thruſtoni;* and ſome obſervations in the Philoſophical Tranſactions. Glanville, ſpeaking of his *Plus Ultra* of the modern improvements in anatomy, numbers Sir George Ent, Doctor Gliſſon, and Doctor Wallis, with the moſt celebrated diſcoverers in that ſcience. The two former were among the firſt members of the Royal Society. Sir George Ent died in October 1689.

ENTABLATURE, or ENTABLEMENT, in *Architecture*, is that part of an order of a column which is over the capital, and comprehends the architrave, frize, and corniche. See ARCHITECTURE, chap. i.

ENTABLER, in the manege, the fault of a horſe whoſe croupe goes before his ſhoulders in working upon volts; which may be prevented by taking hold of the right rein, keeping your right leg near, and removing your left leg as far from the horſe's ſhoulder as poſſible.

This is always accompanied with another fault called *aculer*. See ACULER.

ENTAIL, in *Law*, ſignifies *feetail*, or *fee entailed;* that is, abridged, curtailed, or limited, to certain conditions. See FEE and TAIL.

ENTE', in *Heraldry*, a method of marſhalling, more frequent abroad than with us, and ſignifying grafted or ingrafted.

We have indeed, one inſtance of enté in the fourth grand quarter of his majeſty's royal enſign, whoſe blazon is Brunſwick and Lunenburg impaled with ancient Saxony, *enté en pointe*, "grafted in point."

ENTEROCELE, in *Surgery*, a tumor formed by a prolapſion of the inteſtines through the rings of the abdomen and proceſſes of the peritonæum, into the ſcrotum. See SURGERY *Index*.

ENTHUSIASM, an ecſtaſy of the mind, whereby it is led to think and imagine things in a ſublime, ſurpriſing, yet probable manner. This is the enthuſiaſm felt in poetry, oratory, muſic, painting, ſculpture, &c.

ENTHUSIASM, in a religious ſenſe, implies a tranſport of the mind, whereby it fancies itſelf inſpired with ſome revelation, impulſe, &c. from heaven. Mr Locke gives the following deſcription of enthuſiaſm. "In all ages, men in whom melancholy has mixed with devotion, or whoſe conceit of themſelves has raiſed them into an opinion of a great familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themſelves with a perſuaſion of an immediate intercourſe with the Deity, and frequent communications from the Divine Spirit. Their minds being thus prepared, whatever groundleſs opinion comes to ſettle itſelf ſtrongly upon their fancies, is an illumination from the Spirit of God. And whatſoever odd action they find in themſelves a ſtrong inclination to do, that impulſe is concluded to be a call or direction from heaven, and muſt be obeyed. It is a commiſſion from above, and they cannot err in executing it. This I take to be properly enthuſiaſm, which, though ariſing from the conceit of a warm and overweening brain, works, when it once gets footing, more powerfully on the perſuaſions and actions of men, than either reaſon or revelation, or both together; men being moſt forwardly obedient to the impulſes they receive from themſelves." Devotion, when it does not lie under the check of reaſon, is apt to degenerate into enthuſiaſm. When the mind finds itſelf inflamed with devotion, it is apt to think that it is not of its own kindling, but blown up with ſomething divine within it. If the mind indulges this thought too far, and humours the growing paſſion, it at laſt flings itſelf into imaginary raptures and ecſtaſies; and when once it fancies itſelf under the influence of a divine impulſe, no wonder if it ſlights human ordinances, and refuſes to comply with the eſtabliſhed form of religion, as thinking itſelf directed by a much ſuperior guide.

Enthuſiaſt || Entomology.

ENTHUSIAST, a perſon poſſeſſed with enthuſiaſm. See the preceding article.

ENTHYMEME, in *Logic* and *Rhetoric*, an argument conſiſting only of two propoſitions, an antecedent, and a conſequent deduced from it. The word is Greek, ἐνθύμημα, formed of the verb ἐνθυμεῖσθαι, "to think, conceive," a compound of ἐν and θυμος, "mind."

The enthymeme is the moſt ſimple and elegant of all argumentations; being what a man, in arguing cloſely, commonly makes, without attending at all to the form. Thus, that verſe remaining of Ovid's tragedy, entitled *Medea*, contains an enthymeme; *Servare potui, perdere an poſſum rogas:* "I was able to ſave you; conſequently to have deſtroyed you." All the beauty would have been loſt, had all the propoſitions been expreſſed; the mind is diſpleaſed with a rehearſal of what is nowiſe neceſſary.

Sometimes, alſo, the two propoſitions of an enthymeme are both included in a ſingle propoſition, which Ariſtotle calls an *enthymematical ſentence*, and gives this inſtance thereof: *Mortal, do not bear an immortal hatred.* The whole enthymeme would be, *Thou art mortal; let not, therefore, thy hatred be immortal.*

ENTITY, the ſame with ENS.

ENTOMOLOGY.

ENTOMOLOGY, (from ἔντομος, "an inſect", and λογος, "a diſcourſe,") is that part of zoology which treats of inſects.

Many are diſpoſed to reckon the ſtudy of Entomology trifling. Hunters of butterflies, and catchers of graſhoppers, are laughed at by the vulgar, and even by thoſe who are more enlightened. The great numbers and diverſity of inſects, the beauty and configuration of ſome of them, and the ſingular inſtincts of others, cannot but attract notice, and excite aſtoniſhment in thoſe who are fond of contemplating the works of nature, rendering thus the ſtudy of Entomology, to them, a ſource of much pleaſure. A collection of the individuals which compoſe any of the more numerous genera, placed at the ſame time, before one capable of attending to the ſtriking ſimilarity of the whole, and tracing

the diſtinguiſhing peculiarities of each, cannot fail to create ſurpriſe. The great and almoſt phantaſtic variety of their forms, the nice adaptation of their parts to the ſituation in which each happens to be placed, muſt appear truly wonderful. In every department of nature, which comes within the reach of the human mind, a pleaſing and luxuriant variety is diſcernible. The ſame ſupreme Intelligence, which, by varying the poſition of the planetary orbs with reſpect to the ſun, and by other ſeemingly ſimple but beautiful contrivances, hath produced their different length of day and year, and alternation of ſeaſons, is manifeſt in the formation of the minuteſt inſect. Each has received that mechaniſm of body, thoſe peculiar inſtincts, and is made to undergo thoſe different changes, which fit it for its deſtined ſituation, and enable it to perform its proper functions. The utility of many inſects, ſuch as the bee, the crab, the ſilk-worm, the cochineal inſect, &c. renders them both intereſting and important; and a more intimate acquaintance with the claſs, may enable us to add to the number of thoſe that are uſeful to man, and to improvements in the management of thoſe already known. The havock many inſects make in the vegetable kingdom, the vexation, diſeaſes, and deſtruction they occaſion among animals, ſhould induce thoſe who are engaged in agriculture, and in the rearing and management of animals, to pay attention to Entomology; for the better they are acquainted with their enemies, the abler they muſt be to attack them with advantage.

Moſt inſects undergo three very diſtinct changes: which circumſtance, joined to the very great difference of appearance which is often met with in the male and female, and even in the neuters of ſome ſpecies, renders their number apparently greater than it really is, and adds conſiderably to the difficulty of reducing them to order.

Different naturaliſts have attempted to arrange them into families and genera, particularly the celebrated LINNÆUS, whoſe arrangement is followed here. He has formed them into ſeven families or orders, compoſing his Definition. ſixth claſs of animals, INSECTA. He defines an inſect, a ſmall animal, breathing through pores on its ſides, furniſhed with moveable *antennæ* and many feet, covered with either a hard cruſt, or a hairy ſkin. Before the diſtinguiſhing marks of the orders and genera can be underſtood, it will be neceſſary to enumerate and explain the terms he has given to the different parts, and the moſt remarkable of the epithets he has applied to them.

The body is divided into *Head*, *Trunk*, *Abdomen*, and *Extremities*.

Head, &c. I. CAPUT, the *Head*, which is diſtinguiſhable in moſt inſects, is furniſhed with *Eyes*, *Antennæ*, and moſt frequently with a *Mouth*.

The EYES, 2, 4, 6, or 8 in number, deſtitute of eye-lids, are either ſmall and ſimple; or large, compound and hemiſpherical; or polyedral. They are commonly immoveable. They are called *ſtipitati* when placed on a ſtalk.

The ANTENNÆ are two articulated moveable proceſſes, placed on the head.

They are either, 1. *Setaceæ*, ſetaceous, i. e. like a briſtle, when they taper gradually from their baſe, or inſertion into the head, to their point.

2. *Clavatæ*, clavated, i. e. club-ſhaped, when they grow gradually thicker from their baſe to their point.

3. *Filiformes*, filiform, i. e. thread-ſhaped, when they are of an equal thickneſs throughout the whole of their length.

4. *Moniliformes*, moniliform, i. e. of the form of a necklace, when they are of an equal thickneſs throughout, but formed of a ſeries of knobs, reſembling a ſtring of beads.

5. *Capitatæ*, capitate, i. e. with a head or knob, when they grow thicker towards the point, and terminate in a knob or head.

6. *Fiſſiles*, fiſſile, i. e. cleft, when they are capitate, and have the head or knob divided longitudinally into three or four parts or laminæ.

7. *Perfoliatæ*, perfoliated, when the head or knob is divided horizontally.

8. *Pectinatæ*, pectinated, i. e. reſembling a comb, when they have a longitudinal ſeries of hairs projecting from them, in form of a comb.

9. *Barbatæ*, barbed, when they have little projections or barbs placed on their ſides. They are either, 1. *Longiores*, longer than the body; 2. *Breviores* ſhorter than the body; or, 3. *Mediocres*, of the ſame length with the body.

The MOUTH, in moſt inſects, is placed in the under part of the head; ſometimes however, it is ſituated in the thorax, and in a few inſtances, is entirely wanting. It is furniſhed with, 1. *Palpæ*, or feelers; 2. *Roſtrum*, i. e. beak or ſnout; 3. *Labium*, or lip; 4. *Maxillæ*, or jaws, placed tranſverſely, and moving laterally; 5. *Dentes*, or teeth; 6. *Lingua*, or tongue; 7. *Palatum*, or palate.

Palpæ, feelers, which are 4 or 6 in number, are attached to the mouth, and have 2, 4, or 3 articulations.

The *Stemmata* are three prominent ſhining points on the top of the head.

II. TRUNCUS, the *Trunk*, to which the legs are Trunk. attached, is ſituated between the head and the abdomen. It is divided into, 1. the *Thorax*, or cheſt, which is the ſuperior part; 2. *Scutellum*, i. e. ſmall ſhield or eſcutcheon, which is the poſterior part; 3. the *Breaſt* and *Sternum*, which is the inferior part.

III. The ABDOMEN, that part which contains Abdomen. the ſtomach, inteſtines, and other viſcera, conſiſts of ſeveral annular ſegments. It is perforated on the ſides with *ſpiracula*, i. e. breathing-holes. The upper part of it is termed *Tergum*, or back; the inferior part *Venter*, or belly; the poſterior part *Anus*.

IV. ARTUS, the extremities, are, 1. the *Wings*; Extremities. 2. *Legs*; 3. *Tail*.

I. ALÆ, the wings, are two, or four. They are either,

1. *Planæ*, i. e. plain, ſuch as cannot be folded up by the inſect.

2. *Plicatiles*, or folding, ſuch as can be folded up by the inſect at pleaſure.

3. *Erectæ*, erect, ſuch as have their ſuperior ſurfaces brought into contact, and ſtand upright when the inſect is at reſt.

4. *Patentes*, ſpreading; ſuch as are extended horizontally.

5. *Incumbentes*, incumbent; ſuch as reſt on the upper part of the abdomen.

6. *Deflexæ*, bent down; ſuch as are partly incumbent,

bent, but have their exterior edge inclined towards the ſides of the abdomen.

7. *Reverſæ*, reverſed; ſuch as are incumbent, but inverted.

8. *Dentatæ*, ſuch as have their edges notched or ſerrated.

9. *Caudatæ*, ſuch as have proceſſes extended from their extremitres like a tail.

10. *Reticulatæ*, netted; when the veſſels of the wings put on the appearance of net-work.

11. *Pictæ*, painted; ſuch as are marked with coloured ſpots, bands, ſtreaks, lines or dots.

12. *Notatæ*, marked with ſpecks.

13. *Ornatæ*, adorned with little eyes, or circular ſpots, containing a ſpot of a different colour in their centre. The central ſpot is termed *pupil*; the exterior one is called *iris*. This may happen either in the primary or ſecondary wings, on their upper or under ſurfaces. The ſuperior wing is called *primary*, and the inferior *ſecondary*, to avoid confuſion, as they may be at times reverſed.

Elytra. The ELYTRA are hard ſhells, occupying the place of the upper wings. They are, for the moſt part moveable, and are either,

1. *Truncata*, truncated, when ſhorter than the abdomen, and terminated by a tranſverſe line.

2. *Spinoſa*, or prickly, when their ſurfaces are covered with ſharp points or prickles.

3. *Serrata*, ſerrated, when their edges are notched.

4. *Scabra*, rough, when their ſurface reſembles a file.

5. *Striata*, ſtriated, when marked with ſlender longitudinal furrows.

6. *Porcata*, ridged, when marked with elevated ridges.

7. *Sulcata*, furrowed.

8. *Punctata*, marked with dots.

9. *Faſtigiata*, when formed like the roof of a houſe.

Hemelytra. The HEMELYTRA, as it were half-elytra, partaking partly of the nature of cruſtaceous ſhells, and membranaceous wings; being formed of an intermediate ſubſtance.

Halteres. HALTERES, or poiſers, are ſmall orbicular bodies placed on ſtalks, ſituated under the wings of infects, of the order *Diptera*.

II. PEDES, the *Legs*. They are divided into, 1. *Femur*, or thigh, that part which is joined to the trunk; 2. *Tibia*, or ſhank; 3. *Tarſus*, or foot; 4. *Ungues*, hooks or nails: 5. *Manus*, (chela), hands or claws, ſimple, with a moveable thumb, as in the crab.

The hind-legs are termed, 1. *Curſorii*, formed for running; 2. *Saltatorii*, formed for leaping; 3. *Natatorii*, formed for ſwimming.

III. CAUDA, the *Tail*, which terminates the abdomen, is, 1. *Solitaria*, i. e. ſingle. 2. *Bicornis*, i. e. two-horned or double. 3. *Simplex*, ſimple, i. e. unarmed. 4. *Armata*, i. e. furniſhed, 1. with *Forceps* or *Pincers*; 2. with *Furca*, a fork; 3. with one or more *Setæ* or briſtles; 4. with an *Aculeus*, or ſting, either ſmooth or barbed. A ſting is a weapon, frequently hollow, with which ſome infects are furniſhed, through which they diſcharge a poiſon into the wound they inflict.

Sexes The SEXES of infects are commonly two, *male* and *female*. *Neuters* are to be met with among thoſe infects which live in ſwarms, ſuch as ants, bees, &c.

Moſt infects undergo three changes. An infect is at firſt hatched from a very ſmall egg, and becomes a LARVA; a ſoft ſucculent animal, without wings, incapable of producing its ſpecies, ſlow in its motions, ſometimes without feet, but more frequently with them; conſuming greedily the kind of food which is peculiar to it, and which, in proper time, is changed into a *pupa*. Metamorphoſis.

PUPA (*Nympha*, *Chryſalis*), is firmer and drier than the larva, and is confined either by a naked membrane, or encloſed in a follicle. It is commonly without a mouth; ſometimes it has feet, but more frequently none.

1. *Completa*, complete in all their parts, and active; as the aranea, acarus, oniſcus, &c.

2. *Semicompleta*, half complete, with only the rudiments of wings; as the gryllus, cicada, cimex, libellula, and ephemera.

3. *Incompleta*, incomplete, with immoveable wings and feet; as the apis, formica, and tipula.

4. *Obtecta*, covered, having the thorax and abdomen encloſed in a ſkin, and that either naked, or encloſed in a follicle differently compoſed.

5. *Coarctata*, confined within a globe; as the muſca, œſtrus.

The pupa is converted into the *imago*, or the perfect infect.

IMAGO, is the perfect infect, active, furniſhed with antennæ, and capable of generating.

Infects are ſaid to inhabit thoſe plants on which they feed, and not thoſe on which they may be occaſionally found, and receive from them many of their ſpecific names.

LINNÆUS has divided the claſs of infects into ſeven orders.

I. COLEOPTERA, (from κωλεος, "a ſheath," and πτερον, "a wing"), are ſuch infects as have four wings, the upper pair of which are elytra, or cruſtaceous ſhells, which, when the animal is at reſt, ſhut, and form a ſtraight ſuture down the back. Claſſification.

II. HEMIPTERA, (from ημις "half," and πτερον, "a wing"), containing ſuch infects as have four wings, the ſuperior pair being half cruſtaceous, and incumbent, and a mouth or beak bent toward the breaſt.

III. LEPIDOPTERA, (from λεπος "a ſcale," and πτερον, "a wing," containing ſuch infects as have four wings covered with minute imbricated ſcales, a hairy body, and a mouth furniſhed with an involuted ſpiral tongue.

IV. NEUROPTERA, (from νευρον, "a nerve," and πτερον, "a wing"), containing ſuch infects as have four naked wings, marked with veins croſſing one another like net-work; the tail unarmed.

V. HYMENOPTERA, (from υμην, "a membrane," and πτερον, "a wing"), containing ſuch infects as have four membranaceous wings, and a tail furniſhed with a ſting.

VI. DIPTERA, (from δυο, "two," and πτερον, "a wing"), ſuch as have two wings and poiſers.

VII. APTERA, (from α, "without," and πτερον, "a wing"), ſuch as have no wings or elytra in either ſex.

CHARACTERS OF INSECTS.

Coleoptera.

I. COLEOPTERA.

The inſects belonging to this order are formed into four ſubdiviſions. 1. Thoſe that have the antennæ clavated, and thickened towards their exterior ſide. 2. Thoſe that have the antennæ moniliform. 3. Thoſe which have the antennæ filiform. 4. Thoſe which have the antennæ ſetaceous.

A. *Antennis clavatis, extrorſum incraſſatis.*

a. *Clava lamellata.*

1. SCARABÆUS. Tibiæ anteriores dentatæ.
2. LUCANUS. Penicilli duo ſub labio, palpigeri.

b. *Clava perfoliata.*

3. DERMESTES. Caput inflexum ſub thorace, vix marginato.
4. MELYRIS. Labium clavatum, emarginatum.
5. BYRRHUS. Labium porrectum, bifidum.
6. SYLPHA. Thorax et elytra marginata.
7. TRITOMA. Palpi anteriores ſecuriformes.
8. HYDROPHILUS. Maxilla bifida.

c. *Clava ſolida.*

9. HISTER. Caput retractile intra thoracem.

10. PAUSUS. Antennæ biarticulatæ. Clava uncinata.

11. BOSTRICHUS. Caput inflexum ſub thorace, vix marginato.
12. ANTHRENUS. Maxilla bifida.
13. NITIDULA. Thorax et elytra marginata.
14. COCCINELLA. Palpi anteriores ſecuriformes; poſteriores filiformes.
15. CURCULIO. Roſtrum elongatum corneum.

B. *Antennis moniliformibus.*

16. BRENTUS. Roſtrum elongatum, corneum, rectum.
17. ATTELABUS. Roſtrum elongatum, incurvum.
18. ERODIUS. Labium corneum, emarginatum.
19. STAPHYLINUS. Elytra dimidiata, alas tegentia. Veſiculæ duæ ſupra caudam exſerendæ.

20. SCAURUS. Labium truncatum integrum.
21. ZYGIA. Labium elongatum, membranaceum.
22. MELOE. Thorax ſubrotundus. Caput gibbum, inflexum.
23. TÈNEBRIO. Thorax marginatus. Caput exſertum. Corpus oblongum.
24. CASSIDA. Corpus ovatum. Elytra marginata. Caput tectum clypeo.
25. OPATRUM. Thorax et elytra marginata.
26. MORDELLA. Laminæ ad baſin abdominis. Caput inflexum.
27. CHRYSOMELA. Corpus ovatum, immarginatum.
28. HORIA. Palpi inæquales. Maxilla bifida. Labium rotundatum.

A. *The Antennæ clavated, becoming thicker towards their exterior ſide.*

a. *The Clava or Club lamellated.*

S. The ſhanks of the fore-legs dentated.
L. Two tufts under the lip, to which the feelers are attached.

b. *The Club perfoliated.*

D. The head bent under the thorax, which is ſcarcely marginated.
M. The lip clavated and emarginated.
B. The lip ſtretched out, and bifid.
S. The thorax and elytra marginated.
T. The two anterior feelers hatchet-ſhaped.
H. The jaw bifid.

c. *The Club ſolid.*

H. The head capable of being drawn back within the thorax.
P. The antennæ conſiſting of two articulations. The club hooked.
B. The head bent under the thorax, which is ſlightly marginated.
A. The jaw bifid.
N. The thorax and elytra marginated.
C. The anterior feelers hatchet-ſhaped; the poſterior filiform.
C. The beak lengthened and horny.

B. *With the Antennæ moniliform.*

B. The beak elongated, horny and ſtraight.

A. The beak elongated and crooked.
E. The lip horny and emarginated.
S. The elytra half the length of the body, covering the wings. Two veſicles above the tail, which can be puſhed out at pleaſure.
S. The lip truncated, and entire.
Z. The lip elongated and membranaceous.
M. The thorax roundiſh. The head gibbous, and bent inwards.
T. The thorax marginated. The head ſtretched out. The body oblong.
C. The body oblong. The elytra marginated. The head covered with a ſhield.
O. The thorax and elytra marginated.
M. Laminæ at the baſe of the abdomen. Head inflected.
C. The body oval, immarginated.
H. Feelers unequal. Jaw bifid. Lip rounded.

C. *Antennæ*

C. *Antennis filiformibus.*

29. APALUS. Thorax ſubrotundus. Caput gibbum, inflexum.

30. MANTICORA. Maxillæ exſertæ, dentatæ. Oculi prominuli.

31. PIMELIA. Thorax marginatus. Caput exſertum. Corpus oblongum.

32. GYRINUS. Antennæ rigidulæ. Oculi quatuor.

33. CUCUJUS. Labium breve, bifidum, laciniis diſtantibus.

34. CRYPTOCEPHALUS. Corpus ovatum immarginatum.

35. BRUCHUS. Antennæ extrorſum craſſiores.

36. PTINUS. Thorax caput recipiens. Antennæ articulis ultimis longioribus.

37. HISPA. Antennæ porrectæ, approximatæ, fuſiformes.

38. BUPRESTIS. Caput dimidium, intra thoracem retractum.

39. NECYDALIS. Elytra dimidiata, alis nudis.

40. LAMPYRIS. Elytra flexilia. Thoracis clypeus caput obumbrans recipienſque.

41. CANTHARIS. Elytra flexilia. Abdomen lateribus plicato-papilloſum.

42. NOTOXUS. Labium bifidum; laciniis conniventibus obtuſis.

43. ELATER. Pectoris mucro è poro abdominis reſiliens.

44. CALOPUS. Thorax ad latera mucronato-calloſus.

45. ALURNUS. Maxilla fornicata.

46. CARABUS. Thorax obcordatus, poſterius truncatus.

47. LYTTA. Thorax ſubrotundus. Caput gibbum inflexum.

D. *Antennis ſetaceis.*

48. SERROPALPUS. Palpi anteriores profundè ſerrati.

49. CERAMBYX. Thorax ad latera mucronato-calloſus.

50. LEPTURA. Elytra apice attenuata. Thorax teretiuſculus.

51. RHINOMACER. Antennæ roſtro inſidentes.

52. ZONITIS. Labium emarginatum.

53. CICINDELA. Maxillæ exſertæ, dentatæ. Oculi prominuli.

54. DYTISCUS. Pedes poſteriores ciliati, natatorii.

55. FORFICULA. Elytra dimidiata. Alis tectis. Cauda forcipata.

Hemiptera.

II. HEMIPTERA.

56. BLATTA. Os maxilloſum. Alæ coriaceæ, planæ. Pedes curſorii.

57. PNEUMORA. Os maxilloſum. Alæ membranaceæ, deflexæ. Pedes curſorii. Corpus cavum, inflatum, diaphanum.

58. MANTIS. Os maxilloſum. Pedes anteriores ferrati, ungue unico.

59. GRYLLUS. Os maxilloſum. Pedes poſteriores ſaltatorii.

C. *Antennæ filiform.*

A. Thorax roundiſh. Head turgid, inflected.

M. Jaws ſtretched out, furniſhed with teeth. Eyes rather prominent.

P. Thorax margined. Head ſtretched out. Body oblong.

G. Antennæ a little rigid. Eyes 4.

C. Lip ſhort, bifid, the diviſions diſtant.

C. Body oval, immarginated.

B. Antennæ growing thicker towards the external edge.

P. Thorax receiving the head: laſt joints of the antennæ longer than the reſt.

H. Antennæ ſtretched forwards, approaching one another, and ſpindle-ſhaped.

B. Head half retracted within the thorax.

N. Elytra half the length of the body. Wings naked.

L. Elytra flexible. Shield of the thorax ſhading and receiving the head.

C. Elytra flexible. Sides of the abdomen edged with folded papillæ.

N. Lip bifid; the diviſions of it obtuſe and approaching cloſely.

E. A ſharp point proceeding from the breaſt, ſpringing out at a pore in the abdomen.

C. The thorax callous at the ſides, and ſet with ſharp points.

A. Jaw arched. Feelers 6.

C. The thorax reſembling a heart inverted, and terminating abruptly behind.

L. Thorax roundiſh. Head turgid, inflected.

D. *Antennæ ſetaceous.*

S. The anterior feelers deeply ſerrated.

C. The thorax callous at the ſides, and ſet with ſharp points.

L. Elytra tapering towards the tip. Thorax roundiſh.

R. Antennæ ſeated on the ſnout.

Z. Lip emarginated.

C. Jaws ſtretched out, furniſhed with teeth. Eyes a little prominent.

D. Hind-legs fringed, formed for ſwimming.

F. Elytra half as long as the body. Wings covered. Tail furniſhed with pincers.

II. HEMIPTERA.

B. Mouth furniſhed with jaws. Wings coriaceous, plane. Legs formed for running.

P. Mouth furniſhed with jaws. Wings membranaceous, deflected. Legs formed for running. Body hollow, inflated, and tranſparent.

M. Mouth furniſhed with jaws. The anterior legs ſerrated, and terminated by a ſingle claw.

G. Mouth furniſhed with jaws. Hind-legs formed for leaping.

60.

60. Fulgora. Roſtrum inflexum. Frons producta, inermis. Antennæ capitatæ.
F. Snout inflected. Fore-head projecting, unarmed. Antennæ capitated.

61. Cicada. Roſtrum inflexum. Pedes poſteriores ſaltatorii.
C. Snout inflected. Hind-legs formed for leaping.

62. Notonecta. Roſtrum inflexum. Pedes poſteriores natatorii (ciliati).
N. Snout inflected. Hind-legs fringed and formed for ſwimming.

63. Nepa. Roſtrum inflexum. Pedes anteriores cheliferi.
N. Snout inflected. Fore-legs furniſhed with claws.

64. Cimex. Roſtrum inflexum. Pedes curſorii. Antennæ thorace longiores.
C. Snout inflected. Legs formed for running. Antennæ longer than the thorax.

65. Macrocephalus. Roſtrum inflexum. Antennæ breviſſimæ.
M. Snout inflected. Antennæ very ſhort.

66. Aphis. Roſtrum inflexum. Abdomen bicorne.
A. Snout inflected. Abdomen 2-horned.

67. Chermes. Roſtrum pectorale. Pedes poſteriores ſaltatorii.
C. Snout placed in the breaſt. Hind-legs formed for leaping.

68. Coccus. Roſtrum pectorale. Abdomen (maribus) poſterius ſetoſum.
C. Snout placed in the breaſt. Abdomen (in the males) terminating in briſtles.

69. Thrips. Roſtrum obſoletum. Alæ incumbentes, abdomine reflexile.
T. Snout obſolete. Wings incumbent. The abdomen capable of being turned up.

Lepidoptera.

III. LEPIDOPTERA.

III. LEPIDOPTERA.

70. Papilio. Antennæ extrorſum craſſiores. Alæ erectæ.
P. Antennæ thicker towards the point. Wings erect.

71. Sphinx. Antennæ medio craſſiores.
S. Antennæ thicker in the middle.

72. Phalena. Antennæ introrſum craſſiores.
P. Antennæ thicker towards the baſe.

Neuroptera.

IV. NEUROPTERA.

IV. NEUROPTERA.

73. Libellula. Cauda forcipata. Os multi maxillоſum. Alæ extenſæ.
L. Tail forked. Mouth with many jaws. Wings expanded.

74. Ephemera. Cauda ſetis 2 et 3. Os edentulum. Alæ erectæ.
E. Tail with 2 and 3 briſtles. Mouth without teeth. Wings erect.

75. Myrmeleon. Cauda forcipata. s bidentatum. Alæ deflexæ.
M. Tail forked. Mouth with two teeth. Wings deflected.

76. Phryganea. Cauda ſimplex. Os edentulum. Alæ deflexæ.
P. Tail ſimple. Mouth without teeth. Wings deflected.

77. Hemerobius. Cauda ſimplex. Os bidentatum. Alæ deflexæ.
H. Tail ſimple. Mouth with two teeth. Wings deflected.

78. Panorpa. Cauda chelata. Os roſtratum. Alæ incumbentes.
P. Tail furniſhed with a claw. Mouth ſtretched out into a beak. Wings incumbent.

79. Raphidia. Cauda filo 1. Os bidentatum. Alæ deflexæ.
R. Tail ending in a ſimple thread. Mouth with two teeth. Wings deflected.

Hymenoptera.

V. HYMENOPTERA.

V. HYMENOPTERA.

80. Cynips. Aculeus ſpiralis!
C. Sting ſpiral.

81. Tenthredo. Aculeus ſerratus! bivalvis.
T. Sting ſerrated, two-valved.

82. Sirex. Aculeus ſerratus, ſub abdominis ſpina terminali.
S. Sting ſerrated, under a ſpine which terminates the abdomen.

83. Ichneumon. Aculeus exſertus! triplex.
I. Sting ſtretched out, triple.

84. Sphex. Aculeus punctorius. Alæ planæ. Lingua inflexa, trifida.
S. Sting pungent. Wings ſmooth. Tongue inflected, and divided into three at the extremity.

85. Scolia. Lingua inflexa, trifida. Labium apice membranaceum.
S. Tongue inflected, trifid. Lip membranaceous at the extremity.

86. Thynnus. Lingua breviſſima, involuta. Labium trifidum.
T. Tongue very ſhort, involuted. Lip trifid.

87. Leucopsis. Labium maxilla longius, emarginatum. Antennæ clavatæ.
L. Lip longer than the jaw, notched. Antennæ clavated.

88. Tiphia. Labium breve, corneum, tridentatum.
T. Lip ſhort, horny, with three ſmall diviſions.

89. Chalcis. Antennæ breves, cylindricæ, fuſiformes.
C. Antennæ ſhort, cylindrical, ſpindle-ſhaped.

90. Chrysis. Aculeus punctorius. Abdomen ſubtus fornicatum.
C. Sting pungent. Abdomen arched beneath.

91. Vespa. Aculeus punctorius. Alæ superiores plicatæ!
92. Apis. Aculeus punctorius. Lingua inflexa!
93. Formica. Aculeus obsoletus. Alæ neutris nullæ!
94. Mutilla. Aculeus punctorius. Alæ neutris nullæ.

V. Sting pungent. Upper wings folded.

A. Sting pungent. Tongue inflected.
F. Sting obsolete. Neuters without wings.

M. Sting pungent. Neuters without wings.

Diptera.

VI. DIPTERA.

A. *Proboscide et Haustello.*

95. Diopsis. Caput bicorne. Oculis terminalibus.
96. Tipula. Haustellum sine vagina. Palpi 2, porrecti, filiformes.
97. Musca. Haustellum sine vagina, setis instructum.
98. Tabanus. Haustellum vagina univalvi, setisque instructum.
99. Empis. Proboscis inflexa.
100. Conops. Proboscis porrecta, geniculata.

B. *Haustello sine Proboscide.*

101. Oestrus. Haustellum retractum intra labia, connata poro pertusa.
102. Asilus. Haustellum rectum bivalve, basi gibbum.
103. Stomoxys. Haustellum vagina univalve convoluta, basi geniculata.
104. Culex. Vagina exserta, univalvis, flexilis, setis 5.
105. Bombylius. Haustellum longissimum, rectum, setaceum, bivalve.
106. Hippobosca. Haustellum breve, cylindricum, rectum, bivalve.

VI. DIPTERA.

A. *With Proboscis and Sucker.*

D. Head two-horned. Eyes terminal.
T. Sucker without a sheath. Feelers 2, projecting, filiform.
M. Sucker without a sheath, furnished with bristles.

T. Sucker with a single-valved sheath, furnished with bristles.
E. Proboscis inflected.
C. Proboscis projecting, and bent with an angular flexure.

B. *With Sucker, but no Proboscis.*

O. Sucker drawn back within the lips, which are perforated.
A. Sucker straight, with two valves, turgid at the base.
S. Sucker with a single-valved convoluted sheath, bent at the base, with an angular flexure.
C. Sheath stretched out, of one flexible valve, with 5 bristles.
B. Sucker very long, straight, setaceous, with two valves.
H. Sucker short, cylindrical, straight, with two valves.

Aptera.

VII. APTERA.

A. *Pedibus sex, Capite à Thorace discreto.*

107. Lepisma. Cauda setis exsertis.
108. Podura. Cauda bifurca, inflexa, saltatrix.
109. Termes. Os maxillis duabus. Labium corneum, quadrifidum.
110. Pediculus. Os aculeo exserendo.

111. Pulex. Os rostro inflexo, cum aculeo. Pedes saltatorii.

B. *Pedibus 8—14. Capite Thoraceque unitis.*

112. Acarus. Oculi 2. Pedes 8. Palpi compressi.
113. Hydrachna. Oculi 2—8. Pedes 8, in anteriore corporis parte. Papillæ textoriæ.

114. Aranea. Oculi 8. Pedes 8. Papillæ textoriæ. Palpi clavati.

115. Phalangium. Oculi 4. Pedes 8. Palpi chelati.
116. Scorpio. Oculi 8. Pedes 8. Palpi chelati.
117. Cancer. Oculi 2. Pedes 10, primo chelato.

VII. APTERA.

A. *Legs six. Head distinct from the Thorax.*

L. Tail ending in setaceous bristles.
P. Tail forked, inflected, elastic.
T. Mouth with two jaws. Lip horny, cleft into four pièces.
P. Mouth armed with a sting capable of being pushed out at pleasure.
P. Snout inflected, armed with a sting. Feet formed for leaping.

B. *Legs 8—14. Head and Thorax united.*

A. Eyes 2. Legs 8. Feelers compressed.

H. Eyes 2—8. Legs 8. Abdomen furnished with papillæ, with which the animal spins thread and weaves itself a web.
A. Eyes 8. Legs 8. Abdomen furnished with papillæ, with which the animal spins thread and weaves itself a web.
P. Eyes 4. Legs 8. Feelers furnished with claws.

S. Eyes 8. Legs 8. Feelers furnished with claws.
C. Eyes 2. Legs 10, the first pair furnished with claws.

118. Monoculus. Oculi 2. Pedes 12, decem chelatis.

119. Oniscus. Oculi 2. Pedes 14.

C. *Pedibus pluribus. Capite à Thorace discreto.*

120. Scolopendra. Corpus lineare.

121. Julus. Corpus subcylindricum.

M. Eyes 2. Legs 12, 10 of them furnished with claws.

O. Eyes 2. Legs 14.

C. *Legs numerous. Head distinct from the Thorax.*

S. Body linear.

J. Body nearly cylindrical.

N. B.—*In the following classification, some of the more remarkable species only are enumerated. Those marked with an asterisk are natives of Britain.*

I. COLEOPTERA.

Elytra covering the wings.

Scarabæus. 1. Scarabæus, *Beetle.*

Antennæ clavated, the club lamellated. Feelers 4. Jaws horny, for the most part without teeth. The shanks of the fore-legs generally dentated.

The larvæ of the genus *scarabæus* have six feet, and a body composed of annular segments, furnished with hairs, and with vesicles at the end of the abdomen. Their heads are hard, formed of a substance like horn. They are commonly called *grubs*, and do much mischief, both in the fields and in the garden. They live chiefly under ground, or in dung, on which they frequently feed. The larvæ of the species *cetonia* live on rotten wood, and those of the *melolontha* on the roots of plants. The *pupa* remains under ground.—Grubs are devoured by many kinds of birds, particularly by the rooks, which, on that account ought not to be destroyed so eagerly as they are in many places; for, though they do much mischief themselves, in spring, and during harvest, yet it is amply compensated by the good they do through the year, in clearing the ground of grubs.

* *Feelers filiform.*

† *Jaw arched.*

a. *Without teeth.*

N. *Thorax horned.*

α. *Scutellati.*

* *hercules.* A horn on the thorax, large, and bent inwards, barbed below with one tooth; a horn on the head bent back, dentated on the upper side with many teeth. *Syst. Nat. Lin.* 1. It is a native of America, and varies in colour, being sometimes black, sometimes azure spotted with black. The female is without horns.

* *centaurus.* The horn on the thorax bent inwards, with two teeth at its base, and bifid at the point; the horn on the head bent back, furnished with one tooth. 92.

chorinæus. The horn on the breast bent inwards and very thick at the base, bifid at the point; the horn of the head bent back, very long, bifid. Native of Brasil. 96.

* *typhæus.* *Bull-comber.* With three horns on the thorax, the middle ones smaller than the rest, lateral ones projecting as far as the head does, which is without horns. It is a native of Europe; to be met with under cow-dung. It makes its nest in holes, which it digs deep into the ground. It is black. Head depressed, hairy at the sides, narrow. Knob of the antennæ grayish. Thorax smooth. The horns sometimes as long as the head, and sometimes twice as long; in the female hardly visible. Elytra striated. Shanks hairy. 9.

* *mobilicornis.* Thorax with four projections like teeth. The horn of the head bent back, and moveable. 116. Native of England and Germany. Black. Elytra striated. Female without horns on the head, or projections on the breast.

actæon. Smooth; thorax with two horns; horn of the head notched with one tooth, bifid at the end; elytra smooth. 3. Native of South America. The largest of all known insects, except crabs and monoculi. Elytra black, or azure spotted with black.

N. *Thorax horned.*

β. *Without Scutellum.*

violaceus. Thorax with six spines; jaws prominent; front sloping; body entirely of a violet colour. 117. Native of Siberia; found under stones; small. Elytra marked with deeply excavated spots.

oedipus. Horn of the thorax flat, marked with one tooth on the under side; the horn of the head terminating abruptly, with three teeth. 119. Native of the Cape of Good Hope. Middle-sized.

* *lunaris.* Thorax with three horns, the middle one obtuse, and bifid; horn of the head erect; shield emarginated. 10. Native of Europe; on dunghills. The female always without horns on the breast.

camelus. Thorax marked with four projections like teeth; posterior part of the shield slightly marked with two horns; body black. 134. Native of Germany. The female with nearly the same marks as the male.

b. *Thorax unarmed; Head horned.*

a. *Furnished with a Scutellum.*

bilobus. Thorax prominent, divided into two lobes; horn of the head simple; elytra striated. 12. Native of the south of Europe. Black.

nasicornis. A triple prominence on the breast; horn on the head bent back; elytra smooth. 15. Native of Europe; met with in dunghills. Its larva gray, with a reddish head, feet, and spiracula or breathing holes. Swammerdam has supposed it to be the *cossus* of the ancients. Vid. *Plin.* 17. 24. Thorax of the female roundish.

β. *Without Scutellum.*

jacchus. Thorax prominent, formed of two lobes; horn on the head bent back, and simple. 156. Native of the Cape of Good Hope. The horn on the head of the female very short, and terminating abruptly.

carnifex. Thorax flat, angularly rough; the horn on the head bent

bent inwards; the body of a yellow colour. 22. Native of America. During the whole ſummer they may be ſeen in great numbers, rolling about balls which they form out of dung. They mutually aſſiſt one another to roll them into holes made for their reception, like the *pilularis*. Their bodies are broad, and depreſſed; the horn on their heads is placed backwards. It is black, and ſmooth. In the female it is effaced.

c. *Both Thorax and Head without horns.*

a. *Furniſhed with a Scutellum.*

* *fimetarius.* *Dunghill-beetle.* Body black; head marked with tubercles, commonly three in number; the elytra reddiſh. 32. Native of Europe; frequently to be met with in dung.

* *ſtercorarius.* *Clock-beetle.* Body black, ſmooth; the elytra furrowed; the head of a rhomboidal figure; fore-head prominent. 42. Native of Europe; to be met with in dung; much infeſted with ſome ſpecies of the *acarus* and *ichneumon*, and, on that account, frequently called *louſy beetle*. It flies about in the evening with a loud noiſe, and is ſaid to foretel a fine day. It was conſecrated by the Egyptians to the ſun. It is ſometimes of a greeniſh blue colour. It is likewiſe ſometimes yellowiſh below, with duſky-red elytra. This is the *ſhard-borne beetle* of Shakeſpeare. The female digs a hole, and kneads a lump of freſh dung, generally of a cylindrical ſhape, on which ſhe depoſits one egg, and then covers it with more dung, attaching it to the root of ſome graſs. In a few days the larva breaks the egg, and feeds on the freſh dung. During the autumn it changes its ſkin four times.

β. *Without Scutellum.*

facer. The ſhield of the head marked with ſix denticulations; the thorax notched; the ſhanks of the hind-legs fringed; top of the head marked with two ſlight projections. 18. Native of the ſouthern parts of the old continent. It is frequent in dry ſituations in the ſouthern parts of Ruſſia, where it rolls about cylinders formed of cow-dung. Its figure is carved by the Egyptians on the ancient pillars at Rome.

pilularius. Black, opaque, ſmooth, yellow underneath; the thorax rounded behind. 40. Native of the ſouth of Europe; of the ſame ſize with the louſy beetle. In pairs, they daily roll, like Siſyphus, a ball made of excrement, ſeven times the bulk of their own body.

ſchaefferi. The thorax round; the ſhield emarginated; the elytra triangular; the thighs of the hind-legs elongated and dentated. 41. Native of Italy, Germany, and Siberia; to be met with on the ſunny hills, where it rolls and buries balls made of cow-dung. It is black.

* *foſſor.* Thorax retuſe; head marked with three tubercles, the middle one faintly reſembling a horn. 31. A native of Europe, in ſandy places, and in dunghills.

b. *Jaw arched, furniſhed with ſome teeth; the point of the Abdomen naked, and obliquely truncated.* Melolonthæ.

* *fullo.* Of a brick colour, and ſpotted with white. The ſcutellum with two notches; the antennæ divided into ſeven leaves. 57. It inhabits ſandy ſituations in Europe and Barbary, living on the oak, *elymus arenaria*, and *arundo arenaria*. It is hairy below: the hooks at the ends of their legs are furniſhed, at their baſe, with a crooked branch. It is the largeſt coleopterous inſect to be met with in Britain, except the ſtag-beetle. It is but rare in England.

The head and thorax beſet with bluiſh hair; the elytra of a livid colour; the ſhield bent back at the top. 236. Native of Germany; on the ears of rye. *fruticola*

The head and thorax beſet with bluiſh hairs; the elytra of a brick colour; the legs black. 59. Native of Europe; to be found in gardens, where its grub proves very deſtructive to cabbages, &c. and the beetle to the fruit-trees. * *hortico-la.*

The thorax hairy; the elytra of a livid colour, with a black edge, and black band; the ſhield turned back at the top. 58. Native of Europe, on graſs-fields. *agricola.*

The head and thorax covered with bluiſh hairs; the elytra reddiſh; the abdomen white and hairy. 40. Native of Europe; reſembles the garden-beetle very much, and is very deſtructive. *abdominalis.*

Of a ſhining copper colour; the ſhield emarginated. 241. Native of Africa, near the equator. *regius.*

Green; the ſides of the thorax yellow. 249. A native both of Europe and America; on the vine: very like the *friſchii*, differing only from it by the elytra, which are of a brick colour. *vitis.*

Blackiſh yellow; the elytra of a brick colour. 250. Is a native of Germany; on the vine, and the roſe. The elytra, ſometimes, are of the ſame colour with the thorax. *friſchii.*

Above ſmooth, and of a golden colour; the ſcutellum, and a line on the back of the thorax, of a blood-colour. 253. A native of New Zealand. *laetus.*

Door-beetle, *May-bug*, *Cockchaffer*. Furniſhed with a ſcutellum; without horns; light brown; the thorax hairy; the tail bent inwards; a triangular white ſpot at each inciſure of the abdomen. 60. It inhabits the northern parts of Europe; flies about in the evening, and feeds on the leaves of trees. It is the moſt deſtructive of all the European inſects. When it happens to be more plentiful than uſual, in the autumn, the vulgar entertain an opinion, that ſome epidemic diſeaſes are to follow. The male is diſtinguiſhed by a ſharp inflected tail. The grub is gray, with reddiſh brown head and feet. Eats the roots of plants, particularly of corn, frequently laying waſte a great tract of country. They remain ſix years under ground, before they become beetles. Their thorax varies yearly in colour, from brown to black. * *melolontha.*

It is furniſhed with a ſcutellum, and is without horns; the thorax is hairy; the elytra are of a pale yellow colour, marked with three white parallel lines. 61. Is a native of Europe, to be met with among trees. The claws at the end of the legs, have one little projection, like a tooth, at their baſe. They make their appearance ſomewhat later than the May-bug, and are very frequent about the ſummer ſolſtice. *ſolſtitialis.*

Body of a brick colour, and woolly below; ſhield marginated, and bent back; ſcutellum white. 263. Native of Europe; of the ſame ſize with the cockchafer. *villoſus.*

†† *Jaw ſtraight.*

a. *Sharp.* Cetoniæ.

Furniſhed with a ſcutellum; without horns; ſternum projecting; ſcutellum one half ſhorter than the elytra. 49. Native of South America. Of the ſame ſize and colour with the golden beetle. * *ryſis.*

faſcicularis. Furniſhed with a ſcutellum; thorax marked with four ſmall white lines; elytra green; inciſures of the abdomen bearded. 75. Native of the Cape of Good Hope. Covered on the under part of the body with pale red wool, collected into little bundles.

b. *Jaws ſtraight and blunt.* Friſchii.

* *faſciatus.* Furniſhed with a ſcutellum; body black, covered with yellow down; elytra marked with two yellow bands uniting into one. 70. Native of the north of Europe: feeding on the flowers of the *ſyringa*, *filipendula*, and on ſome umbelliferous plants.

* *hemipterus.* Furniſhed with a ſcutellum; thorax downy, edged with two longitudinal wrinkles; elytra ſhortened. 63. Native of Europe. The larva is found in wood; the beetle on flowers. The female is armed with a ſtiff, ſhort ſting.

** *Feelers terminating in knobs.* Trox.

* *fabulòſus.* Furniſhed with a ſcutellum; black, opaque, with wrinkled tubercles; antennæ hairy at the baſe. 48. Native of Europe. To be met with on ſandy hills, which are expoſed to the ſunſhine.

mortícinii. Shield unequal and fringed; elytra ſtriated, and marked with convex ſharpiſh points. 404. Native of Tartary. To be found in great numbers, under dead bodies, which have been dried by the ſun. It makes a noiſe, by rubbing its tail againſt its elytra. Is of an opaque black colour; and of the ſame ſize with *ſc. foſſor.*

*** *Feelers cylindrical: the Club of the Antennæ tunicated.*

hemiſphæricus. Hemiſpherical; the fore part of the ſhield marked with two obtuſe projections. 406. Larger than the *ſc. ſacer.*

432 ſpecies of this genus, have been deſcribed by Gmelin, in his laſt edition of the Syſtem of Nature.

2. Lucanus.

Antennæ clavated; the club compreſſed, being broadeſt at the ſides, and divided into pectinated leaves. Jaws ſtretched out, and forked at the points. Two tufts under the lip, to which the feelers are attached.

alces. The jaws ſtretched out, and furniſhed with four teeth at the point. 8. A native of Aſia.

* *cervus.* *Stag-beetle.* Furniſhed with a ſcutellum; the jaws ſtretched out, and forked at the points, furniſhed with one lateral tooth. 1. Native of Europe. It is the largeſt coleopterous inſect to be met with in Britain. It feeds on decayed oak. The larva is white and very thick, with head and feet of a ruſty colour. By ſome ſuppoſed to be the *craſſus* of the ancients. The female ſmaller than the male.

elaphus. The jaws projecting, furniſhed with one tooth, and forked at the point; the lip conical and bent down. 9. Native of Virginia. In the female, which is ſmaller than the male, the jaws do not project.

capreolus. Furniſhed with a ſcutellum; the jaws projecting, and only forked at the point. 2. It is a native of the ſouth of Europe, and North America; about half the ſize of the ſtag-beetle.

20 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

3. Dermestes, *Leather-Eater.*

Antennæ clavated; club perfoliated; three articulations thicker than the reſt. Thorax convex, ſlightly marginated. Head bent and concealed under the breaſt.

The *larvæ*, or grubs, of this tribe, devour dead bodies, ſkins, leather, and almoſt any animal ſubſtance; and are exceedingly deſtructive to books and furniture.

* *Jaw bifid.*

* *lardarius* Black; the fore part of the elytra of an aſh colour. 1. It is a native of Europe. Sometimes, though rarely, the anterior part of the elytra is of a ruſty colour.

This inſect is the common peſt of muſeums, libraries, and preparations of natural hiſtory. It is alſo found in old bacon, whence it has received its name. When it is eating, it protrudes balls of excrement from its anus, which hang down in a ſtring. The larva is oval and hairy.

elongatus. Black; the elytra livid at the baſe, and marked with a band of the ſame colour, at the poſterior part; the antennæ and feet of a ruſty colour. 2. Native of Europe; to be met with in old wood; almoſt filiform.

* *undatus.* Oblong, black; the elytra marked with a double white linear band. 3. A native of Europe. Feeds on putrid animal ſubſtances.

* *pellio.* Black; the elytra marked with two white ſpots. 4. It is a native of Europe. Feeds on ſkins, bacon, and old books. Its larva is oblong, hairy, and furniſhed with a briſtly tail.

* *paniceus.* Oblong, of a ruſty colour; with red eyes. 19. Native of Europe. In bread that has been long kept; in bookbinders glue; in books, &c. About the ſize of a millet ſeed. The larva is oblong, white and ſhining.

** *Jaw furniſhed with one tooth.* Apate.

muricatus. The elytra reticulated, blunted behind and notched; thorax prickly and turgid. 6. It is a native of South America; in wood, and ſugar canes.

ruficornis. Of a duſky colour; the head drawn back; the antennæ and feet reddiſh. 70. It is a native of Europe, and very ſmall.

70 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

4. Bostrichus.

Antennæ clavated; the club ſolid. Thorax convex, and ſcarcely marginated. Head inflected and concealed under the thorax.

capucínus. Black; the elytra and abdomen red; the thorax flattened. 1. It is a native of Europe, and of Siberia. It is to be found in trunks of trees, paticularly dead ones, and in houſes.

* *typogra-phus.* Of a brick colour; hairy; the elytra ſtriated, blunted and notched. 4. It is a native of Europe, and America; to be met with under the bark of trees. It is particularly hurtful to the pine tree; very prolific, and very voracious; ſcooping out furrows under the bark, from which other ſmaller ones proceed, in a parallel direction. They are very tenacious of life; and according to age and ſize, vary in colour, from a yellow to a brown, and from that to black.

chalcogra-phus. Black; the elytra red, and notched. 5. It is a native

tive of Europe; to be found under the bark of trees. It sometimes varies in colour.

polygraphus. Blackish; the elytra are sometimes blunted, and of an azure colour. 6. It is a native of Europe. It forms winding canals under the bark of trees, and is one of the most destructive of this genus.

* *micrographus.* Of a rusty colour; the elytra entire, and of a brick colour. 7. It is a native of Europe; in wood, also within the bark of trees; small, black; the elytra, antennæ, and legs, of a brick colour.

* *piniperda.* Black, and somewhat hairy; the elytra entire, and black; the feet reddish. 13. It is a native of Europe; on the under branches of pine-trees, which it perforates, dries up, and destroys. It sometimes varies in the colour of the elytra.

22 species of this genus have been described in the last edition of the System of Nature.

5. Melyris.

Lip clavated, and emarginated. Antennæ perfoliated throughout their whole length. Jaw with one tooth, and pointed.

viridis. Green; the elytra marked with three elevated lines. 1. Native of the Cape of Good Hope.

nigra. Black; the elytra marked with three elevated lines. 2. About the third part of the size of the preceding species.

6. Ptinus.

Antennæ filiform; the articulations towards the points larger than the rest. Thorax roundish, not marginated, receiving the head.

* *Feelers clavated.* Anobia.

rugosus. Brown; thorax unequal; elytra striated. 1. It is a native of Europe; without spots, and double the size of the subsequent species.

* *pertinax.* All over brown. 2. It is a native of Europe; is very destructive to wooden furniture, particularly to articles made of oak; likewise to books, &c. When catched, it contracts itself and counterfeits death. It can be put in motion again, neither by pricking, nor any other means, except by the application of a strong heat. It is destroyed by the *attelabus formicarius.*

* *mollis.* Of a brick colour, with dark-coloured eyes. 3. It is a native of Europe, amongst rubbish; an unwelcome visitor in collections of plants, and to be got rid of effectually, in no other way, but by the heat of an oven. The larva is white, and is capable of enduring a great degree of cold.

* *pulsator.* *Death-watch.* Cylindrical, opaque, and much wrinkled, sprinkled with gray spots. 13. It is a native of Europe. It is common in trunks of old trees, particularly of the willow, and in houses. It beats, especially in the night time, making a noise resembling that produced by one's nail struck against a table. This is done by seven, nine, or eleven distinct strokes, and has been considered, by the vulgar, as foreboding some fatal occurrence to the family occupying the house in which the noise is heard. But, it is nothing more than the call of one sex to the other.

** *Feelers filiform, bifid.* Ptini.

* *fur.* Light brown, and almost without wings; the thorax marked with four projections like teeth; the elytra marked with two white bands. 5. It is a native of Europe, and is exceedingly destructive to seeds, museums, books, furniture, preserved subjects of natural history, and even to the leaves of tobacco. It delights in cold and moisture; and is best kept off by heat and dryness, by arsenic or alum. It is most effectually destroyed by corrosive sublimate. The female is without wings. The larva has six feet, and is soft, thick, and hairy. The pupa is enclosed in a glutinous spherical covering.

* *imperialis.* Brown; the thorax somewhat crenated; the elytra marked with a white blotch, divided into lobes. 4. It is a native of the north of Europe; to be found in trees. It is about the size of a grain of wheat: the antennæ are of the same length with the body; the legs are of a rusty colour; the scutellum white; the elytra marked with a white spot, resembling the eagle worn on the imperial standard; from whence it has received its name.

* *scotius.* The thorax black, and smooth; the elytra connected, shining, brown. 22. It is a native of Europe; on the birch.

32 species of this genus have been described in the last edition of the System of Nature.

7. Hister.

Antennæ clavated. Club solid, the lower joint compressed, and bent down. Head capable of being drawn back into the body. Mouth furnished with pincers. Elytra shorter than the body. Shanks of the forelegs notched.

maximus. Very large. 1. It is a native of India, similar to the *unicolor*, but ten times larger. The corners of the thorax rounded; point of the breast extended, not quite up to the mouth.

* *unicolor.* Black; the elytra obliquely striated. 3. It is a native of Europe and America; in sand, and in dung.

* *bimaculatus.* Black; the posterior part of the elytra red. 5. Native of Europe; in cow dung.

17 species of this genus have been described in the last edition of the System of Nature.

8. Gyrinus, *Whirler*, or *Water-flea.*

Antennæ cylindrical. Jaw very sharp, and horny. Eyes four; two above, and two below.

These little animals are found on the surface of water, on which they run very nimbly, and describe circles. When attempted to be taken, they dive down, drawing after them a bubble, resembling a globe of quicksilver.

* *natator.* Black; faintly striated. 1. Native of Europe; in lakes and ponds.

bicolor. Black above; below, of a rusty colour; hind-legs compressed. 3. Native of Europe; frequents waters; is larger than the *natator.*

Nine species of this genus have been described in the last edition of the System of Nature.

9. Byrrhus.

Antennæ clavated, and perfoliated. Feelers equal, and somewhat clavated. Jaw bifid. Lip bifid.

gigas. Black; the elytra of a rusty colour, and marked with points. 1. Native of Europe. The anus of the female furnished with a sting.

* *pilula.* Brown; the elytra marked with black grooves. 4. Native of Europe; in sandy places. It is sometimes, though rarely, black.

* *varius.* Black; thorax of a bright yellow; elytra brown, and marked with three short green grooves, spotted with black. 5. Native of Britain.

Nine species of this genus have been described in the last edition of the System of Nature.

10. Anthrenus.

Antennæ clavated. Club solid. Feelers unequal, filiform. Jaws membranaceous, linear, bifid. Lip entire.

pimpinellæ. Black; elytra marked with a white band, and of a rusty colour towards their points, with a white stain. 4. Native of Europe; feeds on the flowers of the *pimpinella*.

* *scrophulariæ.* Black; elytra spotted with white; suture of a blood-red colour. 1. Native of Europe; on the *scrophularia*.

* *museorum.* Clouded; elytra slightly clouded. 2. Found in museums, destroying animals preserved in them, and books.

* *verbasci.* Black; elytra marked with three waved bands. 3. Native of Europe; on the *verbascum*.

Seven species of this genus have been described in the last edition of the System of Nature.

11. Sylpha, *Carrion-Beetle.*

Antennæ clavated. Club perfoliated. Elytra marginated. Head prominent. Thorax flattish, marginated.

These are chiefly found under the loose bark of trees, or on the half-decayed carcases of animals, upon which both the grub and the insect feed.

* *germanica.* Oblong, black; shield roundish, unequal, and marginated; elytra very obtuse, with a rusty coloured lateral margin. 1. Native of Germany. There are many varieties of this species. They deposit their eggs in the carcases of other insects, which they bury under ground.

* *vespillo.* Oblong, black; shield almost spherical and unequal; elytra marked with a double rusty-coloured band. 2. Native both of Europe and America.—There are many varieties of this species. In America, some of them are ten times larger than those in Europe. They frequently have the smell of musk, and fly very quickly, with their elytra erect, and applied close together. They are much infested by the *acarus*, and deposit their eggs in the carcases of other insects, which they bury.

* *quadripustulata.* Black, oblong; elytra marked with two rusty spots. 5. Native of Europe and America, in decayed wood; very smooth; the larva oblong, gray and hairy.

* *quadrimaculata.* Red; thorax and elytra black; the latter marked with two red spots. 27. Native of Europe.

* *rufifrons.* Oblong, smooth, black; the front, the legs, and two spots on the elytra, of a rusty colour. 41. Native of England. Antennæ black; club reddish; thorax smooth, without spots; elytra smooth.

* *rugosa.* Blackish; elytra wrinkled, and marked with three elevated lines; thorax wrinkled and scolloped behind. 16. Native of Europe and Asia. It consumes dead bodies, either flesh or fish. When catched, it vomits a very fœtid fluid.

94 species of this genus are described by Gmelin, in the last edition of the System of Nature.

12. Nitidula.

Antennæ clavated. Club solid. Elytra marginated. Head prominent. Thorax a little flattened, and marginated.

* *Lip square.* Elophori.

* *aquatica.* Brown; thorax wrinkled, which, together with the elytra, are of a browniish yellow. 1. A native of Europe, in stagnant waters; very small, and frequently to be found among the *conferva*.

* *minuta.* Brown; thorax wrinkled, and of the colour of brass; elytra pale. 4. To be found in England, in stagnant waters; very similar to the *aquatica*, but only the third part of its size.

* * *Lip cylindrical.*

* *bipustata.* Oval, black; elytra marked with a red dot. 5. It is a native of Europe; and feeds on animal substances.

* *discoidea.* Black; elytra of a dusky colour at the point. 16. Native of England.

30 species of this genus have been described in the last edition of the System of Nature.

13. Opatrum.

Antennæ moniliform, thicker towards the outside. Elytra marginated. Head prominent. Thorax somewhat flat, and marginated.

griseum. Of an ash-colour; thorax flat, and marginated; elytra marked with three elevated lines, and dentated behind. 1. Native of Italy, larger than the *fabulosum*.

* *fabulosum.* Brown; thorax emarginated; elytra marked with three elevated lines, and dentated. 2. Native of Europe and North America, in sandy plains.

monilicorne Brown; thorax and elytra hairy. 16. Native of Europe; not quite half an inch in length.

testaceum. Of a light brown colour; eyes, thorax, elytra, and antennæ dark brown. The base and tips of the latter are reddish; the elytra marked at the base with a large brick-coloured spot, resembling a crescent; the thorax impressed with two dots.

22 species of this genus have been described in the last edition of the System of Nature.

14. Tritoma.

Antennæ clavated. Club perfoliated. Feelers, anterior pair hatchet-shaped.

* *bipustulatum.* Black; the elytra marked with a lateral scarlet line. 1. Native of England, to be met with in those species of *boletus* which grow on trees.

Smooth,

fabrum. Smooth, black; the antennæ and legs of a dark colour. 2. Native of the north of Europe, to be met with under the bark of trees. It somewhat resembles the *bipustulatum*.

Seven species of this genus are described by Gmelin in the last edition of the System of Nature.

15. Cassida.

Antennæ moniliform. Elytra marginated. Head concealed under the shield of the thorax.

viridis. Green. 1. Native of Europe; frequently met with on thistles, and on a variety of plants. The larva is depressed, and furnished with six feet; it is armed with acute lateral prickles, and has a tail formed of two bristles. It walks about covered with its own excrement.

murraca. Black, with a red shield; the elytra of a blood-colour, sprinkled with black dots. 2. Native of Europe; to be met with on different kinds of plants.

nobilis. Gray; the elytra marked with a very bright blue line. 4. Native of Europe; to be met with on thistles and various plants. The bright blue line on its elytra disappears when it dies, but reappears on its immersion into warm water.

æstuosa. Black; elytra reddish yellow, spotted with black. 52. Native of Europe, but rare. It is to be met with on the white poplar, is about the same size with the *nobilis*, and, like it, loses its bright colour along with its life.

jamaicensis Of a bright glossy yellow colour; the elytra, without spots, are marked with small concave dots. 21. Native of America. At the anterior part of the future, there is a prominence forming a bunch on its back. It loses its colour in spirits of wine, and recovers it again on being immersed into warm water.

superba. Black; elytra and shield dotted, and of a golden green colour; antennæ, abdomen, and legs green. 39. Native of Europe. It loses its golden colour at the same time with its life.

This genus contains 77 species.

16. Coccinella, *Lady-bird.*

Antennæ clavated. Club solid. Feelers, the anterior pair hatchet-shaped; the posterior filiform. Body hemispherical. Thorax and elytra marginated. Abdomen flat.

* *The Elytra red or yellow; marked with black dots.*

marginata. The elytra yellow, without spots, with a black margin; the margin of the thorax marked with two white dots. Sometimes the elytra are red, with a black edge; the margin of the thorax marked with a white dot on each side. 1. Native of America, of a middling size.

immaculata. Elytra yellow, without spots; thorax marked with a black spot, and two white dots. 155. Native of Europe.

* *bipunctata.* Elytra red, marked with two black dots. 7. Native of Europe; frequent in gardens and woods; feeding on *aphides*.

* *quadripunctata.* Elytra yellow, marked with four black dots. 9. Native of Europe. Of a middle size; black below; thorax yellow, with four black dots; feet yellow.

* *quinquepunctata.* Elytra of a blood colour, marked with five black dots. 11. Native of Europe; to be met with on trees.

Elytra red, marked with seven black dots. 15. Native of Europe. The dots on the elytra are placed in the form of a triangle. This insect, as well as some others of the coleopteræ, is said to possess the property of giving immediate and effectual relief in the most violent paroxysms of the toothache, by rubbing them between the finger and thumb, and applying the finger to the affected tooth. * *septempunctata.*

Lady-cow. Elytra red, marked with six black spots; the four anterior ones transverse and arched. 68. It is a native of India. Head whitish; thorax white before with a black spot, black behind; future red; body pale yellowish. * *sexmaculata.*

The elytra yellow; with 12 black dots and a black band in the middle. 86. It is a native of the Cape of Good Hope; of a middle size. *variegata.*

The elytra tawny, with a great number of black dots, many of them running together. 118. It is a native of India, about three quarters of an inch long. *centumpunctata.*

* * *The Elytra red or yellow, marked with white.*

The elytra red; marked with 14 white, and three black dots. 32. A native of Europe; differing perhaps, only in sex, from the *decempustulata*. *punctatoguttata.*

Elytra yellow, marked with 15 white spots; the middle one, common to both elytra, almost effaced. 127. A native of Europe. *quindecemguttata.*

Elytra yellow; marked with 16 white spots. 35. Native of Europe. *sedecemguttata.*

* * * *Elytra black, marked with red.*

Elytra black, without dots, but marked with red at the points. 129. It is a native of Europe, very like the *hæmorrhoidalis*, but only half its size. *analis.*

Elytra black, their points red, marked with a black band. 130. It is a native of Germany. It is frequently marked on the back with a red dot common to both elytra. *hæmorrhoidalis.*

Elytra black, marked with two red spots. 41. It is a native of America; on the *cactus*, and is frequently gathered along with the cochineal insect. It is very similar to the *bipustulata*, which is common in Europe. *cacti.*

Elytra black, marked with two red spots; abdomen of a blood-red colour. 42. It is a native of Europe, common in gardens. Each of the spots on the elytra is composed of three spots uniting into one. * *bipustulata.*

* * * * *Elytra black, spotted with white or yellow.*

Elytra black, marked with eight yellow dots. 48. Native of the north of Europe. *pantherina.*

Elytra black, marked with eight yellow dots, the two anterior ones hooked. 146. A native of Europe. *humeralis.*

163 species of this genus have been described by Gmelin.

17. Alurnus, *Rove-beetle.*

Antennæ filiform. Feelers, six; short. Jaw, horny; arched.

Black; thorax scarlet; elytra yellow. 1. It is a native of America and India. Antennæ black, half as long as the body; thorax a little rough, pointed on each side at the base; the hind margin black; scutellum rounded, black; elytra larger and longer than the body. *grossus.*

Yellowish.

femoratus. Yellowiſh green, with a metallic luſtre; the thighs and ſhanks of the hind-legs dentated. 2. It is a native of India. It is large, ſmooth, and ſhining; the antennæ are half as long as the body; the extreme articulations are black.

dentipes. Black; the thighs and ſhanks of the hind-legs dentated. 3. Native of the Cape of Good Hope. It is ſmooth, without ſpots, and very ſimilar to the *al. femoratus.*

There have been only three ſpecies of this genus deſcribed.

18. Chrysomela.

Antennæ moniliform. Feelers ſix, growing thicker towards their exterior ſides. Thorax marginated; elytra not marginated. Body (in moſt of the ſpecies) oval.

This numerous and beautiful tribe is found everywhere, in woods and gardens. Their motion is ſlow, and ſome of them when caught, emit an oily fluid of a diſagreeable ſmell. The larvæ of this and the next family feed on the leaves of trees and plants, the fibres and cuticle of which they leave, contenting themſelves with the pulp.

* *Thighs of the Hind-legs equal.*

** tenebrioides.* Without wings, black; antennæ and legs of a violet colour. 1. It is a native of the ſouth of Europe. The larva has a bunch on its back, of a violet colour, with a red anus; it feeds on a variety of vegetables.

** gottingenſis.* Black; the legs of a violet colour. 4. It is a native of Europe, very rare in England.

vittata. The elytra blue, with a yellow edge, and marked with a yellow ſtripe in the middle. 3. It is a native of America; very large.

luſitanica. Thorax of a copper colour; elytra reſembling braſs; impreſſed with bluiſh dots, of a violet-colour underneath. 74. Native of Portugal.

** bankſii.* Of a braſs colour above, and of a brick colour below. 76. Native of Italy and Portugal, ſmaller than the preceding ſpecies. Very rare in England.

hæmorrhoidalis. Black, ſhining; antennæ yellow at the baſe; anus red above. 6. Native of Europe, on the birch and alder. The elytra are marked with regular lines of dots.

** graminis* Greeniſh-blue, very ſhining; the antennæ and legs of the ſame colour. 7. Native of Europe, on different plants, eſpecially on graſs.

** ænea.* Green, ſhining; the extremity of the abdomen reddiſh. 8. Native of Europe; on the alder.

** hæmoptera.* Of a violet-colour; feet and wings red. 11. Native of Europe.

centaurei. Of a bright copper-colour; beneath green and gold; the legs of a bright copper colour. 102. Native of Europe, on the *centaureus.* It exhibits ſome variety, eſpecially in ſize.

melanoſtoma. Oblong, black; head red, the mouth and a ſpot on the back part of the head black; the thorax red, with a black ſpot on each ſide; the elytra red, with a black ſuture. 254. Native of Europe.

polita. Thorax gilt; elytra reddiſh. 27. Native of Europe; to be met with on the poplar and willow.

cruentata. Black; the elytra ſmooth; marked with red waved croſs bands, and with ſpots of the ſame colour. 182. Native of South America.

** anglica.* Blackiſh-blue; the elytra blackiſh-yellow, marked with dots arranged in ſtraight lines; wings red. 187. Native of England.

* * *The Thighs of the Hind-legs thickened, and formed for leaping.* Alticæ.

** oleracea* Of a greeniſh-blue. 51. Native of Europe. It feeds on different kinds of plants, particularly on thoſe of the claſs *tetradynamia.* This is the little inſect which is ſo troubleſome in fields and gardens, commonly called *turnip-fly.* It attacks turnips, raddiſhes, and cabbages, when newly ſprung above ground, and conſumes their ſeminal leaves. It frequently deſtroys whole fields of turnips, ſo completely, as to render a ſecond ſowing neceſſary, which goes like the firſt. The attempts may be repeated with ſimilar ſucceſs, till the ſeaſon for ſowing be loſt.

chryſocephala. Blackiſh blue, the head and four fore-legs yellow. 53. Native of Europe.

hyoſcyami. Greeniſh blue; the legs teſtaceous; the thighs of the hind-legs of a violet-colour. 54. Native of Europe; on the henbane, turnip, and cabbage.

** quadripuſtulata.* Black; the elytra marked with four reddiſh ſpots. 217. Native of England and France, in gardens.

** anglicana.* Black; the elytra and lower part of the legs pale. 218. Native of England, on various ſorts of vegetables.

** nigripes.* Greeniſh yellow, with a metallic luſtre; legs black. 220. Native of England.

** fuſcipes.* Of a violet-colour; head and thorax reddiſh; legs black. 224. Native of Britain, on plants of various ſorts.

** teſtacea.* Teſtaceous, hunch-backed; elytra very ſmooth. 225. Native of England, on different kinds of vegetables.

cruciferarum. Blackiſh yellow; oblong, with black legs. 246. Native of Europe, on *tetradynamious* plants.

270 ſpecies of this genus have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature.

19. Cryptocephalus.

Antennæ filiform. Feelers four. Thorax marginated. Elytra not marginated. Body nearly cylindrical.

* *Feelers equal, filiform.*

† *Jaw furniſhed with one tooth.*

a. *Lip entire, Body cylindrical.*

longipes. Duſky black; the elytra pale, marked with three black blotches; fore-legs very long. 1. Native of Europe, on the hazel and willow.

** quadripunctatus.* Black; the elytra red, marked with two black dots; the antennæ ſhort and ſerrated. 3. Native of Europe, very common on the hazel. The larva is contained in a rough bag; which, on the fore-part, is terminated obliquely and abruptly.

longimanus. Of an obſcure braſs colour; the elytra of a brick colour, with a black ſpot at the baſe. 19. Native of Europe; feeds on the *trifolium montanum,* and the *euphorbia cypariſſia;* the fore-legs are very long; the larva is enclоſed in a bag.

cordiger. Thorax variegated; elytra reddiſh, marked with two black dots. 25. Native of Europe, on the hazel and willow.

willow. The ſpot on the middle of the thorax is ſometimes of the ſhape of a heart.

*vitis. Black; ſmooth; elytra reddiſh. 27. Native of the ſouth of Europe; on the vine, committing ſometimes great havock.

*coryli. Black; thorax and elytra reddiſh brown, without ſpots. 28. Native of Europe; on the hazel.

b. *Lip bifid; Body oblong.* Ciſtelæ.

*gigas. Hairy, brown; elytra, abdomen, and thighs of a brick colour. 91. Native of the ſouth of France; very large.

**cervinus.* Livid; with brown legs. 92. Native of the north of Europe.

*rufitarſis. Black; thorax ſquare; elytra ſtriated and of a brick colour. 96. Native of the ſouth of Europe; on the ears of rye.

**ſulphureus.* Yellow; the elytra of a ſulphur colour. 98. Native of Europe. Feeds on *umbelliferous* plants.

**murinus.* Black; the elytra and legs reddiſh brown. 103. Native of the north of Europe.

**anguſtatus.* Thorax and elytra of a dark reddiſh colour, black in the middle. 106. Native of Britain; ſomewhat reſembling the *murinus*, but narrower.

**pallidus.* Pale; the head, and tips of the elytra, brown. 107. Native of Britain.

†† *Jaw bifid, Body oblong.* Criocerides..

*lineola. Gray; the thorax marked with a line behind; the elytra with a black dot at their baſe. 124. Native of Italy.

*nymphæ. Brown; the margin of the elytra a little prominent and yellow, 125. Native of Europe, on the water-lily.

*tenellus. Of a ruſty colour, the edge of the thorax and elytra yellow. 133. Native of Europe, on the willow.

**cantharoides.* Of a violet colour; head, thorax and legs reddiſh. 139. Native of Britain.

**cyanella.* Blue; thorax cylindrical; prominent on the ſides. 161. Native of Britain.

*melanopus. Blue; thorax and legs reddiſh. 162. Native of Europe. Feeds on the oak.

**ſubſpinoſus.* Black; head and thorax ſomewhat prickly; feet reddiſh. 164. Native of Britain.

**aſparagi.* Thorax red, marked with two black dots; elytra yellow; marked with a black croſs, and four black dots. 167. Native of Europe, feeding on aſparagus. There are two or three varieties of this ſpecies. β. With two ſpots on the elytra connected at the baſe, is to be met with in Italy. γ. With two narrow red bands on the elytra, is to be met with in France.

**phellandrii.* Black; the edge of the thorax and two lines on the elytra yellow. 168. Native of Europe; to be found at the roots of the *phellandrium aquaticum*.

** *Feelers unequal, the anterior ones hatchet-ſhaped.*

† *The Lip of a ſubſtance like horn.* Erotyli.

*giganteus. Oval, black; the elytra marked with a great many tawny dots. 191. Native of India.

*venereus. Black; the thorax and elytra of a bright copper colour. 205. Native of New Holland.

†† *The Lip membranaceous.* Lagriæ.

*elongatus. Black; the thorax red and hairy. 221. Native of Europe, particularly of England.

**glabratus.* Smooth; thorax reddiſh; elytra yellow. 230. Native of England.

268 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

20. Hispa, *Bluſſom-eater.*

Antennæ cylindrical; approaching one another at the baſe, and placed between the eyes. Feelers ſpindle-ſhaped. Thorax and elytra frequently prickly.

**atra.* Body entirely black; antennæ ſpindle-ſhaped; thorax and elytra prickly. 1. Native of the ſouth of Europe and north of Africa. To be found at the roots of graſs.

**mutica.* Without prickles; the antennæ hairy. 4. Native of Europe; in rubbiſh and in muſeums.

**cornigera.* Antennæ ſerrated; thorax red; elytra blue; head furniſhed with two horns. 15. Native of Britain.

**ſlabellicornis.* Black; the antennæ pectinated; the elytra ſtripped. 19. Native of England.

20 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

21. Bruchus, *Glutton.*

Antennæ filiform. Feelers equal and filiform. Lip pointed.

**piſi* The elytra black, ſpotted with white; the anus white, with two black ſpots. 1. Native of North America. It has been lately introduced into Europe, where it commits great havock in the fields of peas. It is alſo very deſtructive to orchards when in bloom.

*robiniæ. Gray, ſomewhat ſhining; the elytra very little ſhorter than the abdomen. 9. Large; and has been introduced into Europe, along with the ſeeds of the *robinia pſeudacacia* from America.

**ſcabroſus.* Black; the elytra red, marked with raiſed ſtripes. 11. Native of Europe, chiefly on the horſe-cheſnut.

*cacao. Body brown, ſpotted with gray. 13. It feeds on the ſeeds of the *theobroma*.

*theobromatis. The elytra gray; ſpotted with black; legs red; ſcutellum white. 2. Feeds on the ſeeds of the *theobroma*.

*bipunctatus. Aſh coloured; elytra brown; with a black dot at the baſe; ſurrounded by a yellow circle. 17. Native of Switzerland, on different plants.

**granarius.* Elytra black; ſpeckled with white; the thighs of the hind-legs are marked with a ſingle projection reſembling a little tooth. 5. Native of Europe. Feeds on the ſeeds of various plants.

**ſeminarius.* Black; the baſe of the antennæ and fore feet reddiſh brown; thighs ſmooth. 6. Native of Europe, on flowers; very ſmall.

25 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

22. Pausus.

Antennæ conſiſting of two articulations, clavated. Club ſolid and hooked.

I 2

macrocephalus. 1. It is a native of North America; entirely black, the head very ſmall, the thorax narrow, with an elevated tranſverſe margin on the fore-part; the elytra terminated abruptly by a tranſverſe line, and a little longer than the abdomen; which is likewiſe terminated abruptly. It is about the ſize of the *dermeſtes lardarius*.

23. Zygia.

Antennæ moniliform. Feelers unequal, filiform. Lip elongated, membranaceous. Jaw furniſhed with one tooth.

oblonga. Oblong, reddiſh; head and elytra of an obſcure blue. 1. Native of the eaſt.

24. Zonitis.

Antennæ ſetaceous. Feelers four, filiform; ſhorter than the jaw, which is entire. Lip emarginated.

chryſomelina. Yellow; the elytra marked with a black dot in the middle and at the baſe. 1. Native of Egypt. Black below; the extremity of the abdomen reddiſh.

flava. Reddiſh; the elytra yellow and black at the tip. 2. Native of the eaſt.

25. Apalus.

Antennæ filiform. Feelers equal; filiform. Jaw horny; furniſhed with one tooth. Lip membranaceous; terminating abruptly, and entire.

bimaculatus. Furniſhed with wings; black, the elytra yellow, marked with a black dot behind: formerly *meloë bimaculatus*. Native of the north of Europe; to be ſeen early in the ſpring, in ſandy places.

26. Brentus.

Antennæ moniliform, advancing beyond the middle of the ſnout. Mouth furniſhed with a ſtraight, cylindrical ſnout, which projects conſiderably.

* *Thighs ſimple.*

barbicornis. Cylindrical; ſnout very long, bearded beneath; the elytra lengthened out and elevated. 1. Native of New Zealand. Snout longer than the body; antennæ ſhorter than the ſnout, placed near the tip; eyes globular, black; thorax cylindrical, black with gray hairs; elytra ſtreaked and dotted, with furrowed ſpots; legs black, with gray hairs.

* * *Thighs dentated.*

anchorago. Linear; the elytra ſtriped with yellow: thorax lengthened. Native of South America and India.

This genus includes 11 ſpecies.

27. Curculio, *Diamond-beetle.*

Antennæ clavated, placed upon the ſnout, which is formed of a horny ſubſtance, and prominent. Feelers four, filiform.

This beautiful and numerous genus is divided into five ſubdiviſions: their larvæ have a ſcaly head, and ſix ſcaly legs. Thoſe of the long-ſnouted ones are moſt deſtructive in granaries, and to ſeeds of almoſt every deſcription. They inſinuate themſelves into the grain, and conſume it gradually, leaving nothing but the ſkin, in which they lie concealed, and undergo their metamorphoſis. Thoſe with the ſhort ſnout infeſt artichokes, and the ſtalks and leaves of plants. The leaves of many trees, particularly the elm, may be ſeen marked with yellow ſpots, occaſioned by the larvæ of this tribe inſinuating themſelves within the cuticle of the leaf, and forming a bag, in which they lurk, till they come forth a perfect inſect.

* *Long-ſnouted.*

† *Thighs ſimple.*

gigas. The thorax and elytra rough. Antennæ white at the tips. Native of Japan. Snout cylindrical, long, arched, brown on the fore part, of an aſh-colour behind; thorax rounded, brown, rough, with raiſed ſharp points; elytra rough, gray, with ſcattered brown and white dots.

brachypteros. Black; thorax flat and dotted, with a line ſlightly elevated; elytra ſhortened and ſomewhat ſtripped: the intervals dotted. 555. Native of Europe.

undatus. Black; the elytra marked with white dots ſet in regular rows, and with white interrupted waved bands. 556. Native of Europe.

coccineus. Scarlet; the elytra marked with ten rows of dots. 558. Native of Europe.

cyaneus. Black; the elytra of a violet colour; the ſcutellum white. 5. Native of Europe, particularly on the willow.

craccæ. Black above; aſh-coloured below, and hunch-backed. 6. Native of Europe; feeds on the ſeeds of the vetch; it is very ſmall.

* *malvæ.* Gray; the elytra and legs reddiſh brown. 101. Native of England, on the mallow. The ſnout and abdomen black.

roboris. The ſnout and thorax red; the elytra of a violet colour. 103. Native of Europe, on the oak.

acridulus. Black; with the abdomen oval. 13. Native of the north of Europe, frequently to be met with on plants of the claſs *tetradynamia*.

frumentarius. Of a blood-colour. 15. Native of Europe, and very deſtructive to corn which has been long kept.

oryzæ. Black; the thorax dotted, and of the ſame length with the elytra; the elytra marked with two red ſpots. This ſpecies is very deſtructive to rice kept in granaries.

* *granarius.* *Weevil* or *Bond.* Black; the thorax dotted, and of the ſame length with the elytra. 16. This deſtructive little animal does much miſchief in granaries, and in biſcuit kept in ware-houſes, or on ſhip-board. Woad, henbane, and elder, are ſaid to drive them away from grain which has been infeſted by them, and, on that account, is ſometimes mixed with the grain.

* *pini.* The elytra of a brick colour, with cloudy bands. 19. Native of Europe; in the bark of the *pinus ſylveſtris*.

cyaræ. Black, ſprinkled with green: ſnout black and bent, ſomewhat reſembling a keel. 121. Native of Africa, and the ſouth of Europe: on the flowers of the artichoke.

* *paraplectus.* Cylindrical and aſh-coloured; the elytra ſet with ſharp

ſharp points. 34. Native of Europe; on umbelliferous plants, particularly on the *phellandrum aquaticum*; in the ſtalks of which the larva is frequently lodged, and is ſuppoſed to be the cauſe of the ſtaggers in horſes.

bardanæ. Cylindrical; covered with a gray down; the fore-legs long. 152. Native of Europe, on the *burdock*. When old, it loſes the gray down, and becomes ſmooth and black.

bacchus. Of a bright copper-colour; ſnout and feet black. 38. Native of the ſouth of Europe, on the vine and hazel. Somewhat hairy above.

frugilegus. Oblong; of a cheſnut colour; the elytra equalling the thorax, marked with four red ſpots. Native of South America and India. It is ſmall, and very deſtructive to grain.

†† *Hind thighs thickened.* Saltatorii.

* *quercus.* Pale yellow; eyes black. 25. Native of Europe; on the willow, elm, and oak, the leaves of which it frequently covers with blotches, by inſinuating itſelf within the cuticle. It is about the ſize of the *pediculus humanus*.

fegetis. Body black; elytra oblong. 45. Native of Europe; on the ears of corn.

††† *Thighs dentated.*

aterrimus. Black; the elytra ſhining. 10. Native of Europe; very frequent on plants of different kinds.

* *ceraſi.* Black; the elytra opaque and oblong. 11. Native of Europe; on the leaves of the cherry and pear-tree, the cuticle of which it eats.

* *pomorum* The thighs of the fore-legs dentated; body gray, clouded. 46. Native of Europe, on the flowers of fruit-trees.

* *caliginoſus.* The ſtreaks of the elytra approaching one another, and dotted. 243. Native of Britain, but rare. Body oblong, entirely black, opaque; thorax rounded and punctured; elytra with deep approximate ſtriæ in pairs; thighs ſharply dentated.

* *germanus.* Black; the thorax marked with two reddiſh dots on each ſide. 58. Native of Europe; very common in Germany. It is amongſt the largeſt of this genus that is to be met with in Europe.

* *nucum.* Body gray, of the ſame length with the ſnout. 59. Native of Europe; frequently to be found in hazel-nuts.

* *ſcrophulariæ.* The elytra marked with two black ſpots ſituated near the future. 61. Native of Europe; on the figwort, the capſules of which the larvæ conſume, and ſubſtitute in their place brown follicles.

* * *Breviroſtres.*

† *Thighs dentated.*

ſpectabilis. The body variegated with green and black. 298. Native of New Holland.

fuſco-maculatus. Black; the thighs faintly dentated; the thorax and elytra ſmooth, ſpotted with brown. 301. Native of Europe; large, ſmooth.

ovatus. The abdomen oval and black; the legs and antennæ reddiſh. 69. Native of Europe; in orchards.

* *pyri.* Yellowiſh-brown. 72. Native of Europe. The larva feeds on the leaves of the pear-tree; the perfect inſect on the flowers of the pear and of the plumb. The colour varies; ſometimes it is bronzed, red, green, &c.; legs reddiſh; body covered with oblong ſcales of various colours; elytra ſtriated, punctured.

Downy, brown; the thighs acutely dentated; antennæ and legs browniſh. 308. Native of Europe; on the apple-tree. * *malæ.*

†† *Thighs ſmooth.*

The thorax marked with lines; the elytra of an aſh-colour, marked with little brown lines; the future brown, dotted with black. 26. Native of Europe; on the *polygonum*. *polygoni.*

Above, browniſh-gray; beneath, aſh-coloured; ſnout grooved. 335. Native of Britain. * *griſeus.*

Blackiſh; the elytra gray, marked with two white ſpots, and with a larger one behind, which is common to both elytra. 336. Native of Britain. * *triguttatus.*

The elytra marked with black elevated ſtripes, and with bright green and gold dotted furrows alternately, ſwelling out at their baſe, and drawing to a point at their tips. 349. Native of South America. It is very large, and the moſt beautiful inſect hitherto known; commonly known by the name of the diamond-beetle. *imperialis.*

Body green, ſilky, ſtriped with broad gold bands. 75. Native of South America. The thighs brown, marked with a golden ring. *regalis.*

Oblong, brown; the back part of the thorax flat. 81. Native of Europe; common in fir. * *incanus.*

616 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

28. Rhinomacer.

Antennæ ſetaceous, placed upon the ſnout. Feelers four, thicker towards their exterior ſide.

Covered with gray down; antennæ and legs black. 1. Native of Italy. *curculioides.*

Covered with black hair; antennæ and legs reddiſh. 2. Native of Europe; in pine-foreſts. *attelaboides.*

Blue, ſomewhat hairy; baſe of the antennæ and the legs yellow. 3. Native of Europe. *cæruleus.*

Only three ſpecies of this genus have been deſcribed.

29. Attelabus.

Head drawn to a point on the hind part, and inclined. Antennæ moniliform, the articulations towards the point thicker than the reſt.

* *Jaw biſid.*

Black, the elytra red and reticulated. 1. Native of Europe; on the leaves of the hazel, which it rolls up into cylinders and ſhuts up at both ends. * *coryli.*

Black; legs formed for leaping. 7. Native of Europe; on the leaves of the birch, which it renders beautifully curled by its gnawing. It leaps very nimbly. * *betulæ.*

* * *Jaw furniſhed with one tooth.*

† *The poſterior feelers hatchet-ſhaped.* Cleri.

Black; the elytra marked with three white bands, and red at the baſe. 19. Native of Europe. *mutillarius.*

Black; thorax reddiſh; elytra red, white at the baſe, and * *formicarius.*

and marked with two white bands. 8. Native of Europe: it deſtroys the *ptinus pertinax* and many other inſects.

* *apiarius.* Bluiſh; the elytra red, marked with three black bands. 10. Native of Europe and America. The larva is frequently to be met with in bee-hives, the perfect inſect on flowers. It is double the ſize of the *formicarius*.

†† *Feelers four, nearly filiform.* Spondilides.

ceramboides. Black; the elytra full of wrinkles, and broader than the thorax. 12. Native of Europe, in the *boletus fomentarius*.

buprestoides. Black; the elytra very much ribbed; the thorax almoſt globular. 13. Native of Europe, in woods.

There are 34 ſpecies of this genus.

30. Notoxus.

Antennæ filiform. Feelers four, hatchet-ſhaped. Jaw furniſhed with one tooth.

* *mollis.* Downy; the elytra black, marked with three pale bands. 3. Native of Europe; on flowers.

* *monoceros.* Thorax projecting over the head like a horn; elytra pale, marked with a black band and dot. 4. Native of Europe, on umbelliferous plants.

There are four ſpecies of this genus.

31. Cerambyx.

Antennæ ſetaceous. Feelers four. Thorax prickly or turgid. Elytra linear.

This is a very beautiful and finely variegated family. The larvæ reſemble ſoft, oblong, ſlender worms, with a ſcaly head and hard legs on the fore-part. They bore through the inner part of trees, pulveriſing the wood, and are transformed into perfect inſects in the cavities they make. Many of them diffuſe a ſtrong ſmell, perceivable at a great diſtance; and ſome, when taken, utter a ſort of cry, produced by the friction of the thorax on the upper part of the abdomen and elytra.

* *Feelers four, equal.*

a. *Filiform.*

† *Jaw cylindrical, entire.* Prioni.

a. *The Thorax furniſhed with moveable ſpines.*

trochlearis The elytra variegated with a dark colour and white, with raiſed dots. 2. Native of India.

longimanus. The elytra marked with a ſmall projection at their baſe, and with two at the tip; the antennæ long. 1. Native of South America. The ſhanks of the fore-legs, in the male, are very long.

b. *Thorax marginated.*

cervicornis The thorax with three little projections on each ſide; the jaws ſtretched out, and furniſhed with one ſpine on their outſide; the antennæ ſhort. 3. Native of America. The larva is found in the wood of the *bombax*. It is eatable, and reckoned a delicacy by the natives.

armillatus. The thorax furniſhed with four ſmall projections on each ſide; the elytra ruſty-coloured, edged with black; the thighs of the hind-legs marked with a little projection. 4. Native of India; very large.

damicornis Thorax furniſhed with very ſmall projections; the jaws ſtretching out, and furniſhed with two teeth; the antennæ ſhort. 86. Native of South America. The larva is eaten by the natives, and much reliſhed.

faber. The thorax wrinkly and marked on each ſide with a ſmall projection; the elytra black; the antennæ of a middling length. 6. Native of Europe; in wood.

* *coriarius* Thorax marked with three ſmall projections; body black; the elytra furniſhed with ſharp points; antennæ ſhorter than the body. 7. Native of Europe; on decayed birch-trees. It produces large, oblong, yellowiſh eggs.

†† *Jaw obtuſe, furniſhed with one tooth.* Cerambyces.

nebuloſus. Thorax prickly; elytra formed like the roof of a houſe, marked with black bands and dots; the antennæ longer than the body. 29. Native of Europe; in the ſtems of fir-trees, which it kills by conſuming the inner bark.

faſciculatus. Thorax prickly; elytra entire, marked with three prickly dots; the antennæ of the ſame length with the body. 106. Native of Europe.

* *biſpidus.* Thorax prickly; elytra whitiſh at their anterior part, and furniſhed with two ſmall projections at their tips; the antennæ of the ſame length with the body, and rough. 30. Native of Europe.

* *moſchatus.* Green ſhining; thorax prickly; antennæ blue, and of the ſame length with the body. 34. Native of Europe; on the willow. The colour of the antennæ and legs varies from a blue to brown. The living inſect has a ſmell of muſk, which is ſaid to have a ſoporific effect. It produces white eggs. The green colour of this inſect is ſometimes tinged with blue, and at other times it is entirely blue and gold. The ſmell it diffuſes, is imagined by ſome to reſemble the ſmell of a roſe, and frequently pervades a whole meadow, where the inſect happens to be plentiful.

heros. Black; the thorax prickly and wrinkled; the elytra ſomewhat prickly and reddiſh brown: antennæ long. 128. Native of Europe; on the oak.

††† *Jaw divided.*

* *Horny.* Lamiæ.

futor. Thorax prickly; elytra black, with ruſty-coloured ſpots; ſcutellum yellow; antennæ very long. 38. Native of Europe; in woods.

ſartor. Black; thorax prickly; ſcutellum bright yellow; elytra without ſpots; antennæ very long. 159. Native of Europe; larger than the preceding ſpecies.

textor. Thorax prickly; elytra black and convex; antennæ of the ſame length with the body. 41. Native of Europe; on trunks of trees.

fuliginator Black; thorax ſomewhat prickly; elytra aſh-coloured; antennæ ſhort. 43. Native of Europe. When old, it becomes entirely black. It is met with in wool, after it has been cut from the ſheep.

regalis. Thorax prickly, and marked with green bands; the elytra ſprinkled with green, with three tawny ſpots. 167. Native of Africa. Antennæ longer than the body, black; head beneath lined with green; a tawny ſpot under

under the eyes; thorax black, with three impreſſed green bands; elytra ſomewhat ſtriated; black ſprinkled with green; abdomen with a white line of tawny dots on each ſide.

** *Membranaceous.* Saperdæ.

carcharias Thorax ſmooth, cylindrical; body gray, dotted with black; antennæ of the ſame length with the body. 52. Native of Europe.

cardui. Of a duſky colour; thorax marked with lines; ſcutellum yellow; antennæ long. 56. Native of Europe; on thiſtles, injuring them much in the month of May. Body brown, ſpeckled with yellow; thorax marked with three yellow lines.

* *populneus.* Thorax without ſpines, cylindrical, yellow, and marked with lines; elytra marked with four yellow dots; antennæ of the ſame length with the body. 57. Native of Europe; on the poplar. Body brown; antennæ variegated with black and white.

* *cylindricus.* Cylindrical black; fore-legs yellow. 5. Native of Europe; on the pear and plum-tree.

β. *Feelers capitated.* Rhagia.

curſor. Thorax prickly; elytra obtuſe and reddiſh, marked with a black line, and black along the future; antennæ of the ſame length with the body. 45. Native of Europe.

* *anglicus.* Thorax prickly; elytra marked with two oblique yellow bands. 237. Native of Britain.

inquiſitor. Black; thorax prickly; elytra clouded with brick-coloured ſtripes; antennæ ſhorter than the body. 49. Native of Europe, on the trunks of trees. The larva has ſix feet, and is naked; white; head and collar horny, brown; back grooved.

elegans. Black; thorax with a ſpine on each ſide; elytra cheſnut-coloured; their baſe future, and a ſpot on each, are black; they are likewiſe marked with two yellow bands. 242. Native of Europe.

γ. *Feelers clavated.* Callidia.

* *ruſticus.* Thorax naked; body pale; the antennæ tapering, and ſhorter than the body. 67. Native of Europe; in woods.

luridus. Thorax naked and furniſhed with knobs, black; the elytra of a brick colour. 68. Native of Europe; in fir-woods.

* *violaceus* The thorax ſomewhat downy; body of a violet colour; antennæ ſhorter than the body. 70. Native of Europe; chiefly in fir-timber, which has been cut down ſome time, and which has not been ſtripped of its bark. It bores ſerpentine cavities between the bark and the wood, which are larger in diameter as the inſect increaſes in ſize, filling the ſpace it leaves behind with its excrement, which reſembles ſaw-duſt. Body dark violet, a little hairy; antennæ hardly as long as the body, hairy; ſternum with a ſmall projecting point; elytra linear, rounded at the tip, turgid at the baſe. It varies in having the head and thorax, and even the body, greeniſh.

* *bajulus.* Thorax hairy, marked with two protuberances; body brown. 76. Native of Europe, on the trunks of trees, in timber, in houſes, perforating the joiſts, particularly thoſe that have been formed of fir-timber.

** *Feelers unequal; the anterior pair filiform, the poſterior clavated.* Stenocori Fabricii.

Thorax ſlightly prickly; elytra formed like the roof of a houſe; the anterior part of them reddiſh brown; the breaſt ſhining. 47. Native of Europe. Male of a brick colour, female blackiſh; larva lives under ground, and has very long legs. * *meridianus.*

379 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

32. Calopus.

Antennæ filiform. Feelers four; the anterior ones clavated; the poſterior filiform. Thorax turgid. Elytra narrow, and of an equal breadth throughout their whole length.

Brown; the antennæ compreſſed. 1. A native of Europe; it is long, and cylindrical. * *ſerraticornis.*

Very ſmall, brown; the antennæ ſerrated and hairy. 3. A native of Europe; about the ſize of a flea. *pygmæus.*

There are three ſpecies deſcribed in the laſt edition of the Syſtem of Nature.

33. Leptura.

Antennæ ſetaceous. Feelers four, filiform. Elytra growing ſmaller towards the tip. Thorax ſomewhat tapering.

* *Lip entire.* Donacia of Fabricius.

Of a golden colour; the thighs of the hind legs clavated and notched. 1. A native of Europe; on aquatic plants, on the water-lily, *phellandrum aquaticum*, at the roots of which the pupa may be found enclоſed in brown globes. The thighs of the hind-legs are ſometimes without notches. Antennæ blackiſh, the joints pale, reddiſh at the tip; head with a little down on the middle; thorax grooved; elytra ſtreaked, dotted, and terminating abruptly, with ſhort appendages at each margin; body beneath downy; legs dull, browniſh red. * *aquatica.*

Of a golden colour; the thighs ſimple. 17. A native of Britain; on aquatic plants. * *ſimplex.*

Shining green golden colour; the elytra marked with dotted ſtreaks and with crenated wrinkles, likewiſe with a bright purple and green fillet; the abdomen, antennæ, and legs, of a golden colour; the thighs of the hind-legs notched. 88. A native of Europe. *nitida.*

Silvery green; the elytra marked with dotted ſtreaks, crenated wrinkles, with a broad green and purple fillet common to both elytra; the head, abdomen, and legs, of a golden colour; the thighs of the hind-legs without notches. 89. A native of Europe. *vulgaris.*

** *Lip bifid.* Lepturæ.

A. *The Thorax on the fore part ſomewhat oblong and narrow.*

Black; the elytra reddiſh, with a black dot in the middle. 22. A native of Europe. *unipunctata.*

Black; elytra red, black at the tips and at the future. 23. A native of Europe. The abdomen is reddiſh in the male, which is ſmaller than the female. *baſſata.*

melanura. Black; the clytra reddiſh or livid, black at the tips and at the future. 2. A native of Europe; the elytra are black at the tips in the male, in the female they are all of one colour.

* *rubra.* Black; the thorax, the elytra, and ſhank of the legs, purple. 3. A native of Europe; on flowers.

* *villica.* Of a ruſty colour; the antennæ, clytra, and breaſt, dark brown. 28. A native of Britain.

ſplendidula. Black; covered with yellow hairs; the elytra ſmooth at the tips; the legs tawny; antennæ brown, and of a ruſty colour at the baſe. 49. A native of Europe.

rufipes. Black; the legs reddiſh; the thighs red at the baſe. 52. A native of Europe; frequently to be met with in the month of May, on the buckthorn, the dog-wood, and hawthorn.

B. *The Thorax nearly globular, and not attenuated on its anterior part; the Elytra blunt at the tips, but not truncated.*

* *virginia.* The thorax globular and black; the elytra of a reddiſh colour; the abdomen reddiſh. 15. A native of Europe.

* *collaris.* The thorax globular and red; the abdomen red; and the elytra black. 16. A native of Europe.

bipartita. Black; the thorax of a ruſty colour, marked with a longitudinal black line; the elytra marked with a ruſty-coloured ſpot, common to both of them. 71. A native of Europe.

nitens. The thorax globular, which, as well as the abdomen, is of a ſhining black, covered with a yellow down; the elytra black, marked with four broad tranſverſe yellow bands; the legs of a ruſty colour. 67. A native of America.

100 ſpecies of this genus have been deſcribed by Gmelin, in the laſt edition of the Syſtem of Nature.

34. Necydalis, *Carrion-Eater.*

Antennæ either ſetaceous or filiform. Feelers four, filiform. Elytra ſmaller, ſhorter, or narrower than the wings. Tail ſimple.

* *Antennæ ſetaceous; Elytra ſhorter than the wings or abdomen.*

* *major.* The elytra of a ruſty colour, without ſpots; the antennæ ſhorter than the body. 1. A native of Europe.

* *minor.* The elytra reddiſh brown, with a ſmall line at the top; the antennæ larger than the body. 2. A native of Europe.

* *umbellatarum.* The elytra of a brick colour, without ſpots; the antennæ long. 3. A native of Europe; on umbelliferous plants.

* * *Antennæ filiform; the Elytra growing narrower towards the tips, and of the ſame length with the abdomen.*

* *viridiſſimus.* The thorax ſomewhat tapering; body green. 13. A native of Europe; very frequent in gardens.

* *humiralis.* The elytra black, yellow at the baſe. 18. A native of Britain.

melanura. Black; the thorax and elytra reddiſh brown; the latter are black at the tips. 20. A native of Europe; on plants of different kinds.

26 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

35. Lampyris. *Fire-Fly.*

Antennæ filiform. Feelers four. Elytra flexible. Thorax flat, hemiſpherical, ſurrounding and concealing the head under it. The ſides of the abdomen furniſhed with folded papillæ. The female in moſt of the ſpecies without wings.

* *Feelers nearly clavated.*

* *noctiluca.* *Glow-worm.* Oblong, brown; ſhield aſh-coloured. 1. A native of Europe; in woods and meadows. The female is larger than the male, and emits a beautiful phoſphoric light, for the purpoſe of attracting the male. It is apparent that their ſhining light depends on a fluid placed near the extremity of the abdomen; the light becomes brighter, and of a finer green colour, when the inſect is in motion. The little animal can withdraw the light at pleaſure by contracting itſelf. Though the inſect be bruiſed, the light continues for a conſiderable time.

coruſca. Duſky black; the ſhield marked, on both ſides, with a circular roſe-coloured ſpot. 2. A native of North America.

ſplendidula Oblong, brown; the ſhield reſembling glaſs at the tip. 3. A native of Europe; in woods. This has been thought only a variety of the *noctiluca*; it is peculiarly reſplendent in ſhowery weather. The female emits the brighter light, particularly when pregnant.

pyralis. The ſhield reddiſh, and black in the middle; the elytra black, with a white edge; the abdomen white. 4. A native of the ſouth of America.

japonica. Yellow; the third ſegment of the abdomen from the anus is black. 22. A native of Japan; very plentiful in the months of May and June; diffuſing a very ſtrong light from two ſmall bags at its tail, filled with air; eyes, antennæ, and wings black.

italica. The elytra brown; the thorax tranſverſe, red. 11. A native of Italy and Switzerland; on trees; leſs than the reſt of the genus; brown; the laſt two ſegments of the abdomen yellow; the breaſt and legs pale yellow; the female black.

* * *Feelers nearly filiform.*

ſanguinea. Black; the ſides of the thorax and elytra of a blood colour. 17. A native of Europe; in ſtony ground.

pectinicornis. Black; the thorax and elytra of a brick colour; antennæ pectinated. 34. A native of Europe.

* *coccinea.* Black; the thorax and elytra of a blood colour, and without ſpots. 18. A native of Europe; in hedges; head ſometimes reddiſh, the elytra ſometimes ſtriated.

* * * *Feelers with the laſt joint thicker than the reſt, and terminating abruptly.* Lyci.

latiſſima. Yellow; elytra with a black marginal ſpot, and black behind, the lateral margin very much dilated. 14. A native of Sierra Leona. Mouth cylindrical, prominent; body narrower before, and very wide behind; antennæ ſerrated.

atra. Black; thorax orbicular, and with the elytra red, marked with an impreſſed black ſpot on the back. 44. A native of Europe.

Forty-four ſpecies.

36. Horia.

Antennæ moniliform. Feelers four, thicker towards their outer ſide. Lip linear, rounded at the tip.

teſtacea. Reddiſh; antennæ and legs black. 1. A native of Tranquebar; the hind thigh of the male thickened, and grooved beneath, and marked with a little projection.

dermeſtoides. Reddiſh brown; eyes, wings, and breaſt black. 2. A native of Europe.

There are only two ſpecies of this genus deſcribed.

37. Cucujus.

Antennæ filiform. Feelers four, equal; the laſt articulation terminating abruptly, and thicker than the reſt. Lip ſhort, biſid; the diviſions linear, and diſtant from one another. Body depreſſed.

muticus. Thorax unarmed, black, with an impreſſed dot on each ſide; elytra ſtriated, brown. 2. A native of Europe; black.

teſtaceus. Of a brick colour; thorax nearly ſquare, unarmed; thighs compreſſed. 3. A native of Europe, under the bark of the birch tree.

quadratus. Black; the thorax ſquare, notched behind, marked with tubercles in the middle, and wrinkled on the external edge, clavated on the anterior part; the antennæ brown; the legs and elytra ſimple and reddiſh. A native of Europe.

Eleven ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

38. Cantharis.

Antennæ filiform. Thorax (for the moſt part) marginated, and ſhorter than the head. Elytra flexible. Sides of the abdomen edged with folded papillæ.

* *Feelers four, hatched-ſhaped.*

This is an extremely rapacious genus, preying on other inſects, and even on its own tribe; thoſe of the diviſion *lymexylon* only, both in the grub and perfect ſtate, feed on green wood.

* *fuſca.* Thorax red, with a black ſpot; elytra brown. 2. A native of Europe; in hedges; moſt rapacious, and devouring its own ſpecies.

marginella. Reddiſh; the abdomen black and marginated; the back part of the head, eyes, and breaſt yellow. 73. A native of Europe.

media. Brown; the thorax, head, baſe of the antennæ, the ſides and tip of the abdomen, and the legs reddiſh. 14. A native of Europe.

hæmatoma. Black; mouth and abdomen red. 75. A native of Europe.

biguttata. The middle of the thorax black; the elytra ſhortened, black and yellow at the tip. 11. A native of Europe; in groves and gardens.

cardiacæ. The thorax ſomewhat marginated; body black; antennæ pectinated; the elytra marked with a blood-coloured dot at the tip. 13. A native of Europe; on the *leonurus cardiaca.*

biſtrio. Black; the thorax, the baſe of the antennæ, poſterior baſe of the ſegments of the abdomen, and legs yellow, with a brown ſpot on the thorax. 82. A native of Europe.

** *Feelers filiform, the laſt articulation ſetaceous.* Malachii.

* *ærea.* Bright greeniſh yellow; the upper ſurface of the elytra red. 7. A native of Europe; on plants. It is furniſhed with two tentacula at the baſe of the abdomen, of a blood colour, blunt, and connected at the baſe; likewiſe two on the thorax which can be ſtretched out. There is a ſmaller variety, with the elytra wholly of a blood colour.

* *bipuſtulata.* Bright yellowiſh green; the elytra red at the tips. 8. A native of Europe.

hæmeroidales. Black; the thorax and tips of the elytra red. 86. A native of Europe.

cryſomeloides. Thorax red, emarginated; elytra blue and ſmooth; antennæ and legs black. 63. A native of France; when touched under the breaſt, it contracts its head and body; when ſet at liberty it runs off very quickly.

*** *The anterior feelers ſtretched out; the laſt articulation but one, is enlarged with a large oval ſplit appendage; the laſt articulation arched, and acute.* Lymexylon.

proboſcidea. Black; the elytra light brown, and black at the tip; the feelers hooked, and irregular. 69. A native of Europe; in timber.

barbata. Brown; the antennæ and ſhanks of the legs black. 70. A native of Europe; in timber; covered with gloſſy down of a changeable hue; antennæ and legs paler.

* *navalis.* The thorax ſomewhat tapering; body yellow; the margin and tips of the elytra black. 26. A native of Europe; in the timber of the oak, to which it is very deſtructive.

Eighty-ſix ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

39. Serropalpus.

Antennæ ſetaceous. Feelers four, unequal; the anterior one longer than the reſt, and deeply ſerrated; four articulations, the laſt one very large, terminating abruptly, compreſſed, and like a plate; the poſterior ones nearly clavated. Thorax marginated, the anterior one receiving the head, with a prominent angle on each ſide. Head bent down. Legs formed for digging.

ſtriatus. Body brown; the elytra ſtriated. A native of the iſland of Runſala; found on old wooden buildings in autumn.

lævigatus. Body black; the elytra ſmooth. 2. A native of Europe.

40. Elater, *Skipper.*

Antennæ filiform. Feelers four, hatchet-ſhaped. Under ſide of the thorax terminating in an elaſtic ſpine, coming out from a cavity of the abdomen; by which means the body, when placed on the back, ſprings up and recovers its natural poſture.

Brown;

flabellicornis. Brown; antennæ with a fan-shaped tuft of eight large black leaves. 1. A native of India. This is one of the largest of the genus; the antennæ short.

noctilucus. Sides of the thorax marked with a smooth yellow spot. 4. A native of America. This insect, like the *Lampyris* and *fulgora*, affords a strong phosphoric light in the night time, the streams of which are so strong, that a person may see to read the smallest print. When placed on its back, it will spring four or five inches from the level on which it is put, to recover its natural position; the abdomen when removed from the body is luminous internally.

phosphoreus. Brown; the thorax marked on its posterior part with two smooth yellow spots. 5. A native of South America, resembling the *noctiluca* very much, but only half the size, although considerably larger than the species to be found in Europe; the spots of the thorax shine in the night like the preceding species.

bipustulata Black, shining; the elytra marked with a black dot at the base. 9. A native of Europe, on pasture grounds.

* *brunnius* The thorax reddish, and black in the middle; the elytra and body of a rusty colour. 10. A native of Europe; in gardens.

* *cruciatus* The thorax black, rusty-coloured on the sides; the elytra yellow, marked with a black cross, and black on the edges. 12. A native of Europe; on pasture grounds.

* *ruficollis* Black; the hind part of the thorax red, and shinning. 14. A native of Europe; on grass land.

mesomelos. The thorax and edge of the elytra of a rusty colour; body and elytra black. 16. A native of Europe; larva six-footed, filiform, and hardish, furnished with a horny shield at the tail, notched at the sides, and furnished beneath with a conical hollow tubercle in form of a leg on the under side. It is common in decayed wood.

* *aterrimus* Thorax black and shining; the elytra striated and black. 17. A native of Europe.

* *castaneus* The thorax reddish and downy; the elytra yellow, and black at the tip. 13. A native of Europe; in low grounds.

* *sanguineus.* Black; elytra of a blood colour. 21. A native of Europe; in grass lands. The tip of the elytra black. —A larger variety is found with the thorax downy and tawny; the elytra of a deep colour, and marked with a faint black blotch at the base.

segetis. Black; the antennæ and feet brown; the elytra marked with longitudinal black and brown lines. 114. A native of Europe; at the roots of corn. The larva destroys the fields, especially in dry seasons; it is a long time before it undergoes its metamorphosis.

funereus. Reddish; the elytra striated; head brown. 144. A native of Europe.

* *obscurus.* Of a rusty colour; head and thorax brown, the latter, together with the elytra and legs, are of a brick colour. 146. A native of Europe.

149 species of this genus have been described in the last edition of the System of Nature.

Cicindela, the *Sparkler*.

Antennæ setaceous. Feelers six, filiform; the posterior ones hairy. The jaws prominent and many-toothed. Eyes prominent. Thorax rounded and marginated.

* *Lip divided into three little projections.*

This is, in general, a very beautiful genus of insects; they are found in dry sandy places, and prey with the most ravenous ferocity upon all other insects which come in their way, and which they can overcome. The larva is soft, white, long, and has six feet, with a brown scaly head; and lurks in a round perpendicular hole in the ground, with its head at the entrance, to draw in, and devour whatever insects may come near, or fall into it.

Green; the elytra marked with five white dots. 1. A native of Europe; in sandy plains. The upper part of the antennæ brown, the under part red; thorax a little angular, rough; elytra irregularly dotted; upper lip white; jaws projecting, sharp; legs red, with a coppery tinge. * *campestris.*

Purple; the elytra marked with a white band, and two white circular dots. 2. A native of Europe; in sandy places. * *hybrida.*

Of a copper colour; the elytra green, marked with a white spot, like a crescent, at the tip. 4. A native of Europe. It varies in colour, being sometimes blue, green, or black. *germanica.*

Black, above bright brown; the elytra with lateral striæ at a good distance from one another. 40. A native of Europe. *danica.*

Black, on the upper part nearly of the colour of brass; the elytra striated, marked with four impressed dots; legs a yellowish brown. 41. A native of Europe. *punctata.*

Of a rusty colour; legs, elytra, head, and thorax reddish; the latter green behind; the elytra are marked with a waved green band, and have a green suture. 49. A native of Europe; in water. Head two-lobed behind; lip white; thorax jagged on the fore part; it has no scutellum; elytra with each 15 punctured striæ, and three spots at the base near the anterior margin. *ferruginea*

* * *Lip rounded, pointed, entire.* Elaphrus.

Of a bright greenish yellow; the elytra marked with broad concave points. 10. A native of Europe; in moist places. * *riparia.*

Of an obscure brass colour; the elytra somewhat cloudy, legs yellow. 11. A native of Europe; on banks. The elytra are sometimes dotted; antennæ black, the first joint yellow; thorax rounded, and grooved on the back. * *flavipes.*

Black; the elytra brown, marked with two pale spots, the shanks of the legs reddish. 13. A native of Europe. *quadrimaculata.*

Of a bright brass colour, polished; head striated. 14. A native of Europe; common in water. * *aquatica.*

48 species of this genus have been described in the last edition of the System of Nature.

42. Buprestis, the *Cow-burner*.

Antennæ filiform, serrated, and of the same length with the thorax. Feelers four, filiform; the last articulation obtuse and terminating abruptly. Head half drawn back within the thorax.

This is a genus remarkable for its rich metallic colours,

lours, having frequently the appearance of the moſt highly poliſhed gold or copper; the larvæ are uſually found among timber, and in decayed trees.

vittata. The elytra dotted, and furniſhed with two little projections; they are likewiſe marked with four elevated lines, and with a broad fillet of green and gold. 33. A native of India.

faſtuoſa. The elytra terminating abruptly, furniſhed with two ſmall projections, green, and marked with dotted ſtriæ; the back is of a bright golden colour. 34. A native of America.

berolinenſis The elytra variegated with green and black, and furniſhed with two ſmall projections; the anus is furniſhed with three ſmall projections. 36. A native of Europe.

octoguttata The elytra formed like the roof of a houſe, and deſtitute of projections, marked with four white ſpots; body blue. 2. A native of Europe; in groves.

maculoſa. The elytra black, ſtriated, furniſhed with projections, and terminating abruptly, marked with four yellow ſpots. 50. A native of Europe; of a middle ſize. Head and abdomen green and gold; the legs and thorax black; the edge of the latter yellow.

mariana. The elytra are ſerrated, and marked with longitudinal wrinkles, likewiſe with two impreſſed ſpots; the thorax furrowed. 6. A native of Europe.

* *chryſocephala.* The elytra are ſerrated, marked with two golden impreſſed ſpots, and longitudinal furrows; the thorax dotted. 7. A native of Europe.

* *ruſtica.* The elytra formed like the roof of a houſe, and ſtriated; the thorax dotted. 8. A native of Europe; in groves.

* *ſalicis.* Shining green; the elytra entire, of a golden colour, and green at the baſe. 85. A native of Europe; on the willow.

120 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

43. Hydrophilus.

Antennæ clavated; the club perforated. Feelers four, filiform. The hind-legs hairy, formed for ſwimming, and almoſt deſtitute of nails or claws.

The inſects of this and the next genus, *dytiſcus*, are inhabitants of ponds and ſtagnant waters, where they ſwim with much dexterity, turning round with great velocity. They fly abroad by night in ſearch of other waters. The males are diſtinguiſhed from the females, by having a horny concave flap or ſhield on the fore-legs, near the ſetting-on of the feet; the hind-legs are peculiarly fitted for their aquatic ſituation, being furniſhed on the inner ſide with a ſeries of long and cloſe-ſet filaments, reſembling a fin, by which they are enabled to ſwim with great eaſe and celerity. The larvæ remain about two years and a half before they change into pupæ, forming a convenient cell, and ſecreting themſelves in ſome bank; are extremely voracious and deſtructive to the more tender aquatic inſects, worms, and young fiſh, which they ravenouſly ſeize with their forked jaws, and deſtroy by ſucking out their juice.

* *piceus.* *Water-clock.* Black; breaſt grooved, with a long ſpine pointing backwards. 1. A native of Europe. The larva appears to have its legs ſeated on the upper part of the body near the back; but this is occaſioned by the peculiar ſhape and poſition of the legs; the female ſpins a flattiſh circular web, terminated by a long tapering horn, from which the young eſcape, as ſoon as they are hatched.

* *caraboides.* Black, ſhining; the elytra ſomewhat ſtriated. 2. A native of Europe.

* *ſcarabæoides.* Black, ſhining; the edges of the thorax and elytra yellow. 3 A native of Europe. Feelers filiform.

* *minutus.* Oval, black; the elytra and legs gray. 11. A native of Europe. It makes a buzzing noiſe in the evening. Thorax is ſometimes gray.

pilula. Black, ſhining above, and thickly dotted. 13. A native of Europe.

Twenty ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

44. Dytiscus.

Antennæ ſetaceous. Feelers ſix, filiform. The hind-legs hairy, almoſt entirely deſtitute of claws or nails, and formed for ſwimming.

* *latiſſimus.* Black; the edges of the elytra dilated, marked with a yellow line. 6. A native of Europe. It is ſo voracious as even to deſtroy its own ſpecies. The male is ſmooth, the female grooved.

* *marginalis.* Black; the whole of the edge of the thorax, and the outer edge of the elytra, yellow. 7. A native of Europe. The fore-feet of the male have a hemiſpherical appendage, with two circular cavities in the middle. The female is ſemiſtriated.

* *ſemiſtriata.* Brown; the elytra hairy, marked with ten furrows, reaching half their length. 8. A native of Europe. It is furniſhed with a ſharp crooked concealed ſword. Its eggs are oblong, large, and white.

* *fulcatus.* The elytra marked with ten longitudinal furrows, and are hairy. 3. A native of Europe and America. The elytra of the male are ſmooth.

notatus. Brown; thorax yellow, marked with four black dots. 31. A native of Europe. The thorax is ſometimes reddiſh, ſometimes variegated with black dots, or with a ſhort black band.

d preſſus. The thorax of a ruſty colour, marked with two black dots at the baſe; the elytra brown, ſpotted with red. 32. A native of Europe.

* *glaber.* Brown; the elytra ſmooth; the legs and belly of a ruſty colour. 86. A native of Britain; in ſtagnant waters.

* *nebuloſus* Bluiſh, clouded with black; the antennæ and legs of a ruſty colour; the belly black, the margin of a light-brown colour. 87. A native of Britain; in ſtagnant waters.

133 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

45. Carabus, *Bull-head.*

Antennæ filiform. Feelers ſix; the laſt articulation obtuſe, and terminating abruptly. Thorax heart-ſhaped; ſmaller end which terminates abruptly being next the body. Both thorax and elytra are marginated.

Theſe inſects are exceedingly active and quick in running: they devour the larvæ of other inſects, and all the weaker animals they can overcome; the legs are long,

long, thighs compreſſed, ſhanks rounded and ciliated within; the fore ones prickly before; the larvæ are found under ground or in decayed wood.

** Majores.*

coriaceus. Black, opake; without wings; the elytra connected and marked with dots which run into one another, and ſomewhat wrinkled. 1. A native of Europe; in woods. One of the largeſt ſpecies in Europe; head and thorax irregularly dotted; body beneath ſhining.

** granulatus.* Without wings, and blackiſh; the elytra of the colour of braſs, ſtriated, and marked with elevated dots, placed between the ſtriæ. 2. A native of Europe; in fields.

** hortenſis.* Without wings; black, the elytra ſmooth, marked with a triple row of bright yellow depreſſed dots, and with a blue edge. 3. A native of Europe; in gardens and woods. The dots on the elytra are ſometimes of the ſame colour with the elytra.

arvenſis. Without wings, and of a blackiſh copper colour; the elytra ſtriated, and marked with a triple row of concave dots. 42. A native of Europe.

** niteus.* Without wings; the elytra rough, green, with longitudinal raiſed lines, the edge golden; legs black. 6. A native of Europe; in woods.

** auratus.* Without wings; the elytra gilt, and marked with elevated ridges and ſmooth furrows. 7. A native of Europe; in cloſe confined places in woods.

violaceus. Winged; the elytra ſomewhat ſmooth, black, with a gilt edge; the thorax of a violet colour. 8. A native of Europe; very common in woods.

** ſycophanta.* Shining golden colour; the thorax blue; the elytra marked with ſtrips of green and gold. 12. A native of Europe. This is the largeſt of this genus that is to be met with in Europe; the larva is black, it attacks caterpillars by night, and devours them.

adſperſus. Without wings; above of an obſcure greeniſh yellow; beneath black; the elytra marked with four rows of concave ſpots, and with furrows. 82. A native of Europe; in woods, under ground. The elytra are ſometimes black.

** * Minores.*

fabuloſus. Pale; the head black, and a black ſpot in the elytra. 96. A native of Europe; in ſandy grounds.

** ruſicornis.* Black; the elytra ſmooth, and furrowed, the antennæ and legs reddiſh. 97. A native of Europe; in woods frequently.

** pilicornis* The thorax roundiſh; the elytra ſtriated, and marked with impreſſed dots; the antennæ hairy. 104. A native of Britain. It is ſometimes black, ſometimes of a bright yellow.

** ſpinibarbis.* Blue; the thorax ſpherical; mouth, antennæ, and ſhanks of the legs reddiſh. 105. A native of England.

crepitans. The thorax, head, and legs, of a ruſty colour; the elytra black. 13. A native of Europe; in groves. It purſues the larger beetles, driving them away by the noiſe made by its belly.

280 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

46. Tenebrio.

Antennæ moniliform; the laſt articulation roundiſh. Thorax flat on one ſide, and convex on the other, and margined. Head projecting. Elytra ſomewhat rigid.

** Feelers ſix, filiform; the Fore-legs formed for digging, furniſhed with projections at the extremity like a hand.*

The larvæ of ſome of the ſpecies of this genus live in damp places under ground among rubbiſh; of others in flour and different kinds of food, where they perform their metamorphoſis. The perfect inſects are very troubleſome in houſes, eating bread, meal &c.; they precipitately avoid the light; reſort to damp cellars, and dark places, where putrefaction allures and nouriſhes them. They are all of a very dark gloomy appearance, from which circumſtance they have received their name.

Black; thorax nearly ſquare; the elytra very ſmooth. 13. A native of Cayenne; large. *complanatus.*

Black. 7. A native of Europe; on ſand hills, in which it digs holes. ** foſſor.*

Brown; thorax oblong, marked with five projecting angles. 8. A native of Europe; in ſand hills. ** curſor.*

** * Feelers unequal; filiform.*

Wholly black, and ſmooth. 21. A native of Egypt; the elytra joined together, the fore legs furniſhed with two projections. *atratus.*

** * * Feelers four; the anterior ones faintly clavated, the poſterior ones filiform.*

Black; the thorax nearly ſquare and ſmooth; the elytra furrowed; the ſhanks of the fore legs crooked and ſharp, terminating in a ruſty-coloured plate. 22. A native of India; the largeſt of the genus. *laminatus.*

Black; the elytra ſtriated; thorax ſmooth. 1. A native of Surinam, about the ſize of the ſtag-beetle; the antennæ are ſomewhat clavated. *gigas.*

Wholly black; the thighs of the fore legs thicker than thoſe of the reſt. 2. A native of Europe; among flour, in bake-houſes, mills, dry bread &c. The larva is white, ſoft, and ſmooth, compoſed of thirteen ſegments; it is eagerly ſought after by the nightingales. ** molitor.*

Of a ruſty colour; the elytra ſtriated, the ſhield emarginated. A native of Europe; in looſe ſand, in rubbiſh, and in granaries. *culinaris.*

Black above; beneath of a deeper and brighter black; the elytra marked with five elevated ſtriæ on each ſide. 45. A native of Europe, in orchards; the larva covered with a looſe net, by twos or threes lurk in the folded leaves. *pomona.*

The thorax marked with two cavities; the elytra of a violet colour or reddiſh; the antennæ and legs of a ruſty colour. 57. A native of Europe. The larva is to be met with in the trunks of pine trees that have been cut down, the inner bark of which they conſume; the inſect is, when full grown, about half an inch long. *lignarius.*

64 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

47. Pimelia.

Antennæ filiform. Feelers four. Thorax flat on one ſide, and convex on the other and marginated. Head projecting.

jecting. Elytra ſlightly ridged. Wings are wanting in many of the ſpecies.

** Antennæ moniliform towards their extremity.*

A. *Feelers clavated.*

gages. Black; thorax roundiſh; the elytra ſharp pointed and very ſmooth. 1. A native of Europe.

ſulcata. The elytra furniſhed with ſharp points, and furrowed. 2. A native of Egypt; common in gardens. They are recommended as remedies in the earache, and againſt the bite of ſcorpions; the Turkiſh women dreſs and eat them, and think them very fattening.

** mortiſaga.* Black; the elytra are furniſhed with ſharp points, and ſmooth. 3. A native of Europe; in ſhady cloſe ſituations. This inſect is regarded as a preſage of the death of one of the family, by the common people in Sweden, when it is ſeen crawling about the houſe.

B. *Feelers filiform.*

muricata. Black; the elytra obtuſe, ſtriated, and furniſhed with ſharp points. 20. A native of Europe, and the northern parts of Africa and Aſia; it makes a noiſe by rubbing its hind legs againſt its elytra; it reſembles the *mortiſaga*, but larger.

ſtriatula. Black; the elytra oblong, oval, and ſtriated. 54. A native of Europe.

*** The Antennæ filiform through their whole length.*

A. *Feelers four, filiform.*

tricuſpidata. The thorax furniſhed with three ſharp points; body gray. 56. A native of Egypt.

B. *The anterior feelers hatchet-ſhaped, the poſterior ones clavated.*

cærulea. Bluiſh; the thorax nearly round, the elytra ſtriated. 61. A native of Europe.

** anglica.* Black; the thorax roundiſh before; the elytra dotted and ſtriated; the antennæ reddiſh at the tips. 76. A native of England.

buparia. Black; ſmooth and furniſhed with wings; the thorax circular; the jaws ſtrong, furniſhed with teeth, and longer than the head. 84. A native of Europe.

84 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

48. MANTICORA.

Antennæ filiform. The articulations cylindrical. Feelers four, filiform. Thorax roundiſh before, and emarginated at the tip behind. Head projecting. Jaws projecting. Elytra united. No wings.

maxilloſa. 1. A native of the Cape of Good Hope; body large, black; head nearly globular, and impreſſed on each ſide; jaws furniſhed with teeth at the baſe; thorax impreſſed in the middle, and clavated behind, the margin rounded and notched at the tip; elytra above, flat and rough, deflected at the edge with a very ſharp lateral ſerrated line; legs ſimple, black.

Only one ſpecies of this genus has been deſcribed.

49. ERODIUS.

Antennæ moniliform. Feelers four, filiform. Jaw horny, bifid, and ending abruptly. Lip horny, emarginated.

teſtudinarius. Hunch-backed, black; the elytra united and rough; the ſides duſty white. 1. A native of the Cape of Good Hope; large, flat beneath.

Hunch-backed, black; the elytra marked with three dotted lines. 2. A native of Africa; in looſe ſand, and very common in Egypt. *gibbus.*

Black; the elytra marked with one clavated line. 3. A native of Egypt. *planus.*

Black; the elytra very ſmooth. 4. A native of Aſia. *minutus.*

Only four ſpecies of this genus have been deſcribed.

50. LYTTA.

Antennæ filiform. Feelers four, unequal; the poſterior pair clavated. Thorax roundiſh. Head inflected, and turgid on the upper ſide. Elytra ſoft, and flexible.

Green; the antennæ black. 1. A native of Europe; on the privet, the aſh, the elder, the lilach both common and Perſian, the poplar, and on the Tartarian woodbine. *veſicatoria.*

This inſect is uſed in pharmacy, chiefly for the purpoſe of raiſing bliſters. It multiplies greatly, and has a nauſeous ſmell, not much unlike that of mice; which helps to conduct thoſe who go in queſt of them. The odorous particles exhaled from them are extremely corroſive. They were formerly ranked among the *cantharides*; more recently in the genus *meloë*. More accurate obſervation has placed them in the genus *lytta*.

Green and gold; the elytra reddiſh brown. 2. A native of England. ** nitidula.*

Black, ſmooth; breaſt downy; the elytra grayiſh yellow, marked with two black and almoſt ſquare ſpots. 14. A native of the north of Aſia. A pleaſant ſmelling oil exſudes from its legs. *quadrimaculata.*

Smooth, pale reddiſh brown; thorax depreſſed; elytra gray, and black at the tips, and marked with two ſquare glazed ſpots. 15. A native of the north of Aſia, among flowers; of a middle ſize. A pleaſant ſmelling oil is likewiſe exſuded from its legs. *feneſtrata.*

Brown; the fore part of the elytra, and the thorax, which are elongated, are red. 29. A native of Europe. *formicaria.*

29 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

51. MELOE, *the Bloſſom-eater.*

Antennæ moniliform. Thorax roundiſh. Elytra ſoft, and flexible. Head inflated, and turgid on the upper ſide.

The larva as well as the perfect inſect, both of this and the preceding genus, feed on leaves.

** No Wings; Elytra ſhortened.*

Body of a violet colour. 1. A native of Europe. It is to be met with, particularly in the ſpring, in ſandy plains. They feed on the ranunculus and veratrum; its eggs have a pleaſant ſmell; when touched, a very thin yellowiſh oil exſudes from the joints of its legs. It is recommended as a remedy in the hydrophobia. The female is thrice as large as the male. ** proſcara. bæus.*

The ſegments of the abdomen red. 2. A native of the ſouth of Europe. *majalis.*

** Furniſhed with Wings; the Elytra covering the Wings.*

A. *Jaw bifid.*

Black; the elytra yellow, marked with three black bands. *cicborci.*

bands. 5. A native of Aſia, and the eaſt of Europe. It is uſed in medicine among the Chineſe. The antennæ are ſometimes yellow at the tips.

decempunctatus. Black; the elytra reddiſh, marked with five black dots. 6. A native of Italy. The laſt articulation of of the antennæ clavated.

B. *Jaw entire.*

ſchæfferi. Green; the antennæ and legs yellow. 12. A native of Europe.

ſchreberi. Green; the antennæ, legs, and three ſegments of the abdomen, yellow.

32 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

52. MORDELLA, *the Nibbler.*

Antennæ moniliform or pectinated. Feelers four; the anterior pair clavated, the poſterior filiform. Head bent down under the neck. Elytra bent downwards towards the lip. Before the thighs, and at the baſe of the abdomen, there is a broad plate.

* *Antennæ pectinated.*

paradoxa. The ſides of the thorax, and the elytra, a brick colour. 1. A native of Europe; on umbelliferous plants.

flabellata. Reddiſh brown; mouth, breaſt, and upper part of the abdomen, black. 10. A native of Europe.

** *Antennæ moniliform.*

bimaculata Of a ruſty colour; breaſt black; elytra reddiſh marked with a black ſpot. 13. A native of Europe. Large.

* *aculeata.* Black; the anus terminating in a ſpine. 2. A native of Europe; on umbelliferous, and a variety of other plants.

* *abdominalis.* Black; thorax and abdomen tawny; the anus terminating in a ſpine. 19. A native of Europe.

* *humeralis.* Black; the mouth, ſides of the thorax, and legs yellow. 3. A native of Europe; on flowers.

* *licolor.* Black; the elytra reddiſh, black at the tip, and marked with a black band in the middle. 25. A native of Britain; very common on the flowers of the hawthorn, of the dock, and of ſome kinds of umbelliferous plants. Very ſmall.

*** *Antennæ clavated.*

* *clavicornis.* Wholly black. 23. A native of Europe; on the rhubarb.

28 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

53. STAPHYLINUS, *Rove-beetle.*

Antennæ moniliform. Feelers four. Elytra half the length of the body. Wings covered. Tail ſimple, furniſhed with two veſicles, which can be thruſt out at pleaſure.

This is an extremely rapacious tribe, devouring whatever inſects they can catch, and frequently each other; many of them, when laid hold of, turn up the tail; the jaws are ſtrong and projecting, with which they bite and pinch very hard. Moſt of them are found in damp places, among putrid ſubſtances, and a few upon flowers. The larvæ live under ground.

* *All the Feelers filiform.*

Hairy, black; the thorax and poſterior part of the abdomen black. 1. A native of Europe; in ſandy places. * *hirtus.*

Downy, and aſh coloured, clouded with black. 2. A native of Europe; in dead bodies, and in dung. The elytra blue underneath; larva ſix-footed, naked, pale; the head and three firſt ſegments of the abdomen cheſnut brown; tail with two jointed briſtles, and a cylindrical tubercle beneath. * *murinus.*

Downy black; marked with aſh-coloured bands; the jaws of the ſame length with the head. 3. A native of Europe; in woods, living on plunder. * *maxillofus.*

Black; the thorax and elytra ſhining. 5. A native of Europe; on dead bodies; when recently caught, it diffuſes a very fragrant ſmell. * *politus.*

Black; the edges of the thorax yellowiſh; the elytra of a ruſty colour, with a black edge. 4. A native of Britain. * *nitidulus.*

** *The poſterior Feelers hatchet-ſhaped.*

Reddiſh; the head, poſterior part of the elytra and abdomen, as well as the baſe of the thighs, black. 6. A native of Europe; on the *boletus.* * *rufus.*

Black; the elytra, antennæ, and legs of a ruſty colour. 22. A native of Europe; on the *boletus.* *flavipes.*

*** *The anterior Feelers clavated.*

Reddiſh; the elytra blue; the head and tip of the abdomen black. 9. A native of Europe. *riparius.*

Black; thorax reddiſh; the elytra pale blue. 96. A native of Europe; under ſtones. *ruficollis.*

Black; the poſterior part of the elytra, the legs and antennæ, of a ruſty colour. 14. A native of Europe. *elongatus.*

56. FORFICULA, *the Earwig.*

Antennæ ſetaceous. Feelers unequal and filiform. Elytra half the length of the body. Wings covered. Tail furniſhed with pincers.

The larvæ of the forficula run very quickly. This inſect is very common, and very well known; the pincers at its tail, from whence it has received its Latin name *forficula*, afford a very good diſtinguiſhing mark.

The elytra white at the tip; the antennæ have fourteen articulations. 1. A native of Europe; common in fruit. It is accuſed of creeping into the ears of people while ſleeping, whence it has received its name, *earwig.* * *auricularia.*

Pale above, variegated with black; the anus furniſhed with two projections; the pincers projecting conſiderably, and each furniſhed with one projection. 3. A native of Europe. Very large. *gigantea.*

The elytra reddiſh, without ſpots; the antennæ have ten joints. 2. A native of Europe. The tips of the antennæ are whitiſh. It is rare. * *minor.*

Black; the hind-part of the head and legs reddiſh; back of the elytra marked with a white ſpot. 4. A native of Europe. The antennæ have eleven joints. *bipunctata.*

11 ſpecies of this genus bave been deſcribed in the laſt edition of the Syſtem of Nature.

II. HEMIPTERA.

The mouth and ſnout bent inwards, towards the breaſt. Wings covered with hemelytræ. The upper wings, compoſed of a ſemicruſtaceous ſubſtance, do not form a ſtraight ſuture when ſhut, but the inferior edge of the one paſſes over the ſuperior edge of the other.

55. Blatta, *Cock-roach.*

Head bent inwards. Antennæ ſetaceous. Feelers unequal, filiform. Elytra and wings ſmooth, and ſomewhat reſembling leather. Thorax flattiſh, circular, and marginated. Feet formed for running. Two ſmall horns are ſituated at the tail in moſt of the ſpecies.

Theſe inſects, with their larvæ, wander about by night, and ſecrete themſelves by day. They are fond of warmth, and haunt about houſes, devouring meal, and whatever proviſions they can get at. They run with great celerity; and are deſtroyed by the fumes of charcoal or ſulphur, alſo by the root of the *nymphæa alba* boiled in milk.

gigantea. Livid; the ſhield of the thorax marked with a ſquare cheſnut-coloured ſpot. 1. A native of Aſia and America. It is the largeſt of this genus, being nearly the ſize of a hen's egg.

maderæ. Brown; the thorax and elytra livid, and variegated with brown. 11. A native of the iſland of Madeira; a little ſmaller than the laſt ſpecies.

** americana.* Of a ruſty colour; the ſhield of the thorax whitiſh behind. 4. A native of America; it has been introduced into Europe along with ſugar.

auſtralaſiæ. Of a ruſty colour; the thorax black, marked with a white ring; the elytra marked at the baſe with a ſmall white line. 13. Found in ſhips returning from the ſouth ſeas.

** orientalis.* Of a ruſty brown colour, without ſpots; the elytra ſhort, marked with an oblong furrow. 7. A native of America, and has been introduced into Europe for almoſt two hundred years. Frequent in many countries of Europe, in meal and bread, and other proviſions; likewiſe in ſhoes, which it deſtroys. It ſhuns the light, and runs very quickly. It is much haraſſed by the large *tenthredo cærulea*. The female is without wings; ſhe produces a cylindrical egg, half the ſize of the abdomen.

lapponica. Yellowiſh; the elytra ſpotted with black. 3. A native of Europe; conſuming proviſions. In the moiſt woods however of the eaſt of Europe it is leſs noxious.

germanica Livid; body yellowiſh; the thorax marked with two black parallel lines. 9. A native of Europe.

maculata. Thorax black, with a whitiſh edge; the elytra pale, marked with a large black ſpot near the tip. 25. A native of Europe; in pine foreſts and heaths.

43 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

56. Pneumora.

Body oval, inflated, and tranſparent. Head bent inwards, and furniſhed with jaws. Thorax convex, beneath formed like a keel of a ſhip. Elytra deflected and membranaceous. Legs formed for running.

The whole of this genus ſeem to conſiſt of a mere hollow inflated membrane; by rubbing their legs againſt their bodies, they make a ſhrill noiſe in the twilight; and during the night, they are attracted by a bright light.

Elytra without ſpots. 1. A native of the Cape of Good Hope. Head green; eyes white; between the eyes are three red ſtigmata, and above theſe two ſhort projections; antennæ ſhort, green; thorax rough, with a ſhort tooth before and an impreſſed wrinkle in the middle; the elytra aſh-coloured, reticulated with green, ſometimes marked with very ſmall black dots; they are very rarely yellowiſh or reddiſh; the inſect is about twice the ſize of the houſe-cricket. *immaculata.*

Three ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

15. Mantis, *Soothſayer.*

Head nodding; furniſhed with jaws. Feelers filiform. Antennæ ſetaceous. Wings four, membranaceous, rolled up. Fore-legs compreſſed, notched underneath, furniſhed with one hook, and with a lateral ſetaceous jointed finger; the four hind-legs ſmooth, and formed for walking. Thorax linear, long, and narrow.

The thorax ſomewhat tapering and rough; the elytra very ſhort; the legs prickly. 1. A native of Aſia; wings very large. *gigas.*

Thorax marginated, and marked with ſmall projections; the elytra variegated with green and white; dotted with white along the edge. 17. A native of Alexandria. *mendica.*

The thorax ſmooth; the elytra green; the wings reddiſh at the anterior part, marked with a black ſpot. 6. A native of Europe. This inſect reſts ſometimes on its four hind-legs, ſtretches the fore-legs out to the right or left, and for this reaſon has been ſuppoſed to point out the way to ſtrangers, when aſked. *oratoria.*

The thorax ſomewhat fringed; the elytra greeniſh, marked with a ruſty-coloured ocellus. 8. A native of America and Africa; the half of the ocellus on the elytra is white, ſometimes entirely white. This is ſuppoſed to be the idol of the Hottentots. *precaria.*

Linear, aſh coloured, ſpotted with black. 30. A native of the Cape of Good Hope. This is the tutelary deity of the Hottentots. *fauſta.*

52 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

58 Gryllus, *Cricket.*

Head bent inwards; furniſhed with jaws. Feelers filiform. Antennæ either ſetaceous or filiform. Wings four, either deflected or twiſted; the under wings folded. Hind-legs formed for leaping.

The whole of this genus feed on vegetables, except thoſe contained in the firſt diviſion, *acrida*, which devour other inſects; the *achetæ* deſtroy the roots of plants; the *tettigoniæ* and *locuſtæ*, the leaves or tender ſhoots, in ſome countries laying waſte whole diſtricts; the larvæ and pupæ reſemble the perfect inſects, reſide chiefly under ground, and are ſix footed, voracious and active: ſome of this tribe are uſed as an article of food by the natives of Africa and India; many of them produce ſound by the friction of ſome parts of their body.

** Antennæ the ſhape of a ſword; Head conic, and longer than the thorax.* Acridæ.

naſutus. Body green. 1.

turritus. Head conic; antennæ ſword-ſhaped; the wing tranſparent. A native of Africa and the ſouthern parts of Europe; the mouth placed at the under part of the head; antennæ on the top of the head, and not longer than the thorax.

giganteus. Green; marked with two reddiſh fillets; the antennæ of a ruſty colour; thorax marked with three raiſed lines. 64. A native of America; larger than the *gr. naſutus.*

foliaceus. Wings yellowiſh; the antennæ reſembling a leaf. 67. A native of Aſia.

** * Thorax formed like a keel; Antennæ filiform, ſhorter than the thorax.* Bullæ.

** bipunctatus.* Browniſh; the ſcutellum of the thorax, of the ſame length with the abdomen. 7. A native of Europe; on ſand hills expoſed to the ſunſhine.

** ſubulatus.* The ſcutellum longer than the abdomen. 3. A native of Europe; in ditches. It is ſometimes gray, ſometimes brown.

*** Antennæ ſetaceous; Feelers unequal; Thorax rounded; the Tail furniſhed with two briſtles.*

** gryllotalpa.* *Mole-cricket.* The wings furniſhed with a projection like a tail, and longer than the elytra; the fore-feet formed like hands, and downy. 10. A native of Europe. This troubleſome little animal frequents gardens and cultivated grounds, both of Europe and America, where it burrows below the ground, and is very deſtructive; eating and deſtroying the roots of plants. Body dark brown, hairy; antennæ ſhorter than the body.

monſtroſus. The elytra and wings furniſhed with projections like tails, and rolled up. 73. A native of India.

** domeſticus.* *Houſe-cricket.* The wings furniſhed with a tail and longer than the elytra; legs ſimple; body yellowiſh brown. 12. A native of Europe; in many houſes, about ovens, and kitchen chimneys: wanders about during the whole night, keeping a continual chirping, eſpecially before rain; is ſaid to forſake houſes infeſted by the cockroach. There is a variety of this ſpecies ſix times the ſize of the European. Arſenic or the root of the wild carrot, mixed up into a paſte with flour, is ſometimes made uſe of to poiſon them; but an opinion prevails among the vulgar, that their preſence in any houſe is the cauſe of good fortune; and, therefore, though they be troubleſome, they are unwilling to drive them away.

** campeſtris.* *Field-cricket.* Wings ſhorter than the elytra; body black, and furniſhed with a long ſpine. 13. A native of Europe; chirps from the beginning of May till the end of September, and is ſaid to drive away the houſe-cricket when domeſticated.

pellucens. Whitiſh; thorax of the form of a trapezium. 85. A native of Carniola and Europe; in vineyards and gardens; about half an inch in length; it makes a noiſe during the whole ſummer in the night time; it reſembles the houſe cricket, but larger; the head is ſhining; the thorax is marked with three brown ſpots, the elytra with yellowiſh ones.

** * * Antennæ ſetaceous. Feelers unequal. Tail of the female armed with a projection like a ſword.* Tetigoniæ.

aquilinus. The thorax round, and ſomewhat warty; wings very broad; with 15 nerves. 27. A native of South America and India; large; the elytra of the ſhape of a lance; the ſhanks of the legs ſet with four rows of prickles.

griſeus. Brown; the thorax roundiſh and keel-ſhaped behind, furniſhed with a black crooked ſpine reſembling a ſword, the baſe of which is pale on each ſide. 108. A native of Europe; the antennæ yellow, and of the ſame length with the body; legs greeniſh; the elytra variegated with brown and aſh-colour.

viridiſſimus. The thorax round; the wings green and without ſpots; the antennæ very long. 31. A native of Europe; on trees, in paſture grounds, in barley fields. It makes a noiſe in the night time in warm weather about the time of the dog days.

** verrucivorus.* Thorax nearly ſquare and ſmooth; the wings green, ſpotted with brown; the antennæ ſetaceous, about the ſame length of the body. 34. A native of Europe, and is collected by the common people of Sweden for the purpoſe of deſtroying warts in the hand; which it is ſaid to perform by biting off the excreſcences, and diſcharging on the wound a fluid which cauſes them to decay.

** * * * * Antennæ filiform, Feelers ſimple, Tail unarmed.* Locuſtæ.

elephas. The thorax entirely keel-ſhaped; body without wings. 35. A native of Africa; this is the largeſt and heavieſt of the *Locuſtæ*; green, the thighs ſmooth, the rudiments of two wings.

migratorius. The thorax faintly carinated, compoſed of one ſegment; head obtuſe; jaws black. 41. A native of Tartary, and migrates in incredible ſwarms into various parts of Europe. The miſchief theſe voracious creatures do, when they appear in vaſt ſwarms, far exceeds that done by any other tribe of animals. By ſuddenly deſtroying all vegetation, they change the moſt fertile countries into barren deſerts, leaving behind them deſolation and famine. They have occaſionally appeared in ſmall flights in England, but have periſhed in a ſhort time. This was probably the ſpecies that conſtituted one of the plagues of Egypt. They are eaten by the inhabitants of different countries, particularly by the Egyptians, who roaſt them alive and eat their bodies, after having removed their wings and legs.

** ſtridulus.* The thorax marked with an elevated ridge like a keel, the wings red and black at the tips. 47. A native of Europe; in dry ſandy ſituations, chirping all day long, till late at night. Either black or variegated with black and yellow.

240 ſpecies of this genus have been deſcribed.

59. Fulgora, *Lanthorn fly.*

The head inflated; fore head prominent. The antennæ ſhort, placed under the eyes, compoſed of two articulations, the upper one being the largeſt and globular.

globular. The ſnout long and bent inwards, is a ſheath conſiſting of five articulations. Legs formed for walking.

nterna-ia. The forehead extended, forming a ſtraight beak; wings bluiſh, the under wings marked with ocelli. 1. A native of South America. It emits a very bright light from the prominent part on its forehead. Travellers are ſaid to avail themſelves of the light they emit; two or three of them, fixed on the end of a ſtick, affording light ſufficient to let them ſee in the dark.

iadema. The fore-head ſet with tapering points, and extended into a beak, divided at the tip into three; wings black, ſpotted with red. 2. A native of India.

andelaria The forehead extended into a clavated beak; the elytra green, ſpotted with yellow; the wings yellow with black tips. 3. A native of China.

hoſphorea The forehead raiſed into a tapering beak; body grayiſh yellow. 4. A native of South America.

yalina. The forehead conic and unequal; wings tranſparent, marked with a black ſtreak. 17. A native of Bengal.

20 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

60. CICADA, *Frog-hopper.*

Snout bent inwards. Antennæ ſetaceous. Wings four; membranaceous and deflected. Legs, (in the moſt of the ſpecies) are formed for leaping.

The inſects of this genus feed on the juice of plants; the larva is without wings; the pupa has only the rudiments of wings, but they have both ſix legs; they very much reſemble the perfect inſect, and are very active; the perfect inſect chirps as well as thoſe of the preceding genus.

* *Antennæ tapering at the point, and placed on the forehead.* Membracides.

A. *Thorax compreſſed, membranaceous, and larger than the body.* Foliaceæ.

ſtata. The thorax inflated, light brown and reticulated. 52. A native of Cayenne.

geniſtæ. The thorax brown; lengthened out behind, the abdomen being half the length of the thorax. 56. A native of England; on the *geniſta tinctoria.*

ermis. The thorax greeniſh, tapering to a point, and of the ſame length with the abdomen. 57. A native of America, on plants.

B. *The thorax furniſhed with a horn on each ſide.* Cruciatæ.

cornuta. The thorax furniſhed with two horns; black, tapering to a point behind, and of the ſame length with the abdomen; wings brown. 6. A native of Europe; on thiſtles and willows.

* * *Legs not formed for leaping.* Maniferæ.

lebeia. The tip of the ſcutellum marked with two ſmall projections; the elytra marked with four anaſtomoſes, and ſix lines of a ruſty colour. 15. A native of Europe and Africa, very large. Of this inſect Virgil ſays, *et cantu quærulæ rumpent arbuſta cicadæ*, and *ſole ſub ardente reſonant arbuſta cicadis.*

ni. Black, ſpotted with yellow; the elytra are ſurrounded with a thin edge, with ſix brown connected dots; the wings are white, marked with two black ſpots, and yellow at the baſe. 16. A native of Europe; the larva is eatable.

* * * *Antennæ filiform, ſituated under the eyes.*

A. *The ſheath of the ſnout ſtretched out, obtuſe, and grooved above.* Cercopides.

Yellowiſh; the elytra brown, marked with two white bands. 11. A native of Europe; on plants of different kinds. *bifaſciata.*

Brown; the elytra are marked on the ſides with two white ſpots, and with a double interrupted whitiſh band. 24. A native of Europe; on various plants, frequently on the roſe, on graſs and oſier; the larvæ and pupæ of this, and ſome others of the genus, diſcharge a frothy matter from numerous pores about the tail, within which they are completely encloſed; this is frequently found in ſummer on various plants, very much reſembling a quantity of ſaliva, and is commonly known by the name of *cuckow ſpit*; the perfect inſect will frequently leap two or three yards to eſcape from any one who attempts to catch it. * *ſpumaria.*

Brown; the fore part of the thorax marked with impreſſed dots, the elytra marked on the ſides with two white ſpots. 212. A native of Europe. *punctulata.*

† † *The ſheath of the ſnout very ſhort, membranaceous, cylindrical, obtuſe.*

* *Legs formed for leaping.* Ranatræ.

Brown; wings tranſparent, ſpotted with brown, and marked with dotted ribs. 25. A native of Europe; on plants. *nervoſa.*

Yellow; the elytra gilt and brown. 123. A native of Britain; on plants. * *fulgida.*

§ § *The wings deflected, covering the ſides.* Deflexæ.

Yellow; the elytra marked with brown, with four black ſpots, and gilt behind. 48. A native of Europe. *aurata.*

Yellowiſh; the elytra marked with blood-coloured ſpots, and brown at the tips. 173. A native of Europe; on the oak. *quercus.*

240 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

61. NOTONECTA, *Boat-fly.*

Snout bent inwards. Antennæ ſhorter than the thorax. Wings four, folded croſs-wiſe, the upper ones coriaceous. Hind legs hairy, formed for ſwimming.

The inſects of this and the next genus, *Nepa*, live in ſtagnant waters, and prey on aquatic animals; the larvæ and pupæ are ſix-footed, active, and ſwim readily, and very much reſemble the perfect inſect; the larvæ is deſtitute of wings, the pupæ have only the rudiments of wings.

* *Lip long.*

The elytra gray, dotted with brown along the edge, and divided at the tip. 1. A native of Europe; in waters, very troubleſome to fiſh. It ſwims on its back, for which reaſon it has been called by the Greek name of *notonecta*. The hind legs, which are longer than the reſt, ſerve it as oars. When caught, it muſt be cautiouſly handled, as the point of its ſnout is very ſharp, and its puncture very painful. * *glauca.*

* * *No*

* * *No lip.* Sigaræ.

**ſtriata.* The elytra brown; marked with a great number of croſs waved lines of a darker colour. 2. A native of Europe.

14 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

62. Nepa, *Water Scorpion.*

Snout bent inwards. Antennæ ſhort. Wings four, folded croſs-wiſe, the upper ones coriaceous. The fore-legs formed like claws; the other four are formed for walking.

The inſects of this genus are very voracious, and feed on other aquatic animals, which they pierce and tear with their ſharp ſnout, while they hold them with the claws of their fore-legs. They fly well, eſpecially in the evening and night, and convey themſelves from one pool to another, particularly when water begins to fail in the pool they have been in.

* *Antennæ divided into ſeveral diviſions reſembling a hand; Lip wanting.*

**cinerea.* Aſh-coloured; thorax unequal; body long and oval. 5. A native of Europe; in ſtagnant waters; the upper part of the abdomen red.

**linearis.* Linear; the claws furniſhed with a lateral ſpine. 7. A native of Europe and India, in freſh water. The eggs of this inſect are furniſhed at one end with two hairs; they depoſit them in holes made in ſtalks of ruſhes, leaving the hairs ſtanding out.

* * *Lip ſtretched out and roundiſh.* Naucorides.

**cimicoides.* The edge of the abdomen ſlightly notched. 6. A native of Europe.

Twelve ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

63. Cimex, *Bug.*

Snout bent inwards. Antennæ longer than the thorax. Wings four, folded croſswiſe; the upper wings coriaceous in the fore part. Back flat. Thorax marginated. Legs formed for running.

Moſt bugs have a bad ſmell; all of them except the *reduvii*, feed on the juice of plants, and all of them, without exception, on the juices of animals, particularly of the ſofter inſects, which they ſuck by means of their ſnout. The larvæ and pupæ have ſix feet, run quickly, and very much reſemble the perfect inſect; the larvæ have no wings, only ſtumps of wings.

* *Antennæ placed before the Eyes.*

A. *Lip wanting.* Acanthiæ.

† *Without Wings.*

**lectularius.* *Houſe-bug.* Without wings. 1. A native of Europe, though originally a foreigner; it was introduced into Europe before the Chriſtian era, but not into Britain until the ſeventeenth century, being little known before the year 1670. It is a troubleſome and nauſeous inhabitant of moſt houſes in large towns; crawling about in the night time to ſuck the blood of ſuch as are aſleep, and hiding itſelf by day in the moſt retired holes and crevices.

†† *The Elytra almoſt totally coriaceous.* Coleoptrati.

Black; without wings; the elytra oval, with yellow edges, and ſhorter than the abdomen. 13. A native of Europe. The thorax reſembling the *gryllus*. *grylloides*

††† *Membranaceous and very flat.*

The thorax divided into three wings; the ſcutellum reſembling a leaf; the elytra reticulated and ſwelling out at the baſe. 137. A native of Europe; on the under ſurface of the leaves of the pear tree, which become ſpotted with its punctures. * *pyri.*

B. *Lip long, tapering to a point at the extremity.*

† *The Scutellum of the ſame length with the Abdomen.* Scutellati.

Black; the thorax marked with five, and the ſcutellum with three orange-coloured lines; the abdomen yellow, dotted with black. 6. There is a variety of this ſpecies. *lineatus.*

(β) Red; the thorax marked with five, and the ſcutellum with three black lines; the abdomen yellow, dotted with black. A native of Europe; on the flowers of the apple and elder. *nigrolineatus.*

†† *The Thorax armed with a ſpine on each ſide.* Spinoſi.

The thorax armed with blunt prickles; the elytra gray, marked with a brown ſpot, the ſhield emarginated. 190. A native of England; in thickets. * *luridus.*

††† *Thorax without ſpines.*

A. *Rotundati, ſuch as are round or oval.*

Somewhat tawny, the edge of the abdomen ſpotted with brown. 45. A native of Europe; on berries. * *baccharum.*

Blue, with a metallic luſtre; the thorax marked with a ſmall line; the tip of the ſcutellum, and dots on the elytra, all of a red or white colour. 53. A native of Europe; on tetradynamious plants. It is very deſtructive to cabbages and to turnip fields. * *oleraceus*

B. *Such as have the Thorax oblong.*

† *Antennæ terminating in ſmall hairs.*

Black; head, thorax, and legs reddiſh. 364. A native of England. * *flavicollis.*

* * *Antennæ clavated.*

Brown; head and thorax reddiſh. 679. A native of Europe. *ictericus.*

C. *Antennæ filiform.*

‡ *Legs ſmooth.*

Yellowiſh; elytra green. 36. A native of Europe; in meadows. * *pratenſis.*

‡ ‡ *Legs*

‡ ‡. *Legs notched or prickly.*

alcaratus. Brown; the upper part of the abdomen of a blood colour; the thighs of the hind-legs furnished with six sharp projections. 114. A native of Europe.

D. *Antennæ setaceous.*

‡ *Legs notched.*

lictis. Spotted, with tawny coloured spots; legs reddish; thighs thick. 115. A native of Europe; on the fir tree.

‡ ‡ *Legs without prickles.*

atulinus. Green, without spots; wings transparent. 83. A native of Europe; in meadows.

§ § § *Linear; Body oblong and narrow.*

‖ *Antennæ setaceous.*

edes. Variegated, with brown and yellow; the thighs of the hind-legs long and notched. 524. A native of India.

‖ ‖ *Antennæ filiform.*

flagno-um. Black and tapering; the thorax marked in the centre with two globular dots. 113. A native of England; very common in lakes.

‖ ‖ ‖ *Antennæ clavated.*

-ispinosus. Greenish brown; the antennæ long, with three erect prickles on the back. 542. A native of Surinam.

‖ ‖ ‖ ‖ *Antennæ double clavated.*

tecicus. Ash-coloured; the thighs clavated. 543. A native of Europe.

‖ ‖ ‖ ‖ ‖ *Antennæ with two terminations.*

pularius. Whitish; all the legs very long; the thighs clavated. 120. A native of Europe; on mosses.

* * *The Antennæ placed above the Eyes; the Snout arched.* Reduvii.

ersonatus. The antennæ resembling hairs at the tips; body somewhat hairy and brown. 67. A native of Europe; in rubbish. The larva is rough, and destroys the house-bug.

ridulus. Smooth, black; the elytra brown, spotted with black, and with a red edge. 557. A native of Europe. It is small, and moves about with great agility early in the spring; it keeps its antennæ in constant motion, and makes a shrill noise by rubbing them against the thorax.

693 species of this genus have been described in the last edition of the System of Nature.

54. Macrocephalus.

Snout bent inwards. Sheath of one valve, and consisting of three articulations, and furnished with three bristles, destitute of jaws, feelers, and lip. Antennæ stretched forwards, very short, clavated, and nearly moniliform. Head oblong, cylindrical above. Scutellum of the length of the abdomen, flat and membranaceous.

A grayish-reddish colour; the scutellum of an ash-colour; a yellow spot on the elytra; the wings of a purplish violet colour; the thighs of the fore-legs thickened. 1. A native of America. *cimicoides.*

Only one species of this genus has been described in the last edition of the System of Nature.

65. Aphis, *Plant-louse* or *Vine-fretter.*

Snout bent inwards; a sheath of five joints, furnished with one bristle. Antennæ setaceous, and longer than the thorax. Wings four, erect in none. Legs formed for walking. Abdomen frequently terminating in two horns.

The minute animals which compose this singular genus, infest various plants, generally in large societies, hindering their growth, and consuming their juices. A peculiarity in the mode of their propagation attracted the attention of naturalists a good deal towards the beginning and about the middle of last century. Reaumur, from some observations of his own, and from the opinions of some preceding observers, was led to believe, that they propagated without sexual connection. Bonnet adopted the same opinion, and thought he had established it beyond controversy by some very accurate experiments and observations of his own, which he communicated to the Royal Academy of Sciences. He shut up a young aphis, at the instant of its birth, in the most perfect solitude, which nevertheless brought forth 95 young ones in his sight. The same experiment being repeated on one of this family, it multiplied like its parent; and one of this third generation, brought up in solitude, proved no less fruitful than the others. Repeated experiments, in this respect, as far as the fifth or sixth generation, all uniformly afforded the same result. A suspicion entertained by Mr Trembley induced Mr Bonnet to repeat his experiments with still more accuracy, and to continue them longer. He reared to the amount of the tenth generation of solitary aphides, and had the patience to keep an account of the days and hours of the births of each generation: he discovered, that they are really distinguished by sexes; that the males are produced only in the tenth generation, and are but few in number; that these soon arrive at their full growth, and copulate with the females; that the virtue of this copulation serves for ten generations: he likewise found that they were viviparous during spring and summer; and that they were oviparous only in the tenth generation; that from these eggs the aphides of the following year were hatched early in the spring. His observations have been repeated by other naturalists, particularly by Dr Richardson of Rippon, who has given a very minute account of his observations, in a paper published in the Philosophical Transactions, vol. xi. art. 22. These little animals discharge from their anus a sweet fluid, commonly called *honey-dew*, which attracts the bees and ants. The species are very difficultly distinguished: it is still more difficult to describe them; different species are sometimes found on the same plant.

Of

* *longiroſtris.* Of an aſh-colour; the ſnout three times the length of the body. 34. A native of Europe; under the barks of trees; feeds on the larvæ of the ants.

* *vitis.* 56. A native of Europe; on the vine. This deſtructive little inſect cuts through the peduncles, or ſtems which ſupport the cluſters of grapes, in their very early ſtage, cauſing them to wither and drop off ſoon after the fruit is formed.

* *piſtaciæ.* Black; wings whitiſh; ſhanks of the legs very long; the thorax warty. 33. A native of Europe and Aſia; on the piſtachia: the antennæ moniliform; eyes blackiſh; the abdomen without briſtles, covered with white down, mixed with ſmall balls; the wings ſometimes erect. It is lodged in a follicle ariſing from the baſe of the leaf, ſwelling out in the middle, and tapering towards each end, of more than an inch in thickneſs, at firſt green, after the inſects have left it becoming fleſh-coloured.

77 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

66. Chermes.

The ſnout is a ſheath placed in the breaſt, furniſhed with three briſtles, bent inwards. Antennæ cylindrical, longer than the thorax. Wings four, deflected. Thorax turgid on the upper ſide. Legs formed for leaping.

Theſe inſects inhabit various trees and plants, and produce by their punctures, protuberances and excreſcences of various ſhapes and ſizes, in which are frequently encloſed the eggs, and inſects in their ſeveral ſtates; the larva is ſix-footed and apterous; the pupa is diſtinguiſhed by two protuberances on the thorax, which are the rudiments of future wings.

* *graminis* 1. A native of Europe; on graſſes, particularly the *aira flexuoſa.*

* *caſtanea.* Brown; the antennæ ſetaceous and ſmooth; the wings very much ribbed. 21. A native of Europe; on different plants.

Twenty-ſix ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

67. Coccus, *Cochineal.*

The ſnout furniſhed with briſtles, ſituated in the breaſt. Antennæ filiform. The anus furniſhed with briſtles. Male with two erect wings; female without wings.

Theſe are extremely fertile, and very troubleſome in hothouſes and greenhouſes: the male is very active, with an oblong body, and ovate abdomen; the tail furniſhed with a ſtyle and two long briſtles: the female has a body nearly globular, and is inactive and fixed to different parts of plants.

heſperidum. Oval, oblong. 1. A native of Europe; on evergreen plants, in greenhouſes, *e. g.* the orange, the laurel, &c.

adonidum. Reddiſh, duſted over with powder, and hairy. 4. A native of America and Africa, lately in the warmer parts of Europe; on trees. Body oval and whitiſh; antennæ and legs brown, marked on the back with an elevated line, and with a raiſed dot on each of its ſegments, with the edges of the ſide acute, furniſhed with fourteen prominent ſegments and raiſed dots; its ſurface ſprinkled with as many dots ſet longitudinally between the clavated line on the back and the edge; the tail divided: the perfect inſect conſtructs a follicle in which it conceals itſelf and its yellow eggs.

polonicus Body oblong, ovate; purple or cheſnut. 17. On the roots of the *ſcleranthus perennis.*—This inſect without impropriety may be called the cochineal of the northern part of the world. It prefers cold climates, and is commonly called *coccus tinctorius polonicus*, or the *ſcarlet grain* of Poland. Ray calls the plant on which it feeds the *polygonum cocciferum;* but it is not confined to one kind of vegetable, for it is found on the mouſe-ear, pimpernel, and pellitory, as well as on the *ſcleranthus perennis.* It is a native of ſome other northern countries as well as Poland; though formerly the greateſt quantity of it uſed to be collected there. Towards the end of June the *coccus* is in a fit ſtate for gathering. Every one of theſe creatures is then nearly of a ſpherical form, and of a fine violet colour. Some of them, however, are not larger than poppy ſeeds, and others of the ſize of a pepper corn. The males are produced from the ſmall grains, the females from the larger ones; each of them is lodged, in a ſort of cup like that of an acorn. Theſe cups cover more than one half of the body of the animal. They are rough and of a blackiſh brown on the outſide, and ſmooth and ſhining on the inſide. At the roots of ſome of the plants only one or two grains are to be found, at the root of others more than forty are to be met with.

Thoſe who collect the grains have a ſhort ſpade, with which they raiſe the plants from the ground; after the inſects have been collected they replace the plants: the grains are then ſeparated from the earth, which may have adhered to them, by means of a ſieve, and ſprinkled with very cold water or vinegar to prevent them from hatching.

After this they are dried in the ſun, or by gentle artificial warmth; but this muſt be managed with caution as too haſty drying might injure their colour. Sometimes the grains are ſeparated from their covers, and made up into balls.

According to Bernard de Bemith, the Turks and Armenians make uſe of theſe grains not only for dyeing ſilk and wool, but likewiſe the manes and tails of their horſes. The Turkiſh women uſe it for tinging the tips of their fingers. The Dutch formerly mixed it with the true cochineal. The colouring matter extracted from this inſect, by means of a ſolution of alum with the addition of a little chalk, is ſaid to form a lake equal in beauty to that of Florence. The great ſuperiority of the Mexican cochineal, has cauſed the ſcarlet grains of Poland to be neglected in all the countries of Europe where dyeing is beſt underſtood, as they contain not a fifth part of the colouring matter which may be extracted from the real cochineal.

cacti. Body depreſſed, downy, and tranſverſely wrinkled; abdomen purpliſh; legs ſhort and black; antennæ ſubulated, the third part of the length of the body. 22. A native of South America, on the *cactus coccinillifera.* The male is very ſmall; its body is long, of a deep red colour; two long diverging threads proceed from the extremity of the abdomen; its wings are large, white, and incumbent; its legs are pretty long; the antennæ are nearly the length of the body.

The female is more than double the ſize of the male, when

when at its full growth, it is almoſt as large as a pea, of a dark brown colour, and covered with a white powder; the antennæ are ſhort; the body flat beneath, and convex above, and edged with annular ſegments diſtinctly marked; the legs are ſhort.

The female of this inſect is the real cochineal, ſo highly valued in every part of the world, for the incomparable beauty of the red colour which it affords, which forms ſo conſiderable a branch of commerce between the new and old continents. In the year 1736, there was imported into Europe 700,000 pounds weight, worth upwards of 700,000l. ſterling. It was a long while made uſe of before its nature was aſcertained: for a conſiderable time it was thought to be the fruit of ſome vegetable. The ſame opinion prevailed with reſpect to another ſpecies of *coccus*, which was much uſed as a dye before the introduction of the Mexican cochineal, and which, under the name of *kermes*, is collected in Spain, Sardinia, Africa, and Aſia Minor. America is ſtill the only quarter from which the true cochineal is to be obtained. The principal countries, where the cochineal inſects are bred, are Oaxaca, Tlaſcala, Chulula, Nueva Gallicia, and Chiapa, in the kingdom of New Spain; and Hambalo, Loja, and Tucuman in Peru; but it is only in Oaxaca that they are gathered in great quantities, and form a branch of commerce; the cultivation of theſe little creatures being there the chief employment of the Indians. It is imported into Europe, in the form of ſmall irregular grains, flat on the one ſide, and convex on the other: the beſt is of a ſlate gray colour, mixed with red, and covered with a white powder. There are two kinds of cochineal, firſt the fine, called by different names, according to the places from whence it comes, viz *Maſtique*, *Campeſcane*, and *Tetraſcale;* of theſe the maſtique is reckoned the beſt. The ſecond is called *ſylveſter*, from its being commonly collected from a ſpecies of *cactus*, which grows without culture: this is much inferior to the other, both in price and in the quantity of the colouring matter which it affords; it is likewiſe ſmaller, and generally believed to be a different ſpecies of *coccus*. The plant on which they rear the beſt cochineal is called *nopal* by the Indians, (*cactus coccinellifera* of Linnæus). The colour of the cochineal is by ſome ſuppoſed to be derived from the juice of this plant. Its flowers and the juice of its fruit are of a beautiful red colour. The natives of thoſe countries where the cochineal is reared, form plantations of the nopal in ſmall gardens near their houſes; the plant is propagated by cuttings, which grow freely. In about eighteen months after the plantations have been formed they are fit for the reception of the inſects. Theſe plantations muſt be renewed every ſix years, as the inſects ſucceed beſt on young vigorous plants.

The nopal will grow on almoſt any ſoil, and needs no other culture but to be kept clear of weeds, and protected from the north-wind. The inſects are placed upon the nopal about the middle of October, the period at which good weather commonly commences in Mexico after the rains. Thoſe who rear the inſects, take care to preſerve a ſufficient number of females for this purpoſe, either by protecting them during the rainy ſeaſon with a covering of matts, or by removing ſome branches of the nopal loaded with them into their own houſes. Eight or ten of theſe females are put into a ſmall neſt, formed of a tuft of threads collected from a ſpecies of palm, or of any other cottony matter, which is attached to the ſpines of the nopal, on that ſide of the plant expoſed to the riſing ſun, the rays of which promote the hatching of the young inſects, which ſoon proceed in great numbers from the neſt, as each female produces upwards of a thouſand. The larvæ ſpread over the plant, and ſoon fix themſelves by means of their trunk; after this, ſhould they by any accident be diſplaced, they inevitably periſh, as their trunks are broken. In ſome diſtricts the females are preſerved during the rainy ſeaſon in boxes carefully ſhut up. The males live for little more than one month. The females about double that time. Both of them remain in the ſtate of larvæ for about ten days; they remain fifteen days longer in the ſtate of pupæ. The males when they paſs from the ſtate of pupæ get wings; but till that time they are not diſtinguiſhable from the females, except that they are only about half the ſize. After they acquire wings, they impregnate the female, and die. The female, in going through her different changes, does not change her form, but only caſts her ſkin. After ſhe has been impregnated ſhe lives for about a month, and increaſes conſiderably in bulk; then lays her eggs, and dies. According to M. Thierry, there are ſix generations of theſe little animals in the year. They might be collected during the whole year, did not the rainy ſeaſon check their progreſs, and almoſt entirely deſtroy them. According to all the writers on the ſubject, there are three collections made of them yearly. The firſt takes place about the middle of December, and the laſt in the month of May. When they make the firſt collection, they take away the neſts, and pick out the dead females, which had been placed on the nopal the preceding October. The ſecond collection is made when the inſects again begin to produce young. The inſects are detached from the plant with a knife, the edge and point of which have been blunted, to prevent the nopal from being injured. The inſects are received into a veſſel as they are ſeparated from the plant, put to death, and dried. The Indians have ſeveral ways of killing theſe inſects; which they are anxious to accompliſh as ſoon as poſſible, becauſe the females may live for ſome time after they are detached, and produce their young, which might eſcape and diminiſh the quantity of cochineal collected. Some natives put the cochineal in a baſket, and dip them in boiling water; afterwards they expoſe them to the ſun to dry.

Others put them in a hot oven, or on heated plates of iron. But it appears that the beſt cochineal is obtained by following the firſt mode. The different colours imported into Europe depend entirely on the mode of killing the inſects. That which has been killed by dipping in boiling water, loſes part of the white powder, with which they were covered, and acquires a browniſh red colour: this kind is called *renagrida*. That which is killed in an oven retains the white powder, and remains of a gray colour: this is called *jarpeada*. That which is killed by plates of heated iron becomes blackiſh, and is called *negra*.

The dead females which are taken from the neſts which had been put on the nopal, loſe more of their weight in drying than the inſects which are taken off alive and full of young; the firſt loſing three-fourths, and the laſt two-thirds in drying. After it has been dried

it may be kept for any length of time without losing either weight or colour.

It requires much care and attention to preserve these insects from their numerous enemies. The principal enemies which infest the cochineal are, the larvæ of a species of coccinella, which suck them, and leave nothing but the skin. A caterpillar of about an inch long, and of the thickness of a crow quill, is their most destructive enemy, which would soon destroy the whole race, were they allowed to carry on their depredations without molestation. The larvæ of a species of *ptinus* feeds on them likewise. There is a species of insect which lives on the nopal in great numbers, and does as much injury to the plant as the cochineal insects themselves do; which pinches their body, prevents them from taking nourishment, and causes them to drop from the plant. A small mouse which always prefers the fine cochineal to the sylvester, because the cottony matter with which the sylvester is more abundantly covered entangles its teeth, also preys on them. Many birds, too, are fond of them, and would destroy great numbers of them, were they not driven away by the owners of the plantations.

The sylvester is smaller than the true cochineal; their bodies are covered with a white cottony matter, and edged all round with hairs. About eight days after they are fixed, the cottony matter and the hairs increase in length, and become so closely attached to the plant, that part of them is commonly left adhering after the insect has been removed. Though these insects commonly feed on a prickly species of *cactus*, which grows wild, the Indians frequently rear them on the nopal, because they are collected from it with much more facility than from the uncultivated species: for the most dexterous workman cannot collect more of the insects in one day than will produce two ounces of cochineal when dry; whereas he can collect from the *cactus coccinellifera* as many as will yield three pounds when dry. There is also another advantage obtained from rearing the sylvester on the nopal which they cultivate in their gardens; the insects become almost as large as the true cochineal, and lose more and more of their cottony covering in proportion to the frequency of their reproduction. The sylvester has been lately introduced into the British settlements in India. The following account of its introduction and comparative value has been published by Mr Nicolas Fontana, who resided for many years in that part of the world.

"The introduction of cochineal into Bengal, which our neighbours had endeavoured to naturalize in their West India possessions, deserves particularly to be marked, as being likely, under proper management, to become not only a new æra in the progressive resources of the company, but an accession of opulence to the British empire: an æra the more remarkable, as, notwithstanding the attempts of government, the design was not accomplished but through accident, the great parent of discovery, which, with never-ceasing influence operates in many ways for the good of mankind.

"After a large plantation of the various species of *opuntia* had been reared at Madras, waiting only the arrival of the insect to make it serviceable, which a long correspondence of thirteen years could not obtain, Dr Anderson's solicitations about it had almost been forgotten; yet though his laborious industry and zeal for his country's interest, had no other reward, the introduction of the cochineal insect into India is entirely owing to his publications on the subject, which fortunately fell into the hands of Captain Nelson, who was then stationed at Madras with the 52d regiment. On the captain's return to India in 1795, the fleet in which he sailed, repaired for refreshment to the port of Rio de Janeiro. In his perambulations a little way out of this town, he was attended as usually by the centinel, when he saw a plantation of opuntia with the insect upon it. This circumstance immediately brought to his recollection the ardent wish for the importation of the insect expressed in the letters he had read at Madras; and he conceived the hope of being able to gratify Dr Anderson's desire, by carrying some to India with him.

"A day or two previous to his embarkation, he took another walk to the place where he had seen the opuntia or nopal. He made bold to ask the cultivators for some of the plant, being curious, he said, in matters of natural history. Having collected several other plants, he wished to have this also. The good people, being the less suspicious as he was in his regimentals, granted his request. They gave him several plants with insects on them, which he carefully carried aboard. Many of these, during the passage to Bengal, which was remarkably long and tedious for such delicate passengers, died. A few insects only remained alive on the last plant, several of the leaves having withered.

"Captain Nelson, on his arrival in Calcutta, sent the survivors to the botanic garden, where they were distributed on the different species of the opuntia. This well nigh frustrated the whole labour. On the China and Manilla species, they were found to die fast. It fortunately occurred to make trial on the indigenous opuntia of Bengal, which is also abundant in many parts of India. On this the insects thrived amazingly; insomuch, that from these few, in the course of four or five months, a quantity had been collected sufficient for distribution among all who wished to try the rearing of them, and several plants upon which the insects were feeding were sent to Madras.

"The novelty and importance of the object promising so speedy and plentiful a harvest of fortune, engaged a multitude of individuals to undertake the business; and this, no doubt, the more readily, as the cultivation of this field of wealth required but very little capital. Many golden dreams were enjoyed by the new planters. All who had a mind were provided with insects; and undertook plantations of opuntia.

"The anxiety and impatience natural to all, who, indulging in ardent expectations, undertake new enterprises, induced some of the planters of nopal to put the insect upon it when the plant had just emerged from the ground. Others, through inattention, kept their insects in places too near to where the opuntia was growing young, which in that tender and premature state was devoured by these creatures when hard pressed by hunger. The unskilful mode of drying was likewise adopted; and some of those persons whose opinions led the multitude, declared in the most decided and positive manner, that the cochineal would never answer, as it would not be found worth the trouble and expence attending the cultivation of it. All these considerations damped in a great measure the ardour of the enterprise.

Many

Many abandoned the purſuit, and left the inſects to provide for themſelves, after the plants deſtined for their uſe were deſtroyed, wherever they could find nourithment. They were ſeen flying about indiſcriminately on various other plants, and thus perithing; while others rooted out the plantations, and employed the ground for other purpoſes.

"Beſides the diſcouraging circumſtances already mentioned, it was urged that the ſpecies imported into India was the *grana ſylveſtris*, and that the firſt ſpecimens ſent home had been of no value. They had grown lumpy and muſty for want of being properly dried, or thoroughly diveſted of the cottony matter with which the inſect is covered. But ſuppoſing, it was added, that a proper mode of drying and preparing it could be found out, and the cultivation of it brought to the greateſt perfection, it would ſoon overſtock the market, as there is a certain quantity only, and that not very great, which is required for Europe. This would ſoon be ſupplied, and loſs inſtead of gain would accrue to the planters. This exceſs, however, it was farther urged, was to be preſumed only in the caſe of the country being able to ſupply plants ſufficient for the food of the inſect, which was very doubtful on account of its quick reproduction, as it ſends forth a new generation every forty days. Theſe with other objections of leſs force, may eaſily be refuted by any impartial obſerver acquainted with the nature of the climate and ſoil of India, even without any kind of knowledge of agriculture. In ſuch a vaſt extent of territory as that of the Eaſt India Company, and lying under ſuch a variety of climates, it is not ſurely impoſſible, or very difficult, to find a climate and ſoil fitted for the naturalization and rearing the cochineal inſect, and where the plants will grow to proper ſize for affording it food; in the ſame manner as in the diſtricts of Mexico, where the people who take moſt pains, have them growing to ſuch a height as to require ladders to gather the inſects. Such a ſtate of the plant would check the too rapid reproduction of the inſect, and at the ſame time improve its quality; for it is a fact, that the ſylveſter cochineal, when bred upon a full grown nopal, loſes part of its tenacity, and grows to double the ſize of that gathered on gummy plants, and is leſs covered with the cottony ſubſtance.

"The cultivation of cochineal, would in all probability be greatly favoured by the vicinity of a hilly country; ſuch as the Boglepore, Rajahmahl, and Purneah. It can be aſcertained by good authority, that there are already in the Chittagong diſtrict, plantations of large opuntias, which have been growing for two years paſt. Whenever the inſect ſhall be placed on theſe plants, we ſhall ſee cochineal of a very good quality. The nature and habits of the natives ſeem entirely calculated for the employment of gathering the inſect; work that may be done by old men, women or boys.

"As to the drying the inſects, there is no country where the ſun has ſuch influence as in Bengal. The method of drying in the ſun, after ſcalding the inſect in hot water, is that practiſed in Mexico and in Brazil: the inſects collected in wooden bowls are thereby ſpread from them on a hot diſh of earthen ware, and placed alive on a charcoal fire, where they are ſlowly roaſted, till the downy covering diſappears, and the aqueous juices of the animal are wholly evaporated. During this operation, the inſects are conſtantly ſtirred about with a tin ladle, and ſometimes water is ſprinkled upon them, to prevent abſolute torrefaction, which would deſtroy the colour: but a little practice will teach them to remove them from the fire, though ſurely its barbarity ought to prevent its adoption.

"By an eſtimate, made on a large ſcale, of the neceſſary expence that would attend the cultivation of one hundred biggahs of opuntia, it appeared, that after making every poſſible allowance for ground rent, ryots gathering, and an European overſeer, and intereſt on diſburſement at twelve per cent. the quantity produced of *grana ſylveſtris*, during nine months of the year, reckoning it at four ſicca rupees per ſeer of thirty two ounces, would more than treble the capital employed. But if this calculation be juſt in the vicinity of Calcutta, and there is no reaſon to ſuppoſe it otherwiſe, where labour and ground rent is dear; how much would the whole expence of cultivation and preparation be, if transferred to a greater diſtance, and to the other provinces!

"When the inſect has been well dried, it ſhould be packed immediately, as it might otherwiſe be affected by the damp air of Bengal. In this buſineſs the method uſed in Mexico ſhould be followed; which is to put it firſt into a linen bag, covered with a compact net; and then over the whole an ox's hide ſewed ſo cloſely as to render it impervious to water.

"For ſome of the cochineal which I wanted for the purpoſe of making experiments, collected at Entally, two miles from Calcutta, I paid in 1796 ſixteen rupees per ſeer; for the ſame quantity raiſed by another planter the following year eight rupees; and in 1797, I might have bought a great quantity, part of which came one hundred miles from Calcutta, at five rupees per ſeer.

"The improveability of the *grana ſylveſtris*, by attention, will be aſcertained more clearly by the following fact, than by a thouſand arguments. Some merchants, at my recommendation, bought about two hundred pounds of cochineal made at Raſſapuglah, five miles from Calcutta, at five rupees per ſeer. The ſame houſe paid for ſeven mauns, or 280 ſeers, to Mr Stephens at Keerpay, ſeven rupees per ſeer; and I can ſay, that it was the beſt of the ſort that had yet been ſeen in the town, both for its ſize, cleaning and drying.

"Let us now ſuppoſe for a moment, ſuch cochineal as that made at Keerpay, to be the beſt that can ever be obtained at Bengal, and that the above may be within a rupee, more or leſs, the average price. The *grana fina* that is brought to Bengal by way of Manilla, ſells, when abundant, at ſixteen rupees per ſeer, but oftener at nineteen and twenty. The Bengal *ſylveſtris* contains only from $\frac{1}{10}$ to $\frac{1}{20}$ parts of the colouring matter contained in the other; but ſay only one half, ſo that the manufacturer will be obliged to uſe two ſeers inſtead of one, the quality of the colour to be the ſame; even at this rate, the ſilk manufactories at Bengal might be ſupplied with it, with a yearly ſaving. After ſupplying this market, if the quantity be increaſed, there will be a demand for it in the China and Engliſh markets, though only of the ſylveſter kind. Suppoſing it for ever to remain ſuch, by leaving it to the indolent natives only, even this would be a great acquiſition, conſidering the various ways in which it can be employed by the dyers. Beſides, if the prices were immediately to fall, ſo as not to indemnify the preſent freight and inſurance to the private adventurers, how eaſy would it be to reduce the in-

fect to a much ſmaller bulk, by making a lake, and producing carmine no leſs valuable than the *grana fina*.

"The overſtocking of the market, however, with a drug ſo important, and of ſuch extenſive uſe, is not a thing very likely to happen. The manufacturer, whereever he could get it at a low price, would uſe it generally, and ſubſtitute it in the room of other materials for reds, ſuch as madder, red-wood, and others, uſed for woollens, and ſilks; beſides the great varieties of ſhades from ſcarlet and crimſon, down to all thoſe various tints to be obtained by modifications of reagents from cochineal, with a brilliancy, and ſtability, that would ſoon repay the ſmall additional expence that might be incurred by the ſubſtitution.

"It is a thing greatly to be wiſhed, by every citizen and patriot, that the Bengal cochineal may ſoon be brought to ſuch a degree of perfection, and produced in ſuch plenty, as may admit of a reduction of its price ſufficient to induce the calicoe printers in Europe to uſe it more commonly than hitherto, in the dyeing of cotton; which would open a much wider field for its conſumption. As to the ſhyneſs of cotton to the admiſſion of this animal colour, it is not an obſtacle that ought by any means to be conſidered as inſurmountable in the preſent ſtate of chemiſtry, advancing ſo rapidly to farther improvements, and particularly applying with vaſt ſucceſs many of its operations to the art of dyeing. The few unſucceſsful attempts made by manufacturers and chemiſts to fix this colour on cotton, have been defeated more by the dearneſs of the drug, than by any impracticability of the deſign. This exhauſted at once the purſe and patience, both of the artiſt and chemiſt; and precluded that continuation, repetition, and diverſification of experiment, which is neceſſary to the completion of new inventions.

"It was upon cotton that the Spaniards firſt ſaw the cochineal uſed in Mexico; but for want of preparation it produced but a dull crimſon. When ſome of the dried Bengal inſect was ſhewed to the vakeel of the rajah of Napaul, reſiding as miniſter to our government at Calcutta, he ſoon knew it, and declared that it was always uſed in dyeing his country robes and turbans. The opportunity ariſing from the management of a chintz manufactory, induced me to make ſome trials of cochineal in cotton cloth and thread. By theſe it was aſcertained, that the quantity of colouring matter contained in the Bengal cochineal of 1796, compared with the *grana fina*, was from nine or eleven to ſixteen. I then repeated, as far as the chemical reagents to be obtained in India would permit, various experiments of the kind mentioned by Dr Bancroft, in his firſt volume of the Philoſophy of Faſt Colours; and nearly with the ſame ſucceſs, in variety of ſhades, and degrees of permanency. From theſe experiments, there reſulted two conſiderable benefits to that manufactory: the firſt was, that I was induced to make an addition of a certain quantity of powdered cochineal to the morinda root, for the fine cloths and muſlins that were to undergo the boiling proceſs in the vat. The ſecond, I was led to mix with the baſis for printing red (alum), a decoction of cochineal, inſtead of the *turmeric* or red wood, formerly uſed by printers in tracing their deſigns. This laſt ſubſtitute was only boiled in ſimple morinda, and the other with the addition of cochineal. By this proceſs, deep and brilliant reds were obtained, ſuch as had not hitherto been ſeen in Bengal."

The cultivation, therefore, of the cochineal inſect, is an object worthy of all the countenance and care of government. The attempts toward its naturalization ought not by any means to be abandoned; but continued with all perſevering induſtry, and unwearied attention to every circumſtance that may promote ſo important a branch of commerce. For this article we ſend annually immenſe ſums to the Spaniards. Not only might this expence be ſaved to Britain; but, in due time, the reſt of the world might be ſupplied from the Bengal produce of this valuable commodity. It is in the recollection of moſt people converſant with India affairs, how the firſt ſpecimens of indigo ſent home from Bengal were depreciated and rejected. Hence the cultivation of it was obſtructed for ſome years. But when it began to be attended to in 1780, and 1782, by people who were acquainted with the beſt modes of manufacturing it, it was improved with ſuch rapidity that in 1790, ſome of the Bengal indigo was judged to be equal to the Guatimala, and bore the ſame price. The quantity ſent home in the years 1795 and 1796, was far beyond what had ever been imported into the port of London from all the world, and more than is required for the annual conſumption of Europe. The uſe of indigo in the dye-houſe is very circumſcribed, and confined chiefly to the colours of blue and green. It gives alſo a few finer blacks, with lilac grounds; but it cannot, like cochineal, be applied to the various principal colours, as crimſon, ſcarlet, purple, and all the intermediate ſhades.

Body red; antennæ branched; tail furniſhed with two briſtles. 23. A native of India; on the *ficus religioſa* and *indica*. This is the inſect which produces the gum lac. *ficus.*

In the months of November and December, they firſt appear, and traverſe the branches of the trees on which they are produced for ſome time, and then fix themſelves on the extremities of the young branches. By the middle of January, they are all fixed in their proper ſituations, when they appear as plump as before, but ſhew no other ſigns of life. The legs, antennæ, and ſetæ, are no longer to to be ſeen. Around their edges they are environed with a ſub-pellucid liquid which ſeems to glue them to the branch; it is the gradual accumulation of this liquid which forms a complete cell for each inſect, and is what is called *gum lacca*. About the middle of March the cells are completely formed, and the inſect is in appearance an oval ſmooth red bag without life, about the ſize of a ſmall cochineal inſect, emarginated at the obtuſe end, full of a beautiful red liquid. In October and November, we find about twenty or thirty oval eggs, or rather larvæ, within the red fluid of the mother. When this fluid is all expended, the young inſects pierce a hole through the back of their mother, and walk off one by one, leaving their exuviæ behind, which is that white membranous ſubſtance found in the empty cells of the ſtick lac.

Theſe inſects feed on ſome other trees beſides the *ficus religioſa* and *indica* of Linnæus, viz. on the *rhamnus jujuba* (Linn.) and on the *plaſo*, (Hort. Malabar.) The inſects generally fix themſelves ſo cloſe together, and in ſuch numbers, that ſcarcely one in ſix can complete her cell; the others die, and are eaten by various inſects.

The

The extreme branches appear as if they were covered with a red duſt, and their ſap is ſo much exhauſted that they wither and produce no fruit; the leaves drop off or turn to a dirty black colour. Theſe inſects are tranſported from one tree to another by birds. It is worth obſerving, that theſe fig-trees exſude, when wounded, a milky juice, which inſtantly coagulates into a viſcid ropy ſubſtance, and when dried reſembles the gum lac.

A red gum is procured by inciſion from the *plaſo*, ſo ſimilar to the gum lacca, that it may readily be taken for the ſame ſubſtance. Hence, it is probable, theſe animals have but little trouble in preparing the ſap of the trees for the conſtruction of their cells.

The gum *lacca* is rarely ſeen on the *rhamnus jujuba*, and is inferior to what is found upon the other trees. This gum, in Bengal, is principally found on the uncultivated mountains on both ſides the Ganges, where it is produced in ſuch abundance, that the markets might be readily ſupplied, were the conſumpt ten times greater than it is.

The only trouble in collecting it is in breaking down the branches. The beſt lac is of a deep red colour; if it be pale and pierced at top, the value diminiſhes, becauſe the inſects having eſcaped, it cannot be uſeful as a dye, though it may anſwer better as a varnith.

Theſe inſects and their cells have been variouſly denominated: viz. *gum lacca*, *lack*, *laçra*, and in Bengal *laſcha*. By the Engliſh, lac is divided into four kinds; viz. *ſtick lac*, *lump lac*, *ſeed lac*, and *ſhell lac*; for which, and their varieties, ſee the article Lac.

The following account of the lac inſect by Dr William Roxburgh, is publiſhed in the Aſiatic Reſearches, vol. ii.

"Some pieces of very freſh looking lac, adhering to ſmall branches of the *mimoſa cinerea*, were brought me from the mountains on the 20th of laſt month. I kept them carefully, and to day, the 4th December, fourteen days from the time they came from the hills, myriads of exceedingly minute animals were obſerved creeping about the lac and branches it adhered to, and more ſtill iſſuing from ſmall holes over the ſurface of the cells: other ſmall and perforated excreſcences were obſerved with a glaſs, amongſt the perforations; from which the minute inſects iſſued, regularly two to each hole, and crowned with ſome very fine white hairs. When the hairs were rubbed off, two white ſpots appeared. The animals, when ſingle, ran about pretty briſkly; but in general they were ſo numerous, as to be crowded over one another. The body is oblong, tapering moſt towards the tail, below plain, above convex, with a double or flat margin; laterally on the back part of the thorax are two ſmall tubercles, which may be the eyes; the body behind the thorax is croſſed with 12 rings; legs ſix; feelers (antennæ) half the length of the body, jointed, hairy, each ending in two hairs as long as the antennæ; rump, a white point between two terminal hairs, which are as long as the body of the animal; the mouth I could not ſee.

"On opening the cells, the ſubſtance that they were formed of cannot be better deſcribed, with reſpect to appearance, than by ſaying it is like the tranſparent amber that beads are made of: the external covering of the cells may be about half a line thick, is remarkably ſtrong, and able to reſiſt injuries; the partitions are much thinner; the cells are in general irregular ſquares, pentagons, and hexagons, about an eighth of an inch in diameter, and a fourth deep; they have no communication with each other: all theſe I opened during the time the animals were iſſuing, contained in one half a ſmall bag filled with a thick red jelly-like liquor, replete with what I take to be eggs: theſe bags, or utriculi, adhere to the bottom of the cells, and have each two necks, which paſs through perforations in the external coat of the cells, forming the fore-mentioned excreſcences, and ending in ſome very fine hairs. The other half of the cells have a diſtinct opening, and contain a white ſubſtance, like ſome few filaments of cotton rolled together, and numbers of the inſects themſelves ready to make their exit. Several of the ſame inſects I obſerved to have drawn up their legs, and to lie flat; they did not move on being touched, nor did they ſhow any ſigns of life, with the greateſt irritation.

"December 5th. The ſame minute hexapedes continue iſſuing from their cells in numbers; they are more lively, of a deepened red colour, and fewer of the motionleſs ſort. To day I ſaw the mouth; it is a flattened point, about the middle of the breaſt, which the little animal projects on being compreſſed.

"December 6th. The male inſects I have found to day. A few of them are conſtantly running amongſt the females moſt actively; as yet they are ſcarce more, I imagine, than one to 5000 females, but twice their ſize. The head is obtuſe; eyes black, very large; antennæ elavated, feathered, about two thirds the length of the body; below the middle an articulation, ſuch as thoſe in the legs; colour between the eyes, a beautiful ſhining green; neck very ſhort; body oval, brown; abdomen oblong, the length of the body and head; legs ſix; wings membranaceous, four longer than the body, fixed to the ſides of the thorax, narrow at their inſertions, growing broader for two thirds of their length, then rounded; the anterior pair is twice the ſize of the poſterior; a ſtrong fibre runs along their anterior margins; they lie flat, like wings of a common fly, when it walks or reſts; no hairs from the rump; it ſprings moſt actively to a conſiderable diſtance on being touched; mouth in the under part of the head; maxillæ tranſverſe.

"To day the female inſects continue iſſuing in great numbers, and move about as on the fourth.

"December 7th. The ſmall red inſects ſtill more numerous, and move about as before; winged inſects, ſtill very few, continue active. There have been freſh leaves and bits of the branches of both *mimoſa cinerea* and *corinda* put into the wide-mouthed bottle with them: they walk over them indifferently, without ſhowing any preference, nor inclination to work nor copulate.

"I opened a cell whence I thought the winged flies had come, and found ſeveral, eight or ten, more in it, ſtruggling to ſhake off their encumbrances; they were in one of theſe utriculi mentioned on the 4th, which ends in two mouths, ſhut up with fine white hairs, but one of them was open for the exit of the flies; the other would no doubt have opened in due time; this utriculus I found now perfectly dry, and divided into cells by exceeding thin partitions. I imagine, before any of the flies made their eſcape, it might have contained about twenty. In thoſe minute cells with the living flies,

flies, or whence they had made their eſcape, were ſmall, dry, dark-coloured, compreſſed grains, which may be the dried excrements of the flies.

ilicis. Shining brown, covered with white down. 6. This inſect is commonly called *kermes grains*, and inhabits the *quercus coccifera* of the ſouthern parts of Europe. Mr Hellot of the French Academy of Sciences, in his Art of Dyeing, chapter 12. ſays it is found in the woods of Vauvert, Vendeman, and Narbonne; but more abundantly in Spain, towards Alicant and Valencia; but alſo in Murcia, Jaen, Cordova, Seville, Eſtremadura, la Mancha, Serranias de Cuença, and other places. In Xicona, and Tierra de Relluc, there is a diſtrict called *de la Grana*, where the people of Valencia firſt began to gather it, whoſe example was followed all over Spain. It has ſome years produced 5000l. to the inhabitants of Xicona. Both the ancients and moderns ſeem to have had very confuſed notions concerning the origin and nature of the kermes; ſome conſidering it as a fruit: this opinion was entertained by Pliny, and by moſt of the ancient naturaliſts; others taking it for an excreſcence formed by the punctures of a particular fly, like the common gall obſerved upon the oak. Tournefort was of this number. Count Marſigli, and Dr Niſoli a phyſician of Montpelier, made obſervations and experiments, with a view of diſcovering its nature, but did not perfectly ſucceed. Two other phyſicians at Aix in Provence, Dr Emeric and Dr Garidel, applied themſelves about the ſame time with greater ſucceſs; they diſcovered the kermes to be nothing elſe than the body of an inſect. About the beginning of March they are perceived on the branches of the *quercus coccifera*, very ſmall; they ſoon fix themſelves and become immoveable, after which they increaſe rapidly in ſize. In April they arrive at their full growth, and are nearly about the ſize of a pea. About the end of May, ſooner or later, according to the warmth of the climate, the huſk appears replete with ſmall eggs, leſs than poppy ſeed. Theſe are properly ranged under the belly of the inſects, progreſſively placed in the neſt of down that covers their bodies. After this it ſoon dies, though it ſtill adheres to its poſition, rendering a further ſervice to its progeny, and ſhielding them from the inclemency of the weather, or the hoſtile attacks of an enemy. In a good ſeaſon they multiply exceedingly, producing from 1800 to 2000 eggs. In Languedoc and Provence the poor are employed to gather the kermes; the women letting their nails grow for that purpoſe, in order to pick them off with greater facility.

The cuſtom of lopping off the boughs is very injudicious, as by this means they deſtroy the next year's harveſt. Some women will gather two or three pounds a day; the great point being to know the places where they are moſt likely to be found in any quantity, and to gather them early with the morning dew, as the leaves are more pliable and tender at that time, than after they have been parched by the rays of the ſun: ſtrong dews will occaſionally make them fall from the trees ſooner than uſual; when the proper ſeaſon paſſes, they fall off themſelves, and become food for birds, particularly doves. Sometimes there is a ſecond collection; but the inſects are commonly ſmaller, and do not afford ſo much colouring matter. The inſects which are produced in the ſpring, are generally found adhering to the bark; thoſe of the ſecond crop are commonly attached to the leaves.

Thoſe who buy up the kermes for exportation, ſpread it on linen, taking care to ſprinkle it with vinegar, to kill the inſects, which cauſes a red duſt to ſeparate from them; in Spain, this is carefully collected, and kept apart by itſelf. After it has been dried, they paſs it through a ſearce and put it up into bags. In the middle of each, its proportion of red duſt is put into a leather bag, which likewiſe belongs to the buyer. The people of Hinojos, Bonares, Villalba, and of ſome other parts in Spain, dry it on mats in the ſun, ſtirring it about, and ſeparating the red duſt, which is the fineſt part; which they ſprinkle with vinegar, and call *paſtil*. The kermes is much in requeſt on the coaſt of Barbary, particularly that which comes from Spain. The people of Tunis mix it with what is brought from Tetuan, for dyeing thoſe ſcarlet caps ſo much uſed in the Levant.

43 ſpecies of this genus, have been deſcribed in the laſt edition of the Syſtem of Nature.

68. Thrips.

Snout concealed within the mouth. Antennæ filiform, of the ſame length with the thorax. Body linear. Abdomen capable of being bent upwards. Wings four, ſtraight, incumbent, narrower than the body, and nearly forming a croſs.

The inſects of this genus leap about very actively on flowers; their feet are veſicular; the larvæ are equally active with the perfect inſect; commonly red.

The elytra yellowiſh; body black. 2. A native of * *phyſapus*
Europe; on compound flowers. It ſhuts up the flowers of the *lotus corniculatus*, and cauſes them to ſwell out; it is very deſtructive to wheat and rye, frequently rendering the ears quite empty.

Eleven ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

III. LEPIDOPTERA.

Wings four, covered with ſmall ſcales laid over one another, like tiles on the roof of a houſe. The mouth furniſhed with a ſpiral tongue. Body hairy.

69. Papilio, *the Butterfly.*

Antennæ thicker towards the points. Moſt frequently they are both clavated and furniſhed with a knob at the extremity. Their wings, when at reſt, are for the moſt part erect. They fly about in the day time.

The butterfly feeds on the nectarious juice of flowers, or on the ſaccharine juice which exudes from the leaves of vegetables. Their larvæ are active, and run about a good deal. They are furniſhed with tentacula and 16 feet; ſome are naked, others covered with prickles, and feed on the leaves of plants. The pupa is naked, and remains torpid for a longer or ſhorter period; frequently adhering to different ſubſtances, by means of threads attached to its middle or head. The perfect inſect is furniſhed with two feelers, but wants jaws, and has

has four or six feet. Their names are frequently taken from the plants on which they feed.

These butterflies which belong to the family of *knights* are, for the most part, furnished with filiform antennæ, and with a tail or long appendix to the wings; the larvæ are commonly variegated, and but few of them are natives of Europe.

Linnæus has arranged the genus of BUTTERFLY into six divisions, and these again into many subdivisions.

1. EQUITES. Alis primoribus ab angulo posteriore ad apicem longioribus quam ad basin; his sæpe antennæ filiformes.	1. KNIGHTS. Those which have their upper wings longer from the posterior angle to the tip, than to the base, and have their antennæ for the most part filiform.
A. *Troes*. Sæpius nigri, maculis ad pectus sanguineis.	A. *Trojans*. Those equites that are generally black, and marked on the breast with spots of a blood-red colour.
B. *Achivi*. Pectora non cruenta, ocello ad angulam ani.	B. *Greeks*. Such as are not marked on the breast with red spots; but have an ocellus at the angle of the wing near the anus.
a. Alis absque fasciis.	*a*. Wings without bands.
b. Alis fasciatis.	*b*. Wings marked with bands.
2. HELICONII. Alis angustis integerrimis, sæpe denudatis; primoribus oblongis, posterioribus brevissimis.	2. HELICONII. Those which have narrow and perfectly entire wings, frequently bare, the upper ones oblong, the under very short.
3. PARNASSII. Alis integerrimis rotundatis.	3. PARNASSII. Those with wings perfectly entire, the upper pair being round.
4. DANAII. Alis integerrimis.	4. DANAII. Wings perfectly entire.
A. *Candidi*. Alis albis.	A. *Candidi*. Wings white.
B. *Festivi*. Alis variegatis.	B. *Festivi*. Wings variegated.
5. NYMPHALES. Alis denticulatis.	5. NYMPHALES. Those with wings notched.
A. *Gemmati*. Alis ocellatis.	A. *Gemmati*. Wings adorned with several ocelli.
a. In alis omnibus.	*a*. on all the wings.
b. primoribus.	*b*. on the upper wings.
c. posterioribus.	*c*. on the under wings.
B. *Phalerati*. Alis absque ocellis.	B. *Phalerati*. Wings without ocelli.
6. PLEBEII. Parvi, larva sæpius contracta.	6. PLEBEII. Such as are small and have contracted larvæ.
A. *Rurales*. Alis maculis obscurioribus.	A. *Rurales*. Such as have their wings marked with obscure spots.
B. *Urbicolæ*. Alis maculis sæpius pellucidis.	B. *Urbicolæ*. Those with transparent spots on their wings.

1. *EQUITES.*

A. *Troes.*

†Wings furnished with a tail.

Wings of the same colour, both on their upper and under surfaces, black; the upper ones marked with a white band, the under with red spots. A native of India; on the *aristolochia*. The white band on the upper wings is composed of eight white half-divided spots. The scarlet spots on the under wings are round and form a double arch. *hector.*

Wings black, both above and below marked with a white band, common to both wings; that on the lower clouded with red. A native of the Brasils. It resembles the *tinctoria*; body black, breast marked with blood-coloured spots. *ascanius.*

Wings of the same colour, both on their upper and under surfaces, black spotted with white; the under ones marked with circular red spots along their edges. A native of India. Head red; antennæ and thorax black; abdomen white, with red bands; wings marked with numerous white spots, the lower part greenish in the middle with a red circular spot at the angle of the tail. *antenor.*

Wings nearly of the same colour on both upper and under surfaces, clouded; the upper wings marked with a yellow spot, the under with a tawny one near the tail. A native of America. The under surface of the lower wings are marked with red and yellow spots. *glaucus.*

Wings black, sprinkled with green and gold dots, and marked with a bluish green band. A native of Tranquebar. Body covered with green and gold specks. Wings black, speckled with white on their under surface. The upper ones ash-coloured at the tip, the under marked with tawny spots along their edges. *palinurus.*

Wings black, the under ones of a shining green, the under surface marked with seven red spots somewhat resembling eyes. A native of America. Body black; abdomen speckled with white; margin of the upper wings variegated with white and black; under ones with a few faint white specks; the margin variegated with white and black, marked with a white dot at the base on the under surface; the tip greenish, with seven round tawny dots surrounded with a black ring, and marked with a small white lateral dot. *philenor.*

Wings black, with a white band; the under surface of the lower wings marked at the base and at the tip with red. A native of America. Thorax marked with an ash-coloured lateral line; breast with an ash-coloured dot on each side; abdomen with an ash-coloured lateral line beneath; upper wings with both surfaces alike; under ones black above, with three scarlet circular spots at the angle of the tail, and five white ones at the margin, brown beneath, marked with red spots at the base, a red line at the inner margin, and three circular spots at the angle of the tail, with four white circular spots on the outer margin. *asius.*

††Wings notched.

Wings notched and silky, the upper ones green on their superior surface, marked with a black spot, the under with six black spots. A native of Amboyna. *priamus.*

This

This is the moſt remarkable ſpecies of this genus, both for its ſize and beauty. Head and legs black; abdomen bright yellow, and the ſides of the thorax variegated with ſcarlet lines.

anchiſes. Wings of the ſame colour on both their upper and under ſurfaces, black; the under wings marked with ſeven oval ſcarlet ſpots. A native of America; on the orange-tree. The larva is prickly, brown marked with white circular ſtripes, and furniſhed with tentacula. They are gregarious. Pupa brown, marked with four projections on its anterior part.

B. *Achivi.*

† *Wings furniſhed with a double tail.*

pyrrhus. Wings brown, each of them marked with a white band, the band on the upper wings as it were halved. A native of South America and India.

eteocles. Wings of a duſky blue, marked on both ſides with a white band, the edges of the under ones green. A native of Africa.

†† *Wings furniſhed with two notched tails.*

iridates. Wings black on their upper ſurface, ſpotted with blue, and marked with a dotted white edge. A native of Amboyna.

pollux. Wings brown; marked with a yellow band on their upper ſurface, and on their under ſurface with a white band and white ſpots. A native of Africa.

††† *Wings furniſhed with two very ſlight tails.*

cecles. Wings ſtriped, with white and yellow, with a white band in the middle; the lower wings marked on their under ſurfaces with a ſtrip of dots reſembling little eyes. A native of Siam. Of a middle ſize, and very tender.

†††† *Wings notched and furniſhed with a tail.*

polycaon. Wings black, marked with a yellow band; the under ſurface of the lower wings marked with tawny blue and yellow circular ſpots. A native of Surinam; feeds on ſome ſpecies of the *althæa.*

xiphares. Wings black, the upper ſpotted with white, the under ones marked with a yellow band. A native of Africa.

††††† *Wings furniſhed with a tail.*

ulyſſes. Wings black, with a blue radiant centre; the under ſurface of the lower ones adorned with ſeven ocelli. A native of Aſia.

agamemnon. Wings black, ſpotted with green; the under ſurface of the lower ones adorned with an ocellus, and with red ſpots. A native of Aſia.

**machaon.* Wings of the ſame colour in both ſurfaces, yellow with a brown edge, marked with yellow circular ſpots, and with a tawny one at the angle of the tail. A native of Europe; on umbelliferous plants, and on rue. The larvæ are ſeldom found in numbers together, are ſmooth and marked with annular ſtrips of green and black, dotted with red; their tentacula are ſhort and yellow. They emit a very diſagreeable ſmell by which they keep off the *ichneumon.* Their pupa is black and yellow. The under wings are adorned with an eye of a yellowiſh-red colour, encircled with blue, which is ſituated at the edge neareſt the extremity of the abdomen. This is the largeſt and one of the moſt beautiful butterflies which Britain produces. It changes into the pupa in July, aſſumes the winged ſtate in Auguſt, and frequents meadows. Sometimes it appears in May.

**podalirius.* Wings nearly of the ſame colour both on their upper and under ſurfaces, marked with brown bands ſet in pairs; the under ſurface of the lower wings marked with a blood-coloured line. A native of Europe and the northern parts of Aſia and Africa. It feeds on different ſpecies of the *braſſica:* Larva ſolitary, yellowiſh dotted with brown; head pale green; pupa yellowiſh dotted with brown, marked with two ſlight projections towards the anterior extremity.

alcibiades. Wings white, the upper ones marked with black bands along the edges, the under ones marked on their ſuperior ſurface with red near the tip. A native of Tranquebar. Head tawny, with a broad black line in the middle; thorax downy and aſh-coloured, marked with two tawny ſpots; abdomen whitiſh, marked on the ſides with a line of black blotches; upper wings greeniſh at the baſe; under ones marked with a black ſpot near the tail, and marginal circular ſpots; tail long, black tipped with white, ſtreaked with black beneath.

†††††† *Wings terminating in a ſlight projection faintly reſembling a tail.*

phidippus. Wings brown, marked on their under ſurfaces with white bands, adorned with two eyes, and with a double eye at the tail. A native of India. The female much larger than the male.

aurelius. Wings brown, black at the tip, ſpotted with white; the under wings on their lower ſurfaces adorned with two eyes. A native of India.

jaſon. Wings; upper ſurfaces brown, under wings with a band marked with ſix green blotches. A native of South America and India.

philoctetes. Wings brown; the under wings marked with two blue ocelli, with black pupills, and three white dots. A native of South America and India. The female has a tuft of long diverging hairs at the end of the upper wings.

nereus. Wings black, marked with a plain green band; the under ſurfaces of the wings are blackiſh. A native of South America and India.

††††††† *Wings notched.*

menelaus. Upper ſurfaces of the wings of a bright blue, the under ſpotted with brown. A native of South America. The larva prickly and yellow, marked with roſe-coloured ſtrips; head brown and feet red. Pupa pale, and has a cylindrical inflected tail.

neſtor. Upper ſurfaces of the wings brown ſpotted with white and blue in the centre; their under ſurfaces adorned with three or four eyes. A native of America.

telemachus. Wings brown; the upper ſurfaces of both have a large radiated diſk, the under ſurface of each marked with ſix eyes. A native of South America.

perſeus. Wings pale blue, and black at the tips, ſpotted with red. A native of Surinam.

achilles. Upper ſurfaces of the wings black, marked with a blue band; the under ones are brown, adorned with three or five eyes. A native of America.

argyrios. Under surfaces of all the wings of blue and silver; the upper wings black on their superior surfaces, marked with two silver bands, and with two brown ones on the under surface; the under wings marked on their superior surface with a broad silver band, and with seven spots of blue and silver. 378. A native of Asia.

†††††††† *Wings faintly notched.*

idomeneus. Wings nearly crenated, and of a dusky blue colour; the under surfaces clouded, and adorned with two ocelli. 45. A native of South America. The larva is reddish, with feathery protuberances set round it in a ring. The pupa is dentated and furnished with two crooked horns at the head.

2. *Heliconii.*

terpsichore Upper wings yellow; under wings of a deeper yellow than the upper, sprinkled with black spots. 55. A native of Asia.

calliope. Wings yellow; the upper marked with three black streaks, and the under with three black bands. 56. A native of South America and India. Tips of the upper wings speckled with white.

polymnia. Wings pale-yellow; the upper ones marked with a bright yellow band, the under with three black bands. 58. A native of South America. Larva yellowish and prickly.

violæ. Wings tawny, dotted with black, and the under ones have a black edge dotted with white. 359. A native of India; on the violet and borrage.

ricini. Wings brown; the upper wings marked on both sides with two white bands. 63. A native of America; on the *ricinus palma christi*; the base of the under wing in the male marked with purple, in the female with blue; the larva green, covered with white hairs.

3. *Parnassii.*

apollo. Wings white, spotted with black; the under wings arched at the base, and adorned with four ocelli on their upper, and fix on their under surfaces. 50. A native of Europe, and feeds on the *sedum telephium*, and the *saxifraga cotyledon*; flies about slowly; the larva solitary, silky, black, and furnished with two tentacula at the back part of its head; all its segments are marked on each side with two red dots. The pupa covered with a slight follicle; oval, bluish, and marked on each side with red dots on the anterior part.

mnemosyne Wings white, with black veins; the upper ones marked with two black spots near their edges. 51. A native of Europe.

* *crataegi.* Wings white, with black veins. 72. A native of Europe; on fruit trees. It is very destructive in gardens and orchards, and emits a fluid of a reddish colour, which has frequently given rise to the reports of showers of blood which are said to have fallen in different places. Larva gregarious; hairy and yellow, green beneath; head black; body marked with three black lines; pupa greenish, with black spots and dots

andromache. Wings of the same colour, both on their upper and under surfaces; the upper ones dusky and naked, the under yellow. 382. A native of New Holland. Head black; feelers yellow; thorax black, with a yellow dot on each side; breast spotted with yellow; posterior margin of the lower wings black, marked with seven yellowish dots.

4. *Danai.*

A. *Candidi.*

Wings black at the tips, marked with two black spots. 75. A native of Europe; on some species of *brassica*. The upper wings in the male are without black spots, and the same happens in the two following species. The larva solitary, dotted with black, and marked with three sulphur-coloured lines; the tail black; pupa pale green, marked with three yellow lines, and three of its segments globular; eggs set in clusters. * *brassicæ.*

Smaller than the preceding species; wings white, upper ones tipt with brown; the female has three brown spots on the upper, and one on the lower pair. 76. A native of Europe; on the turnip and other species of *brassica*; also on the *tropæolum*. Larva green; marked with a bright yellow line on the back, and bright yellow on the sides; pupa greenish, marked with three sulphur-coloured lines. * *rapæ.*

Wings marked on their under surfaces with broad greenish veins. 77. A native of Europe; on several species of *brassica*. * *napi.*

Wings roundish; of a dusky colour at the tips. 79. A native of Europe; on the mustard. * *sinapis.*

Wings white above; the upper ones on their superior surface, black at the edge and tip, which is marked with four white dots; inferior surfaces black, marked at the tips with four yellow spots and a yellow base; the inferior surface of the under wings scarlet, marked with black veins. 881. *discors.*

Wings roundish, brown at the edges; their under surfaces of a grayish yellow spotted with white. 81. A native of Europe; on different kinds of *reseda* and *brassica*; larva covered with bluish hairs, marked with black spots and yellow streaks. * *daplidice.*

Wings round; the centre of the upper ones tawny; the inferior surface of the under ones clouded with green. 85. A native of Europe; on the *cardamine*, *brassica*, and *thlaspis*. Larva solitary; greenish above and whitish beneath. Pupa green, marked with a white line on each side; thorax conical, ascending. * *cardamines.*

Wings yellow, with black tips, and a brown margin; the inferior surface of the under ones marked with a silver dot. 99. A native of Europe, on the *coronilla*; wings sometimes whitish. Larva somewhat hairy; green marked with yellow lines and black dots. *palæno.*

Wings angular and yellow; each marked with a rusty-coloured spot. 106. A native of Europe; on the buckthorn. Commonly flies about in August, though frequently it lies dormant all winter, and appears early in the spring. The male is very often of a sulphur colour; the female white. Larva smooth; and green with a dark line on the back. Pupa in the anterior part turgid, and drawn to a point. * *rhamni.*

B. *Festivi.*

Wings almost, entire, brown with a rusty-coloured band divided at the point. The lower surface of the under wings ash-coloured and adorned, with two ocelli. The larva, green, streaked with red, with two prickles *cassiæ*

on its head, and tail divided. Pupa reddiſh, with ſilvery ſpots. 120.

* *hyperanthus.* Wings entire, of a duſky colour; the lower ſurface of the upper ones adorned with three ocelli, and the inferior ſurface of the under wings with two or three. 127. A native of Europe; is found at the roots of the *poa annua*; the wings ſometimes have ocelli on their upper ſurfaces. Larva ſolitary, hairy, and of an aſh-colour, marked with a black line behind; the tail furniſhed with two little prominences; pupa brown, ſpotted with yellow; and has a bunch on its back.

œdipus. Wings entire; their upper ſurfaces black, without ſpots, the under brown; the upper wings adorned with three ocelli, the under with five. 495. A native of Europe.

* *pamphilus.* Wings perfectly entire and yellow; the upper adorned on their lower ſurface with one ocellus; the under ones aſh-coloured, marked with a band and four faint ocelli. 239. A native of Europe; on the *cynoſurus criſtatus*; in woody meadows. Larva and pupa green; the former marked with a white line, and has two ſmall prominences at the tail.

arcanius. Wings perfectly entire, of a ruſty colour; the upper marked on their inferior ſurfaces with a ſingle ocellus; the under wings with five, the firſt being ſeparated by a band. 242. A native of Europe; in woody meadows. Larva green, marked on the back with duſt-coloured lines, and on the ſides with yellow lines; the tail furniſhed with two little prominences.

Iphis. Wings perfectly entire, brownish; (the upper wings of the female tawny), the lower ſurface of the under ones aſh-coloured and tawny at the tips, adorned with ſix ocelli. 503. A native of Europe; ſomewhat reſembling the laſt.

5. NYMPHALES.

A. *Gemmati.*

* *jo.* Wings angularly notched, tawny, ſpotted with black; each adorned with one ocellus. 131. A native of Europe. Larva gregarious, prickly, black, dotted with white; their hind legs of a ruſty colour. Pupa green, dotted with gold; having ten ſmall projections on the fore part of the body; the tail divided.

* *maera.* Wings notched, brown; the upper marked on both ſurfaces with one ocellus and a half; the under adorned on their ſuperior ſurfaces with three ocelli, and on their inferior with ſix. 141. A native of Europe; on paſture ground. Larva greeniſh, ſomewhat hairy, having two ſmall prominences at the tail. Pupa greeniſh, ſlightly divided, and prickly on the ſides.

* *megæra.* Wings notched, yellow, and marked with brown bands; the upper adorned with one ocellus, and the under with five ocelli on the ſuperior, and ſix on the inferior ſurface. 142. A native of Europe; on paſture ground. Larva hairy, green, ſtripped with white; the tail divided.

* *ageria.* Wings notched, brown, ſpotted with yellow; the upper adorned on both ſurfaces with one ocellus; the under with four ocelli on their ſuperior ſurface, and four dots on their inferior. 143.

phædra. Wings notched, brown on both their ſuperior and inferior ſurfaces; the upper wings adorned with violet-coloured ocelli. 150. A native of Europe; feeds chiefly on the *avena elatior*. Larva gray, with two lines of black dots on its back; tail divided. It remains under ground till it has undergone its metamorphoſis.

B. *Phalerati.*

populi. Wings notched, of a duſky colour, marked with white dots and bands; their inferior ſurfaces yellow, marked with white bands and black ſpots. 162. A native of Europe; on the *populus tremula*. The female marked with a broader white band than the male. Larva prickly, and variegated; head and tail tawny. Pupa yellowiſh, dotted with black.

* *antiopa.* Wings angular, black, with a whitiſh circumference. 165. A native both of Europe and America; on the birch and willow. When it appears in ſpring, the edges of the wings are white, and in the ſummer they become yellow. Larva gregarious, prickly, black, marked with ſquare ruſty-coloured ſpots on the back. Pupa black, marked with ſmall projections and tawny dots.

* *polychloros.* Wings angular, tawny, ſpotted with black; the upper ones marked on their ſuperior ſurface with four black dots. 166. A native of Europe; on fruit trees. Larva gregarious, prickly, blackiſh, marked with a yellow line on the ſides. Pupa of a fleſh colour.

* *urticæ.* Wings angular, tawny, ſpotted with black; the ſuperior ſurface of the upper wings marked with three black dots. 167. A native of Europe; very common on the nettle; ſuppoſed, though often falſely, to be a forerunner of ſpring. Larva gregarious, prickly, brown, variegated with green; the head black. Pupa brown, marked with ſmall projections, and golden ſpots on the neck, and ſometimes entirely of a golden colour. This inſect, and many others of the ſame genus, *p. atalanta*, *polychloros*, *jo*, &c. ſoon after their enlargement from the chryſalis ſtate, diſcharge a few drops of a reddiſh coloured fluid; which in places where they have appeared in great numbers, has had the appearance of a ſhower of blood, and been marked by writers as a prodigy foreboding ſome extraordinary event.

* *C album.* Wings angular, tawny ſpotted with black; the under ones marked on their inferior ſurface with a white C. 168. A native of Europe; on the nettle, willow, and gooſeberry. Larva ſolitary, prickly, and tawny; the back yellow on the fore part, and white behind. Pupa of a fleſh colour, contracted in the middle, dotted with gold.

hyſpſipyle. Wings notched, yellow, variegated with black, and radiated at the tips; the under ones marked with ſeven red dots. 607. A native of Europe; on the *ariſtolochia clematis*. Larva yellow, marked with black, furniſhed with prickles ſet round in a circle; red, with black tips.

* *atalanta* Wings black, ſpotted with white; the upper ones marked with a purple band on both ſides, the under with a purple band along the edge. 175. A native of Europe and America; on the nettle. Larva ſolitary, prickly, green, marked with yellow lines on the ſides. Pupa marked with ſmall projections; blackiſh above, and aſh-coloured below, dotted with gold.

celtis. Wings angularly notched, brown, marked with tawny ſpots and a ſingle white one; the under wings gray on their inferior ſurfaces. 639. A native of the ſouth of Europe. Larva green, marked with white lines, ſpotted with black. Pupa green, marked with white lines.

levana. Wings ſlightly notched, variegated, and reticulated,

on

on their inferior ſurface; the upper ones marked on their ſuperior ſurface with ſome white ſpots. 201. A native of Europe; on the common thiſtle. Larva gregarious, prickly, and black; legs red; head marked with two prickles; pupa furniſhed with ſmall brown projections; thorax yellowiſh below.

* *adippe.* Wings notched, brown, ſpotted with black, adorned on the inferior ſurface with twenty-three ſilvery ſpots. 212. A native of Europe; on the *viola odorata* and *tricolor*: the ſilver ſpots ſometimes, though rarely, change into yellow; larva aſh-coloured or brown, covered with many reddiſh prickles, and marked on the back with a black line, riſing out of a white one; pupa brown, marked with ſilver dots.

6. *Plebeii.*

A. *Rurales.*

cupido. Under wings terminating in ſix ſmall projections, white on their inferior ſurface, marked with ſilver ſpots. 217. A native of America; on the cotton. Larva white, dotted with black.

* *betulæ.* Wings furniſhed with a ſlight tail, the under ones marked with two white ſtreaks. 220. A native of Europe; on the birch and ſloe. Wings of the male marked with tawny ſpots; larva thick, green, marked with two obliquely tranſverſe white lines, and two ſmall furrows on the back; pupa ſmooth, of a ruſty colour.

pruni. Wings ſlightly tailed, brown above, with a red ſpot at the tip of the lower ones; lower wings beneath with a tawny marginal band, dotted with black. 221. A native of Europe; on the plum-tree. Larva thick, green, with a pale lateral line; pupa brown, with a white head.

* *quercus.* Wings ſlightly tailed, bluiſh, beneath aſh-coloured, with a white ſtreak and double tawny dot near the tail. 222. A native of Europe; on the oak. Larva thick above, of a roſe colour; with three lines of green dots. Pupa ſmooth, of a ruſty colour; with three lines of brown dots on the back.

ceraſi. Wings tailed, brown, without ſpots; the inferior ſurfaces marked with a white ſtreak, and tawny circular ſpots; the under wings marked with a black dot. 719. A native of Europe; on the cherry tree.

ſedi. Wings furniſhed with a tail, blue, with a white ſpotted edge, white on their inferior ſurfaces, marked with black ſquare ſpots, and a reddiſh band. 743. A native of Europe; on the *ſedum telephium*. Larva green; marked with a red line on the back. Pupa obtuſe; green on the anterior, and brown on the poſterior part.

cyllarus. Wings entire, and blue with a black edge; beneath of a browniſh colour, adorned with a ſtreak of dots reſembling ocelli; the under wings on their inferior ſurface blue at the baſe. 750. A native of Europe; on the flower of the *aſtragalus* and *melilot*. Larva pale; marked with a red ſtreak on the back, and on the ſides with oblique green lines; head black. Pupa brown, ſpotted with black.

B. *Urbicolæ.*

comma. Wings perfectly entire, ſpreading ſo as to form an obtuſe angle, tawny, marked with a ſmall white line, and with white dots beneath. 256. A native of Europe; the line wanting in the female. Larva of a ſhining red; head black, with a white ſtrip on the collar. Pupa long, cylindrical, and brown.

* *linea.* Wings perfectly entire, ſpreading ſo as to form an obtuſe angle; tawny, with a black margin. 817. A native of Europe; upper wings in the male marked with a ſmall black line on the middle. Larva ſolitary and green. Pupa green; with a very thin covering.

* *malvæ.* Wings notched and ſpreading ſo as to form an obtuſe angle; brown, waved with aſh colour; the upper wings marked with tranſparent dots; the under ones with white dots. 267. A native of Europe; in the *malva* and *althæa*. Larva gray; head black; neck marked with four ſulphur-coloured dots. It draws together the leaves on which it feeds, by threads which it ſpins. Pupa hunch-backed and bluiſh.

876 ſpecies of the butterfly have been deſcribed in the laſt edition of the Syſtem of Nature publiſhed by Gmelin; but a great many more are to be met with in the collections of the curious, which have not yet been deſcribed by any author.

Sphinx, *Hawk-moth.*

Antennæ nearly priſmatic, thickeſt in the middle. Tongue (in moſt ſpecies) projecting. Feelers two, bent back. Wings deflected.

* Legitimæ. *Antennæ ſcaly, Feelers hairy, Tongue ſpiral.*

† *Wings angular.*

* *ocellata.* The under wings reddiſh, adorned with a blue eye. 1. Native of Europe and America; on the *ſpiræa*, willow, and fruit trees; the thorax marked with a ruſty-coloured ſpot, the tongue very ſhort. The larva ſolitary, rough, green, and furniſhed with a tail; marked with obtuſe white ſtreaks, and dotted with yellow ocelli. The pupa is brown, with a black back.

quercus. Wings angularly notched, yellowiſh, marked on the under ſurface with brown bands; the under wings with a red band. 48. Native of Europe, on the oak. The body of the male is aſh-coloured; that of the female brown. The larva ſolitary, furniſhed with a tail, and green; marked on the ſides with oblique white ſtripes, and with reddiſh ſpecks. The pupa a light brown, with reddiſh edges.

* *populi.* Wings dentated, reverſed and gray; the under wings of a ruſty colour at the baſe; the upper ones marked with a white dot. 2. Native of Europe; on the poplar and willow. The larva ſolitary, rough, green, furniſhed with a tail; it is marked on each ſide with a white line, and with white oblique croſs ſtripes. The pupa a duſky gray, and of a ruſty colour behind.

* *tiliæ.* Wings marked with greeniſh bands, and clouded with dark green; the ſuperior ſurface of the upper wings of a yellowiſh brick-colour. 13. Native of Europe; on the lime-tree. The larva ſolitary, rough, green, furniſhed with a tail. It grows ſmaller towards the head, and is marked on the ſides with oblique blood-coloured and yellow ſtripes. The pupa of a duſky brown.

œnothera. Wings irregularly notched, and greeniſh, marked with a dark green band; the under wings tawny, and black at the tips. 54. Native of Europe; on the *œnothera*. The larva ſolitary, brown, and without a tail; marked with blood-coloured ſpecks, and with a black ocellus, the pupil of which is white, on the laſt

segment but one of the abdomen. The pupa is uncovered, and light brown.

nerii. Wings faintly angular and green; variegated with bands of pale or dark green, and yellow. Native of Europe; on the *nerium*. The larva ſolitary, dotted with white, and marked on each ſide of the neck with a blue ocellus. The tail is bent down, and almoſt jointed. The pupa yellow, marked with a black line and black dots on the back.

†† *Wings entire.*

* *convolvuli.* Wings clouded; the under ones faintly marked with bands; the abdomen marked with belts of red, black, and white. 6. Native of Europe; on the *convolvulus*. It ſmells of ambergriſe. Its eyes are very bright. The larva furniſhed with a tail; marked on each ſide with oblique white lines, and dotted with faint *ocelli*. The pupa light brown, furniſhed with a reflected involuted horn.

* *liguſtri.* The under wings reddiſh, marked with three black bands; the abdomen red, ſurrounded with black belts. 8. Native of Europe; on the privet, lilac, aſh, and elder. The larva green, and furniſhed with a tail; marked on the ſides with oblique ſtreaks of a carnation colour towards the anterior part of the body, and white towards the poſterior. The fore part of the body is erect, and it reſts with the feet elevated. The pupa brown; with a tail formed of four ſmall projections.

* *atropos.* The under wings yellow, marked with brown bands; the abdomen yellow, marked with black belts. 9. Native of Europe; on the jeſſamine, potato, and hemp. It is alſo a native of Africa and Aſia; but the variety to be met with there, is double the ſize of that in Europe. It makes a noiſe by rubbing its feelers againſt its tongue. The larva is ſolitary, and lies concealed under ground all day, coming out in the evening to feed. It is yellow dotted with black, and furniſhed with a tail which is bent down; it is marked on the ſides with croſs lines, half blue, half green. The pupa light brown, marked on both ſides with black ſpecks.

* *celerio.* Wings gray, marked with white ſtreaks; the under ones with brown ones, and with ſix red ſpots. 12. Native of the ſouth of Europe; on the vine. The larva is brown, marked on the ſides with two white lines, and with two ocelli on each ſide of the neck. It is furniſhed with a tail. The pupa is of a dark brown before, and of a light brown behind.

* *elpenor.* The wings variegated with purple and green; the under wings red, and black at the baſe. 17. Native of Europe; on the French willow, the balſam, the convolvulus, and the vine. The larva is furniſhed with a tail, and is ſpotted with black; it is alſo adorned with two blue ocelli on each ſide of the neck. The pupa on the anterior part of the body is of a duſky gray, and brown on the poſterior part, marked with dark-coloured ſpecks.

* *euphorbiæ.* Wings gray; the upper ones marked with two green bands; the under with two red bands, with a black ſtreak at the baſe; the antennæ a pure white. 19. Native of Europe; on the *euphorbia*. The larva is furniſhed with a tail, and is black, marked with white; marked with a blood-coloured line on the back, and on the ſides with yellow dots. The pupa light brown, marked with black ſpecks.

** Seſiae. *The Wings entire; the Tail furniſhed with a beard; the Tongue projecting, and terminating abruptly; the Antennæ cylindrical.*

* *ſtellatarum.* The ſides of the abdomen variegated with black and white; the under wings of a ruſty colour. 27. Native of Europe; on the madder, and on the reſt of theſe plants which form the natural order called *ſtellatæ*. The larva is ſpotted with white, and is furniſhed with a blue tapering tail, of a ruſty colour at the tip. The pupa brown.

* *ſuciformis.* The abdomen black, marked with a yellow band; the wings tranſparent, with a black edge. 28. Native of Europe; on the woodbine, and on the ſcabious. The larva is green, marked on the ſides with a yellow line, and furniſhed with a reddiſh horn. The pupa black, marked on the fore part of the body with yellow ſtreaks, and encloſed in a follicle.

* *apiformis.* The wings tranſparent; the abdomen yellow, with black inciſures; the thorax black, marked with two yellow ſpots. 29. Native of Europe; on flowers. The larva on the trunk of the poplar-tree.

ſeſia. The upper wings brown, the under wings tranſparent; the abdomen black, marked with three yellow belts. 102. Native of Europe.

* *veſpiformis.* The wings tranſparent, with a black edge and black band; the abdomen black; the ſecond and laſt ſegments marked with a yellow margin. 31. Native of Europe.

* *tipuliformis.* The wings tranſparent, with a black edge and black band; the abdomen black; the inciſures are alternately marked with a yellow margin. 32. Native of Europe. Feeds on the pith of the common red currant.

*** Zygænæ Fabricii, ſ. Adſcitæ. *The Tongue projecting, and ſetaceous; the Antennæ thicker in the middle.*

* *filipendulæ.* The upper wings blue, marked with ſix red dots; the under wings red with a blue edge. 34. Native of Europe; on the *ſpiræa filipendula*. There is a variety of this ſpecies (β. *peucedani*) diſtinguiſhed by a red belt on the abdomen, which feeds on the *peucedanus*. The larva is thick, of a ſulphur-colour; marked with four rows of black dots, and furniſhed with a tail. The pupa is brown, of a ſulphur-colour in the middle, and marked with brown ſpecks.

pythia. Black; the upper wings green, marked with three oblong blood-coloured ſpots, placed near one another; the under ones red. 106. Native of Europe. The larva hairy and white; the head marked with two lines of black dots; the fore legs are black; the hind legs yellow.

fulvia. Blue; the upper wings green, marked with five red ſpots; the under ones of a blood-colour, and without ſpots. 107. Native of Europe; on the *lotus corniculatus*.

phegea. Greeniſh-black; the wings marked with tranſparent dots, ſix on the upper, and two on the under wings; the abdomen marked with a yellow belt. 35. Native of Europe; on the oak, &c. The larva brown, with reddiſh head and legs; with tufts of whitiſh feathers on the back.

ephlte Blue; the upper wings marked with ſix red dots; the under ones with one red dot; the abdomen girt with a red belt. 36. Native of the ſouth of Europe; on the *medicago*.

medicago. Sometimes the wings are dotted with white, and the base of the upper wings and the abdomen marked with a yellow belt. The larva hairy and yellowish; the head, legs, and two lines on the body, are of a pale yellow colour.

165 species of this genus have been described in the last edition of the System of Nature.

71. PHALÆNA, *Moth.*

Antennæ growing gradually smaller from their base to their tip. Tongue spiral. Jaws none. Shield (in most species) short, and of a horny substance.

Moths fly about at night, have their antennæ composed of many articulations, and commonly pectinated in one or both sexes. They feed chiefly on the nectareous juice of flowers. The larva is active, commonly smooth, and more or less cylindrical, and feeds on the leaves of plants. The pupa remains torpid, is generally cylindrical, sometimes pointed before, sometimes at both ends, and in most instances covered with a follicle.

PHALÆNÆ dividuntur in,

1. BOMBYCES. Larva 16-poda, sæpius pilosa, subcylindrica; pupa apice acuminata; antennis filiformibus, apice acutis; palpis duobus, compressis, reflexis, æqualibus, pilosis, obtusis; lingua spirali, brevi, membranacea, vix exserta, filiformi, obtusa, bifida.

a. *Attacos*, alis patulis.

b. *Bombyces*, alis non patulis.

- α. Alis reversis.
- β. deflexis.
- γ. incumbentibus.
- δ. convolatis.

2. GEOMETRÆ. Larva octo vel decem-poda, pedibus pectoralibus 6, caudalibus 2, et interdum subcaudalibus 2; hirudinem instar incedans, dum quiescitat, erecta, glabra, pupa apice acuminata; antennis filiformibus, articulis obsoletis; palpis duobus æqualibus, reflexis, membranaceis, cylindricis; lingua porrecta, membranacea, setacea, bifida; alis inquiescentibus, ut plurimum patulis, horizontalibus.

a. Alis angulatis, antennis ut plurimum pectinatis.

b. integris.

c. rotundatis.

3. TORTRICES. Alis obtusissimis, fere retusis, margine exteriore curvo; antennis filiformibus; palpis duobus æqualibus, nudiusculis, basi cylindricis, medio dilatato-ovatis, apice setaceis; lingua porrecta, membranacea, setacea, bifida; larva 16-poda, folia, quæ vorat, et intra quæ se recipit, filis contorquente, et connectente.

4. PYRALIDES. Alis conniventibus, in figuram deltoideam forficatam; antennis filiformibus, articulis obsoletis; palpis duobus æqualibus, reflexis, membranaceis, cylindricis; lingua porrecta, membranacea, setacea, bifida; larva 14—16-poda.

5. NOCTUÆ. Larva 16-poda sæpius glabra, pupa apice acuminata, antennis setaceis, palpis duobus compressis, pilosis, apice cylindricis, nudis; lingua porrecta, cornea, setacea, bifida.

MOTHS are divided into,

1. BOMBYCES. Those whose larvæ are generally hairy, nearly cylindrical, and furnished with 16 feet; whose pupa is drawn to a point at the head; and which have their antennæ filiform and sharp at the tip; two feelers, equal, compressed, bent back, hairy and blunt; the tongue spiral, short, membranaceous, slightly projecting, filiform, blunt, and divided at the extremity.

a. *Attacos*, with spreading wings.

b. *Bombyces*, with wings not spreading.

- α. Wings reversed.
- β. deflected.
- γ. incumbent.
- δ. convoluted.

2. GEOMETRÆ. Those whose larvæ are smooth, and have eight or ten feet, six attached to the breast, two to the tail, and sometimes two more near to the tail; moving like a leech, and resting in an erect posture; whose pupæ are pointed at the head; which have filiform antennæ, with faint articulations, two feelers equal, bent back, membranaceous, and cylindrical; the tongue membranaceous, setaceous, divided at the extremity, and projecting; the wings, when at rest, spreading horizontally.

a. Wings angular; antennæ, for the most part, pectinated.

b. entire.

c. round.

3. TORTRICES. Those which have their wings very blunt, with a curved exterior margin; the antennæ filiform; two feelers equal, nearly smooth, cylindrical at the base, dilated in the middle into an oval form, and setaceous towards the tip; the tongue membranaceous, setaceous, divided at the extremity, and projecting; and whose larvæ are furnished with 16 feet, and twist up the leaves on which they feed, by means of threads they spin, into a retreat for themselves.

4. PYRALIDES. Those which have the wings passing over one another, forming a forked figure resembling the Greek δ; the antennæ filiform, with their articulations faintly expressed; two feelers equal, bent back, membranaceous, and cylindrical; the tongue membranaceous, setaceous, divided at the extremity, and projecting; whose larva has from 14 to 16 feet.

5. NOCTUÆ. Those whose larvæ are for the most part smooth, and furnished with 16 feet; whose pupæ are pointed at the head, and have their antennæ setaceous; two feelers compressed, hairy, with naked cylindrical tips; the tongue formed of a horny substance, setaceous, divided at the point, and projecting.

a. Alis

a. Alis patulis.
b. incumbentibus.
α. Thorace lævi.
β. criſtato.
c. Alis deflexis.
α. Thorace lævi.
β. criſtato.

6. Tineæ. Larva 16-poda, ſæpius intra cucullum latente; pupa anterius acuminata; antennis ſetaceis; lingua membranacea, ſetacea, bifida.

a. *Tineæ*, palpis quatuor, inæqualibus; larva ſæpius rebus culinariis, veſtimentis, pellibus, &c. victitante.

b. *Tineæ*, palpis duobus ad medium bifidis, lacinia interiori acutiſſima.

7. Pterophori ſive Alucitæ. Alis digitatis ad baſin uſque fiſſis; antennis ſetaceis; palpis duobus tenuiſſimis, cylindricis, filiformibus, reflexis, nudis, apice ſubulatis; lingua porrecta, membranacea, elongata, ſetacea, biſida; larva 16-poda, ovata, piloſa; pupa nuda apice, ſubulata.

8. Hapiali. Larva 16-poda, ſubcylindrica, ſæpius glabra, radicibus plantarum victitante; pupa folliculata, cylindrica, apice acuminata; antennis brevibus, moniliformibus; palpis duobus æqualibus, obtuſis, compreſſis, membranaceis, reflexis; linguæque bifidæ inter hos rudimento.

a. Wings ſpreading.
b. incumbent.
α. Thorax ſmooth.
β. creſted.
c. Wings deflected.
α. Thorax ſmooth.
β. creſted.

6. Tineæ. Thoſe whoſe larvæ have 16 feet, and moſt commonly lie concealed under a covering; whoſe pupa is pointed at the head; and have the antennæ ſetaceous, the tongue membranaceous, ſetaceous, and divided at the extremity.

a. *Tineæ*, with four unequal feelers; whoſe larva feed on clothes, hides, furniture, &c.

b. *Tineæ*, two feelers divided to the middle, the interior diviſion very ſharp.

7. Pterophori or Alucitæ. Thoſe which have their wings divided to the baſe into ſeveral portions; the antennæ ſetaceous; two feelers, very ſlender, cylindrical, filiform, bent back, ſmooth, and tapering at the tip; the tongue membranaceous, ſetaceous, divided at the extremity, projecting, and very long; whoſe larvæ are oval, hairy, and furniſhed with 16 feet.

8. Hapiali. Thoſe whoſe larvæ are cylindrical, commonly ſmooth, furniſhed with 16 feet, and feed on the roots of plants; whoſe pupa is cylindrical, pointed at the head, and encloſed in a follicle; and have ſhort, moniliform antennæ; two feelers, equal, obtuſe, compreſſed, membranaceous, bent back, and the rudiment of a divided tongue placed between them.

* *Antennæ filiform.*

a. *Feelers compreſſed.*

† *Wings ſpreading.* Attaci.

atlas. Wings curved, of the ſame colour both on their upper and under ſurfaces, variegated with yellow, marked with a tranſparent ſpot; the upper wings have a ſmall tranſparent ſpot joined to the other. 1. Native of Aſia and America; on the orange tree. Each articulation of the antennæ has two projections proceeding from them in oppoſite directions. The larva has hairy tubercles ſet round it in circles. It ſpins a large ball of ſilk, which is unravelled with very great difficulty.

nictitans. Wings of a dark carnation colour; the under ones marked with a ruſty-coloured eye, the pupil of which is tranſparent. 469. Native of Africa. Female larger than the male.

* *pavonia.* Wings round, clouded with gray, and faintly marked with bands, adorned with a long ſemitranſparent ocellus. 7. Native of Europe; on heath, bramble, the roſe, the elm, the willow, and fruit trees. There are three varieties of this ſpecies, *minor*, *media*, and *major*. The antennæ in the male are more diſtinctly pectinated than in the female. The larva is gregarious, and green, having red and yellow hairy tubercles ſet round it in circles. The pupa is blackiſh, with a hole at the top of the follicle, which is elaſtic and acting like a valve.

tau. Wings of a brick colour, adorned with an eye of a violet colour; with a white ſpear-ſhaped pupil. 8. Native of Europe; on the birch. The larva green, marked on the ſides with oblique white ſtreaks, the back covered with knots. The pupa light-brown and hairy.

†† Bombyces. *Wings not ſpreading.*

α. Wings reverſed.

populifolia. Wings of a brick colour, notched, and marked with a great many brown ſpots like creſcents. 485. Native of Europe; on the white poplar.

* *quercifolia.* Wings notched, and of a ruſty colour; the mouth and ſhanks of the legs black. 18. Native of Europe; on graſs, the ſloe, pear tree, apple, and willow. The larva is hairy, of a ruſty colour, with a blue neck, and furniſhed with a ſlight tail. The pupa brown, marked with red bands.

* *rubi.* Wings fawn coloured, marked with two whitiſh ſtreaks on their upper ſurface. 21. Native of Europe; on the bramble and willow. The larva is hairy, black on the under ſide, and of a ruſty colour, marked with black rings on the upper ſide. When young it is covered with a veil of black ſilk. The pupa blackiſh, marked with three yellow rings, and encloſed in a covering of ſilk.

pruni. Wings notched, yellow, and marked with two brown ſtreaks and a white dot. 22. Native of Europe; on the plum. The larva is ſmooth, of an aſh colour, marked with blue lines, and furniſhed with tufts of hair on the neck and along the ſides; the hind legs are ſtretched out, and at a diſtance from one another. The pupa black on the fore part of the body, and of a light brown behind.

* *potatoria.* Wings faintly notched, and yellow, marked with a broad tawny ſtripe, and with two white dots. 23. Native of Europe; on graſs. It produces oblong eggs of a leaden colour, marked at each end with a green ring, and with a green dot in the middle. The larva has a

tail and a creſt, is hairy, and ſpotted on the ſides with white. The pupa of a light brown.

* *quercus.* Wings of a ruſty colour, marked with a yellow ſtreak; the upper wings with a white dot. 25. Native of Europe; on heath, the ſloe, the birch, the willow and oak. The colour of the female is paler than that of the male. The larva is hairy, gray, marked with black rings, and ſpotted with white. The pupa is encloſed in a thick covering of ſilk, is green, and brown on the fore part.

* *laneſtris.* Wings of a ruſty colour, marked with a white ſtreak; the upper wings are white at the baſe, and marked with a white dot. 28. Native of Europe; on the lime tree, the ſloe, and the willow. It produces eggs covered with aſh-coloured wool. The larva is hairy and black; each of its ſegments is marked with three white dots between two red tufted ſpots. It is gregarious, and lives in habitations which it forms for itſelf compoſed of many cells; going out in queſt of food, it returns through parallel holes. The pupa is of a ſulphur colour.

* *vinula.* Wings nearly reverſed, waved and ſtreaked with brown; body white, dotted with black. 29. A native of Europe; on the willow and poplar. Larva ſolitary, green, and brown on the back, on which there is ſituated a turgid prominence; the tail is furniſhed with two briſtles; it diſcharges an acrid fluid from a chink under its head. Pupa brown.

mori. *Silk-worm.* Wings pale, marked with three faint brown ſtreaks, and a brown circular ſpot. 33. Native of China and Perſia; on the mulberry. It was introduced into Europe by Juſtinian. It varies a little in ſize and colour; the wings being ſometimes yellowiſh, ſometimes whitiſh. The larva is furniſhed with a tail, is naked, and whitiſh. The pupa light brown, encloſed in a thick ſilky covering, from which ſilk is manufactured. The firſt perſon who unravelled the cocoons of the ſilk-worm, and manufactured them into ſilk, was Pamphilia, a woman of Coos, the daughter of Latous, (*Vide* Plin. xi. 22.); *ſeu potius Platis filia,* (Ariſtot. Anim. v. 19.)

* *populi.* Brown and whitiſh on the fore-part; the wings browniſh, marked with a whitiſh ſpreading ſtripe, with a ſmall one placed cloſe by it. 34. Native of Europe; on the poplar, and on fruit trees. The larva hairy, and of an aſh-colour, darker on the back; each ſegment is marked with two pairs of red dots. The pupa is brown on the fore part, and reddiſh behind.

veria. Wings yellow (in the female brown), marked with a white dot, and becoming paler towards the tip. 499. Native of Europe; on the ſloe, &c. It depoſits rough eggs in cluſters. The larva gregarious, hairy, and light-brown. The diviſions between the ſegments black, and marked on the ſides with blue ſpots and ſulphur-coloured dots. The pupa yellowiſh.

* *caſtrenſis.* Wings dark-coloured, marked with two pale bands. 36. Native of Europe; feeds on the *piloſella, jacea, millefolium, alchemilla,* and *euphorbia.* It depoſits its eggs in circles round branches. The larva is gregarious, conſuming a great variety of vegetables: it feeds under a web, and frequently ſhifts its quarters: it is hairy, blue, and marked with red lines dotted with black. The pupa is dark coloured.

* *proceſſionea.* Wings of a browniſh aſh-colour: the female marked with one dark ſtripe; the male with three. 37. Native of Europe; on the oak. Of a middle ſize. The larvæ gregarious, hairy, of a browniſh aſh-colour, black on the back, and marked with yellow warts: they move in ſets, differing in number. The ſkin which they caſt excites inflammation when touched.

β. *Wings deflected.*

† *Tongue ſhort.*

‖ *Back ſmooth.*

ruſa. Wings whitiſh, marked on the back with a brown ſpot, and with ſix brown ſpots like creſcents on the lower wings. 508. Native of Europe. The under wings white, with a brown edge; the antennæ pectinated and brown; the legs brown.

* *plantaginis.* Wings black, with white veins; the under wings yellow, with a black edge, and dotted with black. 42. Native of Europe; on the plantane, elm, and hyacinth. The under wings in the female are ſcarlet; but in the north of Europe, frequently white, with a black edge and black ſpots: when caught it emits a yellow drop from its collar. Larva hairy, black, with the back brown.

* *monacha.* Wings white, waved with black, marked with blood-coloured rings between the ſegments of the abdomen. 43. Native of Europe; on the bramble, the willow, the apple, the oak, the larix, and other ſpecies of pine. To theſe laſt it is particularly deſtructive. Larva browniſh aſh-coloured, with red tufts on the back; the ſecond ſegment of its body is marked with a black ſpot of a heart-ſhape. Pupa black.

* *diſpar* Wings marked with ſpots clouded with gray and brown; the wings of the female whitiſh, with black ſtains. 44. Native of Europe; on the oak, the lime, and fruit trees; the peſt of orchards. The female twice the ſize of the male, covers her eggs with balls of duſt. The larvæ feed on a variety of vegetables, are hairy marked with white lines, dotted with blue on the fore part of the body, and with red behind. When touched they excite an itching in the hands. The pupa is marked on the fore part of the body with four black dots; when touched, it rolls itſelf up into a circle.

* *chryſorrhœa.* Wings of a ſnowy-white, a beard of a ruſty colour at the anus. 45. Native of Europe; on the oak and fruit-trees. There is a ſmaller variety of this ſpecies with browniſh wings in India. The female produces yellow eggs, and covers them with a large quantity of tawny-coloured wool. The larva is blackiſh, hairy, gregarious; not confined to one kind of food; marked with two red lines on the back, tufted with white on the ſides. The pupa blackiſh.

‖ ‖ *Back furniſhed with a Creſt.*

* *pudibunda.* Wings of an aſh colour, marked with three brown waved ſtreaks. 54. There is a variety of this ſpecies, *ſcopularis* β. Antennæ pectinated, wings whitiſh, marked with three dark-coloured bands; the under wings white. It is a native of Europe; on the oak, beech, and fruit-trees. The larva is yellow, hairy; the tuft on the tail longer than the reſt, and red; four tufts on the back, white; the head is pale yellow. The pupa is black in the lower part of the body, and a light brown behind, ſpotted with yellow.

* *caſſus* Wings clouded; the poſterior part of the thorax marked with a black band; antennæ lamellated. 63.

A native of Europe; in decayed wood. The larva somewhat hairy, of a carnation colour; the head black, and back of a blood-colour. It was reckoned a delicacy by the Romans, who fattened it with flour (Plin. xviii. 24.). The pupa of a light brown on the fore part of the body, and yellow behind.

ceraria. Wings yellowish, marked with black bands. 1306. A native of Chili; on a kind of *conyza*. The larva is naked, and red, while it undergoes its metamorphosis; it rolls itself up in a kind of wax, at first white and sweet, and afterwards yellow and bitter, which the natives gather in the autumn and put into cakes.

†† *Tongue long.*

a. *Back smooth.*

* *aulica.* The upper wings gray, and dotted with yellow; the under ones tawny spotted with black. 68. A native of Europe; on the *angelica*, nettle, and grass. The larva solitary, black, marked with white warts; on the upper part of the body it is covered with whitish hairs, and underneath with hairs of a rusty colour.

matronula. Wings brown; the upper wings gray, spotted with yellow on their superior surface; the under ones yellow marked with black bands. 92. A native of Europe; on the *artemisia vulgaris*.

b. *Back furnished with a Crest.*

oo. Wings of an ash-colour, streaked with a light brown, and marked with *oo*. 81. A native of Europe; on the oak. Larva naked, of a violet-colour, marked with white lines, and dots.

æsculi. Of a snow white colour; wings marked with a great number of bluish-black dots; the thorax with six. 33. A native of Europe; in the wood of the pear and horse-chesnut. Larva yellow, dotted with black; head and tail black.

γ. *Wings incumbent.*

**graminis.* Wings gray; marked with a white line dividing into three branches, and a white dot. 73. A native of Europe; on grass. It varies in size, and is very destructive to pasture grounds. The larva consumes all kinds of grass except the *alopecurus*. It is smooth, dusky, with a lateral and dorsal yellow stripe. It is destroyed by rooks and hogs. The pupa remains torpid for fourteen days only.

**fuliginosa* Wings dark-coloured, tinged with red, marked with a double black dot; abdomen red; and black on the back. 95. A native of Europe; on the turnip, mustard, grass, and birch-tree. The larva is hairy, of a rusty colour, with black head and fore-legs; wanders over the snow in winter in Norway; and is said to forbode a cold summer and scarcity where it appears in considerable numbers. Pupa black, marked with yellow bands behind.

varella. Wings transparent and gray; antennæ brown. 591. A native of Europe; on the *vicia sylvatica*. The female deposits her eggs while in the pupa state, and never becomes a perfect insect.

δ. *Wings convoluted.*

bifaria. Wings tawny, marked with numerous white spots, surrounded with blue. 593. A native of the island of Tobago. Feelers white at the base, and tipt with black; thorax bluish black with white dots, and two tawny spots; abdomen beneath white with black rings; anus tawny; upper wings blue at the tip, with white dots; lower wings, and all beneath, black; the hind margin a little whitish.

§§ *Feelers cylindrical.* Geometræ.

a. *Wings angular.*

Wings green and faintly notched, marked with a faint waved whitish streak; a smaller line of the same description being placed contiguous to it. 199. A native of Europe; on thyme. Larva dark-coloured, marked with carnation-coloured spots on the back; the head and collar furnished with two little projections. Pupa light brown, marked with a black line, sharp-pointed before, and divided behind, and covered with a very thin follicle. *thymiaria.*

Wings ash-coloured, and marked with a rusty-coloured streak, and transverse row of black dots. 200. A native of Europe; on the oak. Larva ash-coloured, marked with yellow spots on the sides. Pupa of a pale carnation-colour above, beneath yellow; and is attached to a leaf. *punctoria.*

b. *Wings entire.*

Wings green, somewhat waved, marked with a waved streak, and smaller streak of the same description contiguous to it. 225. A native of Europe; on birch-trees. Larva green, with ten crooked reddish prickles on the back. Pupa green, varied with yellow; remains torpid for 14 days. *papilionaria.*

Wing purple, marked with a pale fillet. 654. A native of Europe. *vittata.*

c. *Wings round.*

All the wings yellowish, marked with brown streaks, and very small dots. 214. A native of Europe; on the *centaurea*. Larva gray, and smooth, marked with a number of interrupted lines of a rusty colour, having two tubercles on the posterior part of the body. **atomaria.*

Wings white, marked with a striated yellow band; the abdomen yellow dotted with black. 213. A native of Europe; on the elm and plane tree. Larva green marked with black lines; head and tail black. Pupa bluish. * *pantaria.*

Wings variegated with green and ash-colour, marked with two black streaks; the anterior one curved, the posterior one waved. 633. A native of Europe; on lichens. Small. Larva rough, varying in colour according to the colour of the lichen on which it feeds, green, ash-coloured, or yellow, spotted with black on the sides; the fore-legs marked with a black spot, and a green dot. *lichenaria.*

§§§ *Feelers almost naked, and cylindrical at the base; dentated in the middle, and oval; tapering at the tips.* Tortrices.

The upper wings green, marked with two oblique yellow streaks; the under wings white. 235. A native of Europe; on the alder and oak. Larva and pupa green: the former is marked along the side with a yellow line, and has the second segment of the back marked with tubercles; the latter marked on the back with a black line. *prasinaria.*

Wings

pomona. Wings clouded, the under ones marked with a reddiſh golden ſpot. 401. A native of Europe; on the apple. Larva naked, and red; with a black head. Pupa light brown.

reſinaria. Wings brown, marked with a brown ſpot at the baſe, common to both wings, and with a triangular ruſty ſpot at the tips. 406. A native of Europe. It takes up its habitation in a ball of roſin, which exudes from a wound made in the branches of the pine. Larva naked, and yellowiſh; head light brown. Pupa brown.

§ § § § *Wings ſhutting cloſely, with the under edge of one over the upper edge of the other.* Pyralides.

farinalis. Feelers bent backwards; wings yellowiſh and poliſhed, marked with white waved ſtreaks, yellowiſh at the baſe and tips. 327. A native of Europe; in flour and meal. It walks with its tail erect.

* *pinguinalis.* Feelers bent backwards; wings aſh-coloured, thicker at the edges, faintly marked with black bands. 336. A native of Europe; on butter, bacon, &c. Very common in houſes and kitchens, ſometimes in the human ſtomach; the moſt pernicious of all the animals that live within the bodies of others. The larva ſmooth, brown, ſhining. Pupa naked, of a light brown.

ſcalis. Wings gray, ſtreaked with brown, and marked with a kidney-ſhaped ſpot, on which there is inſcribed a Roman A. 338. A native of Europe; within the ſtalks of rye, which it conſumes within the ſheath, going from one to another: this is the cauſe of the ears becoming white and empty. Larva green, marked with three longitudinal green lines; head light brown.

* * *The Antennæ ſetaceous.*

§ *Tongue projecting and horny.* Noctuæ.

a. *Wings ſpreading.*

adora. Wings notched, brown, and waved with black; the upper wings are adorned with a black eye, and marked with a blue ſpot like a creſcent, and with a white ſpotted ſtreak. 11. A native of Surinam.

ſtrix. Wings of the ſame colour, both on the upper and under ſurface, reticulated and clouded with black and white. 82. A native of South America. Larva naked, black, and marked on the ſides with a greeniſh line, and with green rings.

macrops. Wings indented; brown, waved with black; upper pair adorned with a large light brown eye. 968. A native of China. In ſome ſpecimens, probably the females, the outer margin of the lower wings is reflected, forming a pouch which contains a great quantity of fine ſilk.

b. *Wings incumbent.*

α. *Thorax ſmooth.*

livida. Wings ſhining black; under wings of a ruſty colour, edged with dark brown. 999. A native of Europe. Larva growing ſmaller towards each end, naked, greeniſh, variegated with yellow, and ſhining red, marked with a dark-coloured line on the back, and with a very ſlender pale one on the ſides; the head of a pale colour.

β. *The Thorax furniſhed with a Creſt.*

typhæ. Wings white, ſtreaked with dark brown, dotted with black on their poſterior margin. 1005. A native of Europe; on the ſtalks of the *typha anguſtifolia*. It comes forth in Auguſt, about the ſize of *pinguinalis*, ſmooth and whitiſh. Larva is gray and naked. It undergoes its metamorphoſis within the ſtalks, in the month of July.

* *ſolani.* Wings variegated with green and gray; the under ones reddiſh, marked with a band near the edge. 1009. A native of Europe; on the potato and bean, devouring the larvæ of other inſects. Larva thick; wrinkled, and of an aſh-colour. Pupa naked, and of a light brown.

C. nigrum. Wings browniſh gray, marked with a black ſpot; white on the outer edge, and with a black line at the tip. 162. A native of Europe; on the common ſpinach. Larva variegated with gray and dark brown, marked on the ſides with black croſs lines, and with a ſingle pale one.

c. *Wings deflected.*

α. *Thorax ſmooth.*

trapezina. Wings whitiſh, marked with a very broad band of a darker colour, dotted with black along the edge. 99. A native of Europe on the hazel. Larva greeniſh, marked with aſh-coloured, whitiſh, and ſulphur-coloured lines: it devours the larvæ of other inſects, and even of its own ſpecies. Pupa of a light brown; it lies dormant for four weeks.

lucernea. Wings aſh-coloured, without ſpots, marked with three whitiſh waved ſtreaks; the collar divided. 102. A native of Europe; frequently flying into candles, whence it has received its name; though many moths are attracted by the light, as well as this.

β. *Thorax furniſhed with a Creſt.*

* *piſi.* Wings aſh-coloured; the upper wings marked at the baſe with a black line, and black characters; legs without ſpots. 135. A native of Europe; on the alder, oak, and fruit trees; varying in the number and figure of the characters. Larva hairy; back yellow; the ſides ſpotted with black and red; a black erect horn on the thorax.

turca. Wings yellowiſh, marked with two dark brown ſtreaks, and adorned with a yellowiſh eye. 140. A native of Europe; on the *juncus piloſus*, and in corn fields under ſtones. Larva reddiſh yellow, black at each end, underneath of a whitiſh yellow, marked on the back with a whitiſh line, and on the ſides with a dark-coloured one; the diviſions between the ſegments are marked with ſmall black lines, and the head is dark brown. It gnaws over the ſtalks of the corn cloſe by the ground, in the months of May and June.

* *oleracea.* The upper wings of a ruſty colour, marked with a yellowiſh ſpot like a creſcent, and with a white line divided behind. 171. A native of Europe; at the roots of cabbage, greens, &c. likewiſe on the leaves of peas and beans. Larva feeds on a variety of vegetables; naked, of a livid colour, dotted with black, and marked on the back with a dark brown line, and on the ſides with a whitiſh one. Pupa naked and blackiſh.

* *piſi.* Wings of a ruſty colour marked with two ſpots, and with

with a pale waved ſtreak on their poſterior part. 172. A native of Europe; on the pea and broom, conſuming their pods. Larva naked, and of a ruſty colour, marked with four yellow lines; head of a carnation colour. Pupa dark brown; the diviſions between the ſegments of a blood colour.

tritici. Of an aſh-colour; the wings marked with two pale-coloured ſpots, and with a ſingle blackiſh one. 179. A native of Europe; on the ears of wheat and oats. Larva naked and yellow; marked with three white lines.

flavicornis. Upper wings of an aſh colour, marked with three black ſtreaks; antennæ yellow. 182. A native of Europe; on fruit trees. Larva naked, greeniſh, marked on the ſides with white dots; head of a carnation colour.

§ § *Tongue prominent and membranaceous.* Tineæ.

a. *Wings four, unequal.*

tenella. Wings gray, emarginated behind; back of a dark brown, and furrowed. 282. A native of Europe; in bee hives, feeding on the wax.

padilla. The upper wings of a livid colour, and marked with 20 black dots; the under ones brown. 351. A native of Europe; on apple trees. The larva gregarious; living in ſwarms, under a common covering: it is naked, and gray, marked with a black dot on each ſide of its ſegments. Pupa yelloviſh.

**pellionella.* Wings gray, marked in the middle with a black dot. 372. It is to be met with everywhere in woollen ſtuffs, which it deſtroys, lying concealed within a covering. Larva whitiſh, marked with a red line on the back. Pupa yelloviſh.

**tapezella* Wings black, under ones whitiſh; head pure white. 371. A native of Europe; on tapeſtry, furs, and ſkins, into which it gnaws holes.

**faſcitella* Wings of an aſh colour; thorax marked on each ſide with a white dot. 373. A native of Europe; in cloths and furs, which it deſtroys. It lies concealed under a covering.

**mellonella.* Wings whitiſh, growing purple towards their exterior part, marked with a white ſtreak; the ſcutellum black, and white at the tip. 375. A native of Europe; in bee-hives, where it penetrates the honey-combs. Larva is naked, and gray, with a light brown head. Pupa light brown.

**proletella.* Wings whitiſh, marked with two dark brown dots; tongue bent inwards. 379. A native of Europe; on different ſpecies of cabbage; on the horned poppy; and on the oak. An individual, in the ſpace of a year, may produce many millions, as they propagate every month, each depoſiting a great number of eggs.

b. *Feelers divided the length of the middle, two in number.*

**granella.* Wings variegated with black and white; head very white. 377. A native of Europe; in granaries, where it deſtroys the grain and collects it into knots; it climbs up the walls of houſes in winter.

§ § § *Wings divided into many diviſions.* Alucitæ.

**didactyla* Wings ſpreading and brown, marked with white ſtreaks; the ſuperior wings bifid; the poſterior ones divided into three diviſions. 454. A native of Europe; on the *geum rivale*, and on the *convolvulus*. Larva green, covered with tufts of hair. Pupa long; with two lines of tubercles on the back, each furniſhed with four prickles.

* * * *Antennæ moniliform and ſhort.* Hepiali.

Wings yellow, with tawny ſtreaks; the wings of the male of a ſnow-white colour. 84. A native of Europe; at the roots of the hop: the hop-planters manure with hogs dung, as a remedy againſt this troubleſome inſect; it depoſits a very great number of eggs. **humuli.*

1529 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

IV. NEUROPTERA.

Wings four; naked; their veins forming a net-work. Tail unarmed.

72. Libellula, *Dragon-Fly.*

Mouth furniſhed with jaws. Jaws numerous. Lip divided into three. Antennæ ſhorter than the thorax; very ſlender and filiform. Wings extended. Tail of the *male* furniſhed with a hooked forceps.

* *Wings ſpreading when the inſect is at reſt.*

A. *The central diviſion of the Lip very minute.*

The under wings marked at the baſe with a blackiſh ſpot; and all the wings marked on the middle of their upper ſurface with a blackiſh ſpot; the abdomen flattiſh and downy. 1. A native of Europe; in waters. **quadrimaculata.*

The under wings becoming black at the baſe; the body quadrangular. 4. A native of Europe; in freſh waters. The one ſex is waved on the back with red, and the other with yellow. **rubicunda.*

All the wings black at the baſe; the abdomen depreſſed; the ſides yelloviſh. 5. A native of Europe; in freſh water. The abdomen of the male bluiſh, marked on the ſides, near the baſe, with yellow ſpots; the abdomen of the female brown, and yellow on the ſides. **depreſſa.*

B. *The diviſions of the Lip equal.* Æſhnæ:

Abdomen yellow, marked with two black lines; the under wings yellow, marked with two black ſpots. 42. A native of China. Small: head yellow; eyes brown; thorax with yellow lines beneath; abdomen with two black lines above, and one beneath; upper ones black at the baſe, with a yellow ſpot. *minuta.*

Thorax black; marked with various yellow characters; tail furniſhed with crooked hooks. 11. A native of Europe. **forcipata.*

* * *Wings erect when the inſect is at reſt; the Eyes diſtant from one another; the exterior diviſion of the Lip ſlightly divided.* Agriæ.

Wings coloured. **virgo.*

a. Body ſhining, greeniſh blue; wings bluiſh in the middle, the baſe and tip whitiſh, the margin without ſpots.

b. Body ſilky; wings bluiſh green, the tip brown, the margin without ſpots.

c. Silky,

c. Silky, green; wings browniſh, with a white marginal dot.

d. Body ſilky; wings brown, gilt with a black ſpot. 20. A native of Europe; about freſh waters.

* *puella.* Wings tranſparent.

a. Body red, with yellow and black lines at each ſegment; wings with marginal ſpots.

b. Body carnation colour; wings with a brown marginal dot.

c. Body alternately blue and aſh-colour; wings with a black dot.

d. Body beneath bluiſh green, above brown; thorax with alternate brown and bluiſh bands; wings with a black marginal dot.

e. Body green, and pale carnation colour; thorax with three black lines; wings with a brown marginal dot. 21. A native of Europe; in almoſt endleſs variety.

This is an extremely ravenous tribe, and are generally ſeen hovering over ſtagnant waters. They copulate in the air, and fly about joined together. They fly very rapidly, and at a greater height than moſt other inſects. The larvæ are ſix-footed; active; inhabitants of the water; furniſhed with articulated pincers, with which they ſeize and prey with the moſt rapacious ferocity on aquatic animals. The pupa reſembles the larva, but has the rudiments of wings.

48 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

73. Ephemera, *Day-Fly.*

Mouth without jaws. Feelers four, very ſhort, and filiform. The reſemblance of a jaw, membranaceous, cylindrical, and connected with the lip. Antennæ ſhort, and tapering towards the tip. Two large ſtemmata above the eyes. Wings erect, under ones very ſmall. Tail briſtly.

Theſe ſhort-lived animals are found everywhere about waters in the ſummer, and in their perfect ſtate ſeldom live above a day, during which time they perform all the functions of life. They remain in the ſtate of larvæ and pupæ for one, two, or three years. The larva lives under water, and is eagerly ſought after by fiſh, particularly by trout, for which it forms an excellent bait. They are furniſhed with ſix feet, a tail, and ſix fins which ſerve them as oars. The pupa reſembles the larva, except in having the rudiments of future wings. They ſcoop out holes for themſelves in the banks of rivers, formed like ſiphons; the one leg ſerving as an entrance, the other as an outlet. The banks of ſome rivers are often perforated with them. When the waters decreaſe, they form freſh holes lower down. The ephemeræ on the Rhine appear two hours before ſunſet; they come forth almoſt all at the ſame time, and in immenſe numbers. Thoſe on the Marne and Seine, in France, do not begin to fly till two hours after ſunſet. The females, by the help of the threads of the tail, and the flapping of their wings, ſupport themſelves on the ſurface of the water, and in almoſt an upright poſition, drop their eggs in cluſters. A female will drop ſeven or eight hundred eggs, which ſink to the bottom.

* *Tail furniſhed with three briſtles.*

Wings reticulated and ſpotted with brown; body brown. 1. A native of Europe; in freſh waters. In the month of June, they are to be ſeen in the evenings flattering about under trees in innumerable ſwarms. In the neighbourhood of Laz in Carniola, they abound ſo much, that the country people collect them for manure; the peaſant who has not collected to the amount of twenty cart loads, thinks himſelf unfortunate. * *vulgata.*

Wings white, the outer margin brown; body black. 3. A native of Europe. * *marginata.*

Wings black, the under ones whitiſh. 4. A native of Europe; in freſh waters. * *veſpertina.*

** *Tail compoſed of the two briſtles.*

Wings white, and reticulated; the head marked with two yellow tubercles. 5. A native of Europe; in freſh waters. The briſtles of the tail white dotted with brown, and longer than the body. * *bioculata.*

Wings white, the edges blackiſh and thicker than the reſt of the wing. 9. A native of Europe; in freſh waters. * *horaria.*

18 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

74. Phryganea.

Mouth furniſhed with a horny mandible, ſhort, arched and ſharp, without teeth. Jaw membranaceous. Feelers four. Stemmata three. Antennæ ſetaceous, and longer than the thorax. Wings incumbent, the under ones folded.

Theſe inſects are ſeen in a ſummer evening floating in the air in great numbers, and are eagerly devoured by ſwallows; they are eaſily diſtinguiſhed from the ſmaller moths, by their wanting the ſpiral tongue. The larva is ſix-footed, found at the bottom of ſhallow waters encloſed in a tube, conſtructed of ſand, ſtraws, or ſmall chips of wood, and is known to fiſhers by the name of *caddy* or *caddo*, who uſe it as a bait for trout, after they have taken off the tube with which it is covered. When about to become a pupa, it ſhuts up the mouth of its tube with a few looſe threads of ſilk, of the ſame nature with that by which it connects the ſtraws and chips that compoſe its tube. The larvæ of the ſpecies which compoſe the firſt diviſion have one or three tails, which ſerve them for fins; the pupæ have ſix feet, and prominent horny jaws. The larvæ of the other ſpecies are ſomewhat hairy, furniſhed with two hooks at the tail, and with three tentacula on the fourth ſegment. The pupa very much reſembles the perfect inſect.

* *Jaw divided. Tail formed of two briſtles, and terminating abruptly.* Semblis.

Wings marked with many veins, forming a net-work. 1. A native of Europe, in freſh waters; carrying about its eggs in a maſs under its belly; body greeniſh. * *bicaudata.*

Body black; wings white, ſpotted with black. 3. A native of Europe. *phalænoides.*

** *Tail without briſtles; the Jaw joined to the lip.*

reticulata. Body black; the wings of a ruſty colour, reticulated with black. 4. A native of Europe.

* *griſea.* Body gray; the upper wings clouded, and marked with a black ſpot on the edge. 6. A native of Europe; in freſh waters. The larva is covered with a tube compoſed of graſs and ruſhes.

* *grandis.* Wings of a browniſh brick-colour, marked with aſh-coloured ſpots. 7. A native of Europe; in freſh waters. The larva is concealed in a cylindrical tube formed of chips of wood.

* *rhombica.* Wings gray, marked with a white rhomboidal ſpot. 8. A native of Europe; in freſh waters. The larva is lodged within a cylindrical tube, formed of bits of graſs, connected together tranſverſely.

50 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

75. Hemerobius.

Mouth furniſhed with a ſhort horny mandible. Jaw cylindrical, ſtraight, and cleft. Lip prominent and entire. Feelers four; projecting, unequal, and filiform. No ſtemmata. Wings deflected, but not folded. Antennæ ſetaceous, projecting, and longer than the thorax, which is convex.

Like the *ephemera*, theſe inſects are very ſhort-lived; and in every ſtate of their exiſtence, they prey with unceaſing avidity upon *aphides*. The larva is ſix-footed, generally oval and hairy. The pupa commonly foliculated. The eggs are depoſited in cluſters on the leaves of plants; each placed on a ſmall ſtalk made of gum. Many of them, when touched, have an excrementitious ſmell. The follicle in which the pupa is encloſed, is of a denſe texture, formed of whitiſh ſilk. In ſummer, at the end of three weeks, the *hemerobius* comes forth a perfect inſect. When the follicle has not been formed till the end of autumn, the pupa remains in it the whole winter; and does not undergo its final metamorphoſis till the enſuing ſpring.

A. *Lip cylindrical, membranaceous, and marked with rings.* Semblides.

* *lutarius.* Black; wings whitiſh, ſtreaked and ſpotted with white. 14. A native of Europe; in freſh waters; very common in the ſpring. It depoſits a great number of light brown eggs, which it attaches in cluſters to the leaves of aquatic plants by means of a glutinous matter.

B. *Lip horny, round at the tip, and arched.*

perla. Yellowiſh green; wings tranſparent, and marked with green veins. 2. A native of Europe; on vegetables. Its eggs are ſet on capillary ſtalks.

mellanoticlos. Yellowiſh; wings tranſparent, variegated with blue and gold, marked with whitiſh veins, dotted, and ſomewhat hairy, the edges marked with very ſmall black dots. 31. A native of Europe.

verſicolor. Yellow; wings tranſparent, variegated with blue and gold; the baſe of the abdomen, the under-part, and anus black; the antennæ yellow. 32. A native of Europe.

31 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

76. Myrmeleon, *Lion-ant*, or *Ant-eater*.

Mouth with a ſharp horny jaw, and mandible. Lip projecting. Feelers ſix. No ſtemmata. Antennæ thicker towards their outer edge. Wings deflected. Tail of the male armed with a pair of pincers, compoſed of two filaments nearly ſtraight.

A. *The poſterior Feelers much longer than the reſt; jaw furniſhed with one tooth; Lip membranaceous and ſquare, terminating abruptly, and emarginated.*

The inſects of this family prey with the moſt ſavage ferocity upon ants, and leſſer inſects; and for the purpoſe of enſnaring them ſink themſelves into the ſand, and form a kind of funnel or pit in which they lie buried, the head only appearing above the ſand: into this hollow ſuch inſects as wander near it are ſure to fall; and not being able to crawl up the ſides of looſe ſand, are ſeized and devoured by the *lion-ant*. But if the ſides of the pit do not give way, or the unlucky inſect appears to be able to make its eſcape, its enemy, by throwing up with its head repeated ſhowers of ſand, forces it down till it comes within its reach. Larva is ſix-footed, oval and hairy, with exſerted toothed jaws. Pupa encloſed in a ball compoſed of agglutinated ſand or earth.

Wings clouded with brown, marked with a white ſpot on their poſterior margin. 3. A native of Europe. The larva goes backwards; frequents ſandy places, where it digs pits to enſnare other inſects. * *formicarius.*

B. *Feelers nearly equal, and filiform; the Jaw fringed; Lip horny, round and entire.*

The upper wings tranſparent, marked at the baſe with a double yellow ſpot; the under wings are yellow, and black at the baſe. 2. A native of Europe. Head black and hairy. *longicornis*

Wings white, marked with a black ſpot at the edge; body variegated. 14. A native of Europe. Variegated with brown and yellow; the antennæ of the ſame length with the body, and black; club oblong. *auſtralis.*

15 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

77. Panorpa, *Scorpion-fly*.

Mouth ſtretched out into a cylindrical ſnout, compoſed of a horny ſubſtance. Mandible, without teeth. Jaw divided at the point. Lip very long, covering the whole mouth, and like it formed of a horny ſubſtance. Feelers four, nearly equal. Antennæ filiform, and longer than the thorax. Tail of the male notched, of the female unarmed.

Wings equal, ſpotted with black. 1. A native of Europe; lives chiefly on dipterous inſects. * *communis.*

Wings tapering towards the point, ſomewhat curved and fringed; female without wings. 3. A native of *hyemalis.*

Europe. It is common when winter diſappears. It is of a browniſh yellow colour above.

10 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

78. Raphidia.

Mouth furniſhed with an arched mandible ſet with teeth. Jaw cylindrical and obtuſe; lip round and entire; all of them formed of a horny ſubſtance, Feelers four, very ſhort, nearly equal, and filiform. Stemmata three. Wings deflected. Antennæ filiform, the ſame length of the thorax, which is lengthened out at the anterior part, and cylindrical. Tail of the female furniſhed with a looſe curved briſtle.

* *ophiopſis.* Wings without ſpots. 1. A native of Europe; in pine foreſts; feeding on other inſects. Larva has ſix feet. The pupa active, very like the perfect inſect in every point, except that it wants wings.

* *notata.* Wings marked on the edge with a brown ſpot. 2. A native of Britain. Black; a reddiſh brown ſpot on the head and legs, and furniſhed with a projecting ſting of the ſame length with the abdomen.

V. HYMENOPTERA.

Wings four, membranaceous for the moſt part. Tail of the female furniſhed with a ſting.

79. Cynips, *Gall-fly.*

Mouth with a ſhort jaw, furniſhed with one tooth, and membranaceous. The mandible arched, cleft at the tip, and with a ſhort, cylindrical, and entire lip, all compoſed of a horny ſubſtance. Feelers four, ſhort, unequal and capitated. Antennæ moniliform. Sting ſpiral, and for the moſt part concealed.

The numerous excreſcences or galls, found on the roots, branches, and leaves of various trees, are produced by the puncture of theſe inſects. The larva is without feet, ſoft, cylindrical, and inhabits within the gall, feeding on the juices of the tree. The pupa reſembles the perfect inſect, except in having only the rudiments of wings.

aſcendens Of a brazen colour; the abdomen conical, aſcending and joined to the trunk by a very narrow connection. 20. A native of Europe. Large; legs of a pale colour; the thighs black at the baſe.

* *roſæ.* Body black; the abdomen of a ruſty colour, and black behind; the legs of a ruſty colour. 1. A native of Bedeguar; on the roſe.

* *quercus baccarum.* Black; baſe of the antennæ and legs yelloviſh. 4. A native of Europe. Forms roundiſh and tranſparent galls, about the ſize of a pea, on the under ſurface of the leaves of the oak; and comes out about the middle of ſummer.

* *quercus foliі.* Black; thorax marked with lines; legs gray; thighs beneath black. 5. A native of Europe. Forms galls about the ſize of a hazel nut, on the under ſurface of the leaves of the oak.

* *quercus infera.* Black; antennæ and legs pale. 6. A native of Europe. Forms globular, opake, red galls, about the ſize of a hazel nut, on the under ſurface of the leaves of the oak.

Black; legs white; thighs brown. 7. A native of Europe. Forms hollow galls, convex at each end, on the footſtalks of the leaves of the oak.

* *quercus petioli.*

Gray; wings marked with a linear croſs. 8. A native of Europe. Forms granulated connected galls, on the male flowers of the oak.

* *quercus pedunculi.*

In galls on the bark of the oak. 9. A native of Europe. Forms a cup-ſhaped gall, the diſk convex and ſurrounded with about twenty concave dots, ſunk into the bark of the oak.

* *quercus corticis.*

Pale; abdomen and eyes black. 10. A native of Europe. Forms white woolly galls on the ſmall branches of the oak.

* *quercus ramuli.*

In the terminal bud of the *quercus robur.* 11. A native of Europe. Found in the large imbricated galls on the terminal buds of the *quercus robur.* This fly is of a very dark green, ſlightly gilded. Its antennæ and feet are of a dun colour, rather deep. It depoſits its eggs in the oak buds, which produce one of the fineſt galls, leafed like a roſe-bud beginning to blow. When the gall is ſmall, the leaves are compreſſed, and lie over one another like the tiles on the roof of a houſe. In the centre of the gall there is a kind of hard nucleus, in the middle of which is a cavity, and in that is found the little larva, which feeds there, takes its growth, undergoes its metamorphoſis, and breaks through the incloſure in order to get out. The whole gall is often near an inch in diameter, ſometimes more when dried and diſplayed, and is attached to the branch by a footſtalk. (Barbut, Inſect. p. 233.)

* *quercus gemmæ.*

On the calyx of the oak and *ægilops.* 18. A native of Europe. Forms galls on the calyx of the *quercus robur*, ſometimes uſed by tanners. They were called by the Romans *cerri.*

quercus calicis.

Black, without ſpots. 12. A native of Europe. Forms galls of the ſhape of a pear, on the upper ſurface of the leaves of the common beech.

* *fagi.*

Body brown. 22. Forms tenacious globular galls, about the ſize of a hazel nut, filled with clear oil, on the branches of the *roſmarinus chilenſis.*

roſmarini.

Body black; the baſe of the antennæ and legs of a brick colour; the abdomen lengthened out into a broad tail. 25. It is lodged at the top of the ſtalk of the *arundo fragmitis*, which becomes dilated, and grows no higher.

phragmitis.

28 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

80. Tenthredo, *Saw-fly.*

Mouth furniſhed with an arched mandible, formed of a horny ſubſtance, and notched in the inſide. Jaw ſtraight and blunt at the tip. Lip cylindrical and divided into three. Feelers four, unequal, and filiform. Wings plain and ſwelling out. Sting compoſed of two ſerrated laminæ, ſlightly projecting. Scutellum marked with two grains placed on its ſurface, at a diſtance from one another.

The male and female of many of the ſpecies of this genus vary in colour. They feed on the leaves of various plants; the female uſes her ſting in the manner of a ſaw, and cuts out ſpaces in the twigs or buds of trees, for the purpoſe of depoſiting her eggs: larva cylindrical, ſoft, with ſixteen or twenty-eight feet; feeds on the leaves

leaves of plants, and when touched rolls itſelf up ſpirally. Pupa encloſed in a follicle, and is very like the perfect inſect; the eggs increaſe in ſize every day till the larvæ burſt from them.

** Antennæ elavated.*

* *femorata.* Antennæ pale yellow; body black; thighs of the hind-legs very large. 1. A native of Europe; on the alder and willow. Larva green, marked on the back with a blue line, and on the ſides with a yellow one.

triſtis. Body black; antennæ pale yellow; wings brown at the tips. 56. A native of the Sundmore iſlands. Larva green, marked on the back with a blue line fringed with black and yellow.

* *vitellinæ.* Abdomen black above, reddiſh on the ſides; the thighs of the hind-legs dentated. 5. A native of Europe; on the birch and willow; the antennæ yellow, and black at the tip. The larva is green, and ſpouts water from an opening a little above the anus.

*** Antennæ without articulations, and thicker towards their outer edge.*

* *enodis.* Antennæ ſmooth: body of a bluiſh black. 11. A native of Europe; on the willow. Larva green, dotted with black, marked on the ſides with a wrinkled yellow line, and furniſhed with an acute tail.

* *uſtulata.* Body black; abdomen bluiſh; ſhanks of the legs pale. 13. A native of Europe; on the *roſa canina.* Wings of a faint ruſty colour, marked with a brown ſpot. Larva green, marked with two white lines; the head of a brick-colour, marked with a dark-coloured band.

cyanocrocea. Head and thorax bluiſh: the abdomen of a ſaffron-colour. 6. A native of Britain; on umbelliferous plants: antennæ black; legs of many colours.

**** Antennæ pectinated.*

cephalotes. Body black; abdomen marked with four yellow belts. 64. A native of Europe; large; head large, three dots ſituated between the eyes; the thorax marked on the fore part with an interrupted yellowiſh ſtreak; legs of a ruſty colour.

* *dorſata.* Body whitiſh; head and back of the thorax and abdomen black. 65. A native of Britain; antennæ black.

***** Antennæ feathered.*

* *pini.* Antennæ ſpear-ſhaped; the thorax ſomewhat hairy. 14. A native of Europe; very common in the fir-tree. The male black; the thighs and ſhanks of the legs of a tawny colour: female twice the ſize of the male; gray; antennæ ſerrated. Larva blue, and of a tawny colour at each end.

****** Antennæ filiform; furniſhed with ſeven or nine articulations.*

* *ruſtica.* Body black; the abdomen marked with three yellow belts; the poſterior pair being interrupted. 16. A native of Europe; on the woodbine. Mouth whitiſh; the ſcutellum and thorax marked with a yellow ſpot; the legs yellow; the knees of the hind-legs black. Larva of an aſh-colour, marked with triangular light brown dots on the back.

Greeniſh yellow; legs tawny; the thighs of the hind-legs of a braſs colour. 69. A native of Europe; in the pods of the vetch; about the ſize of a black ant; the thorax lengthened very much, reſembling a *cynips.* Female bluiſh green, with a metallic luſtre. *cynipiformis.*

Body variegated. 21. A native of Europe; on the poplar and willow. Larvæ feeding in parallel troops; flat, rough, yellow, and marked on each ſide with two rows of black dots; head black. * *ſalicis.*

Body black; head and thorax red. 29. A native of Europe; on the leaves of the alder. When looked at, it attempts to conceal itſelf. The antennæ are black; the abdomen black, with a violet gloſs; the fore-legs reddiſh brown. * *alni.*

Body black; belly, legs, and ſcutellum whitiſh. 35. A native of Europe; on the leaves of the turnip. Small; whitiſh beneath; the edges of the wings black; the edges of the ſegments of the abdomen faint yellow; head and thorax variegated with white. *rapæ.*

Body yellow; head and upper part of the thorax and abdomen black; wings marked with a yellow dot. 55. A native of Europe; on the willow and corinth. The larva yearly deſtroys the gooſeberry and red corinth, but does not injure the black corinth; blue; the three firſt and three laſt ſegments tawny, marked with nine lines of dots. * *capreæ.*

Body black; the ſhanks and apophyſes of the thighs of the hind-legs are white on their exterior ſide. 88. A native of Europe; on the red corinth. The larva deſtroys the edges of the leaves of the red corinth; it is green; the head edged with black; body wrinkled; ſix feet ſituated on the breaſt, are furniſhed with hooks; ſix on the abdomen are ſet cloſe together, and two near the tail reſemble papillæ. *ribis.*

******* Antennæ ſetaceous, compoſed of many articulations.*

Body blue; head red. 40. A native of Europe; on the common pine. Male black; the mouth and ſhanks of the fore-legs pale yellow. * *erythrocephala.*

Black, with a tinge of blue; mouth, feelers, and ſhanks of the legs yellow. 44. A native of Europe; on the poplar; wings brownith; the breaſt variegated with pale yellow on each ſide, edged with bright yellow; the abdomen pale yellow; ſpotted on the back with black. *populi.*

******** The following ſpecies, and other five, ſeem doubtful.*

Black; legs yellow; antennæ ſlightly clavated. 50. A native of Europe; on the leaves of the burdock, the nightſhade, and the *vulvaria;* it is lodged under the cuticle of the leaf; the antennæ ſhorter than the body, tranſparent and deeply articulated; the abdomen oval and pointed. *intercus.*

140 ſpecies of this genus have been deſcribed by Gmelin, in his laſt edition of the Syſtem of Nature.

81. Sirex, *Tailed Waſp.*

Mouth furniſhed with a thick mandible, compoſed of a horny ſubſtance, terminating abruptly at the tip; the

the jaw bent inwards, pointed, cylindrical, and fringed, which, together with the lip, is membranaceous, ſhort and entire. Feelers four; the poſterior ones longer than the reſt, and thicker on the outſide. Antennæ ſiliform, compoſed of upwards of 24 articulations. Sting projecting, rigid, ſerrated. Abdomen cloſely attached to the trunk, terminating in a ſharp point. Wings lance-ſhaped and plane.

The larvæ of this genus are ſix-footed, ſoft, and cylindrical; the head rounded: they perforate wood, and frequently eat their way into the bowels of other inſects and their larvæ, particularly caterpillars, living upon and conſuming their vitals: pupæ foliculated. The perfect inſect lives on the nectar of flowers.

* *gigas.* Body black; the abdomen yellow at the baſe and at the extremity. 1. A native of Europe; on fir trees.

* *ſpectrum* Abdomen black; thorax hairy, with a pale yellow mark before the wings. 3. A native of Europe; in decayed timber, particularly fir wood.

phantoma. Abdomen yellow above, marked with black rings; head and legs pale yellow. 12. A native of Europe; mouth, thorax, and under part of the abdomen black.

18 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

82. Ichneumon.

Mouth furniſhed with a jaw, ſtraight, membranaceous, roundiſh at the tip, divided, expanded, and fringed; the mandible arched, ſharp, and ſmooth; and with a lip cylindrical, membranaceous at the tip, and marginated. Feelers four, unequal, and ſiliform; ſituated in the middle of the lip. Antennæ ſetaceous, furniſhed with upwards of 30 articulations. Sting prominent, furniſhed with a ſheath compoſed of two valves.

The whole of this ſingular genus are paraſitical, deriving their nouriſhment from other inſects. The fly feeds on the nectar of flowers; and when about to lay her eggs perforates the body of ſome other inſect or its caterpillar, with its ſting or inſtrument at the end of the abdomen, and there depoſits them; theſe, after being transformed into larvæ, prey upon the inteſtines of their foſter parents till they are metamorphoſed into pupæ. The larva is without feet, ſoft, and cylindrical; pupa ſometimes naked, ſometimes covered with a follicle. It is a ſpecies of this genus which produces the animal cotton, of which M. Baudry des Lozieres gives an account (Vide *Second Voyage à la Louiſiane, par Baudry des Lozieres*). A worm of conſiderable ſize, which Baudry calls *fly-carrier*, (well known to planters as the *manioc* or indigo worm,) is at one period of the year, attacked by ſwarms of the *ichneumon fly*, which depoſit their eggs in every pore of the worm. The inſects are produced all nearly at the ſame time, and ſpin each of them a minute covering for itſelf. The manioc worm is now covered with a white caſe, which he with conſiderable difficulty ſhakes off, and, in a few days, the inſects are again hatched from it, but in the form of flies, leaving the animal cotton behind them. This production is very abundant, as M. Baudry could collect ſeveral buſhels of it in a ſhort time. In his opinion, it poſſeſſes many advantages over the vegetable cotton.

A. *Scutellum whitiſh; the Antennæ marked with white rings.*

* *raptorius.* Scutellum white; the thorax without ſpots; the ſecond, third, and fourth ſegments of the abdomen pale yellow; the reſt white at the tip. 2. A native of Europe; the thighs of the four hind-legs black.

* *ſeductorius.* Black; the ſcutellum, the extremity of the abdomen, and a notched band on the anterior part of the abdomen, yellow; the legs, and connection between the abdomen and trunk likewiſe yellow. 221. A native of Italy. It forms cells compoſed of cemented clay, in chimneys and windows, arranged commonly in parallel rows, forming a cylindrical neſt, each containing a brown, lucid follicle, in which the larva is lodged, together with the body of a ſpider in which the egg had been originally depoſited. The upper wings are dark-coloured towards the tip.

B. *Scutellum whitiſh; Antennæ totally black.*

equitatorius. Black; the ſcutellum whitiſh; the diviſions between the ſegments black; the ſecond, third, and fourth ſegments, as well as the legs, are yellow. 90. A native of Europe. In the pupa of the *phalæna piniperda*.

* *dimicatorius.* Black; the ſcutellum yellowiſh; the under part of the antennæ reddiſh; the thorax armed on each ſide with a prickle; the abdomen black, marked with yellow belts; anus yellow. 198. A native of Britain.

* *faſciatorius.* Scutellum white; the thorax ſpotted; abdomen black; the baſe of the ſecond ſegment, the third and ſixth ſegments yellow. 93. A native of Britain.

C. *The Scutellum and Thorax of the ſame colour; Antennæ marked with rings.*

migrator. Black; the abdomen of a ruſty colour, and black at the extremity. 116. A native of Europe.

* *obſcurator.* Black; legs reddiſh; the feet of the hind-legs white at the tips. 199. A native of Britain. It ſmells of muſk.

D. *The Scutellum, and Thorax of the ſame colour; Antennæ black.*

denigrator. Body and wings black, marked with a tranſparent ſpot like a creſcent; abdomen ſcarlet. 28. A native of Britain; in gardens.

turionellæ. Black; legs reddiſh; the ſhanks of the hind-legs black, marked with white rings. 40. A native of Europe. In the larva of moths, particularly in the *phalæna turionellæ*. Antennæ of the ſame length with the body; the ſting ſhorter than the abdomen.

* *compunctor.* Black; mouth and legs reddiſh; the abdomen joined to the trunk by a ſtalk, or narrow connection. 33. A native of Europe. In the pupæ of ſome ſpecies of butterfly.

* *jaculator.* Black; the abdomen curved like a ſcythe, reddiſh in the middle; the thighs of the hind-legs clavated; white at the baſe and at the extremity. 52. A native of Europe; in the larvæ of the bee and of the *ſphex*. Having examined with its antennæ, where the ſphex is, and

and having discovered it, it flies away, and returns and places its egg on it.

E. *Antennæ pale yellow.*

venosus. Entirely yellow, except some black between the stemmata; wings white, with yellow veins. 354. A native of Europe.

cinctus. Black; antennæ and legs of a rusty colour; wings transparent, marked with a black speck. 60. A native of Europe; in gardens.

F. *Minute, with the Abdomen closely attached to the Thorax.*

gregarius. Black; the legs and sides of the abdomen of a rusty colour. 204. A native of Europe; in the larvæ of butterflies; gregarious, and very frequent in the spring. Soon after they are hatched they spin each of them a white follicle for themselves, which are connected together in a cluster, from which they come forth perfect insects.

* *bedeguaris.* Shining green; abdomen golden-coloured. 63. A native of Europe; in the larvæ of the *cynips*, which produces the galls on the rose and the oak. The sting the same length with the body.

* *gallarum.* Of a bronze colour; abdomen black; shanks of the legs whitish. 64. A native of Europe; on the larvæ of the *cynips*, which produces the galls on the branches of the oak.

puparum. Body blue and gold; abdomen shining green; the legs pale. 66. A native of Europe; in the larvæ of flies and butterflies.

cynipis. Green and gold; the abdomen brown, marked with a pale-coloured belt at the base; legs yellowish. 68. A native of Europe; on the larvæ of the *cynips*, and on the pupæ of butterflies.

globatus. Black; legs of a rusty colour. 74. A native of Europe; in stalks of grain, within a roundish follicle, composed of white silk, common to a number of the insects.

* *glomeratus.* Black; legs yellow. 75. A native of Europe; in the larvæ of butterflies. Soon after they are hatched, they spin each of them a yellow follicle for themselves; they depofite their eggs on the pupæ of butterflies soon after they have changed from larvæ.

418 species of this genus have been described in the last edition of the System of Nature.

83. Sphex.

Mouth furnished with an entire jaw; the mandible curved, notched, and formed of a substance like horn. Lip horny, and membranaceous at the tip. Feelers four. The antennæ in some species have upwards of 10 articulations. Wings in each sex incumbent and not folded. Sting pungent and concealed within the abdomen.

The insects of this genus are the most savage and rapacious of this class of animals; they attack whatever insects come in their way, and by means of their poisonous sting overcome and devour such as far exceed themselves in size; when they attack any insect, they give one stroke, and fall down as if dead, and quietly wait till the poison they have infused through their sting produce its effect. Their prey either serves as food for themselves or their young. Those of the division B are to be found chiefly on umbelliferous plants; the larva is without feet, soft, and inhabits the body of some other insect, on the juices of which it feeds; the pupa has only the rudiments of wings; the perfect insect deposits her eggs in the bodies of other insects.

A. *Antennæ setaceous; Lip entire; Tongue wanting.* Evaniæ.

Body black; the abdomen very short, and attached to the back part of the thorax by a foot-stalk. 12. A native of Europe, America, and Africa. Sprinkled with concave dots; the thorax flattened behind; the abdomen oval, compressed and very smooth; wings transparent, short, and deflected. *appendigaster.*

B. *Antennæ filiform; the Lip emarginated, and furnished with a bristle on each side; Tongue bent inwards, and divided into three divisions for almost half its length.*

a. *Abdomen attached to the trunk by a stalk or narrow communication.*

Black, hairy; the attachment of the abdomen to the trunk furnished with two articulations; the second and third segments of the abdomen of a rusty colour. 1. A native of Europe; on sandy ground, where it digs a hole with its fore-feet, like a dog, in which it buries the larva of a moth, on which it deposits an egg, and then shuts up the hole. The abdomen exceeds the wings in length about one half, and in the male is black on the back. * *fabulosa.*

Smooth, black; the lip and the edges of the segments of the abdomen lucid. 11. A native of Europe; in holes of wood, in partitions, which have been formed and abandoned by other insects: these it cleanses by gnawing round them; and placing a piece of moist clay at the bottom, sticks a spider upon it. In the body of this spider it deposits its eggs, and then closes up the entrance with clay. The larva is pale, and very like the larva of the bee. Having consumed the spider, which had been enclosed along with it, it spins a yellowish brown membrane for itself, exactly adapted to its body. One female sphex forms a great many nests; she spends no more than two days in forming any one. *figulus.*

Body black; fore-head, mouth, scutellum, and two bands on the abdomen, yellow. 98. A native of Italy; breeds in chimneys and in windows, in the same nest with the *ichneumon seductor*. It is about seven lines long, dotted; the shanks of the legs yellowish, and black at the extremities; wings transparent and dark-coloured at the tips. *insubrica.*

b. *The Abdomen closely attached to the Thorax.*

Downy and black; wings brown; the anterior part of the abdomen of a rusty colour, marked with black belts. 15. A native of Europe; in sandy ground: it digs holes in the sand, in which it buries the larva of a moth, after it has deposited an egg on it. * *viatica.*

Body black; the fore part of the thorax furnished with *spinosa.*

with a prickle on each ſide; the lip and the breaſt of the colour of ſilver. 86. A native of England; ſmooth; wings tranſparent; legs reddiſh.

98 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

84. Scolia.

Mouth furniſhed with a curved ſharp mandible, crenated on the inſide. Jaw compreſſed, projecting, entire and horny. Tongue inflected and divided into three at the tip, very ſhort. Lip projecting, membranaceous at the tip, and entire. Feelers four, equal, ſhort, filiform, and ſituated in the middle of the lip. Antennæ thick and filiform; the firſt joint longer than the reſt.

ſexmaculata. Hairy, black; the abdomen marked with three pair of yellow ſpots. 6. A native of Europe; marked with a yellow ſpot both before and behind the eyes.

quadripunctata. Body black; the abdomen marked with four white dots, the wings of a reddiſh brown. 22. A native of Europe.

27 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

85. Thynnus.

Mouth formed of a horny ſubſtance; the mandible incurved. The jaw ſhort, and ſtraight. Lip longer than the jaw, membranaceous at the tip, and divided into three, the middle diviſion emarginated. Tongue very ſhort and involuted. Feelers four, equal and filiform. Antennæ filiform.

Sentatus. Abdomen black; the ſecond, third, and fourth ſegments marked with two white dots. 1. A native of New Holland. Likewiſe the firſt ſegments are marked with a white dot on the ſides.

13 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

86. Leucopsis.

Mouth compoſed of a horny ſubſtance, and furniſhed with ſhort jaws. The mandible thick, and furniſhed with three teeth at the tip. Lip longer than the jaw; membranaceous and emarginated at the tip. Feelers four, ſhort, equal, and filiform. Antennæ ſhort, ſtraight, and clavated. Thorax furniſhed with a lance-ſhaped ſcale on its under ſide. Sting bent backwards, and concealed in a groove in the upper part of the abdomen.

Cælogaſter. Abdomen attached cloſely to the trunk; ſcale of the thorax half the length of the abdomen. 2. A native of Europe; eyes black; forehead without ſpots; the poſterior part of the thorax marked with a yellow fillet, and without dots. Small than the common waſp.

Three ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

87. Tiphia.

Mouth furniſhed with a membranaceous rounded jaw. The mandible arched, and acute. The lip ſhort, furniſhed with three ſmall projections, and compoſed of a ſubſtance like horn. No tongue. Feelers four, filiform, unequal, projecting, and ſituated in the middle of the lip. Antennæ filiform and arched.

Black; the thighs of the four hind-legs angular and reddiſh. 4. A native of England. **femorata.*

Black; thorax ſpotted; abdomen marked with five yellow bands, the ſecond interrupted. 6. A native of Europe, chiefly in England. **quinquecincta.*

17 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

88. Chalcis.

Feelers four, and equal. Antennæ ſhort, cylindrical, and ſpindle-ſhaped; the firſt articulation a little thicker than the reſt.

Shining black; the thighs of the hind-legs thickened, and marked with a white dot at their extremities. 6. A native of Europe. Feet white. *puſilla.*

7 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

89. Chrysis. *Golden-fly.*

Mouth compoſed of a horny ſubſtance, and projecting; is furniſhed with a linear jaw, and with a lip emarginated, and membranaceous at the tip, and much longer than the jaw. No tongue. Feelers four, projecting, unequal, and filiform. Antennæ ſhort, and filiform; the firſt articulation longer than the reſt. Body gilt and ſhining. Abdomen arched beneath, furniſhed with a ſcale on each ſide. The anus (in moſt of the ſpecies) is furniſhed with ſmall projections. Sting is ſlightly projecting. Wings plane.

The inſects of this genus commonly form their neſts in holes made in walls.

Smooth, poliſhed; the thorax green; the abdomen of a golden colour, and furniſhed with four ſmall projections at the extremity. 1. A native of Europe; in walls. **ignita.*

Smooth, ſhining; the thorax green; the abdomen of a golden colour; the anus furniſhed with two ſmall projections. 4. A native of Europe; in walls. **aurata.*

Smooth, ſhining; the thorax and abdomen blue; the anus furniſhed with three ſmall projections. 5. A native of Europe; in walls. **cyanea.*

Smooth, ſhining green; the thorax and ſuperior part of the two firſt ſegments of the abdomen gilt; the anus furniſhed with four ſmall projections. 6. A native of Europe; in walls of houſes. *viridula.*

27 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

90. VESPA, *Wasp.*

Mouth compoſed of a horny ſubſtance. Jaw compreſſed. Feelers four, unequal, and filiform. Antennæ filiform; the firſt articulation longer than the reſt, and cylindrical. Eyes large and circular. Body ſmooth. Sting pungent, and concealed within the abdomen. The upper wings are folded in the males, females, and neuters.

Theſe live moſtly in numerous ſocieties, conſtructing curious neſts or combs, generally under ground; they prey upon other inſects, eſpecially bees and flies, and devour meal, bread and fruit. The larva is ſoft, without feet, and feeds on the nectar of flowers and honey; the pupa quieſcent, and has the rudiments of wings. Some of them are ſolitary, others live in ſwarms.

A. *No tongue.*

* *The Antennæ thicker towards their outer edge.*

* *crabro.* *Hornet.* The thorax black, marked on the fore part with reddiſh ſpots; there is a double dot contiguous to the diviſions between the ſegments of the abdomen. 3. A native of Europe. It has its neſt in hollow trees, in out-houſes, or any dry ſituation; its combs are very neatly conſtructed, and compoſed of a ſubſtance like coarſe paper, or decayed parchment. They prey on other inſects, particularly on bees. Their ſting is very painful.

* *vulgaris.* Thorax marked on each ſide with a ſmall interrupted line; the ſcutellum marked with four ſpots; the diviſions between the ſegments of the abdomen dotted with black. 4. A native of Europe, about houſes; they prey on flies, and rob bee-hives. They live in ſwarms compoſed of males, females, and neuters. The male has a yellow head, and long antennæ; an abdomen compoſed of ſeven yellow ſegments, marked with black triangular ſpots. They are deſtitute of ſtings, but are longer and larger than the neuters, though ſmaller than the females. The female has ſhort antennæ; lip yellow; abdomen compoſed of ſix ſegments, marked on the ſides with two black dots, and is furniſhed with a ſting. There are frequently between two and three hundred females, and as many males, in a ſwarm of waſps. A ſingle female in the ſpring that had been impregnated in the preceding autumn, lays the foundation of a ſwarm. It makes itſelf a hole in ſome dry ſituation, or fixes on a mole hole, where it haſtily builds a few cells, and depoſits its eggs; which in the courſe of about twenty days, paſs through their different changes, and become perfect inſects. Almoſt the whole of thoſe produced from the firſt depoſited eggs are neuters. As ſoon as they are fit to fly about, they commence their labours, enlarge their hole by removing the earth with their mouth, go out in queſt of materials for forming new cells, which are compoſed of ſmall fibres of wood, cemented together by a glutinous ſubſtance formed within the body of the animal. They may frequently be ſeen on rails, poſts, &c. on reeds, or ſtalks of decayed vegetables, gnawing off ſmall particles which they convey to their neſt, and deliver to thoſe occupied in the conſtruction of the work. The external covering of their neſt is formed of ſeveral layers of thin leaves reſembling paper, which are not in immediate contact with one another, and in that way they prevent external moiſture from penetrating into the cells, which are arranged in flat combs placed one over another, each ſtory being ſupported by a number of very neat pillars. The female continues to depoſit her eggs, which are oblong and yellowiſh, during the whole ſummer, to the amount of many thouſands. A few hundreds of thoſe that are laſt depoſited, produce males and females, which are impregnated in the autumn, and which, ſhould they ſurvive the winter, lay the foundation of new ſwarms in the ſpring. All the neuters and males periſh in the beginning of winter.

Body black; the thorax is marked with two dots; the ſcutellum is likewiſe marked with two dots, the abdomen with five yellow bands, the firſt of which is at a diſtance from the reſt. 6. A native of Europe; about houſes. It forms its neſt in holes in wood. * *parietum*

Black; thorax marked with two pale yellow ſpots; the abdomen marked with four yellow bands, the firſt at a conſiderable diſtance from the reſt. 8. A native of Europe, in walls; the ſcutellum without ſpots; the ſhanks of the legs yellowiſh. * *muraria.*

Firſt ſegment of the abdomen funnel-ſhaped; the ſecond bell-ſhaped, and very large. 11. A native of Europe, in gardens. It attaches its neſt, which is globular, and conſtructed of the ſame materials with that of the common waſp, to the branches of trees; the abdomen black, the ſegments yellow at the edges the the firſt and ſecond marked with two dots. * *coarctata*

* * *Antennæ filiform.* Crabrones.

The abdomen marked with two yellow bands; the anus furniſhed with three ſmall projections; wings black, white at the edge. 98. A native of Europe. *tridentata.*

Thorax without ſpots; the abdomen marked on each ſide with five yellow ſpots; legs black. 101. A native of Europe, in ſandy ſituations. Head large, terminating abruptly in the fore part; mouth of a ſilver colour; the ſpots on the abdomen uniting ſo as to form a band. *foſſoria.*

B. *The Tongue bent inwards, and divided into three at the point.* Bombyces.

The upper lip conical and divided; the abdomen black, marked with waved yellowiſh bands. 152. A native of Europe, on ſand hills. Their neſts contain only a ſingle larva. *roſtrata.*

Black; lip roundiſh; the abdomen marked with ſix yellow bands, the firſt five of which are interrupted. 157. A native of Europe, covered with aſh-coloured down; the thorax ſpotted with brown, the antennæ black, the firſt articulation yellow below, the laſt of a ruſty colour; lip and legs yellow; the thighs black; the anus furniſhed with three ſmall projections. *faſciata.*

The lip nearly conical; the thorax brown, ſpotted with yellow; abdomen black, marked with ſix yellow bands; antennæ and legs of a ruſty colour. 159. A native of Europe; head brown; mouth yellow; the bands on the abdomen broad, the firſt four interrupted. *ruficornis.*

160 ſpecies of this genus have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature.

91.

91. APIS, *Bee.*

Mouth formed of a ſubſtance reſembling horn; the lip and jaw membranaceous at the tip; tongue bent inwards. Feelers four, unequal, and filiform. Wings plane. The females and neuters have a pungent ſting concealed within the abdomen.

The inſects of this genus live ſome of them in large ſocieties, and ſome are ſolitary; their food is the nectar of flowers, honey, and ripe fruit; the larva is ſoft and without feet; the pupa reſembles the perfect inſect. The larvæ of the neuters are very numerous, and placed in hexagonal cells; the larvæ of the males are turgid and obtuſe in the fore part, and tapering behind.

A. *The Tongue divided into five at the point; the Feelers very ſhort.*

**centuncularis.* Black; the under part of the abdomen covered with yellow wool. 4. A native of Europe. It forms ſeveral neſts under ground, very neatly compoſed of the leaves of roſes. There are ſeveral ſpecies which form ſimilar neſts in the trunks of trees or in walls, compoſed ſometimes of the leaves of the roſe, at other times of thoſe of the horſe cheſnut.

**punctata.* Black, covered with aſh-coloured hairs; abdomen black; the ſegments of the abdomen marked on each ſide with a white dot; the ſcutellum entire. 59. A native of Britain, on flowers.

mellifica. *Common Honey Bee.* Downy; the thorax grayiſh; abdomen brown; thighs of the hind legs fringed with hairs; on the inſide marked with tranſverſe ſtriæ. 22. A native of Europe, in hollow trees; but they are more frequently domeſticated, and kept in hives. This well-known and buſy inſect lives in great ſwarms, compoſed of females or queens, males or drones, and neuters or working bees. The female is larger and longer than the reſt, the abdomen being about one-third longer than the wings; the antennæ have ten articulations; the feet reddiſh. The males are larger than the neuters; their wings are longer than the body; their antennæ have eleven articulations; the trunk is covered with long hairs, and is of a tawny colour. The neuters as well as the females are gray on the thorax, and are furniſhed with a ſting, of which the males are deſtitute; their antennæ have fifteen articulations; they are furniſhed with two ſtomachs. A ſwarm conſiſts commonly of one female, from 1000 to 1500 males, and of nearly 20,000 neuters (vide BEE.) They conſtruct regular combs, compoſed of hexagonal cells, with wax which is formed within the body of the inſect. Reaumur and others have ſuppoſed, that the wax was formed from the farina of flowers, which the neuters collect and carry home on their legs, and their opinion has been implicitly followed. But Mr Huber, member of the Society of Natural Philoſophy and Natural Hiſtory of Geneva, by a ſet of very accurate experiments and obſervations, has clearly proven that the wax is formed from honey (vide *Journal de Phyſique*, &c. *Pluviôſe* An. XII.) We ſhall give here his own account of the experiments he has made. "It has been thought ſtrange that the word wax ſhould ſeldom occur in a book which treats of bees alone; but nevertheleſs, as in the courſe of my obſervations I had not attended to the products of their induſtry, I could only have repeated what had been ſaid by Swammerdam and Reaumur, and that did not ſeem to me to be neceſſary. I knew that theſe inſects collected abundantly upon the antheræ of flowers; that they are acquainted with the method of opening them, of gathering their duſt, keeping it in the cavities of their hind legs, and carrying it to their hives. It had been obſerved that the particles of this duſt ſwell in water, and that when one of them burſts, an oily liquor runs out, which floats on its ſurface, but did not mix with it. From theſe experiments, repeated on the duſt of a great number of flowers, it was concluded that they contain the principles of wax; but it was admitted that theſe muſt undergo a peculiar elaboration in the body of the bee, ſince, according to the experiments of Reaumur, a flexible wax could not be made from the duſt of the antheræ. It will be ſeen here from ſeveral paſſages in my work that I had adopted this opinion; a ſingle obſervation of Burnons, (the name of Mr Huber's ſecretary), changed all my ideas. The true origin of wax might have been ſooner known, had there been any ſuſpicion that it was not already diſcovered. I ſhall now ſtate how I was led to doubt, and what I have done to verify my new conjectures.

"I was in Switzerland in 1793: the farmer of the eſtate on which I reſided had many bees; and the greater part of his hives having been ſtocked in former years, the combs with which they were filled reached to the ſtands, conſequently there was no room to conſtruct new ones. We remarked, however, that the working bees carried in a conſiderable quantity of this fecundating powder. There was alſo in the ſame apiary, ſome ſwarms of that year, the hives having only been ſtocked a day or two; in ſome of them the combs were only begun; in others they were larger; but in all of them there were vacancies to fill up, and much work to do. We obſerved with aſtoniſhment, that the bees of theſe ſwarms did not carry in the pollen; and that, nevertheleſs, they worked with activity in the conſtruction of new combs, and in lengthening thoſe already commenced. Where, therefore, did they procure materials for their edifices? After theſe obſervations, we ſuſpected that it was not from the duſt of the ſtamina, and that they had a very different uſe for it than that for which it was believed to be intended. We, however, found that it was impoſſible to explain theſe extraordinary facts, without abandoning the hypotheſis of Reaumur, by ſuppoſing that the bees of the old hives ſtored up ſo much pollen in their combs for their future wants, while thoſe of the new ſwarms did not carry it outwardly on their legs, in the infancy of their eſtabliſhment, becauſe they had no cells in which they could depoſit it; it might be ſufficient to enable them to conſtruct their combs, if they were at liberty to fly to the flowers, procure their pollen, and return to their hives after having filled their ſtomachs, where it muſt be elaborated, and converted into perfect wax. It was to obviate theſe doubts, that I undertook the following experiments.

"*Firſt Experiment.*—On bees in confinement, with honey alone for their nouriſhment. Muſt pollen be ate by bees, to be in a ſtate to produce wax? This was the firſt queſtion which I thought it neceſſary to inveſtigate: the method of trying the experiment was obvious;

it was only required to keep the bees within their hives, and thus prevent them from collecting or eating the fecundating powder. On the 24th of May, Burnons lodged a ſwarm in a ſtraw-hive, with as much honey and water as was neceſſary for their conſumption; and he cloſed the doors, ſo that the bees could not get out, and the air be at the ſame time renewed.

"At firſt the bees were very uneaſy, but became calm on removing the hive to a cool dark place; their captivity laſted five days; they were permitted to come out into a room, the windows of which were ſhut; we then examined the hive more conveniently. We firſt noticed that there was no honey left in the veſſel which had been filled with it, with the ſole intention of feeding the confined bees; and were more aſtoniſhed to ſee five combs of the moſt beautiful wax, ſuſpended from the roof of the hive; they were perfectly white, and very brittle. This reſult was very remarkable; however, before forming a concluſion from it, that the honey with which theſe bees were fed, had enabled them to produce the wax, it was neceſſary to inquire, whether it could not alſo be explained in another manner. The bees which I had employed had doubtleſs collected the duſt while they were at liberty. They might have done ſo the evening before, or on the very ſame day of their confinement, and might have enough in their ſtomachs, and in the cavities of their legs, to extract from it all the wax which we found in their hives. But if it was true that it had been obtained from the fecundating powder, previouſly obtained, this ſource was not inexhauſtible, and the bees being unable to procure any more, they would ſoon ceaſe to conſtruct combs, and fall into the moſt complete inaction. It was neceſſary, therefore, to repeat the ſame trial, to render it deciſive.

"The 28th, Burnons returned this ſwarm into its hive; after having taken out all the combs, he ſhut them up as before, with a freſh ſupply of honey. This experiment was not long, for on the evening of the ſecond day we perceived the priſoners working with new wax. The next day the hive was inſpected, and we found five combs, as heavy and as regular as thoſe made during the firſt captivity. We afterwards repeated this experiment five times ſucceſſively, with the ſame bees, and the ſame precautions: we always found that the honey had diſappeared, and that new wax was produced. This reſult was ſo invariable during this long ſecluſion, that we could no longer doubt that the honey alone had ſupplied them with all the elements of their wax, without the aſſiſtance of the fecundating duſt.

"*Second Experiment.*—On a hive from which honey was excluded, and in which only pollen and fruits, for the nouriſhment of the bees, were left, I thought it would not be uſeleſs to make the inverſe of the preceding experiment; it would ſhow me whether the pollen could not ſupply the want of honey, when the bees were deprived of it, and enable them to produce wax.

"I therefore encloſed a ſwarm in a bell-glaſs, in which had been placed a comb, whoſe cells contained only pollen, and the ſole nouriſhment of the bees was fruit.

"Theſe bees did not make combs, nor did they form a ſingle cell during eight days, which was the time of their captivity. I was going to repeat this experiment, when Burnons remarked, that the free bees were, in ſome meaſure, in the ſame ſtate as thoſe we had confined; there being no honey at that time in the flowers, they found only pollen, and did not work in wax.

"It may perhaps be aſked, how I was ſatisfied of this: to which I anſwer, bees wax is white at firſt, the cells ſoon become yellow; and in time, this colour grows browner; and in older hives have acquired a blackiſh tinge. It is, therefore, very eaſy to diſtinguiſh the new cells from thoſe which have been ſome time formed, and conſequently to know whether the bees are really making combs, or whether that work is ſuſpended; it is ſufficient to raiſe the hives, and to notice the lower edge of the combs.

"The odour exhaled by the hives, and the ſhape of the bees, are indications, by which it may always be known whether there is honey in the flowers: if they are combined, there can be no further doubt; and, particularly, if a great number of bees return to the hive, which are remarkable for the bulk and form of their bellies. Thoſe which are filled with honey, have the abdomen cylindrical; the name of wax-making bees, belongs to them excluſively: the bellies of the labouring bees, which have other functions, always preſerve their ovoid form, and their volume is never ſenſibly augmented; the name of *nurſing bees* is proper for theſe.

"The farmers of the neighbouring villages kept their bees in baſkets, or in caſes of different forms; and I was able to viſit a very great number, without going to any great diſtance from my habitation.

"In 1793, an intemperate ſpring had retarded the ſeparation of the ſwarms; there had not been any in the country before the 24th of May; but towards the middle of June there were ſeveral in the vicinity of my reſidence. At that time the fields were covered with flowers, the bees collected much honey, and the new ſwarms worked at the wax with vigour.

"On the 18th, Burnons viſited 65 hives; at the entrance of all of them he obſerved wax-making bees. Thoſe which returned to old hives, not having to conſtruct cells, depoſited their honey in the combs, or diſtributed it among their companions; thoſe belonging to the young ſwarms converted their honey into wax, and haſtened to conſtruct combs for the reception of their young bees.

"It was ſhowery on the 19th; the bees went abroad, but brought home only pollen. The weather was cold and rainy until the 27th. We were deſirous of knowing if this had prevented their working. On the 28th, all the hives were liſted. Burnons found that the work had been ſtopped; the combs which he had meaſured on the 19th, were not at all increaſed, and were of a citron yellow; nor was there a ſingle white cell in any of theſe hives.

"On the firſt of July, the cheſnuts and limes were in bloſſom; the thermometer indicated the twentieth degree; the wax-making bees reappeared; they carried away great quantities of honey, which, as we had before obſerved, was employed in augmenting the proviſions of the old hives, and enabling the young ſwarms to conſtruct new combs. The greateſt activity was obſervable among them; the gathering of honey, and the production of wax continued, until the middle of this month. July 16th, the heat remained the ſame; the field flowers, as well as thoſe of the cheſnut and limes, were completely withered; they yielded no more honey, their pollen alone attracted the working bees, and they collected

collected it abundantly; but there was not any wax produced; the combs were not lengthened; those of the young swarms did not fill more than two-thirds of their hives.

"August 9th. It had not rained for six weeks; the heat was very powerful, nor was there any dew to allay it during the night; the black wheat which had been in flower for some days, did not offer any honey to the bees; they found only pollen.

"On the 10th of August, it rained for several hours; next day, the black wheat had the odour of honey; in fact it might be seen glittering in their expanded flowers. The bees found enough to feed them, but too little to induce them to work at new wax.

"On the 14th, the drought recommenced, and lasted to the end of the month; no more honey appeared upon the flowers; and when we visited the 65 hives for the last time, we found, 1st, That the bees had not produced any wax after the middle of July. 2d. That they had stored up a great quantity of pollen. 3d, That the supply of honey was much lessened in the old hives, and that hardly any remained in the new swarms, that which they had collected in the spring having been employed in the preparation of wax. The pollen, therefore, has not this property, and no further doubt remained on this head. This year had not been stormy, and I have since ascertained, by a great number of observations, that electricity is singularly favourable to the secretion of honey by the flowers; the bees never collect it in greater abundance, nor is the preparation of wax ever more active, than when the wind is in the south, the air humid and warm, and a storm gathering.

"Heat too long continued, and the drought which is the consequence of it, cold rains, and principally a north wind, suspend it entirely.

"*Third Experiment.* On the use which the bees make of the fecundating powder. In the second experiment, the bees did not touch the pollen which I had placed within their reach, and as its quantity was not sensibly diminished during this trial, I was induced to believe it was not an aliment proper for them.

"I also knew that the new swarms were liable to perish from hunger in the middle of summer, and even when the country was covered with flowers, if a particular temperature, which is too uncommon in our climate, did not favour the secretion of honey in their nectaria. What, therefore, is the use of the pollen they collect with such avidity during eight months of the year, and of which they lay up such abundance (A)? This question remained to be investigated.

"I had a hive in divisions, the queen of which was barren; its combs did not contain any pollen, but they had much more honey; the two narrowest sides of this hive were formed of panes of glass, through which the surfaces of the exterior combs might be seen, and the conduct of the bees observed.

"I took away the queen on the 16th of July; but to console the working bees, I removed the first and twelfth combs, in which there was not any thing to interest them; and I supplied their places with two combs, the cells of which were filled with eggs and worms of all ages. I carefully cut away all the cells in which pollen could be perceived, and shut up the hive with a grating. My intention will be guessed; I wished to know whether these insects could support their young without this fecundating powder. The next day nothing extraordinary occurred; the bees sat on their eggs and seemed to nurse them.

"On the 18th, after sunset, a great noise was heard in the hive. Anxious to see what occasioned it, we opened the shutters, and observed that all was in confusion; the incubation was stopped; the bees ran over the combs in disorder; we saw thousands precipitate themselves on the stand, those which were nearest to the mouth eagerly gnawing the grating; their intention was no longer doubtful, they wished to get out of their confinement.

"I was fearful of destroying them by continuing to prevent them from yielding to their instinct; they were therefore set at liberty. The whole swarm came out, but the hour was unfavourable to their collecting: the bees did not go far from the hive, the darkness and the chilness of the air soon compelled them to return, and probably calmed their agitation; for we saw them quietly reascend their combs, and order appeared, to us, to be re-established. This moment was taken to close the hive again. On the 19th, we saw two royal cells begun on one of the combs of the nursery: the evening of this day, and at the same hour as the day before, we heard a great tumult in the closed hive; it was in a general confusion, and we were again obliged to permit the swarm to come out. The 20th was the fifth day of their captivity. We thought it had been of sufficient duration, and were also very impatient to examine the nursery, and to see what was the cause of this periodical agitation of these bees: Burnous therefore opened the first and twelfth windows, and drove the bees from the combs, suffering them to take their flight in a room, the windows of which were shut. He first noticed that the royal cells had not been continued, that they did not contain any worm, and that there was not an atom of the jelly which serves for the nourishment and the cradle of the larvæ of the queens. He sought in vain for eggs, for worms, and for the liquid in the common cells; all had disappeared. Had these worms died of hunger? Had we, by withdrawing the fecundating powder, deprived the bees of every means of nourishing the larvæ.

To ascertain this, it would be sufficient to restore them their pollen, and observe the issue. The bees were, therefore, again returned to their prison, after having substituted young worms for those which had been suffered to die.

"On the 22d, we found that the bees had fastened these combs, and that they were again in a state of incubation; we then gave them some pieces of combs in which other bees had stored up the fecundating powder; and

(A) Reaumur was of opinion that the bees of a well-stocked hive, might collect at least a hundred pounds of this substance in the course of a year; but having remarked that the weight of wax, fabricated in the same time, did not exceed two pounds, he concluded that the bees extract only a very small portion of the true wax from this native wax, that the greatest part of it is required for their nourishment, and that the rest is discharged from their bodies in the form of excrement.

and the better to obſerve what they did with it, we took ſome of the pollen out of the cells, and laid it expoſed on the ſtand of the hive. In a few minutes the bees diſcovered the pollen in the combs, and that which we had taken out; they took it grain by grain in their jaws, and conveyed it into their mouths; thoſe which had eaten moſt voraciouſly reaſcended the combs, and placed themſelves, at firſt, upon the cells of the young worms, which they entered head foremoſt, and remained there a greater or leſs length of time. One of the windows of the hive was now opened cautiouſly, Burnons powdered the bees which ate the pollen, and watched them for ſome hours; he obſerved that the marked bees always reaſcended the nurſery, and immediately entered the cells of the young bees.

"The 23d, we found the royal cells begun.

"The 24th, we drove the bees from off the young worms; and we remarked,

"1ſt. That all of them had the jelly, as in the common hives.

"2d. That the worms had grown larger, and were forwarder in their cells.

"3d. That others had been ſhut up again: and,

"4th. That the royal cells had been lengthened,

"The 25th, we withdrew the pieces of comb which we had placed on the ſtand, and found that the quantity of pollen was certainly diminiſhed; we afterwards replaced them in the hive with other cells filled with the fecundating powder.

"The 26th, the royal cells had been cloſed during the night, as well as ſeveral of the common ones.

"The 27th, I reſtored theſe bees to liberty. Burnons examined the cells with the greateſt attention, and found jelly in all thoſe which ſtill contained worms, but moſt of them were ſhut with a lid of wax: he examined ſome of the latter, and found the worms employed in ſpinning cocoons of ſilk.

"All the worms therefore had been tended as in the natural hive. In this ſecond trial we did not perceive any diſorder in this hive; there had not been the leaſt agitation: it is true ſome of the working bees attempted to go out in the courſe of the day; but finding it impoſſible, they reaſcended the combs quietly, which were never left for an inſtant. The hive being abundantly ſupplied with honey, and with the pollen neceſſary for their young, left them nothing to wiſh for; and they were ſtill more happy when a queen was born, who afterwards became pregnant, and laid a great number of eggs. After theſe two experiments, there could be no more doubt that the fecundating powder was the aliment proper for the young bees, and that the want of this ſubſtance was the cauſe of their death, and of the evident anguiſh of their nurſes during their firſt captivity.

"*Fourth Experiment.*—On bees deprived of honey and pollen, and which it was attempted to feed with ſugar. I wiſhed to know, if it was the ſaccharine part of the honey which enabled the bees to produce wax. Burnons confined a ſwarm in a glazed hive; one pound of Canary ſugar was their ſole aliment. He put a ſecond ſwarm into another hive, and endeavoured to feed them with very coarſe raw ſugar; and to obtain a term of compariſon, a third ſwarm was ſhut up in the ſame manner, and fed with honey. The bees of the three ſwarms produced wax; thoſe fed with the different qualities of ſugar produced it ſooner than the ſwarm which had only had honey, and they produced a greater quantity. A pound of Canary ſugar reduced to ſyrup, and clarified with white of egg, yielded 10 gros, 52 grains, of a wax not ſo white as that which the bees extract from honey. An equal weight of raw ſugar, gave 22 gros of very white wax. Maple ſugar produced the ſame effect. This experiment having been repeated ſeven times ſucceſſively, always employing the ſame bees, we could not doubt that ſugar contains the principles of wax; and concluded that it was the ſaccharine part of the honey which had this property.

"*Concluſion.* Theſe obſervations ſhew,

"1ſt. That the wax comes from the honey.

"2d. That the honey is alſo a food of the firſt neceſſity to the bees.

"3d. That flowers do not always contain honey, and that the ſecretion of honey depends in a great meaſure on the ſtate of the atmoſphere.

"4th. That it is the ſaccharine part of the honey which enables the bees to produce wax.

"5th. That raw ſugar yields more wax than honey, or refined ſugar.

"6th. That the duſt of the ſtamina does not contain the principles of wax.

"7th. That this duſt is not the food of the adult bees, and that they do not collect it for themſelves.

"8th. That the pollen affords the only aliment which is proper for their young; but that this ſubſtance muſt undergo a peculiar elaboration in the ſtomachs of the bees, to be converted into an aliment; which is always appropriated to their ſex, their age, and their wants; ſince the beſt microſcopes do not ſhew the particles of pollen, or their coverings in the liquor, prepared by the working bees."

Hairy, black; wings of a violet-colour. 38. A native of Europe, and of India. It pierces the trunks of decayed trees, or poſts, and forms longitudinal excavations, in which it conſtructs ſeveral neſts; having placed one at the bottom of the hole, it depoſits an egg in it, fills it with a mixture of honey and pollen of flowers, cloſes it up, and commences another; it proceeds in this way till the cells occupy the whole length of the perforation; the eggs are ſo placed in the cells, that the head of the larva points downwards towards the exit. *violacea.*

Humble-bee. Hairy, black; thorax marked with a yellow belt; anus white. 41. A native of Europe. It forms a neſt at a conſiderable depth under ground, and collects a good quantity of honey. *terreſtris.*

Hairy, black; the anus of a tawny colour. 44. A native of Europe; in heaps of ſtones, or in old walls. It collects a conſiderable quantity of honey. *lapidaria.*

Black; ſlightly covered with reddiſh hairs; abdomen ſmooth, marked with three bands, white above, and reddiſh beneath. 147. A native of Europe. It ſomewhat reſembles A. *mellifica*, but leſs. It comes out very early in the ſpring. *præcox.*

B. *The Tongue divided into three at the extremity.*

* *The Lip furniſhed on each ſide with two membranaceous briſtles.* Andrenæ.

Abdomen brown, marked with five whitiſh belts; the anus furniſhed with two ſmall projections. 136. A native of America. It forms its neſts in walls, of leaves *bidentata*

of trees neatly folded up; the fore legs are long and yellow; the feet fringed.

dichroa. Black; anus of a rufty colour. 137. A native of Europe; in groves.

** *Lip without briſtles, compreſſed, and entire; poſterior Feelers tongue-ſhaped.* Nomadæ.

fuecica. Covered with aſh-coloured hairs; the abdomen ſmooth and black; the ſecond and third ſegments of the abdomen of a rufty colour. 200. A native of Europe; in groves.

variegata. The thorax and abdomen variegated with white; the legs of a rufty colour. 24. A native of Europe. It ſleeps all night fixed to the flowers of the *geranium phæum*. The ſcutellum ſometimes of a rufty colour, and ſometimes white; the firſt and ſecond ſegments of the abdomen marked with two white ſpots; the third, fourth, fifth, and ſixth, marked with four.

morio. Very hairy, and black; the jaws broad, and marked on the outſide with elevated lines, and rounded at the points; wings of a reddiſh violet-colour. 214. A native of the ſouth of America. One of the largeſt of this genus.

92. FORMICA, *Ant*, or *Emmet*.

Feelers four, unequal, with cylindrical articulations, placed at the tip of the lip, which is cylindrical, and nearly membranaceous. Antennæ filiform. A ſmall erect ſcale placed between the thorax and abdomen. The females and neuters have a ſting concealed within the abdomen. The males and females have wings; the neuters none.

This is a gregarious, and proverbially induſtrious family, conſiſting, like bees, of males, females, and neuters. The laſt are the well known little inſects, who conſtruct the neſts or ant-hills, who labour with ſuch unremitting aſſiduity for the ſupport of themſelves and the idle males and females, and who guard with ſuch ferocity the larvæ, or what are commonly called ant eggs. They wander about all day in ſearch of food or materials for the neſt, and aſſiſt each other in bringing home what is too cumberſome for ſuch as have attempted it. They every day bring out of the neſt, and expoſe to the warmth of the ſun, the new hatched larvæ, and feed them till they are able to provide for themſelves. In the evening they conſume together whatever has been collected during the day, and do not, as is commonly ſuppoſed, lay up any ſtore for the winter, but probably become torpid or die. They are peculiarly fond of *aphides*, and are themſelves eagerly ſought after by the ant-eaters, and various birds. The puncture inflicted by their ſting, occaſions a hot painful itching ſenſation. They contain a peculiar acid. See CHEMISTRY *Index*.

**herculanea.* Black; the abdomen oval; legs of a rufty colour. 1. A native of Europe, and America; lodge in the trunks of decayed trees.

viatica. Of a rufty colour; the abdomen oval and black. 23. A native of Europe; runs very quickly; the tip of the jaws black; the abdomen ſmooth.

**ruſa.* Black; the thorax compreſſed; the legs of a rufty colour. 3. A native of Europe; it lodges in ſandy hills, in woods; it is large, and has no ſting.

**fuſca.* Black; the mouth, the tip of the thorax, and legs, of a rufty colour. 4. A native of Europe; in woods.

**rubra.* Of a brick colour; eyes black; a black dot under the abdomen. 7. A native of Europe. It lodges under ſtones in woods. They inflict a very painful puncture.

**cæſpitum.* Black; two knots on the filament which connects the abdomen to the trunk; the ſcutellum furniſhed with two ſmall projections. 11. A native of Europe; in dry meadows, under moſs. The males and females, in the month of Auguſt, leave their neſt about mid-day, when the weather is ſerene, and fly about in the air. The abdomen oval.

omnivora. The thorax marked with raiſed dots; the filament which joins the abdomen to the thorax is furniſhed with two knots; the body of a brick colour; the abdomen ſmall. 12. A native of America. It is very deſtructive to all ſorts of proviſions. Small. The abdomen brown, covered with white hairs ſcarcely perceptible.

aga. Black; abdomen oval and hairy. 52. A native of Europe; on decayed trees. It gnaws holes in the wood under the bark, and forms a number of paſſages for itſelf.

glabra. Black, ſmooth; the ſcale placed between the thorax and abdomen furniſhed with two ſmall projections; the diviſions between the ſegments of the abdomen whitiſh; legs reddiſh. 53. A native of Europe.

55 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

93. MUTELLA.

Mouth formed of a ſubſtance like horn; without a tongue. Jaw membranaceous at the tip. Lip projecting, reſembling an inverted cone; at the extremity of which are placed four unequal feelers, with conical articulations. Antennæ filiform. Wings wanting in moſt ſpecies. Body downy. The poſterior part of the thorax turned back. The ſting is pungent, and concealed within the abdomen.

occidentalis. Scarlet; the abdomen marked with a black belt. 1. A native of Europe. The antennæ, eyes, legs, and under part of the body black; the ſting long and filiform.

diadema. Black; the baſe of the abdomen marked with two yellow dots; the middle with an interrupted yellow ſtreak; the extremity with a ſmall white line. 10. A native of South America. Large; the lower part of the head marked with a white band; the thorax marked with two white lines, and with white on the inferior part.

aurata. Bluiſh; the abdomen marked with a large golden-coloured ſpot. 13. A native of New Holland.

**europæa.* Black; the thorax reddiſh; the edges of the ſegments of the abdomen white. 4. A native of Europe; in woods of maple.

halenſis. Hairy, black; the thorax reddiſh; the abdomen marked with two white dots, and with a white band on the poſterior part. 15. A native of Europe; the upper part of the ſhanks brown.

27 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature, publiſhed by Gmelin.

VI. DIPTERA.

Wings two. Poiſers clavated; one placed behind each wing, under a little ſcale.

94. Oestrus. *Gad-fly, Breeze.*

A ſucker drawn back within the lips, which are connected, and furniſhed with a ſmall pore. Feelers two, of two articulations, orbicular at the tip, and ſeated in a depreſſion on each ſide of the mouth. Antennæ ſhort and ſetaceous.

The face of this ſingular genus is broad and depreſſed, and has ſome reſemblance to the ape. They are extremely troubleſome to horſes, ſheep, and cattle, depoſiting their eggs in different parts of their bodies, and occaſioning painful tumours and even death. The larva is without feet, thick, ſhort, ſoft, and compoſed of ſeveral ſegments; they are ſometimes furniſhed with hooks. They lurk within the bodies, or under the ſkin, of horſes, oxen, &c.; and feed on their juices during the winter. The pupa is without feet, oval, and incapable of motion, covered with a hard light-brown cruſt. The perfect inſect lives but for a ſhort time.

* *bovis.* Wings brown, without ſpots; the abdomen black, white at the baſe, and of a tawny colour at the extremity. 1. A native of Europe. It depoſits its eggs on the backs of oxen, and lodges them under the ſkin. The larva, when young, is ſmooth, white, and tranſparent; as it advances in age it becomes browniſh, and when full grown and ready to be changed into a pupa, it acquires a dark-brown colour. It is lodged in a ſack formed in the cellular ſubſtance immediately under the ſkin, and occaſions a very conſiderable tumour on the back of the animal. The ſack communicates with the air by a very narrow opening, next to which the anus of the animal is placed. Through the anus a yellow purulent matter is diſcharged; and near the anus are ſituated two ſpiracula. There is a ſmall indentation on the oppoſite extremity of the larva, which is ſituated at the bottom of the ſack, ſurrounded by two or three papillæ, which forms the mouth. It has a number of dots on its ſurface, diſpoſed in tranſverſe interrupted lines. Two diſtinct and different kinds of lines are ſeen on each ſegment; the uppermoſt of them is narrower, and conſiſts of larger dots. Underneath this is a broader line, and the dots conſiderably ſmaller. The firſt are eaſily ſeen, by uſing the lens, to be hooks bent upwards, or towards the tail of the inſect. On examining the broader line of ſmall dots, with a tolerably powerful magnifier, they are alſo found to be hooks, but turned in an oppoſite direction, that is, downwards in the ſack, and towards the head of the inſect. Theſe hooks, it is probable, are occaſionally erected by the muſcles of the ſkin; and according to the ſeries of them uſed by the larva, it is raiſed or depreſſed in the ſack; and by this motion, and conſequent irritation, a more or leſs copious ſecretion of pus is occaſioned for its ſuſtenance.

This ſingular arrangement of hooks round the body of the larvæ, in this inſtance ſerves the ſame purpoſe as the legs in other larvæ, enabling them to move about in the ſack, and to crawl out of it when about to change into pupæ.

They never change their ſkin like moſt other larvæ, the ſame ſerving them through their growth; and it at length alſo ſerves to form the ſhell of the pupa. After leaving the ſack, and previous to their becoming pupæ, they contract themſelves, and aſſume a different figure.

They continue in the ſtate of pupæ from about the latter end of June until about the middle of Auguſt, when the fly appears. Full grown larvæ are ſometimes to be met with on the backs of cows in the month of September, which probably remain in the ſtate of pupæ till the enſuing ſpring. The perfect inſect, on leaving the hard cruſt which ſurrounds it, forces open a very remarkable, marginated, triangular valve, which may be traced in the ſkin of the larvæ, and is ſituated on one ſide of the ſmaller end.

The *oeſtrus bovis*, in its perfect ſtate, is the largeſt of the European ſpecies of this genus, and is very beautiful.

The pain it inflicts in depoſiting its eggs is much more ſevere than any of the other ſpecies. When one of the cattle is attacked by this fly, it is eaſily known by the extreme terror and agitation of the whole herd: the unfortunate object of attack runs bellowing from among them to ſome diſtant part of the field, or the neareſt water, while the tail, from the ſeverity of the pain, is held, with a tremulous motion, ſtraight from the body, in the direction of the ſpine; and the head and neck are alſo ſtretched out to the utmoſt. The reſt, from fear, generally follow to the water, or diſperſe to different parts of the field. When the oxen are yoked to the plough, the attack of this fly is attended with real danger, as they become perfectly uncontroulable, and will often run with the plough directly forwards, through the hedges, or whatever obſtructs their way. There is provided, on this account, a contrivance in many ploughs, to let them immediately at liberty.

The ſtrongeſt and healthieſt beaſts ſeem conſtantly to be preferred by it, and commonly have the greateſt number of botts, wormuls, or warbles, on their backs; dealers are frequently guided in their choice of cattle by this circumſtance. The female fly is very quick in performing the operation of depoſiting her eggs: ſhe does not appear to remain on the back of the animal more than a few ſeconds.

Gray, marked with a white band, and dotted with *buccatus* black. 6. A native of Carolina.

Black, hairy; wings of a ſooty colour; their outer *trompe.* edge bright black; head, thorax, ſcutellum, and anus, grayiſh yellow. 7. A native of Lapland. The larvæ occupy the frontal ſinus of the rein-deer; the animal ſometimes in the ſpring, forces out great cluſters of larvæ by ſneezing. This is the largeſt ſpecies of the genus.

Wings without ſpots; the thorax yellow, marked *tarandi.* with a black band; the abdomen tawny, and bright yellow at the extremity. 2. A native of Lapland. It depoſits its eggs on the back of the rein-deer. Such is their dread of it, that they every year leave the woods, and take refuge in the mountains. A very great proportion of them fall victims to this inſect, before they are three years old. Thoſe who eſcape with life are very much emaciated, and have their ſkins ſpoiled.

Botts.

* *equi.* *Botts.* Wings whitiſh, marked with a black band in the middle, and two black dots. A native of Europe. (*Vide* Tranſactions of the Linnæan Society, vol. iii. p. 326.) The forehead white and downy; top of the head brown; the eyes black, and diſtant from one another; thorax brown, with a dark-coloured centre; the abdomen yellowiſh brown, the diviſions between the ſegments of the abdomen marked with black ſpots and dots; the ſcutellum furniſhed with two tufts of hair; wings marked near the baſe with a very ſmall black dot, in the middle with a black band, and towards the extremity with two black ſpots. The male is diſtinguiſhed by a brighter yellow; the female by a deeper brown, and by the extremity of the abdomen which is long, bent inwards, and black, terminating in a bifid ſtyle. It depoſits its eggs on the hairs of the knees or ſides of horſes, which, when the animal licks itſelf, are conveyed by the tongue into the ſtomach. The body of the larva is compoſed of eleven ſegments, all of which, except the two laſt, are ſurrounded with a double row of horny briſtles directed towards the truncated end, and are of a reddiſh colour except the points, which are black. Theſe larvæ attach themſelves to every part of the ſtomach, but are generally moſt numerous about the *pylorus*; and are ſometimes, though much leſs frequently, found in the inteſtines. Their numbers in the ſtomach are very various, often not more than half a dozen; at other times more than a hundred; and if ſome accounts might be relied on, even a much greater number than this. They hang moſt commonly in cluſters, being fixed by the ſmall end to the inner membrane of the ſtomach, to which they adhere by means of two ſmall hooks or *tentacula*. When they are removed from the ſtomach they will attach themſelves to any looſe membrane, and even to the ſkin of the hand. For this purpoſe they ſheath or draw back the hooks almoſt entirely within the ſkin, till the two points come cloſe to each other; they then preſent them to the membrane; and keeping them parallel till it is pierced through, they expand them in a lateral direction, and afterwards, by bringing the points downwards towards themſelves, they include a ſufficient piece of the membrane, and remain firmly fixed for any length of time. Theſe hooks, the better to adapt them to this purpoſe, appear to have a joint near their baſe.

The larvæ attain their full growth about the latter end of May, when they quit their hold of the internal membrane of the ſtomach, and paſs along with the food through the inteſtinal canal. From the end of May till the beginning of July they may be ſeen in the dung which drops from the horſe; when they reach the ground they ſeek out ſome convenient ſituation, and become pupæ, and remain in that ſtate for about ſix or ſeven weeks. The mode purſued by the perfect inſect to obtain for its young a ſituation in the ſtomach of the horſe, is truly ſingular, and is effected in the following manner.—When the female has been impregnated, and the eggs are ſufficiently matured, ſhe ſeeks among the horſes a ſubject for her purpoſe; approaching it on the wing, ſhe holds her body nearly upright in the air, and her tail, which is lengthened for the purpoſe, curved inwards and upwards: in this way ſhe approaches the part where ſhe deſigns to depoſit the egg; and ſuſpending herſelf for a few ſeconds before it, ſuddenly darts upon it, and leaves the egg adhering to the hair; ſhe hardly appears to ſettle, but merely touches the hair with the egg held out on the projected point of the abdomen. The egg is made to adhere by means of a glutinous liquor ſecreted with it. She then leaves the horſe at a ſmall diſtance, and prepares a ſecond egg, and poſting herſelf before the part, depoſits it in the ſame way. The liquor dries, and the egg becomes firmly glued to the hair: this is repeated by various flies till 400 or 500 eggs are placed ſometimes on one horſe.

The inſide of the knee, or thoſe parts of the body of the animal that are liable to be licked, are choſen by the fly from inſtinct, as the proper places for depoſiting its eggs. The well-known diſeaſe in horſes called the *botts*, which frequently proves fatal, is ſuppoſed to be occaſioned by the larvæ of this inſect.

Wings without ſpots; the thorax of a ruſty colour; *naſalis.*
abdomen black, covered with yellow hairs. 3. A native of Europe. This inſect is ſaid to depoſit its eggs in the noſtrils of horſes, mules, aſſes, and of goats; and the larvæ occupy the fauces. Body black; thorax deſtitute of furrows; the head and abdomen covered with yellow hairs, except the firſt ſegment, which is covered with white ones.

Thorax yellow, marked with a black band; wings * *hæmorrhoidalis.*
white, marked with black bands. 4. A native of Europe. It depoſits its eggs on the lips of horſes, occaſioning a titillation, which cauſes the animal, when attacked by it, to move his head about violently, and gallop about with every appearance of diſtreſs. The larva of this inſect needs not to be particularly deſcribed, as it reſembles in almoſt every reſpect that of the *equi*. Its habits are the ſame, being ſeen in the ſtomach of the horſes, occupying the ſame ſituation as thoſe of the *equi*, from which they can only be diſtinguiſhed by their ſmaller ſize and greater whiteneſs. When it approaches maturity it acquires a red colour. It is frequently ſeen adhering to the extremity of the rectum; which circumſtance, along with its colour, has occaſioned it to receive the name of *hæmorrhoidalis*. In about two days after it has left the body of the horſe, it is changed into a pupa, in which ſtate it remains nearly two months.

Wings faintly dotted; the abdomen variegated with * *ovis.*
white and black. 5. A native of Europe. The larva occupies the frontal ſinus of the ſheep; they are flat on the one ſide, and convex on the other; of a whitiſh colour; and nearly of the ſame ſize with the larvæ of the *O. equi*. When young theſe larvæ are perfectly white and tranſparent, except the two horny plates, which are black. As they increaſe in ſize, the upper ſide becomes marked with two tranſverſe brown lines on each ſegment, and ſome ſpots are ſeen on the ſides. When full grown they fall through the noſtrils, and change to the pupa ſtate, lying on the earth. The inſect depoſits its eggs on the inner margin of the noſtrils of the ſheep. The moment the fly touches that part of the ſheep, they ſhake their heads, and ſtrike the ground violently with their fore feet; at the ſame time holding their noſes cloſe to the earth, they run away, looking about them, on every ſide, to ſee if the fly purſue. They do not, like the horſes and cows, take refuge in the water; they have recourſe to a rut, or duſty road, or a gravel pit, where they crowd together during the

heat of the day, with their noſes held cloſe to the ground, which renders it difficult for the fly conveniently to get at the noſtril.

antilopæ. Wings dotted with brown, and marked with a brown band; body hairy, of a grayiſh yellow colour; the abdomen marked with three rows of blackiſh ſpots. 8. A native of Aſia. It depoſits its eggs under the ſkin of the back of the antelope. About the ſize of the *muſca carnaria*.

faſciculoſus. Yellow and downy; the anus furniſhed with three tufts of black hairs. 9. A native of Siberia; head and eyes black.

hominis. Entirely brown. 10. A native of South America. Depoſits its eggs under the ſkin of the abdomen of the natives, or of people reſiding in countries where they are prevalent. The larvæ continue ſix months under the ſkin; if they be diſturbed, they penetrate deeper, and produce very troubleſome ulcers, which ſometimes prove fatal.

10 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

95. Tipula, *Crane-fly.*

Mouth furniſhed with a very ſhort proboſcis, membranaceous, and grooved on the back, receiving a briſtle; with a ſhort ſucker without a ſheath; and with feelers two, equal, filiform, and longer than the head. Antennæ in moſt of the ſpecies filiform.

Moſt of this genus have a great reſemblance to the gnat. They feed on various ſubſtances. The larva is ſoft, without feet, and cylindrical; its head is furniſhed with a ſmall projection, and terminates abruptly; they feed on the roots of plants; they are eagerly ſought after by crows and other birds. The pupa is cylindrical, and is furniſhed with two horns on the anterior extremity, with ſmall projections behind.

A. *Wings expanded.*

* *pectinicornis.* The antennæ pectinated; the wings marked with a black ſpot; the thorax yelloviſh. 1. A native of Europe; in moiſt places. The abdomen reddiſh at the baſe, marked with a yellow band in the middle, black at the tip.

* *oleracea.* Wings tranſparent, with a brown rib along the edge. 5. A native of Europe. It does a great deal of miſchief in gardens, corn fields, and meadows, by conſuming the roots of potherbs, growing corn, and graſs.

* *hortorum* Wings tranſparent, ſprinkled with very faint ſpots. 6. A native of Europe; in gardens, deſtroying the crops.

* *triangularis.* One half of the wings brown, marked with white triangular ſpots. 111. A native of Scotland.

* *variegata.* Black; the baſe and ſides of the abdomen red, ſpotted with yellow. 7. A native of Europe; in gardens.

* *pratenſis.* The thorax variegated; abdomen brown, ſpotted with yellow on the ſides; the forehead tawny. 10. A native of Europe; in meadows. It is very deſtructive to the roots of graſs.

cornicina. Wings tranſparent, marked on the edge with a brown ſpot; the abdomen yellow, marked with three brown lines. 12 A native of Europe. Very deſtructive to the roots of plants, and much ſought after by crows.

Wings tranſparent, and ſhining; body of a browniſh aſh colour. 21. A native of Europe. This ſpecies appears very early in the ſpring; and may be ſeen dancing in the air in great numbers in mild weather.

* *regelationis.*

B. *Wings incumbent.* Culiciformes.

Thorax greeniſh; wings white, marked with a brown dot; the antennæ feathered. 26. A native of Europe; in marſhy places.

* *plumoſa.*

Greeniſh; wings ſpotted; the fore legs very long. 27. A native of Europe; on the ſea coaſt.

* *littoraliſ.*

Black, ſmooth; wings white, marked with a black dot; the antennæ ſhort; legs black. 41. A native of Europe; in ſhaded places.

johannis.

Black; ſmooth, wings tranſparent, marked with a black dot; the thighs of a ruſty colour. 101. A native of Britain, and Norway; on the flowers of fruit trees.

* *pomonæ.*

Black, ſilky. 45. A native of Europe; on the flowers of fruit trees, which it injures very much. It frequently blaſts the hopes of the farmer.

ſterilega.

Wings tranſparent; the outer edge black. 46. A native of Europe. It is very deſtructive to aſparagus, and to the flowers of fruit trees. The thorax and abdomen ſometimes black, ſometimes red.

* *hortulana.*

Wings of an aſh colour; the thorax and abdomen yellow. 123. A native of Chili. This inſect has a very pleaſant ſmell, and is made uſe of by the young girls of Chili for perfuming their clothes.

moſchifera.

Of a tawny colour, wings white and tranſparent, hairy on the margins; the eyes black. A native of England. Larva leaps; without feet; is orange-coloured, and marginated; the margin folded with papillæ; the head acute; the tail terminating abruptly. The pupa is narrow, acute at both ends and reddiſh.

* *tritici.*

126 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

96. Diopsis.

The head furniſhed with two filiform horns, without articulations, much longer than the head, on the tops of which the eyes are placed.

1. A native of North America and Guinea. Reddiſh; antennæ very ſmall and ſetaceous; the horns of a ruſty colour; the eyes which terminate the horns are globular and black; the thorax black; furniſhed with two yellow tapering projections behind, and with a ſingle one on each ſide; wings tranſparent, and marked with a black dot before; the abdomen clavated, and attached to the trunk by a narrow ſtalk; the two laſt ſegments of the abdomen black; the legs yellow; the thighs of the legs clavated. It reſembles an *ichneumon*, and is about the ſize of the red ant.

ichneumonea.

Only one ſpecies of this genus has been deſcribed in the laſt edition of the Syſtem of Nature.

97. Musca, *Fly.*

Mouth furniſhed with a fleſhy projecting proboſcis, with two equal lips, with a ſucker furniſhed with briſtles, and with two ſhort feelers. Antennæ ſhort (in moſt ſpecies).

Flies live chiefly in dunghills; their larvæ are without feet,

feet, compoſed of ſeveral ſegments, nearly cylindrical, and becoming ſmaller behind. The larvæ of the flies of the firſt and ſecond diviſions, live in the water, have a breathing hole at their head, are bearded, and live on aquatic animalculæ; thoſe of the fourth diviſion live on rubbiſh; thoſe of the third on dung, putrid animal ſubſtances, and on ſmall inſects; ſome of them particularly on *aphides:* they remain fixed on a leaf, and with their ſnout collect, and devour the *aphides.* The pupæ are immoveable, and moſt of them covered with a hard ſkin; the pupæ of the flies of the firſt and ſecond diviſions are cylindrical, and covered with the ſkin of the larvæ, which becomes hard.

A. *The Sucker compoſed of a ſingle valve; the Antennæ connected at the baſe, and ſharp at the points.*
Bibiones.

* *plebeja.* Of an aſh colour, and hairy; the abdomen conical; the edges of the ſegments white. 1. A native of the north of Europe. The thorax is ſometimes yellow, and abdomen of a ruſty colour.

* *marginata.* Black; the abdomen conical; the edges of the ſegments white; the wings ſpotted. 130. A native of Europe.

B. *Sucker without a ſheath.*

a. *Thoſe which have a ſingle briſtle.*

† *The Antennæ pointed and connected at the baſe.*
Stratiomyes.

* *chamæleon.* The ſcutellum pale yellow, and furniſhed with two ſmall projections; the abdomen black, marked on the ſides with yellow bands. 3. A native of Europe; on flowers. The larva lives in freſh water.

uliginoſa. Body black; the ſcutellum without projections; the abdomen white, and black at the extremity. 22. A native of Europe. The forehead yellow; the joints of the legs white; the ſhanks of the legs pale.

* *vallata.* The ſcutellum marked with ſix projections; the abdomen and thighs yellow. 166. A native of Britain; on hedges. Wings of a faint ruſty colour; incumbent and plain; the nerves of the wings marked with a brown dot in the middle; the poiſers yellow; the feet, and lower extremity of the ſhanks of the legs brown.

nectarea. Black; antennæ cylindrical and perfoliated; wings white. 24. A native of Europe; on the flowers of apple trees. It drinks the nectarious juice, and lodges all day long within the flower; it is very ſmall, and not larger than a common flea; body oblong; legs long.

†† *The Antennæ ſhort and clavated, furniſhed with a briſtle.*

* *Feathery, or with hairy feathered Antennæ.*

* *inanis.* Brown; the abdomen tranſparent, marked with three black belts, 61. A native of Europe; in thickets.

* *pellucens* Black; the firſt ſegment of the abdomen white, and tranſparent. 62. A native of Europe; in ſhaded places.

* *cæſar.* Shining green; legs black. 64. A native of Europe; on carrion.

cornicina. Thorax of a ſhining copper colour; the abdomen of a greeniſh yellow with a metallic luſtre; legs black. 169. A native of Europe. The ſides of the lips of a ſhining ſilver colour.

Shining; the thorax blue; the abdomen green. 65. * *cadaverina.*
A native of Europe; on carrion.

The thorax black; the abdomen ſhining blue; the * *vomitoria.*
forehead tawny. 67. A native of Europe and America; on carrion; they conſume dead bodies very quickly; they likewiſe feed on milk.

Black; the thorax marked with pale lines; the ab- * *carnaria.*
domen ſhining, and chequered. 68. A native of Europe; on carrion. The eyes reddiſh; the anus tawny. The larva likewiſe infeſts bee-hives.

Common houſe-fly. The thorax marked with lines; * *domeſtica*
the abdomen chequered, and pale on the under ſide at the baſe. 69. A native of Europe and America; in houſes. The larvæ live in horſe dung.

Brown; the thorax blue and downy, marked with *olea.*
three eminences; the tip of the ſcutellum and thighs yellow. 390. A native of Europe; very deſtructive to olives. The female depoſits a great number of eggs in the month of July, on the fruit of the olive; the larvæ conſume the pulp.

* * *The Antennæ furniſhed with a naked briſtle.*

Smooth, black; the abdomen wrinkled on the upper *feneſtrata*
ſide, marked with white ſtreaks; wings brown. 14. A native of Europe: in windows.

Blackiſh; the tip of the ſcutellum of a faint brick * *larva-*
colour; the abdomen chequered. 78. A native of *rum.*
Europe; on the caterpillars of moths and butterflies, and likewiſe on the roots of cabbage and colewort, rendering the root knotty; the tips and baſe whitiſh; thorax black, marked with lines.

Black; the abdomen of an aſh colour, marked with * *radicum.*
black bands. 79. A native of Europe; on the roots of the raddiſh.

Hairy and whitiſh, marked with a black line on the *napobraſ-*
back, and with ſeveral black lines along the ſides. 208. *ficæ.*
A native of Europe; on the roots of the turnip, which it deſtroys, and cauſes to appear as if rotten; it attacks thoſe turnips chiefly that have been ſown in light ſandy ſoil. The larva is white, without feet; the head is pointed and tipt with black; it undergoes its transformation about September. Pupa is oblong, brown, compoſed of ſeveral ſegments, and becomes a perfect inſect in May.

Of an aſh colour; the thorax marked with five black *pluvalis.*
ſpots; the abdomen marked with very faint ſpots. 83. A native of Europe. It is to be ſeen flying about in ſwarms before rain.

Hairy and aſh-coloured; the extremity of the thighs * *rapax.*
and ſhanks of the legs of a ruſty colour. 212. A native of Britain; and feeds on other flies.

Black; the abdomen pale; the eyes of a ruſty co- * *cellaris.*
lour. 87. A native of Europe; in cellars.

Black; the abdomen of an aſh colour; the wings * *meteorica*
yellowiſh at the baſe. 88. A native of Europe. They fly about very much in the air immediately before rain, and collect about the mouths of horſes in great ſwarms, particularly about the ſummer ſolſtice. The larvæ are ſometimes found in the human ſtomach.

Shining black; eyes browniſh; wings ſhining red and *avenæ.*
green. 216. A native of Europe; in oats, which it

destroys by gnawing the stalks when young. Larva yellowish and without feet

* *frit.* Black; the poisers and feet of the hind legs, and abdomen, pale green. 90. A native of Europe; on the ears of barley. It is so frequent in Sweden, that it has been calculated that one tenth of the grain is consumed by it annually.

* *pumilionis.* Black; the under part of the head, and two lines on the thorax yellow; the poisers white; the legs of an ash colour and black at the tip. 217. A native of Europe. The larva has a sharp head, black at the extremity; the body white, composed of ten segments; it is changed into a pupa about the end of May. The pupa is yellow, shining, and composed of several segments; the perfect insect appears about the middle of June. At what time it deposits its eggs is not well ascertained. The larvæ are perceived early in the spring, in the centre of the stalks of wheat and rye, very near the root. In all probability the eggs have been deposited in the month of October, or end of September, as the early sown grain is found to be most affected. White wheat is more liable to be injured than red. The stalks in which the larva is lodged, do not advance in growth, but continue dwarf, whence the insect has received the name of *pumilionis*. The stalks become yellow in the beginning of summer, and decay; others commonly spring up from the same root, and supply their place. This insect first attracted notice in England in the spring of the year 1791, when it excited some alarm, as fears were at first entertained that it was the Hessian fly, which had done so much mischief in America. Some plants of infected wheat were sent to Mr Markwick by a friend in the neighbourhood of Battle. Mr Markwick succeeded in obtaining the perfect insect from them, of which he has given an account, (*Vide* Transactions of the Linnean Society, p. 76. tab. 15.) Some of the infected wheat was likewise sent by Arthur Young to Sir Joseph Banks, who ascertained the insect to be the *musca pumilionis* described in Gmelin's System of Nature, and not the Hessian fly. An account of this fly, and of the mischief caused by it, was first published in the Transactions of the Royal Academy of Sciences at Stockholm for the year 1778, by Mr Ob. Bjerkander, who discovered it on the young shoots of the rye, in the month of May; and in such quantity, that in some fields he found three or four stalks affected in a square foot.

petronella. Livid; the forehead red; the legs long, and of a light red colour; the joints of the legs black. 96. A native of Europe. It may be seen running about on the surface of stagnant water.

fonchi. Wings transparent, marked on the edge with a black spot; the eyes green. 121. A native of Europe; on the receptacles of the flower of the sow-thistle. Thorax brown, with a pale scutellum; the abdomen black, oval, and greenish beneath; the edges of the segments whitish; tail with an obtuse style; wings with two brown nerves; legs of a brick colour.

b. *Sucker furnished with three bristles.* Ragiones.

vermilio. Of an ash colour; the abdomen marked with three rows of black dots; the thorax spotted; the wings without spots. 17. A native of Europe; in loose sand.

colombatschensis. Black; the divisions between the segments of the abdomen, the shanks of the legs, and feet, white. 324. A native of Europe and Asia. It is about half the size of the common gnat, and is most frequent in the beginning of spring and end of summer, in Servia, Russia, and Siberia; where it insinuates itself into the bodies of cattle, which it frequently destroys, as its bite proves fatal in a few hours; smoke is very offensive to it; and in the places where it prevails the people have recourse to it, as their only mode of defence.

papataſi. Antennæ, body, and wings hairy. 325. A native of Europe. It is very troublesome in Lombardy in the night time, during the whole summer. It is very minute; eyes black, dotted with white; the wings when the insect is at rest, diverge so as to form an obtuse angle; the abdomen red.

acuminata. Black; the abdomen long, slender, and tapering towards the extremity; the wings spotted; the thighs reddish-yellow; the shanks of the legs and feet brownish. 226. A native of Europe.

c. *The Sucker furnished with four bristles.* Syrphi.

‖ *Bristle of the Antennæ feathery.*

* *bombylans.* Black; the abdomen hairy, and reddish behind. 25. A native of Europe; among bushes.

* *apiaria.* The anterior part of the thorax yellow; the extremity of the abdomen white; the wings of a rusty colour at the tip. 328. A native of Europe; the posterior part of the thorax, the forehead, and abdomen black; wings obscure.

‖ ‖ *The Bristle of the Antennæ simple and smooth.*

conopsea. Black, without hairs, the sides of the thorax marked with yellow lines, the abdomen with three yellow lines. 21. A native of Europe; among bushes.

* *pendula.* The thorax marked with four yellow lines; the abdomen with three interrupted yellow bands. 28. A native of Europe. The larva lives in stagnant water, and is suspended by a long filiform tube through which it breathes.

* *tenax.* Thorax gray; the abdomen brown; the thighs of the hind legs compressed. 32. A native of Europe; in dunghills, in necessaries, and in putrid water. The larva is very tenacious, and difficultly destroyed by pressure.

* *pyrastri.* Very slightly hairy, black; the thorax without spots; the abdomen marked with six white circular spots. 51. A native of Europe; and feeds on the *aphides* on the leaves of the pear tree.

* *merthastri.* Black; not hairy; the thorax spotted; the abdomen marked with four yellow belts, the scutellum yellow, 54. A native of Europe; on flowers, chiefly on the mint. The perfect insect feeds on honey, the larva on aphides.

saltatrix. Naked; yellow; the upper part of the abdomen brown; the thorax marked with three brown lines. 60. A native of Europe; in meadows, where it leaps about on the ground like a grasshopper; the longitudinal line on the thorax, somewhat broad, marked with an oblong black spot, and with a black line on each side towards its extremity; poisers white.

360 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature, publiſhed by Gmelin.

98. Tabanus, *Ox-Fly*.

Mouth furniſhed with a ſtraight, projecting, and membranaceous proboſcis; with a ſmall and oval head; with two equal lips; with a long projecting ſucker, which can be concealed in a groove on the back of the proboſcis. Sheath of one valve, and furniſhed with five briſtles. Feelers two, equal, clavated, and ſharp at the points. Antennæ ſhort, cylindrical, approaching to one another, pointed, and compoſed of ſeven articulations.

Theſe inſects live by ſucking out the blood of various animals, of which they are very greedy. The larvæ are found under ground, in moiſt meadows: the colour of the eyes vaniſhes when the inſect is dead, but may be reſtored by placing it in warm water.

* *bovinus.* Eyes greeniſh; the back of the abdomen marked with long triangular white ſpots. 4. A native of Europe. It is very troubleſome to horſes, and horned cattle; their bite is painful; they even moleſt the human ſpecies in very warm weather; they are moſt frequent in moiſt ſituations.

tarandinus Eyes green; the ſegments of the abdomen yellow on the edges; legs reddiſh. 7. A native of Europe. They wound the tender horns of the rein-deer, and ſpoil their ſhape; they are met with in Italy, and the ſouthern parts of Europe, as well as in Lapland.

pellucens. Black; eyes marked with bands; firſt ſegment of the abdomen bluiſh; the ſhanks of the legs pale.

* *paganus.* The anterior parts of the eyes green, marked with three tawny bands; the abdomen marked on both ſides with ruſty-coloured ſpots. 25. A native of Britain.

* *tropicus.* Eyes marked with three purple bands; the ſides of the abdomen of a ruſty colour. 14. A native of Europe; very troubleſome to cattle, eſpecially to horſes, immediately before rain.

* *pluvialis* Eyes green, marked with four waved bands; wings dotted with brown. 16. A native of Europe.—This little animal fixes on the hands, face, and legs, and excites a painful inflammation in the part where it has drawn blood.

* *cæcutiens.* Eyes green, dotted with black; wings without ſpots. 17. A native of Europe. It is extremely troubleſome in hot weather, eſpecially before rain, fixing on the hands and face, or any uncovered part; it draws blood very dexterouſly, and leaves an inflamed bloody puncture behind.

38 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature publiſhed by Gmelin.

99. Culex, *Gnat*.

Mouth furniſhed with a ſheath of one piece, flexible, and ſet with five briſtles. Feelers two, compoſed of three articulations. Antennæ filiform.

The inſects of this genus live on the juices of the larger animals, and are eagerly ſought after by poultry, and ſmall birds. The larva lives in ſtagnant waters, and has a ſmall cylindrical reſpiratory tube, near the tail; the head is armed with hooks to ſeize on the aquatic inſects upon which it feeds; it is devoured by ducks, and water fowl. The pupa is curved and oval, with reſpiratory tubes near the head. They continue but a ſhort time in the ſtate of larva and pupa. The perfect inſect depoſits her eggs in cluſters on the ſurface of the water, where they remain for a few days until they are hatched. Gnats in this country, however troubleſome they may be, do not make us feel them ſo ſeverely, as the muſquito does in foreign parts.

* *pipiens.* Of an aſh colour; the abdomen marked with eight brown rings. 1. A native of Europe, and the northern parts of Aſia and America; in the neighbourhood of freſh waters, and in marſhy places. It is larger in more ſoutherly climates, and its bite occaſions more pain and inflammation. When on the wing it makes a conſtant ſhrill noiſe, whence it has received its name *pipiens*. The male is not eaſily diſtinguiſhed from the female by its pectinate antennæ: it is more troubleſome, and its bite more painful than that of the female. Ducks, and other aquatic fowls, feed their young with them; different ſpecies of the *libellula* likewiſe devour them. They ſometimes inſinuate themſelves into the lungs and inteſtines of quadrupeds, where their bite excites a fatal inflammation. The natives of countries where they are very troubleſome, have recourſe to the ſmoke of different vegetables as a defence. In warm climates they are frequently compelled to make uſe of gauze curtains, which they draw cloſe round them when aſleep. They are ſaid to ſhine in the dark.

annulatus. Brown; the abdomen and feet marked with white rings; the wings ſpotted. 8. A native of the north of Europe; the ſnout half the length of the body.

* *bifurcatus.* Brown; the thorax faintly marked with lines. 3. A native of Europe; in marſhy ſituations.

* *pulicaris* Brown; wings white, marked with three obſcure ſpots. 10. A native of Europe; it creeps about a great deal; its bite is ſucceeded by a brown ſpot.

13 ſpecies of this genus have been deſcribed by Gmelin, in the laſt edition of the Syſtem of Nature.

100. Empis.

Sucker with a ſheath of one piece, furniſhed with three briſtles, and an inflected proboſcis. Feelers ſhort, and filiform. Antennæ ſetaceous.

The minute inſects which compoſe this genus, live by ſucking out the blood and juices of other animals.

* *borealis.* Black; wings nearly round, and of a ruſty colour. 1. A native of Europe; they may be ſeen dancing in the air in great numbers in the evening when the weather is good.

* *pennipes.* Black; the hinds legs long and feathered. 2. A native of Europe; it is frequently found on the leaves of the *geranium ſylvaticum*, and *cardamine pratenſis*.

* *livida.* Livid; thorax marked with lines, the baſe of the wings and legs of a ruſty colour. 3. A native of Europe; it is frequently to be found on the *heraclium ſpondylium*; the upper part of the abdomen very dark brown; wings oblong, marked with brown veins.

Of

* *cinerea.* Of an aſh colour; thorax without ſpots; legs pale; wings brown at the tip. 9. A native of Europe; on umbelliferous plants.

19 ſpecies of this genus are deſcribed in the edition of the Syſtem of Nature publiſhed by Gmelin.

101. Stomoxys.

Sucker conſiſting of a ſheath of one piece, and furniſhed with enclofing briſtles. Feelers two, ſhort, briſtle-ſhaped, and compoſed of three articulations. Antennæ ſetaceous.

The inſects of this genus live by ſucking the blood and juices of other animals; thoſe of the diviſion *ringiæ* principally attack inſects of the orders *lepidoptera* and *diptera*.

A. *The Sheath convoluted, and bent at the baſe, with an angular flexure, and furniſhed with two briſtles.*

* *calcitrans.* Gray; antennæ ſlightly feathered; legs black. 4. A native of Europe. It reſembles the common fly very much in every reſpect, except in the ſnout, and in having the ſegments of the abdomen marked with two black ſpots. It is very troubleſome to horned cattle; by getting about their feet, it cauſes them to kick, and ſtamp with their feet: before rain it bites more frequently. It does not ſpare the human ſpecies, particularly in autumn.

* *irritans.* Of an aſh colour, and ſomewhat hairy; the abdomen ſpotted with black. 5. A native of Europe. This ſpecies is very frequent, and troubleſome to cattle; by fixing on their backs, it cauſes them to keep their tails almoſt in conſtant motion to laſh it off.

pungens. Of an aſh colour, wtth black thighs. 6. A native of Europe. It is very troubleſome to cattle, reſembles *St. irritans*, but much ſmaller wings; whitiſh, without ſpots; the abdomen ſometimes of a dark colour.

B. *Sheath covering the mouth, and furniſhed with four briſtles.* Rhingiæ.

* *roſtrata.* Thorax faintly marked with lines; the ſnout, legs, and abdomen of a brick colour. 8. A native of Europe. Very troubleſome to cattle; about the ſize of the common fly; wings pale.

lineata. Thorax marked with lines; abdomen black, marked on the ſides with yellow ſpots. 9. A native of Europe. The lip long, yellow, with a black emarginated tip, and formed of a horny ſubſtance enclofing the proboſcis. The antennæ black, with a ruſty-coloured knob, and furniſhed with a briſtle; the thorax marked with four white lines; the ſcutellum of a brick colour; wings whitiſh; legs yellow; the thighs marked with a white belt.

Only 9 ſpecies of this genus have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature.

102. Conops.

Mouth furniſhed with a projecting ſnout, which is bent with an angular flexure. Antennæ clavated, and pointed at the extremity.

The inſects of this genus live by ſucking the blood and juices of other animals.

A. *Sucker furniſhed with a ſhort valve of one piece, and with a ſingle briſtle.*

* *veſicularis.* Blackiſh; back part of the head veſicular, the abdomen yellowiſh and black at the baſe. 4. A native of Europe; in groves.

* *macrocephalus.* Black; ſix ſegments of the abdomen yellow on the edges; antennæ and legs reddiſh. 5. A native of Europe; in groves.

B. *The Sucker bent both at the middle and at the baſe, with an angular flexure. Sheath conſiſting of two pieces, the two pieces which compoſe the Sheath equal.* Myopæ.

* *ferrugi-nea.* Of a ruſty colour; the abdomen cylindrical, and bent inwards; the forehead reddiſh. 8. A native of Europe; in groves.

atra. Abdomen cylindrical, and bent inwards; body black. 2. A native of Europe; among buſhes.

14 ſpecies of this genus are deſcribed in the edition of the Syſtem of Nature publiſhed by Gmelin.

103. Asilus.

Mouth furniſhed with a ſucker, compoſed of a horny ſubſtance, projecting, ſtraight; conſiſting of two pieces, and turgid at the baſe. Antennæ filiform.

They prey on other inſects, eſpecially thoſe of the *lepidopterous* and *dipterous* orders.

* *crabro formis.* The abdomen hairy; on the fore part there are three of the ſegments black; behind yellow and bent inwards. 4. A native of Europe. The larva lives under ground. This is the largeſt ſpecies of the genus which is to be met with in Britain. Its ſting is very painful.

epiphium. Hairy, black; the thorax white at the baſe. 19. A native of Europe.

* *ater.* Hairy, black; with a whitiſh band. 7. A native of Europe. It reſts by leaning on its breaſt, with its legs ſpread. Claws white.

diadema Black; wings black; the forehead white. 22. A native of Europe. Band and wings wholly black.

* *tipuloides.* Of an aſh colour, without hairs; legs of a ruſty colour; feet black. 14. A native of Europe.

ſtriatus. Black; the thorax marked on each ſide with an aſh-coloured line; the poiſers yellow. 44. A native of Europe.

Gmelin has deſcribed 48 ſpecies of this genus, in his laſt edition of the Syſtem of Nature.

104. Bombylius, *Buz-fly.*

Mouth furniſhed with a ſucker, very long, ſetaceous, ſtraight, and compoſed of two valves, the valves unequal, and likewiſe with three briſtles. Feelers two, ſhort, and hairy. Antennæ tapering towards the point, and connected at the baſe.

The ſpecies of this genus feed on the nectarious juice of flowers which they collect when on wing.

Humble

* *major.* *Humble Bee.* Wings with a broad black waved outer edge; body black, with thick yellowish down. 1. A native of Europe.

* *medius.* Wings dotted with brown; body yellowish and white behind. 2. A native of Europe. It is to be met with very early in the spring.

minimus. Wings brownish at the base; body yellowish, and hairy; snout and legs black. 7. A native of Europe. Very small; antennæ black; wings white.

griseus. Hairy; wings white, brown at the base; thorax black, marked with white lines; abdomen gray. 11. A native of Europe; on compound flowers. Wings marked with two black dots in the middle.

virescens. Wings white, without spots; body hairy, and greenish; the snout short. 12. A native of Europe; on flowers. Thickly covered with greenish hairs.

There are 15 species of this genus described in the last edition of the System of Nature.

105. Hippobosca.

Mouth furnished with a short, cylindrical, straight sucker, composed of two equal pieces. Antennæ filiform. Legs furnished with many claws.

The species of this genus live on the blood of other insects.

* *equina.* *Horse-fly.* Wings obtuse; thorax variegated with white; legs terminating in four claws. 1. A native of Europe and America.—They are very troublesome to horses; they hide themselves under the hairs, and attach themselves firmly to the skin, by means of their crooked claws.

* *avicularia.* Wings obtuse; thorax of one colour. 2. A native of Europe; on the bodies of various birds, especially swallows. Wings longer than the body by one half, marked with black veins; the hind part of the abdomen flattened and dotted.

* *hirundinis.* Wings tapering towards the extremity; legs terminating in six claws. 3. A native of Europe; on the bodies and nests of swallows.

* *ovina.* No wings. 4. A native of Europe; among the wool of sheep. The abdomen distended, pale, obtuse, marked on each side with a double waved white line, and on the back with a red spot; legs hairy, the claws set in pairs.

There have been only five species of this genus hitherto described.

VII. APTERA.

Wings none in either sex.

106. Lepisma.

Mouth furnished with four feelers, two setaceous, and two capitated. Lip membranaceous, round, and emarginated. Antennæ setaceous. Body covered with scales laid over one another, like tiles on the roof of a house. Tail furnished with bristles. Legs six, formed for running.

These in their various stages of existence prey upon sugar, decayed wood, and putrid substances. The larvæ and pupæ are six-footed, active, and swift.

Scaly, and resembling silver; tail triple. 1. A native of America; among sugar. They have been introduced into Europe, and are frequently to be met with among books and furniture. They run very quickly, and are not easily caught. Antennæ whitish, of the same length with the body. It is furnished with two scutella which enclose the thorax; two segments of the abdomen less than the rest; the tail furnished with three long bristles standing at a distance from each other, and with two pair of very small ones under the anus. * *saccharinum.*

Leaping; tail triple; segments of the abdomen hairy on each side beneath. 2. A native of Europe; in sandy situations, among stones and rubbish, and takes prodigious leaps by means of the springs under its tail; brownish, the antennæ the length of the body; the fore feet placed very near the mouth; each segment of the abdomen is furnished with a spine beneath. * *polypus.*

Naked; tail triple. 3. A native of Europe. It resembles the *podura*, but larger, wholly white, and cylindrical; the antennæ obtuse, and half the length of the body. *terrestre.*

There are seven species of this genus described by Gmelin.

107. Podura, *Spring-tail.*

Mouth furnished with four feelers, slightly clavated; the lip divided. Eyes two, composed of eight facets Tail forked, bent under the body, and acting like a spring. Legs six, formed for running.

The insects of this genus, through all their stages, feed on vegetables. The larva and pupa have six feet, and are active, and very much resemble the perfect insect.

Nearly globular, and green. 1. A native of Europe; on plants of different kinds, especially on the seminal leaves of the buck-wheat (*polygonium fagopyrum*). * *viridis.*

Oblong, and ash-coloured, with black marks. 6. A native of Europe; among bushes, in wood. It is frequently to be seen in the winter on the snow, in the footsteps of men and other animals. * *nivalis.*

Black, and lives in water. 12. A native of Europe. Assembles in troops, early in the morning, on the banks of pools and fish ponds. * *aquatica.*

White; lives on land. 13. A native of Europe; found very early in the spring on recently ploughed land. * *fimetaria.*

31 species of this genus have been described in the last edition of the System of Nature.

108. Termes, *White Ant.*

The mouth furnished with two jaws, formed of a horny substance. Lip formed likewise of a horny substance; is divided into four, the division linear and sharp. Feelers four, equal and filiform. Antennæ moniliform in most species. Eyes two.

These insects might with more propriety be placed under

under the order *Neuroptera*, or *Hymenoptera*, moſt of them having either two or four wings in the perfect ſtate. They are very deſtructive, and deſtroy proviſions, cloths, furniture, books, and timber of whatever magnitude, leaving a thin ſhell not thicker than paper; in houſes they are not only troubleſome, but dangerous, as they deſtroy the beams which ſupport the floors and roofs, and occaſion them to fall in.

fatale. Brown above; the thorax is compoſed of three ſegments; wings pale, furniſhed with a rib or nerve of a brick colour. 1. A native of India and Africa. Larva ſmall, about a quarter of an inch long, furniſhed with ſix feet, pale, with a roundiſh brick-coloured head, without eyes; mandible ſhort and ſtrong, antennæ as long as the thorax; the abdomen oval. Pupa larger; about half an inch long, with a very large oval poliſhed head, without eyes; jaws projecting, as long as the head, forked, without teeth, ſharp and black; thorax and abdomen paliſh. The perfect inſect both male and female has a brown head, antennæ yelloviſh and globular, prominent black eyes, the ſegments of the thorax margined, the abdomen variegated with white ſtreaks, wings twice the length of the body, legs yelloviſh. Of the white ant we have a very curious and intereſting deſcription, in the Philoſophical Tranſactions for 1781, by Mr Henry Smeathman of Clement's Inn. According to this account, the works of theſe inſects ſurpaſs thoſe of the bees, waſps, beavers, and other animals, as much at leaſt as thoſe of the moſt poliſhed European nations excel thoſe of the leaſt cultivated ſavages. With reſpect to the interior conſtruction, and the various members and diſpoſitions of the parts of the building, they may come into compariſon with ſome of the moſt celebrated works of man himſelf. The moſt ſtriking parts of theſe ſtructures are the royal apartments, the nurſeries, magazines of proviſions, arched chambers and galleries, with their various communications; the ranges of Gothic ſhaped arches, projected, and not formed by mere excavation, ſome of which are two or three feet high, but which diminiſh rapidly, like the arches of aiſles in perſpective; the various roads, ſloping ſtaircaſes, and bridges, conſiſting of one vaſt arch, and conſtructed to ſhorten the diſtance between the ſeveral parts of the building, which would otherwiſe communicate only by winding paſſages. In ſome parts near Senegal, their number, magnitude, and cloſe arrangement, make them appear like the villages of the natives. But theſe and many other curious inſtances of the great ſagacity and powers of theſe inſects cannot be underſtood, without viewing the plates in which their feeble frames, and comparatively, ſtupendous works are delineated. See Phil. Tranſ. above referred to. The economy of theſe induſtrious inſects appears to have been very attentively obſerved by the ingenious author, as well as their buildings. There are three diſtinct ranks or orders of them, conſtituting a well regulated community. Theſe are, firſt, the larvæ, labourers, or working inſects; ſecond, the pupæ, ſoldiers, or fighting order, who do no kind of labour, and are about twice as long as the former, and equal in bulk to about fifteen of them; and laſtly, the winged or perfect inſects, which may be called the nobility of the ſtate, for they neither labour nor fight, being ſcarcely able to defend themſelves. Theſe only are capable of being elected kings or queens; and nature has ſo ordered it, that they emigrate within a few weeks after they are elevated to this ſtate, and either eſtabliſh new kingdoms, or periſh within a day or two. The firſt order, the working, are moſt numerous, being in the proportion of 100 to one ſoldier. In this ſtate they are about a quarter of an inch in length, and twenty five of them weigh about a grain, ſo that they are not ſo large as ſome of our ants. See plate DI. fig. 1. and 2. The ſecond order, or ſoldiers, have a very different form from the labourers, and have been by ſome authors ſuppoſed to be the males, and the former the neuters; but they are in fact, the ſame inſects as the foregoing, only they have undergone a change of form, and approached nearer to the perfect inſect. They are now much larger, being half an inch long, and equal in bulk to 15 of the labourers, (fig. 3. and 4). The third order, the inſect in its perfect ſtate, varies its form ſtill more. The head, thorax, and abdomen, differ almoſt entirely from the ſame parts in the labourers and ſoldiers; and beſides this, the animal is now furniſhed with four fine large browniſh, tranſparent wings, with which it is at the time of emigration to wing its way in ſearch of a new ſettlement. It differs ſo much from the other two, that they have not hitherto been ſuppoſed to belong to the ſame community. In fact, they are not to be diſcovered in the neſt, till juſt before the commencement of the rainy ſeaſon; when they undergo the laſt change, which is preparative to the formation of new colonies. They are equal in bulk to two ſoldiers, and about 30 labourers (ſee fig. 5), and by means of the wings with which they are furniſhed, they roam about for a few hours, at the end of which time they loſe their wings, and become the prey of innumerable birds, reptiles, and inſects; while probably not a pair out of many millions of this unhappy race, get into a place of ſafety, fulfil the firſt law of nature, and lay the foundation of a new community. In this ſtate, many fall into the neighbouring waters, and they are eaten with avidity by the Africans The author found them delicate, nouriſhing, and wholeſome, without ſauce or other help from cookery, than merely roaſting them in the manner of coffee. The few fortunate pairs who happen to ſurvive this annual maſſacre and deſtruction, are repreſented by the author as being caſually found by ſome of the labourers, that are continually running about on the ſurface of the ground, and are elected kings and queens of new ſtates. Thoſe who are not ſo elected and preſerved, certainly periſh, and moſt probably in the courſe of the following day. By theſe induſtrious creatures, the king and queen elect are immediately protected from their innumerable enemies, by being incloſed in a chamber of clay, where the buſineſs of propagation ſoon commences; their voluntary ſubjects, then employed in conſtructing wooden nurſeries, or apartments entirely compoſed of wooden materials, ſeemingly joined together with gum. Into theſe, they afterwards carry the eggs produced from the queen, lodging them there as faſt as they can obtain them from her. The author even furniſhes us with plauſible reaſons to believe, that they here form a kind of garden for the cultivation of a ſpecies of microſcopical muſhrooms, which Mr Konig, in an Eſſay on the Eaſt Indian Termites, read before the ſociety of naturaliſts of Berlin, conjectures to be the food of the young inſects. But perhaps the moſt wonderful, and at the

ſame

ſame time beſt authenticated part of the hiſtory of theſe ſingular inſects, is that which relates to the queen or mother of the community in her pregnant ſtate. After impregnation, a very extraordinary change begins to take place in her body, or rather in her abdomen only. It gradually increaſes in bulk, and at length becomes of ſuch an enormous ſize as to exceed the bulk of the reſt of her body 1500 or 2000 times. She becomes 1000 times heavier than her conſort, and exceeds 20,000 or 30,000 times the bulk of one of the labourers. In this ſtate, the matrix has a conſtant periſtaltic or undulating motion, the conſequence of which is (as the author has counted them), (fig. 8.) the protruſion of a great many thouſands of eggs in twenty-four hours. Theſe eggs, ſays the author, are inſtantly taken from her body by her attendants, of whom there always are a great number in the royal chamber and the galleries adjacent, and carried to the nurſeries, which are ſometimes four or five feet diſtant in a ſtraight line. Here, after they are hatched, the young are attended and provided with every thing neceſſary, until they are able to ſhift for themſelves, and take their ſhare of the labour of the community. Many curious and ſtriking particulars are related of the great devaſtations committed by this powerful community, which conſtruct roads, or rather covered ways, diverging in all directions from the neſt, and leading to every object of plunder within their reach. Though the miſchiefs they commit are very great, ſuch is the economy of nature, that it is probably counterbalanced by the good produced by them, in quickly deſtroying dead trees, and other ſubſtances, which, as the author obſerves, would by a tedious decay, ſerve only to encumber the ſurface of the earth. Such is their alacrity and diſpatch in this office, that the total deſtruction of deſerted towns is ſo effectually accompliſhed, that in two or three years a thick wood fills the ſpace, and not the leaſt veſtige of a houſe is to be diſcovered. From the many ſingular accounts here given of the police of theſe inſects, we ſhall mention one reſpecting the different functions of the labourers and ſoldiers, or the civil and military eſtabliſhments in this community, on an attempt to examine their neſt and city.

On making a breach in any part of the ſtructure with a hoe or pickaxe, a ſoldier immediately appears and walks about the breach, as if to ſee whether the enemy has gone, or to examine whence the attack proceeds. In a ſhort time he is followed by two or three others, and ſoon after by a numerous body, who ruſh out as faſt as the breach will permit them, their numbers increaſing as long as one continues to batter the building. During this time they are in the moſt violent agitation and buſtle, while ſome of them are employed in beating with their forceps upon the building, ſo as to make a noiſe that may be heard at three or four feet diſtance. On ceaſing to diſturb them, the ſoldiers retire, and are ſucceeded by the labourers, who haſten in various directions to the breach, each with a burden of mortar in his mouth ready tempered. Though there are millions of them, they never ſtop to embarraſs each other; and a wall gradually ariſes that fills up the chaſm. A ſoldier attends every 600 or 1000 of the labourers, ſeemingly as a director of the works; for he never touches the mortar, either to lift or carry it. One in particular places himſelf cloſe to the wall which they are repairing, and frequently makes the noiſe above mentioned; which is conſtantly anſwered by a loud hiſs from all the labourers within the dome; and at every ſuch ſignal they evidently redouble their pace, and work as faſt again. The work being completed, a renewal of the attack conſtantly produces the ſame effects. The ſoldiers again ruſh out and then retreat, and are followed by the labourers loaded with mortar, and as active and diligent as before. Thus, ſays the author, the pleaſure of ſeeing them come out to fight or to work alternately may be obtained as often as curioſity excites or time permits; and it will certainly be found, that the one order never attempts to fight, or the other to work, let the emergency be ever ſo great. The obſtinacy of the ſoldiers is remarkable. They fight to the very laſt, diſputing every inch of ground ſo well as often to drive away the negroes, who are without ſhoes, and make the white people bleed plentifully through their ſtockings. Such is the ſtrength of the buildings erected by theſe puny inſects, that, when they are raiſed to little more than half their height, it is always the practice of the wild bulls to ſtand as centinels upon them while the reſt of the herd is ruminating below. When at their full height of ten or twelve feet, they are uſed by Europeans as places to look out from over the top of the graſs, which here grows to the height of thirteen feet, upon an average. The author has ſtood with four men on the top of one of theſe buildings, in order to get a view of any veſſel that might come in ſight. Theſe termites indeed are frequently pernicious to mankind, but they are alſo very uſeful and even neceſſary; one valuable purpoſe which they ſerve is to deſtroy decayed trees and other ſubſtances, which, if left on the ſurface of the ground in hot climates, would in a ſhort time pollute the air. In this reſpect they reſemble very much the common flies, which are regarded by mankind in general as noxious, and at beſt as uſeleſs beings in the creation; but it is certainly for want of conſideration. There are not probably, in all nature, animals of more importance; and it would not be difficult to prove, that we ſhould feel the want of one or two ſpecies of large quadrupeds much leſs than one or two ſpecies of theſe deſpicable looking inſects. Mankind, in general, are ſenſible that nothing is more diſagreeable than putrid ſubſtances, and nothing more peſtiferous.

Of a brick colour above; head black; antennæ yellow. 4. A native of America, Africa, and India. They build ſtrong oval neſts round the branches of trees. It very much reſembles the *T. fatale*, but is only half the ſize, the lower ſtemmata are impreſſed with a dot on the centre; wings browniſh, marked with a yelloviſh rib. Larva pale brown; head black, conic, and projecting forwards. *deſtructor.*

Black; ſegments of the abdomen tipt with white; legs pale. 5. A native of Africa; and reſembles in economy the *T. fatale*. It builds a neſt of a cylindrical ſhape, two or three feet high, of brown clay and vegetables mixed up together, with a round vaulted dome, ſurrounded by a prominent terrace. Larvæ or labourers have a pale head, without eyes; mandibles ſhort, furniſhed with teeth; thorax and abdomen oval, grayiſh lead colour; legs of a brick colour. Pupæ or guards have a very large brick-coloured head, clavated and ſwelling out before, oval and extended behind; *arda.*

mandible projecting and forked; antennæ of a brick colour, as long as the head, without eyes; thorax ſmall; abdomen oval, graviſh lead-colour; legs of a brick colour. Perfect inſect leſs than the former ones, with incumbent black wings, and pale brick-coloured legs.

mordax. Black; ſegments of the abdomen tipt with white; legs black. 6. A native of Africa. Builds cylindrical houſes. Larva and pupa like the laſt, but much leſs.

capenſe. Pale yellow; wings tranſparent, edged with brown. 7. A native of India and Africa. Larva furniſhed with two black eyes; and wanders about in the daytime in troops like the common ant.

fatidicum. Abdomen oval; mouth pale; eyes brown; antennæ ſetaceous. 3. A native of Europe.

* *pulſatorium.* Abdomen oblong; mouth red; eyes yellow; antennæ ſetaceous. 3. A native of Europe and America. Frequent in houſes, in old books, wood, decayed furniture, muſeums, and is rarely found with wings. The female beats like the ticking of a watch, and is often miſtaken for the *pinus pulſator*.

divinatorium. Abdomen tranſverſely furrowed; mouth brown; eyes black. 7. A native of Europe; found in books, and is very active and lively. Body whitiſh.

Theſe eight ſpecies are all that have been deſcribed by Gmelin: other two, the *morio* and *flavicolle*, have been deſcribed ſince.

106. Pediculus. *Louſe.*

Mouth furniſhed with a ſucker, which the inſect can ſtretch out or draw back at pleaſure; without feelers or proboſcis. Antennæ of the ſame length with the thorax. Eyes two. Abdomen flattiſh. Legs fix, formed for running.

The inſects of this genus live by ſucking the juices of animals. The larvæ and pupæ have ſix feet, and are active, reſembling the perfect inſect.

* *humanus* Abdomen aſh-coloured, and lobed. 1. There are two varieties of this ſpecies, the one ſofter and whiter, occupying the body and clothes, the other harder and darker-coloured occupying the heads of thoſe that do not attend to cleanlineſs, particularly of children.

The louſe which infeſts the human body makes a very curious appearance through a microſcope. It has ſuch a tranſparent ſhell or ſkin, that we are able to diſcover more of what paſſes within its body than in moſt other living creatures. It has naturally three diviſions, the head, the breaſt, and the tail-part. In the head appear two fine black eyes, with a horn that has five joints, and is ſurrounded with hairs ſtanding before each eye, and from the end of the noſe or ſnout there is a pointed projecting part, which ſerves as a ſheath or caſe to a piercer or ſucker, which the creature thruſts into the ſkin to draw out the blood and humour which are its deſtined food; for it has no mouth that opens in the common way. This piercer or ſucker is judged to be 700 times ſmaller than a hair, and is contained in another caſe within the firſt, and can be drawn in or thruſt out at pleaſure. The breaſt is very beautifully marked in the middle; the ſkin is tranſparent, and full of little pits: and from the under part of it proceed ſix legs, each having five joints, and their ſkin all the way reſembling ſhagreen, except at the ends, where it is ſmoother. Each leg terminates by two claws, which are hooked, and are of an unequal length and ſize. Theſe it uſes as we would a thumb and middle finger: and there are hairs between theſe claws as well as all over the legs. On the back part of the tail there may be diſcovered ſome ring-like diviſions, and a ſort of marks which look like the ſtrokes of a rod on the human ſkin: the belly looks like ſhagreen, and towards the lower end it is very clear and full of pits: at the extremity of the tail there are two ſemicircular parts all covered over with hairs, which ſerve to conceal the anus. When the louſe moves its legs, the motion of the muſcles, which all unite in one oblong dark ſpot in the middle of the breaſt, may be diſtinguiſhed perfectly, and ſo may the motion of the muſcles of the head when it moves its horns. We may likewiſe ſee the various ramifications of the veins and arteries, which are white, with the pulſe regularly beating in the arteries. But the moſt ſurpriſing of all the ſights is the periſtaltic motion of the guts, which is continued all the way from the ſtomach down to the anus. If one of theſe creatures be placed on the back of the hand, when hungry, it will thruſt its ſucker into the ſkin; the blood which it ſucks may be ſeen paſſing in a fine ſtream to the fore part of the head, where falling into a roundiſh cavity, it paſſes again in a fine ſtream to another circular receptacle in the middle of the head; from thence it runs through a ſmall veſſel into the breaſt, and then to a gut which reaches to the hinder part of the body, where, in a curve it turns a little upwards; in the breaſt and gut the blood is moved without intermiſſion with a great force, eſpecially in the gut, where it occaſions ſuch a contraction of the gut, as is very ſurpriſing. In the upper part of the crooked aſcending gut above mentioned, the propelled blood ſtands ſtill, and ſeems to undergo a ſeparation, ſome of it becoming clear and wateriſh, while other black particles are puſhed forwards to the anus. If a louſe is placed on its back, two bloody darkiſh ſpots appear, the larger in the middle of the body, the leſſer towards the tail: the dark bloody ſpot, in or over which the bladder ſeems to lie. This motion of the ſyſtole and diaſtole is beſt ſeen when the creature begins to grow weak; and on pricking the white bladder, which ſeems to be the heart, the creature inſtantly dies. The lower dark ſpot is ſuppoſed to be the excrement in the gut.

The poſterior part of the abdomen emarginated; legs formed like claws. 2. A native of Europe. It is found about the hairs of the groin, and ſometimes, though rarely, on the eyebrows of people who do not attend to cleanlineſs. The antennæ have five articulations; the hind part of the abdomen hairy. * *pubis.*

The abdomen orbicular, marked with a white line; ſcutellum compoſed of three lobes; the ſnout white. 3. A native of America. It gets into the legs of the naked inhabitants, where it draws blood, and depoſiting its eggs in the wound occaſions foul and malignant ulcers. *ricinoides.*

8. A native of Europe; on ſheep. * *ovis.*

The abdomen is marked with eight tranſverſe ruſty-coloured lines. 9. A native of Europe; on horned cattle. * *bovis.*

66 ſpecies of this genus are deſcribed in the laſt edition of the Syſtem of Nature, all of which occupy the bodies of different animals.

110. PULEX, *Flea*.

Mouth without jaws or feelers. The ſnout long, and bent inwards. A ſheath of two pieces, conſiſting of five articulations, covered at the baſe with two oval ſcales, and furniſhed with a ſingle briſtle. Lip round, fringed with ſharp points, which are bent backwards. Antennæ moniliform, projecting, and becoming thicker towards their outer ſide. Eyes two. Abdomen compreſſed. Legs ſix, formed for leaping.

The genus *pulex* is rather doubtful; it approaches in many reſpects to the inſects of the order hemiptera. They live on the juice and blood of other animals. Larva without feet, cylindrical, active, and furniſhed with two ſpines under the tail.

* *irritans*. The ſnout ſhorter than the body. 1. This familiar inſect is to be met with everywhere; it lives by ſucking the blood of other animals, and is very troubleſome to many of them, eſpecially to the hare and rabbit. They depoſit ſmooth round eggs at the roots of the hair of the animals on which they feed, on blankets, and articles made of wool, fur, &c. From theſe eggs are hatched the larvæ, reſembling ſmall white ſhining worms, which feed on the ſcurfy ſubſtance adhering to the cuticle of animals, or on the downy matter collected on clothes. About a fortnight after they are hatched, they acquire a conſiderable ſize, and become very active; when diſturbed they roll themſelves up into a ball. After they have acquired their full ſize, they retire into ſome undiſturbed ſituation; they form ſmall bags for themſelves compoſed of ſilky threads, which they ſpin from their mouths. Theſe bags are very white internally; but on the outſide, they are of the colour of duſt, and are very little diſcernible. They remain in the ſtate of pupa about 14 days. It continues to be of a white colour till the ſecond day before its eſcape from the bag, when it acquires a dark colour, becomes firmer, and is transformed into a perfect inſect.

The flea, when viewed in the microſcope, exhibits a very ſingular appearance. It is covered all over with black and hard ſcales, which are curiouſly jointed, and folded over one another, ſo as to comply with all the nimble motions of the creature. Theſe ſcales are poliſhed, and are beſet about the edges with ſhort ſpikes in a very beautiful and regular order. Its neck is finely arched, and ſomewhat reſembles the tail of a lobſter. Its eyes are very large and beautiful. The ſucker contains a couple of lances or darts; which, after the ſucker has made an entrance, are thruſt farther into the fleſh, to make the blood flow from the adjacent parts, and occaſion that round red ſpot, with a hole in the centre of it, which remains for ſome time after the puncture of a flea, commonly called *flea-bite*. A proper view of the ſucker with its two lances is not eaſily obtained, as the inſect puts out its ſucker only at the time of feeding. The beſt way of obtaining a view is to cut off the head, and ſubject it to the microſcope by itſelf. There is an hoſpital at Surat where a number of fleas are kept, and ſome poor creature, for pay, allows himſelf to be fixed down and fed upon by them.

Chiqur. Snout of the ſame length with the body. 2. A native of America. This inſect is very troubleſome in the ſugar colonies, penetrating into the feet of the inhabitants, where it lodges its eggs and cauſes malignant ulcers. Body reddiſh brown. The female produces a very great number of eggs, and when pregnant the abdomen ſwells to 100 times the ſize of the reſt of the body. It penetrates chiefly under the nails of the toes, and eats its way onwards, depoſiting its eggs, which are exceedingly minute, in a bag. It is diſcovered by the uneaſy itching it occaſions, and muſt be extracted with great caution and dexterity; for if the bag be burſt, and if any of the eggs or animals remain, a very troubleſome ulcer enſues, which ſometimes renders the limb uſeleſs. The ſlaves who go barefooted are chiefly expoſed to this calamity, and they are moſt dexterous at extracting them. *penetrans*.

There are only two ſpecies of this genus deſcribed in the laſt edition of the Syſtem of Nature publiſhed by Gmelin.

111. ACARUS, *Tick* or *Mite*.

Mouth without a proboſcis. The ſucker with a cylindrical ſheath, compoſed of two pieces. Feelers two, compreſſed, equal, and of the ſame length with the ſucker. Eyes two, placed on the ſides of the head. Legs eight.

The inſects of this genus are very minute, and very prolific; they abound everywhere; moſt of them live on the juices of other animals. The larva and pupa have ſix feet, (thoſe of the diviſion *trombidium* have eight feet); they are active, and very much reſemble the perfect inſect.

A. *The Antennæ are filiform, compreſſed, and of the ſame length with the Legs.*

Tranſparent; convex above and flattened beneath; marked in the middle with a blackiſh ſpot. 36. It is very common in waters, on the *mucus* which covers the ſpawn of frogs. Very ſmall, ſlow, inoffenſive, and legs terminating in three nails. *urſellus*.

Oval, almoſt globular; abdomen marked at the baſe with a round brown ſpot; antennæ clavated. 7. A native of Europe; it is very common on oxen and dogs. * *ricinus*.

Second pair of legs very thick. 8. A native of Europe; and very common. It is active, gregarious, frequently to be found in gardens among the earth in ſpring. * *craſſipes*.

Thorax angularly cruciform; the legs terminating in hooks, and longer than the body. 9. It is found on the body of the bat (*veſpertilio murinus*) of an uncommon figure, reſembling the *phalangium*. It cannot walk on a flat ſurface. * *veſpertilionis*.

Commonly called *Red Spider*. Tranſparent and red-diſh; the abdomen marked on each ſide with a brown ſpot. 14. A native of Europe; on various plants, particularly thoſe that are not expoſed to the weather, or ſhut up in hot-houſes. It forms webs of parallel threads, by which it ſometimes ſuffocates plants in green-houſes. *telarius*.

It is frequently to be found on the leaves of the lime-tree in autumn.

* *siro.* *Cheese-Mite.* Whitish; head and thighs of a rusty colour; the abdomen bristly. 15. A native of Europe; in flour, cheese, &c. which have been long kept. The cheese mite is a very minute species; to the naked eye they appear like moving particles of dust. But the microscope shows them to be perfect animals, having as regular a figure, and performing all the functions of life as perfectly, as creatures that exceed them far in size. The head is small in proportion to the body, and has a sharp snout; they have two small eyes, and are very quick-sighted, when they have once been touched by a pin, they artfully avoid another touch. The extremity of their legs are furnished with two little claws, with which they take hold of any thing. The hinder part of the body is plump and bulky, and ends in an oval form, from which issue out some long hairs. Other parts of the body are thinly beset with long hairs. The males and females are easily distinguished. The females are oviparous; and from their eggs the young ones are hatched, in the space of 12 or 14 days in warm weather, but in colder weather longer time becomes requisite. They are very minute when first hatched, and cast their skin several times before they arrive at their full growth, but do not materially change their appearance. They are very tenacious of life, and may be kept alive several months without food. Mr Leeuwenhoek had one that lived 11 weeks on the end of a pin, on which he had fixed it for microscopical observations. They may be kept a long time between two concave glasses, and occasionally subjected to the microscope. In this way they may be seen *in coitu*, conjoined tail to tail, and this is performed by an incredibly swift motion. They are very voracious animals, and have been often seen eating one another. Their manner of eating is by thrusting one jaw forward and drawing the other back alternately, and in this manner, as it were, grinding their food; after they have done feeding they seem to ruminate.

* *scabiei.* *Itch-insect.* White; legs reddish; the four posterior legs are furnished with a very long bristle. 50. In the pustules occasioned by the itch. It is generally thought to be the cause of the itch, though some hold a contrary opinion; the manner, however, in which the itch is communicated, seems to confirm the former opinion.

* *lactis.* Abdomen oval and obtuse, furnished with four bristles the same length with the body, which incline downwards. 16. It is found in cream that has been long kept, and in milk vessels that have not been kept clean.

dysenteriæ Legs furnished with two bristles; the abdomen oval, furnished behind with four horizontal bristles of the same length with the body. 17. It is found in casks and vats, in which beer has been kept; they are most frequently found about the top or near any chink in the vessel; they are likewise found very frequently within the cask, and are said to walk about on the top of the beer from 10 o'clock at night till 10 o'clock in the morning; during the day they conceal themselves in the chinks of the cask.

* *baccarum.* The abdomen turgid and red, and dark-coloured on the sides. 23. It is found on the fruit of the corinth and gooseberry.

The abdomen reddish; the hind-legs very long and filiform. 24. A native of Europe; on different species of flies. * *muscorum.*

Abdomen red, marked on each side with scarlet dots. 26. It is to be found on bees, wasps, dragon-flies, &c. * *gymnopterorum.*

Oval, and reddish; the anus whitish. 27. It is found on many insects, particularly on the common black beetle; which, on that account, has been called the *lousy beetle:* they run very quickly. * *coleoptratorum.*

The posterior part of the abdomen crenated; the scutellum oval, and somewhat tawny; the snout divided into three. 6. A native of America; they fix on the legs of travellers and suck the blood; they adhere so closely, that they are removed with difficulty; the fore-legs are furnished with short prickles, near their junction with the body. *sanguisugus.*

The first pair of legs very thick, and furnished with claws; the second pair very long, and furnished with two bristles at the extremity. 62. Found in books kept in damp places, particularly about the backs, where the sheets have been glued together. It is very injurious, and not visible without the help of a glass. *cruditus.*

Hemispherical, pale, and smooth. Legs equal. 31. It is found in troops on the body of the *acarus crassipes.* *acarorum.*

Oval; furnished with several long hairs at the extremity of the abdomen; the legs are furnished with a single bristle. 61. Found on the bodies of insects and other subjects of natural history which are kept in too moist places, and is more destructive to museums than even the *ptinus fur*, and not visible to the naked eye. *destructor.*

B. *Antennæ setaceous.* Trombidia.

The abdomen hairy, red, and obtuse behind; the fore legs whiter than the rest. 20. A native of Surinam and Guinea; very hairy; it becomes white when immersed in spirits of wine. *tinctorius.*

The abdomen of a blood colour, flat, and downy, turned up behind. 22. A native of Europe and America; is said to be poisonous if swallowed. * *holosericeus.*

82 species of this genus have been described in the last edition of the System of Nature.

112. Hydrachna.

Head, thorax, and abdomen united. Feelers two, jointed. Eyes two, four, or six. Legs eight.

The insects of this genus are inhabitants of the water, swim with great velocity, and prey on the larvæ of *tipulæ* and *monoculi*. They deposit red spherical eggs, which in about a month acquire a lunar form, and produce six-footed larvæ furnished with a single proboscis, which, after they have changed their skin several times, become perfect insects furnished with eight feet.

A. *Eyes two.*

* *Those which are furnished with a Tail.*

Globular; eyes red. 1. It is to be found in ditches containing water; male greenish and spotted; female bluish and without spots, and double the size of the male. * *globator.*

Oval,

buccinator. Oval, red, and black behind; furniſhed with a yellow cylindrical tail, and ſtraightened at the baſe. 3. It is found on the banks of rivers; black beneath, eyes reddiſh, legs black.

fatillator. Purple and globular, furniſhed with a papilla on each ſide of the tail; legs black. 12. It is to be found early in the ſpring in overflowed meadows.

** Furcatæ. *Back marked with a fork.*

craſſipes. White and oval; the diſk black and marked with a reddiſh fork, and furniſhed with papillæ near the anus; fore legs thick. 13. It is found in fiſh ponds and ditches containing water; the legs twice or thrice the length of the body, which renders it eaſily to be diſtinguiſhed. It is tranſparent; breaſt whitiſh; eyes black; when walking freely, it directs its legs forwards; after it has gone a few ſteps, it extends its legs horizontally, and reſts as if it were dead, and a little afterwards it renews its motion.

clavicornis Reddiſh and oval; marked with a yellow fork, feelers clavated, legs pale. 15. It is found in marſhes; eyes ſmall and black, feelers and legs white.

*** *Glabræ.*

deſpiciens. Round and red, marked with ſeveral ſpots; the eyes placed on the under part of the body. 23. It is to be found in ditches full of water; it reſembles the *H. maculata* in every reſpect, except the poſitions of the eyes; flattiſh, wrinkled, full of dimples, marked with nine ſpots; eyes blackiſh; legs yellowiſh.

verſicolor. Nearly ſquare, marked with white, blue, and brown ſpots. 44. It is found in places overflown with water; white above, brown beneath, edge yellowiſh; the feelers and legs white and tranſparent.

B. *Eyes four.*

calcarea. Round, brown, and very white in the middle. 45. It is to be found, though rarely, in moiſt places; eyes black, feelers pointed, legs pale and tranſparent.

maculata. Oval and red; marked on the back with black ſpots. 48. It is found in wet ditches; ſhining; eyes black; legs yellow and tranſparent; feelers yellow, ſometimes long, ſometimes ſhort.

C. *Eyes ſix.*

* *umbrata.* Round and red, marked with ſeveral ſpots. 49. It is found in woody marſhes; ſmooth, ſomewhat depreſſed, marked with more than ten obſcure ſpots, blackiſh beneath; eyes black; feelers very ſmall, tipt with black; legs yellow.

49 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

93. PHALANGIUM.

Mouth furniſhed with two filiform feelers; the mandible compoſed of a ſubſtance like horn; the ſecond joint furniſhed with a ſharp tooth, moveable, and furniſhed with a claw. Antennæ none. Two eyes on the top of the head contiguous, and two lateral eyes. Legs eight. Abdomen (for the moſt part) round.

The inſects of this genus in their various ſtages of tranſformation prey on the ſmaller inſects and worms; the larvæ have eight feet, active, and reſemble the perfect inſect.

A. *Sucker, a conical tube.* Pycnogona.

Feelers four; body filiform; legs very long. 1. A native of the north of Europe; found on the Norwegian ſeas; very ſlow, and very minute; it is compoſed of ſeveral articulations, and has a very narrow linear tail; it enters the ſhells of muſcles, and conſumes their contents. * *groſſipes.*

Feelers two; body oval. 6. It is found in the north ſeas, under ſtones; it is red on the back, the ſucker projecting, ſtraight, obtuſe at the extremity, and perforated with a round entire perforation; the feelers inſerted at the baſe of the ſucker, and almoſt equalling it in length; the legs jointed and angular. * *balænarum.*

B. *Without a ſucker.*

Body oval and black; the under part of the body and legs pale. 10. A native of Europe; it is to be found on rocks. *morio.*

Long-legged ſpider, or *ſhepherds ſpider.* Abdomen oval and gray, beneath white. A native of Europe and America; wandering about in the night time. * *opilio.*

Abdomen inverted, oval and flattiſh; claws ſmooth, the fingers hairy. 4. A native of Europe; in confined ſhaded places, in boxes and damp cellars; it feeds on *termites* and *mites*, and moves like a crab; it is deſtructive to collections of dried plants; it likewiſe enters the ſkin of the human body, and excites a very painful pimple about the ſize of a pea. * *cancroides.*

Abdomen cylindrical, the claws ſmooth; head furniſhed with an appendage. 5. A native of America; in confined places in tropical countries. Its bite is ſaid to be dangerous; yellowiſh, the claws oval. *acaroides.*

Claws notched, and hairy; body oblong. 15. A native of Italy, Africa, Perſia, and the ſouthern ſhores of the Volga; its bite occaſions very violent pain, livid tumors, delirium, and ſometimes death; ſoft, lurid, and woolly; the claws very turgid. *araneoides.*

15 ſpecies of this genus have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature.

114. ARANEA, *Spider.*

Mouth furniſhed with ſhort horny jaws; the lip round at the tip. Feelers two, bent inwards; jointed and very ſharp at the extremity: in the males they are clavated, and have the organs of generation placed in them. Antennæ none. Eyes eight; ſometimes ſix, though ſeldom. Legs eight. The anus is furniſhed with papillæ, with which the inſect ſpins threads, and forms its web.

Theſe inſects, through every ſtage of their exiſtence, prey upon other inſects, eſpecially thoſe of the order *Diptera*; they even do not ſpare thoſe of their own genus or ſpecies: from the papillæ at the end of the abdomen they throw out at pleaſure a number of fine threads, which they unite in various ways for the purpoſe of entangling their prey. They every year caſt their old ſkin, which they perform by ſuſpending themſelves in ſome ſolitary corner, and creeping out of it. The young ones have the power of aſcending the air to

a great height; to accompliſh which, they climb up ſome eminence, and are wafted about by the winds, filling the air with their threads. They are deſtroyed by the ſphex and ichneumon.

Linnæus has ſubdivided this genus according to the number and poſition of their eyes.

A. *Eyes eight.*

1. *Eyes placed thus,* ⁘

faſciata. Of a ſilver colour; the abdomen marked with yelloviſh bands; the legs ſurrounded with brown rings. 48. A native of the iſland of Madeira.

* *diadema.* Abdomen nearly globular and reddiſh; brown, marked with a white croſs compoſed of dots. 1. A native of Europe, on trees; it is a very beautiful inſect.

* *aquatica.* Brown; abdomen oval and of an aſh colour; the back brown, marked with two dots. 39. A native of Europe, in ſtagnant waters, where it dives to the bottom in ſearch of its food. It takes up its winter quarters in an empty ſnail ſhell, the aperture of which it cloſes up with a web; jaws black, claws red.

2. *Eyes placed thus,* ⁘

latro. Thorax hairy, and of an aſh colour; the abdomen oval, black, and ſpotted with red. 65. A native of America; large, the thorax oval, legs black, thighs pale.

* *domeſtica.* Abdomen oval and brown, marked with five black ſpots nearly contiguous, the anterior ones larger than the others. 9. A native of Europe, in houſes, and about windows; feeds chiefly on flies.

3. *Eyes placed thus,* ⁘

* *globoſa.* Black; ſides of the abdomen of a blood red colour. 69. A native of Europe, in meadows.

4. *Eyes placed thus,* ⁘

argentata. Abdomen white, and brown behind, and marked round the edge with ſix ſmall projections. 70. A native of South America.

5. *Eyes placed thus,* ⁘

fumigata. Abdomen oval and brown, marked at the baſe with two white dots. 16. A native of Europe, in meadows; it watches near the neſts of the larvæ of different inſects, and waits their coming out, when it ſeizes on one after another, and ſucks out their ſubſtance.

* *faccata.* Abdomen oval, of a browniſh colour. 40. A native of Europe, in gardens, and carries its eggs behind it encloſed in a bag; legs livid, marked with unequal brown rings ſet cloſe together.

6. *Eyes placed thus,* ::::

extenſa. Abdomen long, of a ſilver colour tinged with green, the legs extended longitudinally. 22. A native of Europe, in woods; its legs are applied cloſely to the branches.

nidulans. Shining black; the abdomen hairy and black. 73. A native of America; it forms a neſt under ground, and ſpins a large cylindrical web, which is covered with a lid; its bite is very painful, and frequently occaſions fever and delirium, which is ſoon removed by a gentle ſudorific; thorax marked with a large depreſſed circular ſpot; abdomen oval; legs equal.

7. *Eyes placed thus,* ⁘

Black, thorax marked with a white line on the back. * *dorſalis.* 79. A native of Britain.

Marked with triangular black ſpots on the back of the abdomen; the legs ſpotted with black. 34. A native of the ſouth of Europe, particularly Italy and Barbary. It is found in caverns in argillaceous ſoil; its bite was formerly ſuppoſed to be curable by nothing but muſic; though it occaſions a great deal of pain, it is almoſt never fatal. *tarantula.*

8. *Eyes placed thus,* ⁘

Oval and oblong; thorax hairy, white; abdomen and legs black, marked with yellow bands. 33. A native of Europe. *pulchra.*

9. *Eyes placed thus,* ⁘

Black, abdomen oval, forehead white, and leaps on its prey. 84. It is to be found frequently in woods about Vienna; abdomen marked with two compreſſed dots. *goezii.*

10. *Eyes placed thus,* ⁘

Thorax orbicular and convex, with a tranſverſe central excavation. 31. It is a native of South America, among trees, where it preys upon the larger inſects, and even ſmall birds, dropping into their neſts and ſucking their blood and eggs; it is of ſo enormous a ſize that its fangs may be compared to the talons of a hawk, and its eyes are very large. *avicularia.*

11. *Eyes placed thus,* ⁘

Of a grayiſh ruſty colour, and ſlightly clouded; thorax globular, and ſlightly heart-ſhaped; abdomen ſomewhat triangular, and marked with a faint longitudinal croſs. 85. A native of Europe, on oak and other trees; abdomen marked with four impreſſed dots on the back; papillæ three. *truncata.*

12. *Eyes placed thus,* ⁘

Abdomen oval, obtuſely conic behind, variegated with brown and white; beneath black. 86. A native of Europe, among buſhes; it ſpins and ſpreads out a web, to the ſurface of which it attaches the inſects it has enſnared, after it has ſucked out their juice. Thorax black, ſlightly tinged with ruſty colour, and nearly double behind; legs gray, marked with brown rings; abdomen marked with a whitiſh ſpot, beneath reſembling a horſe ſhoe; papillæ four. *conica.*

13. *Eyes placed thus,* ⁘

Hairy; body oval, black, variegated with brown. 99. A native of Europe. *albifrons.*

B. *Eyes ſix, placed thus,* ⁘

Abdomen greeniſh, the ſides yellow. 30. A native of Europe; in gardens. * *ſenoculata.*

C. *Eyes*

C. *Eyes* - - - - -

* *holoſericea.* Abdomen oval, oblong, and ſilky; marked underneath near the baſe with two yellow dots. 29. A native of Europe. It is found within the leaves of plants which it rolls up.

venatoria. Thorax orbicular, ſmooth and black; abdomen oval, downy and brown. 33. A native of America. It conſtructs a tenacious cylindrical neſt about a foot in length, furniſhed with a lid.

96 ſpecies of this genus have been deſcribed by Gmelin, in the laſt edition of the Syſtem of Nature.

115. SCORPIO, *Scorpion.*

Legs eight; likewiſe two claws ſituated on the fore part of the head. Eyes eight; three placed on each ſide of the thorax, and two on the back. Feelers two, furniſhed with claws, and projecting. Lip bifid. Antennæ none. Tail long, jointed, terminating in a ſharp crooked ſting. On the under ſide, between the breaſt and abdomen, are two excreſcences reſembling combs.

Scorpions have been conceived to be the moſt malignant and poiſonous of all animals. Though this opinion be now very generally exploded, there are none of the inſects we are acquainted with ſo formidable. It is true the effect of their ſting differs greatly, according to the circumſtances of the conſtitution of the perſon receiving the wound, as well as of the animal itſelf, the heat of the climate in which it lives, and the degree of violence with which the wound may have been inflicted.

The common European ſcorpion certainly is not of ſo terrible a nature as is commonly ſuppoſed; its ſting being very rarely productive of bad conſequences. But the large ſcorpions of Africa, which are ſaid to be nearly a foot in length, may well be ſuppoſed capable of inflicting a wound of the moſt ſevere pungency, and of the moſt dreadful malignity. The poiſon is evacuated through three very ſmall *foramina* near the tip of the ſting; viz. one on each ſide of the tip, and the other on the upper part. A diverſity of opinion has ſubſiſted among naturaliſts, relative to the ſlit or foramen in the fangs of ſpiders, through which their poiſon is evacuated; and the ſame variety of opinion has prevailed with reſpect to the *foramina* in the ſcorpion's ſting. The celebrated Redi, aſſiſted by the beſt microſcopes he could procure, was not able to diſcover them, though he was well convinced of their exiſtence, from having perceived the minute drop of poiſon exſude from near the tip of the ſting. Others have denied the exiſtence of the foramina; but Valiſnerius and Leeuwenhoek have both deſcribed two, viz. one on each ſide of the tip, and which in ſhape are inclining to triangular; beſides theſe a third has ſometimes been ſeen, ſo that the ſting of the ſcorpion can with greater facility diſcharge its venom, than that of any other animal. The poiſon is whitiſh, and is contained in a ſmall bladder near the tail. When this bladder is preſſed, the poiſon may be ſeen iſſuing out through the foramina of the ſting.

Maupertuis has made many experiments with the ſcorpion of Languedoc, the reſults of which were by no means uniform. He provoked one to ſting a dog in three places of the belly, where the animal was without hair. In about an hour after the animal ſeemed greatly ſwollen and very ſick. He then caſt up whatever he had in his bowels, and for about three hours continued vomiting a whitiſh liquid. The belly was always greatly ſwollen when the animal began to vomit, but this operation always ſeemed to abate the ſwelling; thus alternating for the ſpace of three hours. The poor animal after this fell into convulſions, bit the ground, dragged himſelf along on his forefeet, and at length died five hours after he had been ſtung. There was no partial ſwelling round the wound inflicted, as is uſual after the ſting of a waſp or bee; but the whole body was inflated, and there only appeared a red ſpot on the places ſtung. Two days afterwards the ſame experiment was tried on another dog, and even with more aggravated cruelty; yet the dog ſeemed no way offended by the wounds, but howling a little when he received them, continued alert and well after them, and ſoon after was ſet at liberty, without ſhewing the ſmalleſt ſymptoms of pain. The experiment was repeated with freſh ſcorpions upon ſeven other dogs, and three hens, but not the ſmalleſt deadly ſymptom was ſeen to enſue. He put three ſcorpions and a mouſe into the ſame veſſel, and they ſoon ſtung the little animal in different places. The mouſe thus aſſaulted, ſtood for ſome time on the defenſive, and at laſt killed them all one after another, and did not ſeem to have received any material injury itſelf, at leaſt no fatal conſequences followed, though it had received ſeveral ſevere wounds. From hence it appears, that many circumſtances which are utterly unknown muſt contribute to give efficacy to the ſcorpion's venom. Whether the nature of its food, long faſting, the ſeaſon, age of the inſect, or the part of the body which it wounds, add to or diminiſh the malignity of the poiſon, ſtill remains to be aſcertained. The inſects employed by Maupertuis were newly caught, ſeemingly vigorous, and were of different ſexes. The reſult of theſe experiments may ſerve to ſhew, that many of the boaſted antidotes which are given for the cure of the ſcorpion's ſting, owe their ſucceſs more to accident than to their own efficacy. The ſcorpions of tropical climates are very large, and perhaps more venomous. Helbigius, who reſided long in the eaſt, ſays that he was often ſtung by the ſcorpion, and never ſuffered any material injury from the wound, though a painful tumor generally enſued, which was cured by rubbing with a piece of iron or ſtone, as he had ſeen the Indians do, until the part became inſenſible. Seba, Moore, and Boſman, give a very different account of the ſcorpion's malignity; and aſſert that without the ſpeedy application of proper remedies, the wound proves fatal. Several fabulous anecdotes have been recorded of theſe animals by the older writers on natural hiſtory, which are totally unworthy of notice. The moſt remarkable of theſe is, that ſcorpions ſometimes commit ſuicide, when they find themſelves in a ſituation from which they cannot make their eſcape. It is ſaid that a newly caught ſcorpion, placed in a circle formed with pieces of burning charcoal, runs round endeavouring to effect its eſcape, but finding no exit, it applies its tail to the back part of its head, and ſtings itſelf to death. Scorpions are viviparous, and produce about forty or fifty young ones at a time, which are completely ſhaped, and undergo no further change, except caſting their ſkin from time to time like ſpiders. They feed on flies, ſpiders, worms, &c. and even on one another.

The

auſtraliæ. The comb-like excreſcences placed between the breaſt and abdomen, compoſed of ſix teeth; claws ſmooth. 7. A native of the South ſea iſlands.

maurus. Comb compoſed of eight teeth; claws nearly heart-ſhaped and pointed, 1. A native of Africa.

carpathicus. Combs compoſed of ſix teeth; claws nearly heart-ſhaped and ſmooth. 2. It is found on the Carpathian mountains, and in Switzerland.

afer. Combs furniſhed with thirteen teeth; claws nearly heart-ſhaped and hairy. 3. A native of India and Perſia; and is the largeſt and moſt formidable ſpecies.

americanus. Combs furniſhed with fourteen teeth; the claws fringed with hair; toes filiform. 4. A native of South America. It is eaten by the natives of California.

chilenſis. Combs furniſhed with ſixteen teeth; claws ſomewhat angular. This is a variety of the former.

europæus. Combs furniſhed with eighteen teeth; claws angular. 5, A native of the ſouth of Europe and north of Aſia. It is viviparous.

hotentotus. Combs furniſhed with twenty-two teeth; claws ſmooth; the tail rough. 8. A native of Africa, in the neighbourhood of Sierra Leone. Body of a dark brown colour, and marked with raiſed lines; legs pale.

auſtralis. Combs furniſhed with thirty-two teeth; claws ſmooth. 6. A native of Africa.

Theſe are all the ſpecies of the ſcorpion that have been deſcribed in the laſt edition of the Syſtem of Nature.

116. CANCER, *Crab.*

Legs eight, (ſeldom ſix or ten), likewiſe two claws. Feelers ſix, unequal. Eyes two, placed at a diſtance from one another, and ſet on moveable ſtalks in moſt ſpecies. Mandible compoſed of a horny ſubſtance, and thick. The lip triple. The tail jointed and without a ſting.

Theſe live chiefly in water; and feed on inſects, worms, dead fiſh, and dead bodies of any kind. They every year caſt their ſhell, which is performed with much difficulty and pain; and during the change they become weak and ſickly.

A. *Antennæ four.*

† *The laſt articulation bifid; the Tail ſhort.*

‡ *The Thorax ſmooth,*

|| *And entire on the ſides.*

curſor. The poſterior parts of the ſides of the thorax furniſhed with ſharp points; the tail bent back. 1. A native of the Mediterranean and Indian ſeas. About ſunſet it leaves the water, and runs about the ſands with great velocity.

pennophylax. Thorax orbicular, unequal and fringed; four dorſal legs. 5. A native of America, within the ſhell of the *bhama lazarus*, to which it gives notice of the approach of the cuttle-fiſh.

* *piſum.* Thorax orbicular, obtuſe; the tail of the ſame length with the body. 6. A native of the Mediterranean ſeas. About the ſize of a pea; the tail very obtuſe; the legs ſmooth and without ſpines; claws ſomewhat oblong; toes equal.

* *minutus.* Thorax nearly ſquare; edge ſomewhat ſharp; the legs compreſſed. 8. It is found in the open ſea, particularly on the *fucus natans*, and runs about on the ſurface of the water.

pinnotheres. Very ſmooth; the anterior part of the thorax flattened on the ſides; the tail is carinated and knobbed in the middle. 9. A native of the Aſiatic ſeas. It reſides within the ſhell of the *pinna*. The ancients ſuppoſed that this was a friendly connection formed for mutual defence: that the *pinna* being deſtitute of eyes, and thus expoſed, when he opened his ſhell, to the attacks of the cuttle-fiſh and other enemies, was warned of their approach by his little lodger, on which he immediately ſhut his ſhell, and both were ſafe.

ruricola. *Land crab.* The firſt joint of the legs prickly; the ſecond and third joints ſet with tufts of hair. 11. A native of South America. This ſpecies reſides in the woods. In the Bahama iſlands they are ſo numerous that the ground ſeems to move as they crawl about. At breeding time they generally make to the ſea ſhores, for the purpoſe of waſhing off their ſpawn, and depoſiting it in the ſand, and no obſtruction will make them turn aſide from the ſtraight road, when they are on their progreſs towards the ſea. They are eſteemed very excellent food. They feed on vegetables, but when they have fed on the manchineel apple, they are reckoned poiſonous. When taken, they will ſeize the perſon's finger with their claw, and endeavour to eſcape, leaving the claw behind, which for the ſpace of a minute after it has been ſeparated from the body, continues to ſqueeze the finger cloſely. They vary in ſize and colour; the light-coloured ones being eſteemed the beſt food.

|| || *Thorax marked along the ſides with inciſions.*

vocans. Thorax marked with one ſmall projection, one of the claws larger than the other; the eyes long. 14. A native of Jamaica. It conceals itſelf under ſtones, and utters a cry when caught, and pinches ſeverely.

* *angulatus.* The thorax furniſhed with two projections on each ſide; claws very long. 110. A native of England. Found in the ſea near Weymouth. The claws are three times the length of the body.

dromia. Hairy; thorax notched on both ſides; the hind-legs terminating in two nails. 24. A native of the Indian ſeas. Black; the extremities of the claws ſmooth and white. It is reckoned poiſonous.

* *pagurus.* *Common Crab.* Thorax marked on each ſide with nine obtuſe folds; the tips of the claws black. 27. A native of both the European and Indian ſeas. This is the crab moſt generally uſed in this country for the table; they are in ſeaſon and heavieſt in the ſummer; and caſt their ſhells in the winter and ſpring. They frequent rocky ſhores.

‡ ‡ *Thorax hairy or prickly on the upper ſide.*

* *araneus.* Thorax hairy, marked with knobs and oval; furniſhed with a beak which is divided at the extremity; claws oval. 30. A native of the European ſeas. This ſpecies is ſuppoſed to be injurious to oyſterbeds; on this account the fiſhermen, when they meet with them in the courſe of dredging, are careful not to return them into the water, but carry them on ſhore, and deſtroy them.

Thorax

maja. Thorax prickly; claws turgid and covered with ſpines; the fingers of the claws covered with tufts of hairs; legs ſix. 41. A native of the Norwegian ſeas.

**horridus.* The thorax ſet with ſpines, and covered with knobs; claws oval; tail carious. 43. A native of the Aſiatic and Norwegian ſeas. There is a large variety of this found on the eaſt coaſt of Scotland, which has its legs and claws covered with ſpines.

§§ *Antennæ ſet on ſtalks; the laſt articulation of the poſterior pair bifid; Tail long and without leaves.* Paguri Fabricii. Paraſitici.

latro. Thorax divided into four; the tail ſimple and big-bellied beneath. 56. A native of Eaſt India. In holes of rocks. Wanders about on land by night in ſearch of cocoa-nuts, on which it feeds. To procure them it mounts the trees, and having detached the nuts, and let them drop to the ground, it deſcends and tears them open with its claws. This ſpecies is eatable, except the inteſtines.

bernhardus. Claws heart-ſhaped, and covered with ſharp points; the claw on the right ſide larger than the other. 57. A native of the European ſeas. This ſpecies being deſtitute of ſhell towards the tail, takes poſſeſſion of the empty ſhells of different ſpecies of cochlea, changing from one to another as it increaſes in ſize; the tail, which is ſoft and without a ſhell, is furniſhed with a hook to ſecure itſelf in its habitation.

diogenes. Claws ſmooth and downy; the claw on the left ſide larger than the other. 53. A native of the American and Aſiatic ſeas. It occupies the empty ſhells of different ſpecies of cochlea.

caput mortuum. Downy, covered with a hemiſpherical cap. A native of the Mediterranean ſea. It is of a dirty gray colour; hemiſpherical and without ſpines. It very much reſembles a ſcull or death's head, whence it has received its name; it is about the ſize of a cheſnut. The cap proceeds, as it were, from the hind-legs, and is turned over the body; the fingers of the claws equal and naked at the tips; the extremity of the legs ſharp.

**araneiformis.* Claws rough; the tail callous at the extremity, and furniſhed with a hook. 143. It is found in the fiſſures of the rocks on the ſea-ſhore near Edinburgh. It occupies the empty ſhells of the *nerita* or *turbo*.

**rugoſus.* Thorax wrinkled, ciliated, and prickly on the fore part; the beak furniſhed with three ſmall projections, the claws filiform. 149. A native of the Mediterranean and north ſeas. It is found on the ſea-ſhore near Banff in Scotland. This is the *C. banffius* of Pennant, and the *C. brachiatus* of Shaw.

§§§ *Antennæ ſet on ſtalks, the poſterior pair cleft; Tail long.*

‡ *The ſhell of the Thorax covering the Thorax completely.* Aſtaci. Lobſters.

|| *The poſterior Antennæ bifid.*

**gammarus.* *Lobſter.* Thorax ſmooth; the beak notched on the ſides, marked on the upper ſide, at the baſe, with a double tooth. 62. It inhabits the ſea, on rocky ſhores. This is reckoned the moſt delicate ſpecies; and is moſt in requeſt for the table. They chiefly frequent deep clear water. They are taken in wicker-baſkets, with holes on the ſides, which allow the lobſters to enter, and prevent their egreſs; or with ſmall nets attached to iron hoops. They breed in the ſummer months, and depoſit many thouſands of eggs in the ſand. They caſt their ſhell annually, and when any of their legs or claws happen to be torn off they grow again. They are in ſeaſon from October to May. Lobſters are ſaid to be very much alarmed at thunder, ſo much ſo as ſometimes to caſt their claws.

Craw-fiſh. Thorax ſmooth, the beak notched on the ſides, with a ſingle tooth on each ſide at the baſe. 63. It inhabits freſh waters; it lodges in holes in the clayey banks of rivers or lakes. It is reckoned a delicacy, and is much in requeſt as food. **aſtacus.*

Antennæ projecting; beak tapering towards the extremity; eyes globular and prominent. 156. A native of the north ſeas. This little animal is very abundant, and is the principal food of the herrings and cod-fiſh. **balecum.*

||| *The poſterior Antennæ divided into three.*

Prawn. Thorax ſmooth; the beak ſerrated above, beneath furniſhed with three ſmall projections; the edge of the thorax furniſhed with five ſmall projections. 66. A native of the European ſeas. The beak is ſometimes ſtraight, ſometimes crooked. There is a ſmaller variety of this, called in London the *white ſhrimp*, which is white when boiled. Prawns are much reliſhed by moſt people; and are very abundant in ſandy ſhores. **ſquilla.*

Shrimp. Thorax ſmooth; beak ſhort and entire; the moveable toe of the claw longer than the other. 67. A native of the northern ſeas. This ſpecies is reckoned the moſt delicious of the genus. It is very plentiful on the ſandy ſhores of Britain. **crangon.*

‡‡ *The ſhell of the Thorax not covering the Thorax completely.* Squillæ Fabricii.

Claws furniſhed with a ſingle fang, crooked, compreſſed, and notched; without a moveable toe. 76. A native of the Mediterranean and Aſiatic ſeas. It is reckoned a delicacy by the Italians. *mantis.*

|||| *Antennæ ſet on ſtalks, and ſimple.* Gammari Fabricii.

Claws conſiſting of a ſingle fang; legs fourteen; the thighs of the hind-legs compreſſed and dilated. 170. A native of the north ſeas. Large, almoſt white; the beak ſhort, curved, and ſharp; the tail compoſed of ſix leaves or plates; the laſt articulation bifid. *ampulla*

Claws four, furniſhed with a ſingle fang, and deſtitute of a moveable toe; legs ten. 81. A native of Europe. It is frequent on the ſea-ſhore, in wells, ditches, rivulets, and likewiſe in the ſalt lakes of Siberia; it ſwims on its back, and leaps. It is injurious to fiſhermen by eating their nets, and alſo hurtful to fiſhes, by exciting ulcers on their gills. It ſhines in the dark. **pulex.*

B. *Antennæ two.*

‖ *Two arched Scales in place of the posterior Antennæ.* Scyllari Fabricii.

* *arctus.* The scales of the antennæ fringed with prickles. 75. A native of almost every sea.

‖‖ *Scales none; Antennæ fringed with thickly-set hairs.* Hippæ Fabricii.

cancharus. Thorax wrinkled and oval; claws compressed and prickly along the edges. 72. A native of South America and India.

181 species of this genus have been described by Gmelin, in the last edition of the System of Nature.

117. Monoculus.

Legs formed for swimming; very long; from four to eight. Body covered with a shell, composed of from five to ten segments, growing smaller towards the tail. Antennæ two; those of the male thicker and shorter than those of the female. In some species they are wanting. Sometimes one eye, more frequently two, approaching very near to one another. Feelers four, constantly in motion while the animal is swimming; the posterior pair are very small, and bent like hooks.

The insects of this genus live in water; some of them are found in the sea, others in rivers, but most of them in stagnant waters; they have been called *monoculi* from the circumstance of some of them having but one eye, or two eyes placed so close together as to appear but one. Some of them are viviparous, some oviparous.

A. *Those which have one Eye.*

§ *Body covered with a hard Crust.*

‡ *Antennæ none.* Polyphemus Mulleri.

oculus. Feelers two, long and divided; tail inflected. 10. A native of Europe. To be found in lakes and marshes from May to September. It swims on its back, frequently in large swarms; eye very black, occupying almost the whole of its head.

‡‡ *Antennæ two or four.* Cyclopes Mulleri.

§ *Antennæ four.*

* *quadricornis.* Tail straight, and divided at the extremity. 6. A native of Europe; in fresh waters. Body grayish or greenish, smooth or covered with hair; legs eight and hairy. Female with an oval bag on each side of the tail, which contain the eggs. The antennæ in the male are much thicker and shorter than in the female; the tail is composed of four articulations; in the female it is furnished with two small spines. When viewed in the microscope they are found to have two eyes placed very close together. They are very frequent even in the purest water, and are often swallowed along with it.

†† *Antennæ two.*

§ *Antennæ linear.*

* *rubens.* Reddish; tail straight and forked. 13. A native of Europe; in marshes, lakes, and rivulets: it is to be met with throughout the whole year. The antennæ as long as the body; legs eight.

‖‖ *Antennæ nearly clavated.*

claviger. Antennæ stiff; tail bifid. 18. Inhabits, though rarely, the rivers of Germany; and glides slowly along, alternately on its back, belly, and sides; and sometimes raises itself upright. Upper part of the body white, beneath red; legs eight; tail very small and without articulations.

§ § § *Antennæ dilated.*

crassicornis. Antennæ short; tail furnished with two sharp points. 19. A native of Europe; in marshes. It is very rare. Body composed of five segments; the antennæ swelling from the base to the middle, and becoming sharp towards the extremity.

§ § § § *The tip of the Antennæ terminating in three points.*

curticornis. Antennæ very small and straight; body without articulations; claws smooth; tail furnished with two bristles. 20. Inhabits salt water.

§ § § § § *Antennæ bent backwards.*

chelifer. Antennæ short; body without articulations, furnished with claws; tail furnished with two bristles. 21. Inhabits salt water.

§ § § § § § *Antennæ of the (male) furnished with little hooks.*

brevicornis. The bristles of the tail very short. 22. Inhabits salt marshes. It very much resembles the *M. quadricornis*; the top of the antennæ in the female larger, and forked at the extremity.

†† *Those which have a bivalved Shell.*

‡ *Head exposed; two-branched Antennæ; Legs from eight to twelve.* Daphniæ Mulleri.

§ *Tail bent inwards.*

* *pulex.* The posterior part of the shell set with sharp points. 4. It is found everywhere in stagnant waters, and in great abundance. It is a frequent cause of the water assuming the colour of blood. The shell is yellowish; the abdomen, intestines, and ten legs red. The female is three times the size of the male; and produces from eight to twelve green eggs; the back is marked with a large square spot resembling a saddle.

§ § *Tail bent downwards.*

crystallinus. The shell without prickles; the head furnished with two short projecting horns. 29. A native of the north of Europe; in lakes and rivers. White and oblong; very transparent; viviparous, and furnished with twelve hairy feet.

§ § § *Tail bent backwards.*

pediculus. Tail bent backwards. 5. A native of Europe; in fresh water.

§ § § §

§ § § § Tail ſtraight.

ſetifer. The anterior angles of the ſhell furniſhed with a tuft of briſtles. 30. A native of Europe; in ſtagnant waters; tranſparent, of an oblong oval form; antennæ divided into three, furniſhed with eight or more hairy legs; the extremity of the tail terminating in two hooks.

‡ ‡ Head concealed; Antennæ two and hairy; Legs eight. Cytherææ Mulleri.

viridis. Shell kidney-ſhaped and downy, 31. A native of Europe; found on various ſpecies of *fucus* and *conferva*; the extremity of the antennæ terminating in three points; the fore-legs formed like hooks.

‖ ‖ ‖ Head concealed; Antennæ two, like hairs; Legs four. Cyprides Mulleri.

** conchaceus.* Shell oval and downy. 7. Found in clear ſtagnant waters; the antennæ white or yellowiſh, and ſtretched out; ſwims very ſwiftly, with ten briſtles. It is green, opake; feet yellowiſh; abdomen nearly bilobed and orange-coloured, marked in the middle with a black circle. It conceals itſelf within its ſhell, and ſwims on its belly. It reſembles a muſcle in miniature, is very minute, and ſeldom exceeds the tenth part of an inch.

† † † Thoſe with ſhells conſiſting of one valve.

‡ Legs four; Antennæ two. Amymonæ Mulleri.

**ſatyrus.* Shell oval; antennæ obtuſe, and extended in a vertical direction. 46. It is frequent in clear freſh water; it is agitated at intervals with a tremulous motion; the ſhell is flat and membranaceous; antennæ rigid, furniſhed with three very ſhort briſtles at the extremity; the fore-legs thick and bifid; tail terminating abruptly, eight-cleft in the middle. The inſect is tranſparent.

‖ ‖ Legs ſix; Antennæ two. Nauplii Mulleri.

bracteatus Shell orbicular, and without ſpines or briſtles. 52. It is rare; found in clear freſh water; the ſhell very tranſparent; the antennæ reſembling legs; the legs terminating in three briſtles; the eye not conſpicuous.

B. *Eyes two.* Binoculi.

† Thoſe with ſhells compoſed of one valve.

§ Eyes two placed beneath; Antennæ two; Legs four to eight. Arguli Mulleri.

**delphinus* Legs eight. 55. Found in rivers.

§ § Eyes ſituated on the back; Antennæ two or ſix; Legs varying in number. Limuli Mulleri.

polyphemus. Shell orbicular; future in the middle of the form of a creſcent; tail triangular, long and tapering. 1. A native of the Indian ſeas, particularly in the neighbourhood of the Molucca iſlands. It is likewiſe found on the ſhores of Carolina. It is the largeſt of all known inſects; ſometimes it grows to the length of four feet. It is frequently found in pairs, male and female. It is very rarely found among petrefactions. There are ſeven ſpines on the anterior part of the back of the ſhell: legs 14.

Shell oblong; the future before of the form of a creſcent; tail compoſed of two briſtles. 3. A native of Europe; in ditches, ponds, &c.; and though dried in ſummer, when the water has evaporated, yet they revive when the water returns. This is the largeſt ſpecies to be found in Britain. ** apus.*

§ § § Eyes placed on the ſides; Antennæ two, ſetaceous; Legs eight or ten. Caligi Mulleri.

Body ſhort; tail bifid, and compoſed of one thin flap. 2. A native of the European ſeas. Found on flounders, cod-fiſh, ſalmon, &c. adhering on the outſide between the ſcales; running ſwiftly both on the fiſh and on the water. ** piſcinus.*

† † Thoſe with Shells compoſed of two valves; Head not encloſed within the ſhell; the Eyes placed on the ſides; Antennæ two or four, reſembling hairs, and placed beneath; Legs eight and more. Lynceæ Mulleri.

Tail inflected; ſhell globular. 60. A native of Europe. It is found about the edges of ſtagnant waters, and among duck-weed. It is very minute; the ſhell is reddiſh; antennæ two; legs twelve; tail furniſhed with a ſmall hook at the extremity and concave beneath; the ovaria green. ** ſphæricus.*

66 ſpecies of this genus have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature.

118. Oniscus.

Jaw terminating abruptly, and furniſhed with ſmall teeth. Lip bifid. Feelers unequal, the poſterior ones being longer than the others. Antennæ ſetaceous. Body oval. Legs fourteen.

The ſpecies of this genus feed on the leaves of plants, on filth, and on the juices of animals; ſome of them are very injurious to the fruit of wall-trees; they undergo no other change but a change of ſkin. They are found under ſtones, in old walls, houſes, and woods; ſome ſpecies live in water.

Abdomen covered with two thin plates; the tail ſemioval. 1. A native of the European ſeas. Viviparous; and is very injurious to fiſhes. ** aſilus.*

Antennæ four; tail long and ſharp. 5. Inhabits the ſea. It ſwims very quickly. It lives on crabs and fiſhes; the fiſhermen diſlike it very much. ** entomon.*

Oval, and of a browniſh aſh-colour; tail obtuſe and entire. 15. A native of Europe; under ſtones. When touched it rolls itſelf up into a hard motionleſs ball; from which circumſtance it has received the name of *armadillo*. ** armadillo.*

Oval; tail obtuſe, furniſhed with two ſimple appendages. 14. A native of Europe; in houſes, walls, woods, &c. The young are contained in a follicle of four valves on the abdomen of the mother. This ſpecies was formerly uſed in medicine. ** aſellus.*

38 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

119. Scolopendra.

Antennæ ſetaceous. Feelers two, filiform; articulated and connected within the jaws. Lip divided and marked with ſmall projections. Body flattiſh. Legs very numerous; one on each ſide of each of the ſegments of the body.

Theſe inſects live in decayed wood, about houſes, under ſtones, and ſome of them in freſh water. They feed on other inſects in every ſtage of their exiſtence. The larvæ differ but little from the perfect inſect, except that they have fewer feet. The pupæ likewiſe are active, and very much reſemble the perfect inſect. All the European ſpecies are ſmall, but in tropical countries they are to be ſeen a foot long and an inch and a half in circumference.

* *lagura.* Twelve legs on each ſide; body oval; tail furniſhed with a white tuft of hairs. 1. A native of Europe; in moſſy ground.

* *forficata.* Legs fifteen on each ſide. 3. A native of Europe and America. Very frequent under ſtones.

gigantea. Legs ſeventeen on each ſide. 4. A native of America.

morſitans. Legs twenty on each ſide; eyes eight. 5. A native of America and India. Body compoſed of 22 ſegments; the antennæ conſiſting of 20 articulations. It is much dreaded on account of its bite, which is ſaid to be poiſonous.

* *electrica.* Legs 70 on each ſide; body linear. 8. A native of Europe; in cloſe damp places, and ſhines in the dark.

phoſphorea Legs 76 on each ſide. 9. A native of Aſia. It ſhines in the dark like the *lampyris*; it is ſaid that this inſect has dropt from the air into a ſhip 100 miles from land, in the Indian and Æthiopian ſeas. Head oval, yellowiſh, and marked with two grooved lines, and a third tranſverſe line; body filiform, and is about the thickneſs of a gooſe-quill, marked with two parallel yellow lines; antennæ tapering, of a ruſty colour, and conſiſting of 14 articulations.

12 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

120. Julus.

Antennæ moniliform. Feelers two, filiform and jointed. Body ſemicylindrical. Legs very numerous, two on each ſide of every ſegment of the body.

The inſects of this genus feed on other inſects, particularly *acari*. The larva and pupa have many feet, are active, and reſemble the perfect inſect.

Legs 20 on each ſide. 1. A native of the Eu- *ovalis.*
ropean ſeas.

Legs 134 on each ſide. 9. A native of America. *maximus.*
This is the largeſt ſpecies of the genus. It bites ſeverely, but is not poiſonous.

Legs 120 on each ſide. 5. A native of Europe; * *fabuloſus.*
in ſandy places, and on the hazel.

12 ſpecies of this genus have been deſcribed in the laſt edition of the Syſtem of Nature.

The following table exhibits the number of ſpecies included under each order.

Coleoptera	4087
Hemiptera	1427
Lepidoptera	2570
Neuroptera	174
Hymenoptera	1265
Diptera	692
Aptera	679
In all	10,894

GENERAL OBSERVATIONS.

Though the definition of an inſect which we have already given from Linnæus be perfectly correct, (viz. a ſmall animal breathing through pores on its ſides, furniſhed with many feet and moveable antennæ, covered with either a hard cruſt, or a hairy ſkin), it may not be improper to mention, more at large, thoſe circumſtances which form the line of diſtinction between inſects and other animals.

1. Inſects are not furniſhed with red blood, but inſtead of it their veſſels contain a tranſparent lymph. This may ſerve to diſtinguiſh them from the ſuperior animals, but it is common to them with many of the inferior; though Cuvier has lately demonſtrated the exiſtence of a kind of red blood in ſome of the *vermes*.

2. They are deſtitute of internal bones, but in place of them are furniſhed with a hard external covering to which the muſcles are attached, which ſerves them both for ſkin and bones; they are likewiſe without a ſpine formed of vertebræ, which is found in all the ſuperior claſſes of animals.

3. They are furniſhed with articulated legs, ſix or more; this circumſtance diſtinguiſhes them from all other animals deſtitute of a ſpine formed of vertebræ.

4. A very great number of inſects undergo a metamorphoſis: this takes place in all the winged inſects.

5. They frequently change their ſkin in the progreſs of their growth.

6. A very great number of inſects are furniſhed with jaws placed tranſverſely.

7. The wings, with which a very great number of inſects are furniſhed, diſtinguiſh them from all other animals which are not furniſhed with a ſpine compoſed of vertebræ.

8. Inſects are oviparous; ſcorpions and aphides during the ſummer months are viviparous.

9. Inſects have no noſtrils.

10. Inſects are deſtitute of voice.

11. They are not furniſhed with a diſtinct heart compoſed of ventricle and auricle.

12. Incubation is not neceſſary for hatching their eggs.

The Organization of Inſects.

When we wiſh to become throughly acquainted with natural objects, we muſt not confine ourſelves to an examination of their external appearance and configuration,

General Observations.

guration, but ought to examine their internal ſtructure and their component parts; and extend our inquiries to every thing which relates to them. Inſects, like all other organized bodies which form the animal and vegetable kingdoms, are compoſed of fluids and ſolids.

In the four ſuperior claſſes of animals. viz. quadrupeds, birds, reptiles, and fiſhes, the bones form the moſt ſolid part, and occupy the interior part both of the trunk and limbs; they are ſurrounded with muſcles, ligaments, cellular membrane, and ſkin. The matter is entirely reverſed in the claſs of inſects; the exterior part is moſt ſolid, ſerving at the ſame time both for ſkin and bones; it encloſes the muſcles and internal organs, gives firmneſs to the whole body, and by means of its articulations, the limbs, and different parts of the body, perform their various motions. In many inſects, ſuch as the crab, lobſter, &c. the external covering is very hard, and deſtitute of organization; it is compoſed of a calcareous phoſphate, mixed with a ſmall quantity of gelatine, formed by an exſudation from the ſurface of the body. As its great hardneſs would check the growth of the animal, nature has provided a remedy; all of theſe cruſtaceous inſects caſt their ſhell annually. The ſkin of moſt of the other inſects, though compoſed likewiſe of calcareous phoſphate, is ſofter and organized, being formed of a number of thin membranes adhering cloſely to one another, and putting on the appearance of horn. It owes its greater ſoftneſs to a larger proportion of gelatine. The muſcles of inſects conſiſt of fibres formed of faſciculi; there are commonly but two muſcles to produce motion in any of their limbs, the one an extenſor, the other a flexor. Theſe muſcles are commonly attached to a tendon compoſed of a horny ſubſtance, connected to the part which they are deſtined to put in motion. The articulations of inſects are formed in a variety of ways; Cuvier, in his Comparative Anatomy, tom. i. page 445, has given a very minute account of them. Though Linnæus, and ſeveral others following him, have aſſerted that inſects have no brain, yet it is certain that at leaſt a number of the larger kind, as the lobſter, crab, &c. have a ſoft ſubſtance ſimilar to brain, from which the optic and other nerves take their riſe; beſides, when this ſubſtance is irritated, the animal is thrown into convulſions; hence we would conclude, that inſects have a brain as well as the animals of the four ſuperior claſſes, though it be ſmaller in proportion to their body.

In moſt inſects the brain is ſituated a little above the œſophagus; it divides into two large branches which ſurround the œſophagus, and unite again under it, from which junction a whitiſh nervous cord proceeds, correſponding to the ſpinal marrow of the ſuperior animals, which extends the whole length of the body, forming in its courſe twelve or thirteen knots or ganglions, from each of which ſmall nerves proceed to different parts of the body. Thoſe who deny that inſects have no brain, lay much ſtreſs on this circumſtance, that many inſects are capable of running about after they have been deprived of their heads; the *hippoboſca* in particular, is frequently inſtanced, which moves about quite readily, and is even ſaid to copulate after its head has been cut off. The ganglions which are formed in the courſe of the larger nerves, perform in a great meaſure the function of the brain, indeed each of theſe ganglions may be viewed as a ſubordinate brain; in this way it may be eaſily conceived how the various parts which derive their nerves from any one of theſe ganglions, may be enabled to perform their different functions, after they have been ſeparated from the other parts of the body, and deprived of all connexion with the brain.

General Obſervations.

Whether inſects be endowed with any ſenſes different from thoſe of the ſuperior animals, cannot eaſily be aſcertained, becauſe we are only acquainted with the five which we ourſelves enjoy. It appears pretty evident that they poſſeſs viſion, hearing, ſmell, and touch; as to the ſenſe of taſte we are left to conjecture, for we are acquainted with no facts, by which we can prove that inſects enjoy the ſenſe of taſte, nor do we know of any by which we can prove that they do not.

The eyes of inſects are of two kinds; the one compound, compoſed of a number of lenſes, large, and only two in number; the other are ſmall, ſmooth, and vary in number from two to eight. The ſmall lenſes which form the compound eyes are very numerous; they amount in ſome inſects to many hundreds. Leeuwenhoek has counted 800 of them in the eye of a fly. Pugett ſays he obſerved upwards of 17,000 in the eye of a butterfly. The eyes of inſects are without eyelids, and are covered externally with a hard ſmooth ſubſtance. Cuvier has given the anatomy of the eye of a dragon-fly. The internal ſurface of the lenſes is covered with a black varniſh. Under each of the lenſes of which the eye is compoſed, there is a ſmall nervous fibre, attached to the edge of the black covering which lines the internal ſurface of each lens by one extremity, and by the other to a membrane which is of the ſame extent with the cornea, which Cuvier calls the *choroide*. It is eaſily detached from the ſmall nervous fibre, and appears to the naked eye, finely radiated with black and white; behind this there is ſtill another membrane compoſed entirely of medullary ſubſtance, which is connected on each ſide with the hemiſphere of the brain.

Whether inſects from the compound nature of their eyes ſee objects multiplied, or enjoy only ſingle viſion, cannot be aſcertained; were objects to be ſeen multiplied in proportion to the vaſt number of lenſes of which the eyes of inſects are compoſed, viſion would certainly be very confuſed, and were we to be guided by analogy; we might naturally enough ſuppoſe that inſects ſaw objects ſingle with their compound eyes, as we ourſelves ſee objects ſingle with two eyes.

The eyes of inſects, according to Swammerdam, do not contain the ſame humours which are found in the eyes of animals which compoſe the ſuperior claſſes. The external membrane which covers the eyes, varies in colour in different inſects; in many of the dipterous inſects, particularly the gad-fly, it is agreeably variegated.

The far greater number of inſects have only two eyes, like the animals of the ſuperior claſſes; ſome have three, e. gr. the *ſcolopendra;* ſome four, e. gr. *gyrinus;* ſome ſix, e. gr. *ſcorpions;* ſome eight, e. gr. *ſpiders*.

The eyes of inſects are commonly immoveable; crabs, however, have the power of moving their eyes.

That inſects are endowed with the ſenſe of hearing can no longer be diſputed, ſince *frog-hoppers, crickets,* &c. furniſh us with undeniable proofs of the fact. Nature has provided the males of theſe inſects with the means of calling their females, by an inſtrument fitted to produce a ſound, which is heard by the latter. The

male

General Observations.

male and female *death-watch* give notice of each others preſence, by repeatedly ſtriking with their mandibles againſt old wood in houſes, or decayed trees, their favourite haunts. Their ears have been diſcovered to be placed at the root of their antennæ, and can be diſtinctly ſeen in ſome of the larger kinds, as the lobſter.

That inſects enjoy the faculty of ſmelling, is very evident. It is the moſt perfect of all their ſenſes. *Beetles* of various ſorts, *nitidulæ*, the different ſpecies of *dermeſtes*, *ſylphs*, *flies*, &c. perceive at a very conſiderable diſtance, the finell of ordure and dead bodies, and reſort in ſwarms to the ſituations in which they occur, either for the purpoſe of procuring food or laying their eggs. The common blue fleſh-fly, is attracted by the ſtrong ſmell of the *arum dracuntium*, which very much reſembles that of carrion, and depoſits its eggs on it: theſe flies are likewiſe deceived, and depoſit their eggs on the flowers of the *ſtapelia hirſuta*, which has a very cadaverous ſmell. But, though we can thus eaſily prove the ſenſe of ſmell among inſects, it is difficult to diſcover the ſeat of that particular ſenſe. Several naturaliſts have ſuppoſed that it reſides in the antennæ. Dumeril, in a diſſertation publiſhed in 1799, attempts to prove, that it muſt be ſituated about the entrance of the ſpiracula or reſpiratory organs, as Baſter had previouſly ſuppoſed. Notwithſtanding his arguments, Latreille is ſtill diſpoſed to follow the opinion of thoſe who believe the antennæ to be the organs of ſmell. His reaſons for favouring this opinion are:

1. Smell is produced by the action of air, impregnated with odoriferous particles, on the nervous or olfactory membrane, which tranſmits the ſenſation.

If inſects be endowed with an organ, furniſhed with ſimilar nerves, capable of receiving impreſſions from air charged with odoriferous particles, ſuch organ may be regarded as that of ſmell. Should the antennæ preſent a tiſſue of many nerves, what inconvenience can reſult from ſuppoſing that this tiſſue is capable of tranſmitting odour? Would not this hypotheſis, on the contrary, be more ſimple, and more conſonant to anatomical principles, than that which fixes the ſeat of ſmell at the entrance of the ſpiracula?

2. Many male inſects have their antennæ more developed than the females; a fact eaſily explained, if we admit that theſe organs are the ſeat of ſmell.

3. It is certain that moſt of thoſe inſects which live or depoſit their eggs on putrid animal or vegetable matters, ſtagnant waters, &c. are almoſt uniformly diſtinguiſhed by a greater developement of the antennæ; ſuch, for example, as the beetle, ſylphs, leather-eaters, tipulæ, &c. Theſe required a more perfect ſenſe of ſmell, and are organized accordingly.

4. A great many inſects, which are entirely rapacious, have ſimple antennæ; and thoſe which are characteriſed by ſimilar manners, and which are ſedentary, have none at all; as for inſtance ſome of the ſpiders.

5. Inſects diſcover their habitations and food by the ſenſe of ſmell. Latreille deprived ſeveral inſects of their antennæ, and found they inſtantly fell into a ſtate of ſtupor or derangement, and ſeemed to be incapable of recogniſing their haunts or their food, though placed cloſe by them. Such experiments deſerve to be proſecuted. With this view, were the antennæ of dung-beetles to be coated with varniſh, and the animals placed near excrement, (their uſual food), a deciſive proof would be obtained; for were they readily to find their way to the excrement, it may be fairly inferred that the antennæ were not the organs of ſmell. Should the reverſe take place, an oppoſite concluſion might naturally be drawn. General Obſervations.

6. Nerves terminate the antennæ, the articulations of which, though externally covered with a pretty thick membrane, are hollow, lined within with a ſoft ſubſtance, which is often of a watery conſiſtence, the extremities of which, when expoſed to the air, may receive impreſſions from it.

Some have imagined the antennæ to be the organs of touch; but Latreille contends that ſuch an opinion is by no means ſupported by facts, and alleges that the ſhortneſs of the antennæ in moſt ſpecies, and the way in which moſt inſects carry their antennæ, ſeem to prove the contrary. He thinks their antennæ ill adapted to become the organs of touch, becauſe they have a hard and ſcaly covering. He is rather inclined to believe that the ſenſe of touch, at leaſt in certain ſpecies, is ſituated in the paws or extremities of the fore legs. The palpi or feelers in ſpiders and ſome other inſects, ſeem to poſſeſs the ſenſe of touch in an eminent degree; but many are diſpoſed to conſider theſe palpi rather as the organs of taſte. Though we have no direct proof that inſects enjoy the ſenſe of taſte, yet we may naturally enough ſuppoſe that they do, both from analogy, and from the circumſtance that moſt inſects prefer ſome particular kinds of food to all others; many of them will rather die of famine, than eat any other kind of food than that which is peculiar to them. The ſuperior part of the œſophagus has been ſuppoſed by ſome to be the ſeat of the organ of taſte.

Aliment of Inſects.

Insects feed on a great variety of ſubſtances; there are few things either in the vegetable or animal kingdoms which are not conſumed by one or other of them. The leaves, flowers, fruit, and even the ligneous parts of vegetables, afford nouriſhment to a very numerous claſs; animal bodies both dead and alive, even man himſelf, is preyed on by many of them; ſeveral ſpecies of the louſe, of acarus, of the gnat, and the common flea, draw their nouriſhment from the ſurface of his body; the *gigur* or *chiegoe*, (*pulex ulcerans*), penetrates the cuticle, and even enters his fleſh. A ſpecies of gad-fly (*œſtrus hominis*) depoſits its eggs under his ſkin, where the larvæ feed; the *phalena pinguinalis* frequently finds its way into his ſtomach, where it ſometimes proves a fatal lodger. Other caterpillars inſinuate themſelves into different cavities of his body. All the inferior animals have their peculiar paraſitical inſects which feed on them during their life.

There are ſome inſects which can feed only on one ſpecies. The caterpillars both of moths and butterflies, which feed on the leaves of ſome particular vegetable, would die without being able to taſte any other. There are others which can make uſe of two or three kinds of vegetables, but which never attain full perfection, except when they are fed on one particular kind; for example, the common ſilk-worm, which eats readily all the ſpecies of mulberry, and even common lettuce, neither attains ſo great a ſize, nor produces ſo much ſilk, as when fed on the white mulberry. Although that ſpecies of coc-

General Observations.

cus which produces the lac, feeds on the *ficus religiosa*, *ficus indica*, *rhamnus jujuba*, and *plosa* Horti Malabarici; yet the lac collected from the *ficus religiosa*, is very much superior in quality. That species of coccus which produces the cochineal, if it will at all feed on any other species of vegetables, never affords a dye equal to that which is to be obtained from it when fed on that particular species of cactus called *coccinellifera* by Linnæus. There are a great many which feed indiscriminately on a variety of vegetables, which from that circumstance receive the title of *polyphaga*. Almost all herbivorous insects eat a great deal, and very frequently; and most of them perish if deprived of food, for but a short time. Carnivorous insects can live a long while without food, *e. g.* the *carabus*, *dytiscus*, *cicindela*, spiders, &c. As many insects cannot transport themselves easily in quest of food, to places at a distance from one another, nature has furnished the perfect insects of many species with an instinct, which leads them to deposit their eggs in situations where the larvæ as soon as hatched, may find that kind of food which is best adapted to their nature.

Most of the butterflies, though they flutter about and collect the nectarious juice of a variety of flowers as food for themselves, always deposit their eggs on, or near to those vegetables destined by nature to become the food of their larvæ. The various species of *ichneumon* deposit their eggs on the bodies of those insects on which their larvæ feed. The *sirex* (tailed wasp), and *sphex* are likewise careful to deposit their eggs in situations where their larvæ, when hatched, may find subsistence. The *ichneumon seductor*, after having killed an insect (most commonly a spider) deposits an egg on it, and then shuts it up in a cell which it forms of clay. The *sphex figulus* likewise deposits its eggs on the body of spiders which it has killed, and encloses it in a cell composed of clay. Some insects, at different periods of their existence, make use of aliment of very different properties: the larvæ of some are carnivorous, while the perfect insect feeds on the nectarious juice of flowers: e. g. *sirex*, *ichneumon*, &c. The larvæ of most of the lepidopterous insects feed on the leaves and young shoots of vegetables, while the perfect insects either take no food at all, or subsist on the sweet juice which they extract from flowers: indeed the construction of their mouths prevents them from taking any other than fluid food.

The alimentary organs may be divided into four parts. 1. Those of Mastication; 2. Deglutition; 3. Digestion; and 4. Excretion. The organs of mastication vary considerably in different insects. Amongst those animals, some subsist on solid food; therefore must be furnished with tentacula (or pincers) for its comminution. Others subsist on liquid food, and are furnished with suckers, which vary in form in different insects. Sometimes with a trunk formed of a double sheath twisted in a spiral form, as is to be seen in the butterfly and the sphinx. Sometimes with a sharp stiff beak bent towards the breast; such as in the bug, the frog-hopper, and boat-fly. At other times with a fleshy proboscis ending in two moveable lips, or in a sucker composed of several syphons, incloſed in a sheath consisting of two valves, which is the case in the dipterous insects; such as the common fly, the horse fly, the gnat, &c.

Amongst insects which have jaws, some, such as those of the orders *Coleoptera* and *Aptera*, have these parts hard and composed of a horny substance, and subsist on matters of a considerable degree of tenacity. Those coleopterous insects which have six feelers feed on living insects; and those which have only four, feed on putrid animal or vegetable substances. The other insects furnished with jaws (such as many of the order *Hymenoptera*), have these parts soft and membranaceous, and consequently subsist on liquid or very succulent food.

General Observations.

There are no salivary glands to be met with in the mouths of insects, but a set of floating vessels secrete a fluid, varying in colour in different insects, very similar to saliva.

The organs of deglutition present nothing very remarkable. The œsophagus is a straight short tube, reaching from a little way under the brain to the first ganglion of the nerves, which perhaps may be considered as the cerebellum of insects. In the insects without jaws, deglutition is performed by a tube composed of annular muscular fibres. The trunk of the butterfly, the proboscis of the common fly, and the beak of hemipterous insects, may be considered as part of the œsophagus projecting beyond the mouth.

The organs of digestion consist of the stomach and intestinal canal. The stomach of insects varies very much according to the nature of the aliment on which they subsist. Sometimes it is single, frequently double, at other times manyfold. The greater number of insects have a single stomach, which is sometimes entirely membranaceous, sometimes muscular, and at other times it is merely the continuation of the œsophagus without any perceptible dilatation. Those insects which have a dilated membranaceous stomach, subsist commonly on the juices of vegetables; such as the bees, which suck the nectar of flowers, the butterflies &c. Their stomachs are almost always dilated, owing to the disengagement of gas from the substances they contain. Those which are furnished with a muscular stomach, such as the bug, the boat-fly, and almost all the hemipterous insects, feed on animal substances. Finally, these which have no dilatation in the œsophagus so as to form an evident stomach, commonly feed on the leaves and roots of vegetables, such as the cock-chaffer and all the beetles. The whole of the alimentary canal in these insects is very long, without any perceptible enlargement. The double stomach is to be found in those coleopterous insects which feed on other live insects, such as the *cicindela*, *carabus*, *attelabus*, &c. all of them are likewise distinguished by six palpæ. The first of their two stomachs is muscular, and is a sort of gizzard, the muscles of which are composed of slender fibres. The second is a long membranaceous canal, which appears villous when examined by the microscope; this villosity at first sight may appear singular, but a little attention to the manner in which nutrition goes on in insects, will suggest an explanation of this peculiarity. When we consider that circulation proceeds very slowly, and that the nutritive fluids must be nearly in a state of stagnation, digestion could not proceed without the assistance of absorbent tubes, which may take up these fluids. We may naturally enough suppose this villosity to be nothing else, but a number of absorbent vessels which take up the nutritive part of the circumambient fluid. Those insects which have many stomachs may be called ruminating, because they have

General Obſervations.

have the power of cauſing the food to return from the ſtomach to be chewed over again; ſuch as the graſshopper, cricket, &c.

The mole cricket has a long œſophagus terminating in a round membranaceous ſtomach, which may perhaps be compared to the firſt ſtomach of the ruminating animals of the claſs *Mammalia*; where the food is accumulated, to be thrown back into the mouth, again to undergo a farther maſtication.

A ſhort inteſtine proceeds from this into a ſecond ſtomach much leſs than the former, but muſcular and apparently thicker, and furniſhed with parts which reſemble the grinders in the ſtomach of crabs. They are ſmall laminæ, reſembling ſaws, diſpoſed in five longitudinal rows, each compoſed of from ten to twelve ſmaller laminæ, which perform a ſort of periſtaltic motion by means of the muſcular action of the ſtomach; and it appears pretty evident that the action of thoſe laminæ is exerted on the food contained in the ſtomach. The other two ſtomachs are very ſimilar, and placed one oppoſite to the other at the opening of the inteſtine which correſponds to the duodenum of the ſuperior animals; they are wrinkled and thicker than the firſt ſtomach, but not ſo thick as the ſecond.

This apparatus is to imbibe ſome part of the fluid from the aliment.

In the graſshopper the ſtomachs are ſimilarly arranged. The cricket has to the number of five ſmall and ſlender ſtomachs; indeed the two firſt ſeem only to be ſimple dilatations of the œſophagus.

In the cock-roach there is only one ſtomach which is very large, and almoſt entirely membranaceous; at the extremity of which, there is a number of partial enlargements which may be conſidered as ſo many ſtomachs. The ſtomachs of the larvæ frequently differ from thoſe of their perfect inſects; viz. the alimentary canal of the caterpillar differs very much from that of the butterfly; and the inteſtinal canal of the grub differs widely from that of the beetle.

The œſophagus of the grub of the *ſcarabæus naſicornis* dilates ſuddenly, forming a cylindrical ſtomach which is furniſhed with three ranges of cœcum, which have their extremities ſimple and looſe. The inteſtine proceeds in a ſtraight line from the ſtomach; then having formed a doubling, becomes larger, and puts on the appearance of a colon, four times the length of the ſtomach; on which is to be perceived two tendinous lines. At the extremity of the colon there is a conſiderable dilatation; beyond which it becomes ſlender, and forms the rectum. The inteſtinal canal of the *ſcarabæus melolontha*, or cock-chaffer, is almoſt exactly ſimilar; but nothing analogous to this ſtructure is obſervable in the perfect inſect. The inteſtines of the *ſcarabæus melolontha*, and *ſc. naſicornis* are very long, very much contorted, and equal throughout their whole length.

The larva of the *hyarophilus* has a very evident ſtomach, and a very ſhort inteſtine. In the perfect inſect the inteſtine is long, without any viſible enlargement or ſtomach, which may be accounted for, perhaps in this way; the larvæ ſubſiſt on animal food, while the perfect inſects feed on vegetables. The examples we have juſt given are ſtriking. It may be remarked, that whenever the larvæ and the perfect inſect ſubſiſt on the ſame kind of food, the difference in ſtructure is leſs remarkable; only the inteſtinal canal is longer in the perfect inſect.

General Obſervations.

The anus or the poſterior orifice of the inteſtinal canal, not only affords a paſſage for the excrement, but encloſes the extremities of the parts of generation. There are neither kidneys, bladder of urine, pancreas, nor any of the conglomerated glands obſervable in animals of the ſuperior claſſes, to be found in inſects.

Inſtead of the liver, there is a number of ſmall floating filaments which ſurround the inteſtinal canal for almoſt two thirds of its length. There is a great quantity of fat in many inſects, particularly in thoſe which ſpend a conſiderable portion of their lives in a torpid ſtate. It is contained in looſe membranes that fill up the intervals between the bronchiæ. This fat in caterpillars is very white, and both in taſte and conſiſtence very much reſembles that of other animals. The quantity is ſo conſiderable in ſome inſects as to equal one third of the bulk of the body. All the inſects which undergo a metamorphoſis, are abundantly ſupplied with this fat; without it, indeed they ſeem unable to go through their deſtined changes; for it has been obſerved, that thoſe caterpillars which have been fed on by the larvæ of the various ſpecies of ichneumon, though they may ſurvive the ravages of theſe paraſitical inſects till they are changed into pupæ, commonly die before they become perfect inſects.

The Reſpiration of Inſects.

Respiration is the act of inhaling and exhaling the air into, and out of the lungs. Quadrupeds, birds, and moſt of the amphibia, breathe through the mouth and noſtrils. The air when received into the lungs is mixed with the blood, and imparts to it ſomething neceſſary, and carries off ſomething noxious.

Some authors have aſſerted that inſects have no lungs. But late experiments and obſervations ſhow, that no ſpecies wants them, or at leaſt ſomething ſimilar to them; and in many inſects they are larger in proportion to their bodies than in other animals. In moſt of them they lie at or near to the ſurface of the body, and ſend out lateral pores or tracheæ. The reſpiration of inſects has attracted the attention of many naturaliſts, particularly, Swammerdam, Malpighi, Reaumur, Lyonnet, Muſſchenbroeck, Degeer, Bonnet, Vauquelin, &c.

From their obſervations it may be inferred,

1. That inſects do not breathe through the mouth or noſtrils.

2. That there are a number of veſſels for the reception of air placed along on each ſide of the body, which are commonly called *ſpiracula*, which are ſubdivided into a number of ſmaller veſſels or bronchiæ.

3. That the veſſels or tracheæ which proceed from the pores on the ſides, are not compoſed of a ſimple membrane, but are tubes formed of circular rugæ.

4. That the ſpiracula are diſtinguiſhable, and are covered with a ſmall ſcaly plate, with an opening in the middle like a button hole, which is furniſhed with membranes, or threads, to prevent the admiſſion of extraneous bodies.

Reaumur is of opinion that the air enters by the ſpiracula into the tracheæ and bronchiæ; and is expired through ſmall pores on the ſkin, without returning by the ſame way through which it entered. Were this

General Observations.

this the caſe, the reſpiration of inſects would differ from that of other animals. Degeer ſeems to entertain the ſame opinion with Reaumur, from the account he has given of the manner in which caterpillars breathe; but thinks that inſpiration and expiration through the ſpiracula and bronchia take place in the pupa. Lyonnet is not of the ſame opinion with Degeer, on account of an experiment made on the pupa of the ſphinx. He ſuppoſes that this pupa lives for a certain time without reſpiration, and that the two anterior ſpiracula, which are the largeſt, and encloſe the poſterior ones, only ſerve the purpoſe of allowing the ſuperabundant moiſture to exhale, and to permit the external air to enter in its ſtead. Some experiments of Muſſchenbroeck ſeem to confirm the opinion of Lyonnet with regard to the pupa.

Perhaps nature, with that foreſight which is obſervable in all her works, has taken care to form the pupa ſo as to require but a ſmall quantity of air, and may have included in its body every thing neceſſary to enable it to undergo the change of its condition. The pupa of moſt inſects is certainly very torpid, and little capable of receiving external impreſſions. The experiments of Malpighi and Reaumur have eſtabliſhed the fact that inſects muſt reſpire. Oil applied to the ſpiracula cauſes theſe animals to fall into convulſions, induces a general or partial paralyſis, or cauſes their death.

Vauquelin, the celebrated chemiſt, has made ſeveral experiments on the reſpiration of the green graſhopper. The male of this inſect being put into ſix cubic inches of oxygen gas (the purity of which was aſcertained), lived eighteen hours. The oxygen gas was changed into carbonic acid gas; it rendered lime water turbid, but did not extinguiſh a lighted candle; after the carbonic acid had been abſorbed by means of fixed alkali, the combuſtion of the candle was more vivid than in common air. He found that the inſect reſpired fifty or ſixty times in a minute; but when put into oxygen, its reſpiration became about twelve times more frequent, being interrupted at laſt almoſt continually, becauſe it was on the point of undergoing aſphyxia. The air in which the inſect had died, being waſhed with alkali, underwent a diminution of five per cent, and the vapour of ammonia could not again revive the inſect.

A female inſect being put into eighteen cubic inches of common air, lived thirty-ſix hours; its reſpiration was not altered as to frequency; the bulk of the air was not diminiſhed at the death of the animal, but it extinguiſhed a candle even after it had been waſhed in lime water; this is a new proof that oxygen is neceſſary to the life of inſects; and when the atmoſpheric air contains but little of it, that inſects would ſoon die.

This female graſhopper, being placed in ſulphurated hydrogen gas, was ſeized with aſphyxia inſtantly, and could be revived by no ſtimulus. Theſe experiments not only prove that inſects reſpire, and that oxygen is that part of the air which is neceſſary to their exiſtence, but that carbonic acid or azote is fatal to them. The ſpiracula are neither of the ſame form, nor ſimilarly ſituated in every inſect; the larvæ of the common fly have ſeveral of theſe organs placed at the poſterior extremity of their bodies; they are moſt frequently ſix.

General Obſervations.

Circulation and Secretion of Inſects.

All the animals of the two firſt claſſes have a double circulation; their hearts conſiſt of two diſtinct auricles and ventricles. The heart in the amphibia has two diſtinct auricles without any communication; and under theſe there is the appearance of two ventricles ſimilar in ſhape to thoſe of the former claſs; but they may be conſidered as one cavity; for the ventricle ſends out not only the pulmonary artery, but likewiſe the aorta; for there is a paſſage in the ſeptum, by which the ventricles communicate freely, allowing the blood to paſs from the left into the right one.

The heart of fiſhes has but one auricle and one ventricle, and one great artery which conveys the blood to the gills. The circulation in inſects differs conſiderably from that of the ſuperior animals. In the lobſter, and others of the larger inſects, when a piece of the ſhell is broken, the pulſation of the heart is ſeen diſtinctly, and that ſometimes for ſeveral hours after it has been laid bare. A long delicate veſſel runs along the back parallel to the inteſtines of many inſects, particularly caterpillars, in which an alternate contraction and dilatation is perceptible. The heart, or principal artery which performs the function of the heart, ſeems to be compoſed of a great number of ſmall hearts, connected together, which tranſmit the blood from one to another. But when this veſſel is injected it becomes continuous, and the ſmall hearts diſappear. In the caterpillar the pulſation begins at the poſterior part, and proceeds from one ſegment to another, till it arrive at the head. Reaumur has alleged, that the pulſation of this artery changes its direction in the pupa, and that the blood is propelled from the head towards the tail: he ſays this may be plainly obſerved in a pupa newly ſtripped.

Lyonnet denies the accuracy of Reaumur's obſervations; and ſays that he found a ſpecies of caterpillar, the pupa of which is very tranſparent, in which the longitudinal artery was to be ſeen very diſtinctly; having examined it carefully, a few days after its change, he aſcertained that the motion of the artery had not at all changed its direction, and that it ſtill continued to move from the tail towards the head as in the caterpillar. Further obſervations can alone determine which of theſe two opinions is the moſt correct. One anatomiſt has lately aſſerted that the dorſal canal obſervable in inſects, ſerves the purpoſe of reſpiration. Cuvier has proved, that the conglomerate glands which are to be met with in all the animals that have a heart, do not exiſt in inſects; but inſtead of them, that they are furniſhed with very long ſlender veſſels which float in the internal cavities of the body, without being even connected into faſciculi; from this circumſtance Cuvier is diſpoſed to believe that inſects have no heart. It is by means of theſe fine tubes that the different fluids are ſecreted, which are peculiar to various kinds of inſects. Some inſects diſcharge an acrid and fetid fluid, others diſcharge an oil of a very pleaſant ſmell.

The bee, the waſp, the ſphex, the cryſis, have two veſſels ſituated at the bottom of their ſting, which contain a very acrid fluid, ſecreted from the maſs of blood, which the animal diſcharges at pleaſure through a perforation in the ſting; it is this fluid which cauſes the

General Observations.

pain, inflammation, and ſwelling, which follow a wound inflicted by theſe inſects.

In the ſcorpion, there is a fluid of a very malignant nature, which the animal diſcharges at pleaſure through its ſting; under certain circumſtances, this fluid produces fatal effects. Some of the ſpiders diſcharge a fluid, which renders their bite dangerous. The *aranea avicularia*, and the *tarantula*, in particular, are well known; even the common ſpiders inflict a fatal wound on the inſects they entangle in their web. The ſilk of the common ſilk-worm and other caterpillars, according to Malpighi, Lyonnet, and others, is a fluid contained in two veſſels, which are of a conſiderable ſize at the extremity, and taper towards the mouth, and become very ſlender.

The *carabus* and *dytiſcus* contain an acid which reddens the infuſion of litmus. The ant contains an acid well known to chemiſts.

The acrid matter contained in the body of the *lytta veſicatoria*, is uſed in medicine, and forms the beſt epiſpaſtic we are acquainted with.

Generation of Inſects.

Inſects are the only animals without vertebræ in which the ſexes are diſtinguiſhed. Copulation is performed in them by the introduction of the parts of generation of the male into thoſe of the female.

All inſects are either male or female, except in a few of the genera of the order *Hymenoptera*, (ſuch as the bee, ant, &c.) where individuals are to be found, which are neither male nor female; and, on that account called *neuters*. Among the bees, the neuters form the far greater part of the community, and perform the office of labourers. Among the ants, the neuters are very numerous, and conſtitute the only active members of the ſociety. It has been alleged that theſe neuters are nothing but females, whoſe parts have not been developed for want of proper nouriſhment. Olivier, however, after ſtrict examination, is diſpoſed to think them really different, though he does not adduce facts ſufficient to eſtabliſh his opinion.

The parts which diſtinguiſh the male from the female, may be divided into two claſſes, viz. 1. Thoſe which are not directly connected with generation. 2. Thoſe which are abſolutely neceſſary for the purpoſes of generation. The circumſtances which have no direct communication with generation, which ſerve to point out the diſtinction between the ſexes, are, 1. The difference of ſize, obſervable in the male and female. 2. The brightneſs of the colour in each. 3. The form and number of articulations of the antennæ. 4. The ſize and form of their wings. 5. The preſence or abſence of a ſting. The male is always ſmaller than the female. The female ant is nearly ſix times larger than the male. The female cochineal is from 12 to 15 times the ſize of the male. The female *termes* is 200 or 300 times the ſize of the male. The colours of the male are commonly much more brilliant than thoſe of the female; this is particularly the caſe in lepidopterous inſects. In ſome inſects, the colour of the male is totally different from that of the female. The antennæ of the male are commonly of a different form, and larger than thoſe of the female. Frequently the males are furniſhed with wings, while the females have none; the *lampyris*, *coccus*, and *blatta*, and ſeveral moths, afford an example of this. The female bee is furniſhed with a ſting, while the male is deſtitute of one. The males of ſome inſects are furniſhed with ſharp prominent points, reſembling horns, ſituated either on the head or breaſt, which are either not perceptible, or very faintly marked in the female. The parts eſſential to generation afford the beſt diſtinguiſhing mark. In moſt inſects they are ſituated near the extremity of the rectum. By preſſing the abdomen near to the anus they may frequently be made to protrude. But the parts of generation are not always ſituated near the anus. In the ſpiders they are ſituated in the feelers. In the *libellula*, the male organ is ſituated in the breaſt, while that of the female is placed at the anus.

General Obſervations.

Organs of Generation.

In male inſects, the organs which ſerve for the preparation of the ſemen, bear ſome reſemblance to thoſe organs in the animals which compoſe the claſs *Mammalia*. All of them have four organs, two of which may be compared to the teſticles, and the other two to the *veſiculæ ſeminales*. They vary very much in form in different ſpecies. During the period the male is uſually employed in impregnating the female, theſe parts are very diſtinct; after that, they diſappear totally. In the larger aquatic inſects, (particularly in the *hydrophilus*) beſides theſe four organs already mentioned, there are other two ſmall veſicles which may be compared to the proſtate gland of the ſuperior animals. The *vaſa deferentia* in the *hydrophilus* are ſomewhat reflected, its teſticles are very large, and terminate in a very ſlender folded filament. In the graſhopper, theſe four organs are likewiſe found, but the *veſiculæ ſeminales* are of a compound nature; the teſticles have a good deal the appearance of thoſe of the *mammalia*.

They are of an oval form, and are fixed to the inſide of the back, their convex ſurface is covered with ſeveral tubes of a bright golden colour. After theſe yellow tubes have been removed, the teſticles are eaſily unfolded; like all the other ſecretory organs of inſects, they ſeem to be nothing but a collection of convoluted veſſels. The *veſiculæ ſeminales*, which are attached to the teſticles, are formed into cluſters. In the ſeaſon of copulation, they increaſe in bulk ſo much as nearly to occupy three-fourths of the abdomen; they are full of a limpid fluid, which is the ſemen.

The *vaſa deferentia*, which in moſt inſects are very ſhort, in the *blatta mucronata* are of a conſiderable length, and form ſeveral convolutions before they arrive at the penis.

The *penis*, in inſects, is either ſingle or double. Thoſe which have a ſingle penis, have it placed at the poſterior extremity of the abdomen; in the *libellula*, however, it is placed at the anterior part: it is membranaceous externally; internally it is compoſed of a ſubſtance analogous to the *corpus cavernoſum* of other animals; its form is either cylindrical or conical; it is furniſhed with two ſcales, one on each ſide, which form a ſort of wedge; this wedge being introduced into the vagina of the female, and the ſcales being ſeparated by means of particular muſcles, which are ſituated at their baſe, open the vagina, and make way for the introduction of the penis.

General Observations.

penis. This ſingular conſtruction is perhaps owing to the want of a proper erection.

Inſects which have a double penis (ſuch as the ſpider) have this organ placed at the extremity of the feelers of the lower jaw; theſe feelers are large in the male. During copulation, they are introduced into two vaginæ ſituated in the anterior part of the abdomen of the female. In theſe inſects, the two ſmall ſcales are likewiſe to be found, which ſerve to open the vagina of the female.

The female is furniſhed with two *ovaria*; they are long tubular canals, in which the eggs are arranged like a ſtring of beads. The eggs which are ſituated next the opening into the oviduct, are largeſt, and they diminiſh gradually as they recede from it, till they diſappear altogether. The tubular canals unite, and terminate in a common canal, which communicates with an oblong cavity, analogous to the uterus. It is in this cavity, that the ſemen of the male is depoſited. Malpighi aſſerts, that the fluid penetrates into the oviduct, by means of a canal of communication, and that the eggs are fecundated the inſtant they paſs the mouth of this canal, as they proceed towards the external orifice of the uterus.

In viviparous inſects, ſuch as the *hippoboſca*, ſcorpion, &c. the ovaria are different. Sometimes the little animals are arranged in cluſters; at other times they compoſe a ſpiral cord, the length of which correſponds to the number and ſize of the fœtus.

Copulation is not performed exactly in the ſame way by all inſects. In moſt of the ſpecies, the male mounts on the back of the female; but the ſpiders, dragon-flies, and ſome others, have a mode of performing copulation peculiar to themſelves. After copulation, they ſoon begin to lay their eggs. Some depoſit their eggs gradually, one after another; others diſcharge them all at once, for example, the *ephemera*, the very ſhort duration of whoſe exiſtence renders this neceſſary. But the far greater number of inſects lay them one by one. There are ſome which lay a conſiderable number at the ſame time. The large blue fleſh-fly (*muſca carnaria*) when it finds carrion in a proper ſtate for the reception of its eggs, depoſits a good number of them at once in the ſame place; but when it does not find a proper ſituation, in which to depoſit its eggs, it can refrain for ſome time, till it find a proper place and opportunity. There are ſome inſects that do not lay their eggs till a very long time after copulation; bees, waſps, &c. are impregnated before winter, but do not lay their eggs till ſpring.

Eggs of Inſects.

The eggs of inſects are of two ſorts; the firſt membranaceous, like the eggs of the tortoiſe, and the other reptiles; the other covered with a ſhell like thoſe of the birds; their figure varies exceedingly; ſome are round, ſome elliptical, ſome lenticular, ſome cylindrical, ſome pyramidal, ſome flat, ſome ſquare, but the round and oval are the moſt common. The eggs of inſects ſeldom increaſe in ſize, from the time they have been depoſited by the parent till they are hatched. Thoſe of the *tenthredo*, however, and of ſome others, are obſerved to increaſe in bulk.

At firſt there is nothing to be perceived in the eggs of inſects but a watery fluid; after ſome little time an obſcure point is obſervable in the centre; which, according to Swammerdam, is not the inſect itſelf, but only its head, which firſt acquires conſiſtence and colour. And the ſame author alleges, that inſects do not increaſe in bulk in the egg, but that their parts only acquire ſhape and conſiſtence. Under the ſhell of the egg there is a thin and very delicate pellicle, in which the inſect is enveloped, which may be compared to the chorion and amnios which ſurround the fœtus in quadrupeds. The little inſect remains in the egg till the fluids are diſſipated, and till its limbs have acquired ſtrength to break the egg, and make its eſcape. The different ſpecies of inſects remain incloſed in the egg for very different periods. Some continue incloſed only a few days, others remain for ſeveral months. The eggs of many inſects remain without being hatched during the whole winter; and the young inſects do not come forth from them till the ſeaſon at which the leaves of the vegetables on which they feed begin to expand. When the inſects are ready to break their priſon, they commonly attempt to pierce the ſhell with their teeth, and form a circular hole, through which they put forth firſt one leg, and then another, till they extricate themſelves entirely.

Number of Inſects.

Inſects are by far the moſt numerous claſs of animals. About eleven thouſand ſpecies have been deſcribed by Gmelin in the laſt edition of the Syſtem of Nature. A great many more have been deſcribed by other naturaliſts ſince the publication of that work, and a very conſiderable number are to be met with in the cabinets of the curious, which have not as yet been deſcribed by any author.

In thoſe parts of the world which we are beſt acquainted with, we may eaſily ſuppoſe that many ſpecies of inſects exiſt which have hitherto eſcaped notice. The minuteneſs of ſome inſects makes them eaſily overlooked; the agility of others renders the catching of them difficult. The retired ſituations which many of them haunt favour their concealment. In the unexplored parts of America, Africa, and Aſia, many hundred ſpecies muſt exiſt utterly unknown to naturaliſts. All theſe circumſtances render it very probable that not one half of the inſects which exiſt in the world have hitherto been deſcribed.

Utility of Inſects.

Inſects afford nouriſhment to a great number of the ſuperior animals; many of the fiſhes, reptiles, and birds, draw the principal part of their ſubſtenance from that ſource. The immenſe ſwarms of different ſpecies of crab which abound in every ſea, directly or indirectly form the principal part of the food of the cod, haddock, herring, and a great variety of fiſhes. The ſnake, lizard, frog, and many other reptiles, feed both on land and aquatic inſects. Gallinacious fowls, and many of the ſmall birds, &c. feed on inſects. Swallows, indeed, feed entirely on winged inſects. They afford food likewiſe to many of the mammalia, viz. to many ſpecies of the bat, to the ant-eater, &c. and even to man himſelf. Many ſpecies of crab, viz. lobſter, common crab, ſhrimp, prawn, landcrab, &c. are reckoned delicacies. The larvæ of ſome coleopterous inſects and locuſts form part of the food of man.

Inſects likewiſe by conſuming decayed animal and

History. vegetable matter, which if left to undergo the putrefactive proceſs, on the ſurface of the ground, might taint the atmoſphere with peſtilential vapours, preſerve the air pure for the reſpiration of man and other animals.

Preſervation of Inſects in Cabinets.

In collecting inſects, both male and female ought if poſſible to be procured; and the time of the year when they are taken ought to be noted. Specimens with injured wings or antennæ muſt be rejected.

For collecting inſects in their perfect ſtate, a ſort of forceps are made uſe of, which have their extremities covered with gauze. Beſides theſe the entomologiſt, in his walks, ſhould be furniſhed with a pincuſhion, ſtored with pins of various ſizes, and a tin box lined with cork, of a convenient ſize for the pocket, in which the inſects when caught are to be placed; the lepidopterous inſects being firſt carefully killed by ſqueezing their thorax, leſt their fluttering ſhould injure their wings. Coleopterous inſects are moſt expeditiouſly killed by being immerſed in boiling water; and thoſe who prefer this method may carry them home without injury in common pillboxes. Moſt inſects are killed with a few drops of ſpirit of turpentine; the lepidoptera and hymenoptera may eaſily be killed by being ſtuck through with a pin dipt in aquafortis. When the inſects are killed they are to be transfixed with pins, their wings, antennæ, and feet ſpread out and kept diſplayed. In ſome of the lepidoptera, two ſpecimens ſhould be preſerved; the wings in the one diſplayed, and in the other placed as much as poſſible in their natural poſition.

Inſects may likewiſe be collected by breeding them from their larvæ; and this, when it is convenient, is by far the beſt method for procuring fine ſpecimens; it is chiefly practiſed with the lepidopterous kinds. When the caterpillars are taken, they are to be fed on the leaves of the plant or tree on which they were found, and kept in a box with ſome moiſt earth at the bottom; they will afterwards turn into a chryſalis, either by going into the earth, by ſpinning a web and enclofing themſelves in it, or by changing into a pupa *obtecta*, according to their kinds. Having continued in this ſtate their appointed time, the perfect inſect will come forth, and muſt then be killed before it has injured its wings by flying. History.

Lepidopterous inſects are likewiſe to be collected in their pupa ſtate, by ſeeking for them under the projections of garden walls, pales, and out-houſes, ſummer-houſes, &c. or by digging for them in the winter months under the trees they feed on. When thus dug up, they are to be put into a box with moiſt earth, and kept till they come out.

When the inſects are prepared in this manner, they are to be placed in the cabinet, which may conſiſt of boxes or drawers deep enough to hold a long pin, and lined on the bottom with cork, or with wax; the inſects of each order in drawers by themſelves; and the different genera cloſe together. The generic and trivial name of each inſect is to be written on a piece of paper, fixed to the bottom by the ſame pin which ſupports the inſect. The drawers muſt be made to ſhut very cloſe, ſo as to exclude the duſt and minute inſects; ſome cover them with glaſs. A little camphor in each drawer is likewiſe uſeful.

Inſects of the aptera order, ſuch as ſpiders, ſcolopendræ, juli, &c. are beſt preſerved in ſome kind of ſpirits. The oniſci and cancri may be preſerved like beetles.

HISTORY OF ENTOMOLOGY.

THOUGH the attention of man muſt have been attracted by the vegetables and animals with which he found himſelf ſurrounded, and by the earth and minerals on which he trod, even at the very earlieſt periods of human ſociety, yet a very conſiderable time muſt have elapſed before any attempts were made at arrangement or claſſification. Ariſtotle was the firſt (as far as we know) who deſerved the name of natural hiſtorian; his arrangement of animals was the only one followed for many centuries. He divided all animals into viviparous and oviparous; the firſt contained quadrupeds, the ſecond birds, fiſhes and inſects. Under inſects were comprehended all ſmall animals whoſe bodies were divided into ſegments. This definition of inſects was followed by all natural hiſtorians down to the time of Linnæus.

Theophraſtus, the diſciple of Ariſtotle, the only other perſon among the ancient Greeks who deſerves the name of natural hiſtorian, beſtowed the moſt of his attention on vegetables and minerals. Pliny has given us an account of all that was known in natural hiſtory down to his own times. Though he has mentioned many inſects, owing to his want of method little is to be learnt from him reſpecting entomology. Dioſcorides, who was nearly cotemporary with Pliny, has confined himſelf chiefly to natural hiſtory connected with medicine. He has given an enumeration of all the natural bodies which entered into the materia medica. On the reviſal of learning in Europe, writers on natural hiſtory ſeemed to have confined themſelves to writing commentaries on the ancients; and nothing was done in entomology till the times of Geſner, who was the greateſt naturaliſt the world had ſeen from the time of Ariſtotle, and who was the firſt who made a collection of the objects of natural hiſtory, and formed a muſeum. He was born in Zurich in 1516, and died in 1565. Aldrovandus lived nearly about the ſame time with Geſner, and, like him, formed a muſeum which ſerved for the foundation of the public muſeum at Bologna, where many ſpecimens may be ſtill ſeen marked with the venerable hand of the firſt collector. Geſner formed his zoology on the principles of Ariſtotle: his hiſtory of animals is very voluminous. Aldrovandus made a collection of all that had been written on natural hiſtory before his own time, without diſcriminating truth from fiction. He has given a methodical arrangement of inſects in the ſeventh book of his large work publiſhed in 1602. He followed nearly the ſame arrangement with Geſner. Geſner, in conjunction with ſome other natural hiſtorians, wrote a treatiſe on inſects, which was publiſhed by Mouffet,

History. Mouffet, an Engliſh phyſician. About this time our countryman, the illuſtrious Harvey, ventured to controvert Ariſtotle's erroneous opinion with reſpect to equivocal generation. Though his aphoriſm, *omnia ex ovo*, at firſt met with great oppoſition, it was at laſt eſtabliſhed by his own experiments and thoſe of Redi and Malpighi. From this period the writers on entomology have been numerous; we ſhall content ourſelves here with giving little more than an enumeration of the principal works on the ſubject.

Agricola. in a work entitled *de Animantibus Subterraneis*, publiſhed in 1549, has given a methodical arrangement of inſects: he divides them into, 1 Creeping inſects; 2. Flying inſects; and 3. Swimming inſects. After giving this arrangement, he proceeds to give an account of each ſpecies.

A work entitled *Theatrum Inſectorum Thomæ Mouffeti opera concinnatum*. Lond. 1634, the joint labour of ſeveral of the moſt eminent natural hiſtorians who lived about the middle of the ſixteenth century, though not publiſhed till 1734, about 30 years after the death of Mouffet, by whoſe care the work had been abridged, and prepared to meet the public eye, is the next worthy of notice. It is divided into two books; the firſt treats of winged inſects; the ſecond of inſects without wings: theſe two grand diviſions are ſubdivided into ſeveral families characterized by the number and poſition of the legs. There is but little method diſplayed in the arrangement of the inſects which compoſe the different families.

Aldrovandus divides inſects into *terreſtria et aquatica*; (land inſects, and aquatic inſects.) The different orders and ſubdiviſions of theſe two claſſes, are for the moſt part determined by the number, nature and poſition of their wings and legs. He calls his firſt order *Favifica*, (thoſe which form combs). As to the reſt, according to his own declaration, he follows Ariſtotle.

Wolfang Frenzius, in his *Hiſtoria Animalium ſacra*, publiſhed in 1612, has divided inſects into three claſſes, viz. 1. *Aeria*, (ſuch as fly); 2. *Aquatica*, (ſuch as inhabit the water). 3. *Terrea et Reptentia*, (ſuch as creep about, or are lodged in the earth. His deſcriptions are much more accurate than thoſe of any of the authors who preceded him.

John Johnſton has borrowed freely from his predeceſſors, in his *Hiſtoria Naturalis Inſectorum*, publiſhed in 1653. He divides inſects into *terreſtria* and *aquatica*, (into land and aquatic inſects): the land inſects he divides into three orders; 1. Such as have wings and legs; 2. Such as have legs without wings; and 3. Such as have neither wings nor legs. Theſe three orders occupy his three firſt books; his fourth contains aquatic inſects.

Walter Charleton follows the ſyſtem of Aldrovandus in his *Onomaſticon Zoicon*, publiſhed in 1668.

Jo. Goodart publiſhed *Metamorphoſis et Hiſtoria Naturalis de Inſectis*, 8vo. Mediob. 1667.

Likewiſe in 1675, a work of his appeared, *de Inſectis in Methodum redactis, opera Mart. Liſter*. Ebor. In this work inſects are divided into ten families: the 1ſt includes butterflies with erect wings; 2d, Butterflies with horizontal wings; 3d, Butterflies with deflected wings; 4th, Libellulæ, (Dragon-flies); 5th, Apes, (bees); 6th, Coleopterous inſects; 7th, Locuſts, and grashoppers; 8th, Flies correſponding to the order diptera of Linnæus; 9th, Millepeds; and 10th, Spiders. This work is full of typographical errors and miſtakes in natural hiſtory. History.

The diſcovery of the microſcope in 1618, tended greatly to the advancement of entomology, as by means of it the moſt minute parts of inſects could be viewed, and their organization examined. Naturaliſts were much engaged in making microſcopic diſcoveries, particularly Borel, Rhedi, Swammerdam, Bonanni, Bonomo, Leeuwenhoek and Joblot.

John Swammerdam, in his *Biblia Naturæ*, publiſhed in 1669, has divided inſects into four claſſes.

John Ray publiſhed his *Hiſtoria Inſectorum*. Lond. 1710. This work was properly the joint production of J. Ray and Francis Willoughby. Theſe illuſtrious friends laboured together with uncommon ardour in the ſtudy of nature. Death carried off Willoughby in the prime of life, before he had properly digeſted what the induſtry of his early years had collected; and his labours would have been loſt to the world, and his name might have ſunk in oblivion, but for the friendſhip of Ray. So cloſe was the intercourſe between theſe two naturaliſts, and ſo intimately were their labours blended together, that it is not eaſy to aſſign each his due ſhare of merit. Indeed Ray has been ſo partial to the fame of his departed friend, and has cheriſhed his memory with ſuch affectionate care, that we are in danger of attributing too much to Mr Willoughby, and too little to himſelf. Though what Dr Derham aſſerts be not correct, that Mr Willoughby had taken the animal kingdom for his taſk, and Mr Ray the vegetable one, yet it is generally agreed, that the *Hiſtoria Inſectorum* is principally to be aſcribed to Willoughby. In that work inſects are divided into *Tranſmutabilia et Intranſmutabilia*, (thoſe which undergo a metamorphoſis, and thoſe which undergo none). Theſe two grand diviſions are ſubdivided into ſeveral orders, which are aſcertained by the number of their legs, or total want of legs; by the places which they inhabit; by their ſize; by the configuration of the various parts of the body; by the ſmell which they diffuſe, &c. The *tranſmutabilia* are divided into four orders. 1. *Vaginipennes*, (thoſe which have their wings covered with a ſheath). 2. *Papiliones*, (lepidopterous inſects). 3. *Quadripennes*, (thoſe which have four wings); and 4. *Bipennes*, (thoſe which have two). The papiliones, quadripennes, and bipennes are again ſubdivided into families, the characters of which are taken, either from the appearance and conformation of their larvæ, or from the form, colour and different properties of the perfect inſect.

Eleazar Albin publiſhed a natural hiſtory of Engliſh inſects in 1720. He likewiſe publiſhed the Natural Hiſtory of Spiders in 1736.

Antony Valiſnieri, in his work entitled *Eſperienze e Oſſervazioni intorno agli Inſetti*, publiſhed in 1730, has divided inſects into four orders, according to the ſituation in which they paſs their lives.

Mary Sybelle Merian, publiſhed in 1730, *Hiſtoire d'Inſectes d'Europe et de Surinam*. She likewiſe publiſhed in 1705, *Metamorphoſis Inſectorum Surinamenſium ad vivum picta et deſcripta*; and in 1717, *Erucarum Ortus*.

George Bernard Rhump publiſhed in 1705, and again in 1741, a work entitled *Amboiniſche Rarietatkammer*.

History. Hans Sloane, in the years 1707 and 1725, published a Voyage to the Islands of Madeira, Barbadoes, Nevis, Saint Christophers and Jamaica.

Henry Ruisch in 1710 and 1718 published *Theatrum Universale omnium Animalium.*

J. Petiver published in 1715 his *Icones et Nomina Aquatilium Animalium Amboinæ.*

Richard Bradley published in 1721 his Philosophical Account of the Works of Nature.

Linnæus, the most celebrated natural historian the world ever produced, in his first edition of the *Systema Naturæ*, published in 1735, divided insects into four orders, from the number and different appearances of their wings; 1. *Coleoptera;* 2. *Angioptera;* 3. *Hemiptera;* and 4. *Aptera.* This was but an imperfect sketch, a first essay. In the subsequent editions of the System of Nature which he published, to the number of twelve, he completed the arrangement of insects, of which we need say nothing here, as we have followed it in preference to all others; and most authors who have written on the subject for more than half a century past have either followed it closely, or with very slight alterations. His extensive genius embraced all the three kingdoms of nature. In botany and entomology in particular he far excels all who went before him, and as yet remains unrivalled. Writers on entomology became so numerous after Linnæus had published his System of Nature, and established entomology on a solid foundation, that a mere enumeration of their names and titles of their books would occupy more room than we can afford to bestow on this article; we shall therefore only notice a few of the most remarkable.

Charles Degeer, in his *Memoires pour servir à l'Histoire des Insectes*, in 1752, has arranged insects into fourteen orders, distinguished by the different appearances of the various parts which compose their bodies, particularly the elytra, wings, and most remarkable parts of the head. He published again in 1778.

M. de Reaumur published his *Memoires pour servir à l'Histoire des Insectes* at Paris in 1737. No one has paid so much attention to the habits of insects, and to every thing that concerns them, as Reaumur. He ought to be read by every student of entomology.

John Retzius, has simplified the arrangement of Degeer, in a small work entitled *Genera et Species Insectorum.* But although in this arrangement he has followed the method of Degeer, the terms he has made use of are principally those of Linnæus. His 14 orders are, 1. Lepidoptera. 2. Alinguia. 3. Neuroptera. 4. Hymenoptera. 5. Siphonata. 6. Dermaptera. 7. Hemiptera. 8. Coleoptera. 9. Hasterata. 10. Proboscidea. 11. Suctoria. 12. Ancenata. 13. Atrachelia. 14. Crustacea.

M. Geoffroy, in his *Histoire Abrègè des Insectes*, published at Paris in 1762, has divided insects into six orders; Coleopteres, Hemipteres, Tetrapteres ailes farineuses, Tetrapteres ailes nues, Dipteres, and Apteres. He determined his families by the number of the articulations of the feet, and his genera by characters drawn from all the parts of the body. He has formed a great number of new genera.

John Antony Scopoli, in his *Entomologia Carniolica*, published in 1762, has followed the arrangement of of Linnæus, and only changes the names of some of the orders; *e. g.* Proboscidea, instead of Hemiptera; Aculeata, instead of Hymenoptera; Halterata, instead of Diptera; and Pedestria, instead of Aptera. History.

J. C. Schæffer published in 1766, *Elementa Entomologica*, 135 *tabulæ ære excussæ;* he follows in many points the method of Linnæus. He divides insects into seven classes. 1. Coleoptero-macroptera. 2. Coleoptero-microptera. 3. Hemiptera. 4. Hymeno-lepidoptera. 5. Hymeno-gymnoptera. 6. Diptera; and 7. Aptera. His first and second classes correspond with the Coleoptera of Linnæus; the fourth with the Lepidoptera, and the fifth with the Hymenoptera.

John C. Fabricius is the founder of a new system of Entomology, which he published in his *Systema Naturæ* 1775. He discriminates his orders and genera, by the parts of the mouth, (*instrumenta cibaria*). He afterwards published *Species Insectorum*, *Entomologia Systematica*, and *Mantissa Insectorum.*

The arrangement of Fabricius has acquired great reputation, especially on the continent. It may not therefore be amiss to give a slight view of it. He divides insects into eight classes.

Class I.	ELEUTHERATA.	Mouth armed with jaws, and four or six feelers. The jaws naked and free.
Class II.	ULANATA.	The jaws covered with an obtuse helmet.
Class III.	SYNISTATA.	The jaws united with the lip.
Class IV.	AGONATA.	The under jaw wanting.
Class V.	UNOGATA.	Mouth armed with jaws and two feelers; the under jaw generally furnished with a small unguis or nail.
Class VI.	GLOSSATA.	Mouth furnished with feelers, and a spiral tongue.
Class VII.	RHYNGOTA.	Mouth furnished with a snout, and an articulated sheath.
Class VIII.	ANTLIATA.	Mouth furnished with a haustellum and a sheath not articulated.

In a supplement to his *Entomologia Systematica*, he has divided insects into thirteen orders. 1. Eleutherata. 2. Ulonata. 3. Synistata. 4. Piezata. 5. Odorata. 6. Mitosata. 7. Unogata. 8. Polygonata. 9. Kleistagnatha. 10. Exochnata. 11. Glossata. 12. Rhyngota 13. Anthliata. He has lately published a work entitled *Systema Eleutheratorum*, no more than two volumes of which have as yet made their appearance.

Moses Harris published an Exposition of English Insects, &c. with coloured plates, 1776.

Jo. Christ published *Philosophia Entomologica sistens scientiæ fundamenta*, &c. Hamb. 1778, 8vo.

Archiv der Insektengeschichte herausgege bevon. Joh. Casp. Fuesly. Zurich, 1781.

the method of Linnæus. His orders are, 1. Scarabæoides. 2. Grylloides. 3. Cimicioides. 4. Papilionoides. 5. Libelluloides. 6. Veſpoides. 7. Muſcoides. 8. Cancroides. 9. Aranoides, and 10. Oniſcoides.

Olivier, in 1789, publiſhed *Entomologie, ou Hiſtoire Naturelle des Inſectes*, in 3 vols. 4to. Paris. In 1790, in the *Dictionnaire des Inſectes*, forming a part of the *Encyclopedie Methodique*, he has given an arrangement of inſects little different from that of Linnæus. He has added one order which he calls Orthopteres, diſtinguiſhed by the mode of folding the lower wings, and a part on the head, which he terms *galea*. He has likewiſe ſubdivided the order Aptera, into Arachnides and Cruſtaces. Latreille in 1795, in a work entitled *Precis du Caractere des Genres*, divides inſects into two grand diviſions, viz. *inſectes ailès, et inſectes apteres*, (winged inſects, and inſects without wings). Theſe two grand diviſions he ſubdivides into 14 orders. 1. Coleopteres. 2. Orthopteres. 3. Hemipteres. 4. Neuropteres. 5. Lepidopteres. 6. Suceurs. 7. Thyſanoures. 8. Paraſites. 9. Acephalés. 10. Entomoſtraces. 11. Cruſtaces. 12. Myriapodes. Since that he has publiſhed a more detailed account of this method in a work entitled *les Genres et les Familles des Inſectes*.

Clairville in 1798, in the introduction to his *Entomologie Helvetique*, has given an arrangement of inſects, in which he differs from Linnæus almoſt in nothing, except in the names of his orders, viz. Elytropteres, Dictyopteres, Thlebopteres, Haltipteres, Lepidopteres, Hemiſopteres, Rophoteires, and Pododuneres.

Link, in his *Magaſin fur Thiergeſchite*, has divided inſects into eleven orders; he follows de Laicharting almoſt in every thing, even in the names of his orders; he has indeed added an order which he calls Pediculoides.

Cuvier and Dumeril, in their Comparative Anatomy, have very nearly followed the method of Linnæus; they have however divided the order Aptera into two, viz. Gnathaptera and Aptera; they have likewiſe altered the arrangement of the orders, and have placed thoſe firſt which contain inſects furniſhed with jaws, viz. Gnathaptera, Neuroptera, Hymenoptera, Coleoptera, and Orthoptera; and have thrown thoſe laſt which are deſtitute of jaws, viz. Hemiptera, Lepidoptera, Diptera and Aptera.

We ſhall refrain from noticing thoſe authors who have written partial treatiſes; though there are ſeveral works of that kind which the entomologiſt might peruſe with advantage, ſuch as the *Fauna Suecica*, publiſhed in 1761 by Linnæus, at Stockholm. *Fauna Germanica*, by Panzer. *La Faune Pariſienne de Walknair*. Kirby's *Monographia apum Angliæ*. Latreille's treatiſe on Ants.

EXPLANATION OF THE PLATES.

PLATE CCIII.

Fig. 1. ANTENNÆ PECTINATÆ, or feathered; as in the *phalæna*, moths.

2. ——— PERFOLIATÆ, or perfoliated; as in the *dermeſtes* and *dytiſcus*.

——— FISSILES, or fiſſile, divided into laminæ at the extremity, as in the *ſcarabæi*, beetles.

4. ——— CLAVATÆ, or club-ſhaped, as in the *papilio*, butterfly.

5. ——— MONILIFORMES, like a necklace of beads; as in the *chryſomela*.

6. ——— SETACEÆ, ſetaceous, or briſtle-ſhaped; as in many of the *phalænæ*.

7. ——— ARISTATÆ, furniſhed with a lateral hair, as in the *fly*.

8. 9. *a*, Caput, the head.
b, Palpi, or feelers.
c, Antennæ, or horns.
d, Oculi, the eyes.
e, Thorax.
f, Scutellum, or eſcutcheon.
g, Pectus, or breaſt.
h, Sternum, or breaſt-bone.
i, Abdomen, and its ſegments.
k, Anus.
l, Elytra, or ſhells.
m, Membranous wings.
n, Pedes, or feet, which are natatorii.

10. *o*, Femur, or thigh.
p, Tibia, or leg.
q, Tarſus, or foot.
r, Unguis, or claw.

11. *a*, The anterior part of the wing.
b, The poſterior part.
c, The exterior part.
d, The interior part.
e, The margin.
f, The diſk, or middle.
g, Oculus, or eye.

12, 13, 14, 15. Repreſent the inſect in its egg, caterpillar, pupa, and perfect ſtate.

Order I. COLEOPTERA. Fig. 16. *Scarabæus*. Fig. 17. *Ptinus*. Fig. 18. *Bupreſtis*. Fig. 19. *Carabus*.

Order II. Fig. 20. *Mantis*. Fig. 21. *Fulgora*. Fig. 22. *Notonecta*. Fig. 23. *Cimex*. Fig. 24. *Aphis*. Fig. 25. *Coccus*.

Order III. Fig. 26. *Papilio*. Fig. 27. *Sphinx*. Fig. 28. *Phalæna*.

Order IV. Fig. 29. *Libellula*. Fig. 30. *Hemerobius*. Fig. 31. *Panorpa*.

Order V. Fig. 32. *Tenthredo*. Fig. 33. *Ichneumon*. Fig. 34. *Chryſis*. Fig. 35. *Formica*.

Order VI. Fig. 36. *Oeſtrus*. Fig. 37. *Tipula*. Fig. 38. *Aſilus*.

Order VII. Fig. 39. *Lepiſma*. Fig. 40. *Aranea*. Fig. 41. *Scorpio*. Fig. 42. *Cancer*. Fig. 43. *Scolopendra*.

ENT

Entrepas || Entry.

ENTREPAS, in the manege, a broken pace or going, that is neither walk nor trot, but has ſomewhat of an amble.

This is a pace or gait of ſuch horſes as have no reins or back, and go upon their ſhoulders; or, of ſuch as are ſpoiled in their limbs.

ENTRING LADDERS, in a ſhip, are of two ſorts; one uſed by the veſſel's ſides, in a harbour, or in fair weather, for perſons to go in and out of the ſhip: the other is made of ropes, with ſmall ſtaves for ſteps; and is hung out of the gallery to enter into the boat, or to come aboard the ſhip, when the ſea runs ſo high that they durſt not bring the boat to the ſhip's ſide for fear of ſtaving it.

ENTROCHUS, in *Natural Hiſtory*, a genus of extraneous foſſils, uſually of about an inch in length, and made up of a number of round joints, which, when ſeparate and looſe, are called *trochitæ*: they are compoſed of the ſame kind of plated ſpar with the foſſil ſhells of the echini, which is uſually of a bluiſh-gray colour, and very bright where freſh broken; they are all ſtriated from the centre to the circumference, and have a cavity in the middle.

The entrochi are found of all ſizes, from that of a pin's head to a finger's length, and the thickneſs of one's middle finger; and are plainly of marine origin, having often ſea-ſhells adhering to them. They ſeem to be the petrified arms of that ſingular ſpecies of the ſea ſtar fiſh, called *ſtella arboreſcens*.

ENTRY, in *Law*, ſignifies taking poſſeſſion of lands or tenements, where a perſon has a right ſo to do.

Entry of an Heir, in *Scots Law*, that form of law by which an heir veſts in himſelf a proper title to his predeceſſor's eſtate.

Bill of ENTRY, in commerce. See BILL.

In making entries inwards, it is uſual for merchants to include all the goods they have on board the ſame ſhip in one bill, though ſometimes they may happen to be upwards of 20 ſeveral kinds: and in caſe the goods are ſhort entered, additional or poſt entries are now allowed; though formerly the goods ſo entered were forfeited. As to bills of entry outwards, or including goods to be exported, upon delivering them, and paying the cuſtoms, you will receive a ſmall piece of parchment called a *cocket*, which teſtifies your payment thereof, and all duties for ſuch goods.

If ſeveral ſorts of goods are exported at once, of which ſome are free, and others pay cuſtoms; the exporter muſt have two cockets, and therefore muſt make two entries; one for the goods that pay, and the other for the goods that do not pay cuſtom.

Entries of goods, on which a drawback is allowed, muſt likewiſe contain the name of the ſhip in which the goods were imported, the importer's name, and time of entry inwards. The entry being thus made, and an oath taken that the cuſtoms for thoſe goods were paid as the law directs, you muſt carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant warrant, which muſt be given to the ſurveyor, ſearcher, or land-waiter, for them to certify the quantity of goods; after which the certificate muſt be brought back to the collector and comptroller, or their deputies, and oath made that the ſaid goods are really ſhipped, and not landed again in any part of Great Britain.

EON

Envelope || Eonians.

ENVELOPE, in *Fortification*, a work of earth, ſometimes in form of a ſimple parapet, and at others like a ſmall rampart with a parapet: it is raiſed ſometimes on the ditch, and ſometimes beyond it.

ENVIRONNE', in *Heraldry*, ſignifies ſurrounded with other things: thus, they ſay, a lion environné with ſo many bezants. See BEZANTS.

ENUMERATION, an account of ſeveral things, in which mention is made of every particular article.

ENUMERATION, in *Rhetoric*, a part of peroration; in which the orator, collecting the ſcattered heads of what has been delivered throughout the whole, makes a brief and artful relation or recapitulation thereof.

ENVOY, a perſon deputed to negotiate ſome affair with any foreign prince or ſtate. Thoſe ſent from the courts of Britain, France, Spain, &c. to any petty prince or ſtate, ſuch as the princes of Germany, the republics of Venice, Genoa, &c. go in quality of envoys, not ambaſſadors; and ſuch a character only do thoſe perſons bear, who go from any of the principal courts of Europe to another, when the affair they go upon is not very ſolemn or important. There are envoys ordinary and extraordinary, as well as ambaſſadors; they are equally under the protection of the law of nations, and enjoy all the privileges of ambaſſadors; only differing from them in this, that the ſame ceremonies are not performed to them.

ENVY, in *Ethics*, pain felt; and malignity conceived, at the ſight of excellence or happineſs in another. See EMULATION.

EON, or ÆON. See ÆON.

EONIANS, in church-hiſtory, the followers of Eon, a wild fanatic of the province of Bretagne, in the 12th century, whoſe brain was diſordered. He concluded from the reſemblance between *eum*, in the form for exorciſing malignant ſpirits, viz. *Per eum, qui venturus eſt judicare vivos et mortuos*, and his own name Eon, that he was the ſon of God, and ordained to judge the quick and dead. Eon, however, was ſolemnly condemned by the council at Rheims, in 1148, at which Pope Eugenius III. preſided, and ended his days in a

Eoria ‖ Epacts.

miſerable priſon. He left behind him a number of followers and adherents, whom perſecution and death ſo weakly and cruelly employed could not perſuade to abandon his cauſe, or to renounce an abſurdity which, ſays Moſheim, one would think could never have gained credit but in ſuch a place as Bedlam.

EORIA, in *Mythology*, a feaſt celebrated by the Athenians in honour of Erigonus, who, by way of puniſhment for their not avenging the death of his father Icarus, engaged the gods to inflict the curſe on their daughters that they ſhould love men who never returned their paſſion. The feaſt was inſtituted by the order of Apollo.

EOSTRE, in *Mythology*, a Saxon goddeſs to whom they ſacrificed in the month of April, called the month of *Eoſtra*; and thence the name *Eaſter*, which the Saxons retained after their converſion to Chriſtianity, applying it to the feſtival celebrated in commemoration of our Saviour's reſurrection.

EPACRIS, a genus of plants belonging to the pentandria claſs. See BOTANY *Index*.

EPACTS, in *Chronology*, the exceſſes of the ſolar month above the lunar ſynodical month, and of the ſolar year above the lunar year of twelve ſynodical months; or of ſeveral ſolar months above as many ſynodical months, and ſeveral ſolar years above as many dozen of ſynodical months.

The epacts, then, are either *annual* or *menſtrual*.

Menſtrual epacts are the exceſſes of the civil or kalendar month above the lunar month. Suppoſe, c. gr. it were new moon on the firſt day of January; ſince the lunar month is 29 days 12h. 44′ 3″, and the month of January contains 31 days, the menſtrual epact is 1 day 11h. 15′ 57″.

Annual epacts are the exceſſes of the ſolar year above the lunar. Hence, as the Julian ſolar year is 365 days 6h. and the Julian lunar year 354 days 8h. 48′ 38″, the annual epact will be 10 days 21h. 11′ 22″; that is, nearly 11 days. Conſequently the epact of 2 years is 22 days; of 3 years, 33 days; or rather 3, ſince 30 days make an *emboliſmic* or intercalary month.

Thus the epact of 4 years is 14 days, and ſo of the reſt; and thus, every 19th year, the epact becomes 30 or 0; conſequently the 20th year the epact is 11 again; and ſo the cycle of epacts expires with the golden number, or lunar cycle of 19 years, and begins with the ſame, as in the following table:

Gold. Numb.	Epacts.	Gold. Numb.	Epacts.	Gold. Numb.	Epacts.
1	XI	8	XXVIII	14	IV
2	XXII	9	IX	15	XV
3	III	10	XX	16	XXVI
4	XIV	11	I	17	VIII
5	XXV	12	XII	18	XIX
6	VI	13	XXIII	19	XXX
7	XVII				

Again, as the new moons are the ſame, that is, as they fall on the ſame day every 19 years, ſo the difference between the lunar and ſolar years is the ſame every 19 years. And becauſe the ſaid difference is always to be added to the lunar year, in order to adjuſt or make it equal to the ſolar year; hence the ſaid difference reſpectively belonging to each year of the moon's cycle is called the *epact of the ſaid year*, that is, the number to be added to the ſaid year, to make it equal to the ſolar year; the word being formed from the Greek επαγω, *induco*, *intercalo*. Epaminondas.

Upon this mutual reſpect between the cycle of the moon and the cycle of the epacts, is founded this rule for finding the Julian epact, belonging to any year of the moon's cycle. Multiply the year given of the moon's cycle into 11: and if the product be leſs than 30, it is the epact ſought; if the product be greater than 30, divide it by 30, and the remainder of the dividend is the epact. For inſtance, I would know the epact for the year 1712, which is the third year of the moon's cycle. Wherefore 3 is the epact for 1712; for 11×3=33, and 33 being divided by 30, there is left 3 of the dividend for the epact. But the difference of the Julian and Gregorian years being equal to the exceſs of the ſolar above the lunar year, or 11 days, it happens that the Gregorian epact for one year is the ſame with the Julian epact for the preceding year.

EPAMINONDAS, a celebrated Theban, the ſon of Polymnus, and one of the greateſt captains of antiquity. He learned philoſophy and muſic under Lyſis, a Pythagorean philoſopher; and was from his infancy inured to all the exerciſes of body and mind. He was learned, generous, well-ſkilled in war, brave, modeſt, and prudent; and had ſuch a regard for truth, that he would not tell a falſehood even in jeſt. He ſerved firſt under the Lacedemonians; ſaved the life of Pelopidas their chief, who received in a battle ſeven or eight wounds; and contracted a ſtrict friendſhip with that general, which laſted till his death. At his perſuaſions, Pelopidas delivered the city of Thebes from the yoke of the Spartans, who had rendered themſelves maſters of Cadmea, which occaſioned a bloody war between the two nations. Epaminondas was made general of the Thebans; on which he gained the celebrated battle of Leuctra, in which Cleombrotus, the valiant king of Sparta, was killed. He then ravaged the enemy's country, and cauſed the city of Meſſina to be rebuilt and peopled. At length, the command of the army was given to another, becauſe Epaminondas had kept his troops in the field four months longer than he had been ordered by the people; but, inſtead of retiring in diſguſt, he now ſerved as a common ſoldier, and diſtinguiſhed himſelf by ſo many brave actions, that the Thebans, aſhamed of having deprived him of the command, reſtored him to his poſt, in order to carry the war into Theſſaly, where his arms were always victorious. A war breaking out between the Elians and the inhabitants of Mantinea, the Thebans took the part of the former. Epaminondas then reſolved to endeavour to ſurpriſe Sparta and Mantinea; but not ſucceeding, he gave the enemy battle, in which he received a mortal wound with a javelin, the bearded iron remaining in the wound. Knowing that it could not be drawn out without occaſioning immediate death, he would not ſuffer it to be touched, but continued to give his orders: and on his being told, that the enemy were entirely defeated, "I have lived long enough (he cried),

Epanalepſis || Ephemeri-des.

cried), ſince I die without being conquered;" and at the ſame time he plucked the javelin from his wound, and expired, 363 B. C.

EPANALEPSIS. See ORATORY, N° 73.

EPANODOS. *Ibid.* N° 75.

EPANORTHOSIS. *Ibid.* N° 75.

EPARER, in the manege, ſignifies the ſlinging of a horſe, or his yerking and ſtriking with his hind-legs.

EPAULEMENT, in *Fortification*, a work raiſed to cover ſidewiſe, is either of earth, gabions, or faſcines loaded with earth. The epaulements of the places of arms for the cavalry, at the entrance of the trenches, are generally of faſcines mixed with earth.

EPAULETTES, are a kind of ſhoulder-knots choſen for the ſoldiers, which are to be of the colour of the facing, with a narrow yellow or white tape round it, and worſted fringe; thoſe for the officers are made of gold or ſilver lace, with a rich fringe; they are badges of diſtinction worn on one or both ſhoulders. Thoſe of the dragoon-guards, horſe, and dragoons, are worn on the left ſhoulder: the light dragoons, and officers of grenadiers, have one on each ſhoulder: thoſe of the battalion wear one on the right ſhoulder only, which is to be made of embroidery or lace with a gold or ſilver fringe. Thoſe of the royal regiment of artillery are to be gold and embroidery, with gold fringe on ſcarlet cloth, and worn on the right ſhoulder.

EPENTHESIS, in *Grammar*, the interpoſition or inſertion of a letter or ſyllable in the middle of a word; as *alituum*, for *alitum*; *relligio*, for *religio*; *induperator*, for *imperator*, &c.

EPEUS, of the line of Endymion, the inventor of the battering ram, an engine of great ſervice in ſieges to make a breach. He is thought to have built the Trojan horſe, and to have founded the city Metapontum.

EPHA, or EPHAH, in Jewiſh antiquity, a meaſure for things dry, equal to 3 pecks and 3 pints.

EPHEBÆUM, in antiquity, the place where the ephebi or youth exerciſed; or, as ſome ſay, where thoſe who deſigned to exerciſe met, and agreed what kind of exerciſe they ſhould contend in, and what ſhould be the victor's reward.

EPHEBI, among the Athenians, a deſignation given to their young men when they arrived at 18 years of age, at which time they had their names entered in a public regiſter.

EPHEDRA, a genus of plants, belonging to the diœcia claſs, and in the natural method ranking under the 51ſt order, *Coniferæ*. See BOTANY *Index*.

EPHEMERA, from ἐφήμερα, "a day;" a diary fever, or a fever of one day's continuance only. In this caſe, ſuch a heat as attends an exceſs of wine, a pulſe ſomewhat full and quick, but ſoft and regular, a ſlight headach, a nauſea, and reſtleſſneſs, are all the ſymptoms, and which terminate without any ſenſible evacuation. If it continue unto the third day, it is not a diary fever; and if the conſtitution is very dry, a hectic is to be dreaded.

EPHEMERA, the *Day-fly*, a genus of inſects belonging to the order of neuroptera. See ENTOMOLOGY *Index*.

EPHEMERIDES, in *Aſtronomy*, tables calculated by aſtronomers, ſhowing the preſent ſtate of the heavens for every day at noon; that is, the places wherein all the planets are found at that time. It is from theſe tables that the eclipſes, conjunctions, and aſpects of the planets, are determined; horoſcopes or celeſtial ſchemes conſtructed, &c. We have ephemerides of Origan, Kepler Argoli, Heckerus, Mezzarachis, Wing, De la Hire, Parker, &c. S. Caſſini has calculated ephemerides of the ſidera medicæa or ſatellites of Jupiter, which are of good uſe in determining the longitude. Epheſus

In England, the Nautical Almanack, or Aſtronomical Ephemeris, publiſhed annually by anticipation, under the direction of the commiſſioners of longitude, is the moſt conſiderable. In France, celeſtial ephemerides have been publiſhed by M. Deſplaces every ten years, from 1715 to 1745; they were afterwards continued by the Abbé Caille, with many additions; of which an account may be ſeen in the Hiſtory of the Academy of Sciences for 1743. The Academy of Sciences have likewiſe publiſhed annually, from the beginning of the preſent century, a kind of ephemeris under the title of *Connoiſſance des Tems*.

EPHESUS, a city of antiquity, much celebrated on account of its temple of Diana, and for being the moſt famous mart or ſtaple town of Hither Aſia. Epheſus was in ancient times the metropolis of all Aſia. Stephanus gives it the title of *Epiphaneſtates*, or *moſt illuſtrious;* and Pliny ſtyles it the ornament of Aſia. The ancient city ſtood about 50 miles ſouth of Smyrna, near the mouth of the river Cayſter, and the ſhore of the Icarian ſea, which is a bay of the Ægæan; but as it has been ſo often deſtroyed and rebuilt, it is no eaſy matter to determine the preciſe place. Moſt of our modern travellers are of opinion, that the ancient city ſtood more to the ſouth than the preſent; which they argue from the ruins that ſtill remain. Epheſus was, in ancient times, known by the names of *Alopes*, *Ortygia*, *Morges*, *Smyrna*, *Trachæa*, *Samornion*, and *Ptelo*. It was called *Epheſus*, according to Heraclides, from the Greek word *epheſis*, ſignifying *permiſſion;* becauſe Hercules (ſays he) permitted the Amazons to live and build a city in that place. Others tell us, that Epheſus was the name of the Amazon that founded the city; for Pliny, Juſtin, and Oroſius, unanimouſly affirm that it was built by an Amazon; while others beſtow this honour upon Androclus, the ſon of Codrus king of Athens, who was the chief of the Ionians that ſettled in Aſia. But in matters of ſo early a date, it is impoſſible to come at the truth, and therefore not worth our while to dwell on ſuch fruitleſs inquiries. What we know for certain is, that the city, which in the Roman times was the metropolis of all Aſia, acknowledged Lyſimachus for its founder; for that prince, having cauſed the ancient city to be entirely demoliſhed, rebuilt, at a vaſt expence, a new one, in a place more convenient, and nearer the temple. Strabo tells us, that, as the inhabitants ſhowed a great reluctance to quit their ancient habitations, Lyſimachus cauſed all the drains that conveyed the water into the neighbouring fens and the Cayſter to be privately ſtopped up; whereby the city being on the firſt violent rains in great part laid under water, and many of the inhabitants drowned, they were glad to abandon the ancient and

retire

Ephesus. retire to the new city. This new Ephesus was greatly damaged by an earthquake in the reign of Tiberius, but by that emperor repaired and adorned with several stately buildings, of which there are now but few ruins to be seen, and scarce any thing worthy of ancient Ephesus. The aqueduct, part of which is still standing, is generally believed to have been the work of the Greek emperors; the pillars which support the arches are of fine marble, and higher or lower as the level of the water required. This aqueduct served to convey water into the city from the spring of Halites, mentioned by Pausanius. The gate, now called by the inhabitants, for what reason we know not, *the Gate of Persecution*, is remarkable for three bas-reliefs on the mould of an exquisite taste. The port, of which so many medals have been struck, is at present but an open road, and not much frequented. The Cayster was formerly navigable, and afforded a safe place for ships to ride in, but is now almost choked up with sand.

But the chief ornament of Ephesus was the temple of Diana, built at the common charge of all the states in Asia, and for its structure, size, and furniture, accounted among the wonders of the world. This great edifice was situated at the foot of a mountain, and at the head of a marsh; which place they chose, if we believe Pliny, as the least subject to earthquakes. This site doubled the charges; for they were obliged to be at a vast expence in making drains to convey the water that came down the hill into the morass and the Cayster. Philo Byzantius tells us, that in this work they used such a quantity of stone, as almost exhausted all the quarries in the country; and these drains or vaults are what the present inhabitants take for a labyrinth. To secure the foundations of the conduits or sewers, which were to bear a building of such a prodigious weight, they laid beds of charcoal, says Pliny, well rammed, and upon them others of wool. Two hundred and twenty years, Pliny says 400, were spent in building this wonderful temple by all Asia. It was 425 feet in length, and 200 in breadth, supported by 127 marble pillars, 70 feet high, of which 27 were most curiously carved, and the rest polished. These pillars were the works of so many kings, and the bas-reliefs of one were done by Scopas, the most famous sculptor of antiquity; the altar was almost wholly the work of Praxiteles. Cheiromocrates, who built the city of Alexandria, and offered to form Mount Athos into a statue of Alexander, was the architect employed on this occasion. The temple enjoyed the privilege of an asylum, which at first extended to a furlong, was afterwards enlarged by Mithridates to a bow-shot, and doubled by Mark Antony, so that it took in part of the city: but Tiberius, to put a stop to the many abuses and disorders that attend privileges of this kind, revoked them all, and declared, that no man guilty of any wicked or dishonest action should escape justice, though he fled to the altar itself.

The priests who officiated in this temple were held in great esteem, and trusted with the care of sacred virgins, or priestesses, but not till they were made eunuchs. They were called *Ephiatores* and *Essenæ*, had a particular diet, and were not allowed by their constitutions to go into any private house. They were maintained with the profits accruing from the lake Selinusis, and another that fell into it, which must have been very considerable, since they erected a golden statue to one Artemidorus, who being sent to Rome, recovered them after they had been seized by the farmers of the public revenues. All the Ionians resorted yearly to Ephesus with their wives and children, where they solemnized the festival of Diana with great pomp and magnificence, making on that occasion rich offerings to the goddess, and valuable presents to her priests. The asiarchæ, mentioned by St Luke, were, according to Beza, those priests whose peculiar province it was to regulate the public sports that were annually performed at Ephesus in honour of Diana: they were maintained with the collections made during the sports; for all Asia flocked to see them. The great Diana of the Ephesians, as she was styled by her blind adorers, was, according to Pliny, a small statue of ebony, made by one Canitia, though commonly believed to have been sent down from heaven by Jupiter. This statue was first placed in a niche, which, as we are told, the Amazons caused to be made in the trunk of an elm. Such was the first rise of the veneration that was paid to Diana in this place. In process of time the veneration for the goddess daily increasing among the inhabitants of Asia, a most stately and magnificent temple was built near the place where the elm stood, and the statue of the goddess placed in it. This was the first temple; but not quite so sumptuous as that which we have described, though reckoned, as well as the second, among the wonders of the world. The second, being that above described, was remaining in Pliny's time, and in Strabo's; and is supposed to have been destroyed in the reign of Constantine, pursuant to the edict by which that emperor commanded all the temples of the heathens to be thrown down and demolished: the former was burnt the same day that Alexander was born, by one Erostratus, who owned on the rack, that the only thing which had prompted him to destroy so excellent a work, was the desire of transmitting his name to future ages. Whereupon the common council of Asia made a decree, forbidding any one to name him; but this prohibition served only to make his name more memorable, such a remarkable extravagance, or rather madness, being taken notice of by all the historians who have written of those times. Alexander offered to rebuild the temple at his own expence, provided the Ephesians would agree to put his name on the front; but they rejected his offer in such a manner as prevented the resentment of that vain prince, telling him, that "it was not fit one god should build a temple to another." The pillars, and other materials that had been saved out of the flames, were sold, and also the jewels of the Ephesian women, who on that occasion willingly parted with them; and the sum raised from thence served for the carrying on of the work till other contributions came in, which in a short time amounted to an immense treasure. This is the temple which Strabo, Pliny, and other Roman writers speak of. It stood between the city and the port, and was built, or rather finished, as Livy tells us, in the reign of King Servius. Of this wonderful structure there is nothing at present remaining but some ruins, and a few broken pillars.

Ephesus.

The Ionians first settled at Ephesus under the conduct of Androclus, who drove out the Carians and Leleges, by whom those places were possessed at his arrival.

Epheſus. rival. The city, whether built by him, as Strabo affirms, or by Crœſus or Epheſus, long before the Ionic migration, as others maintain, became ſoon the metropolis of Ionia. It was at firſt governed by Androclus, and his deſcendants, who aſſumed the royal title, and exerciſed the regal authority over the new colony: whence, even in Strabo's time, the poſterity of Androclus were ſtyled kings, and allowed to wear a ſcarlet robe, with a ſceptre, and all the enſigns of the royal dignity. In proceſs of time, a new form of government was introduced, and a ſenate eſtabliſhed; but when, or on what occaſion, this change happened, we know not. This kind of government continued till the time of Pythagoras, who lived before Cyrus the Great, and was one of the moſt cruel and inhuman tyrants we read of in hiſtory; for having driven out the ſenate, and taken all the power into his own hands, he filled the city with blood and rapine, not ſparing even thoſe who fled to the temple of Diana for ſhelter. Pythagoras was ſucceeded by Pindarus, who bore the ſame ſway in the city; but treated the citizens with more humanity. In his time Epheſus being beſieged by Crœſus king of Lydia, he adviſed the inhabitants to devote their city to Diana, and faſten the wall, by a rope, to the pillars of her temple. They followed his advice, and were, from reverence to the goddeſs, not only treated with great kindneſs by Crœſus, but reſtored to their former liberty. Pindarus being obliged to reſign his power, retired to Peloponneſus. He was, according to Ælian, grandſon to Alyattes king of Lydia, and Crœſus's nephew. The other tyrants of Epheſus mentioned in hiſtory are, Athenagoras, Comes, Ariſtarchus, and Hegeſias; of whom the laſt was expelled by Alexander, who, coming to Epheſus, after having defeated the Perſians on the banks of the Granicus, beſtowed upon Diana all the tributes which the Epheſians had paid to the Perſians, and eſtabliſhed a democracy in the city. In the war between Mithridates and the Romans, they ſided with the former, and, by his directions, maſſacred all the Romans that reſided in their city; for which barbarity they were ſeverely fined, and reduced almoſt to beggary by Sylla, but afterwards treated kindly, and ſuffered to live according to their own laws, as is plain from ſeveral ancient inſcriptions and medals. The Epheſians were much addicted to ſuperſtition, ſorcery, and curious arts, as the ſcripture ſtyles them: whence came the proverb "Epheſian letters," ſignifying all ſorts of ſpells or charms.

In the time of the apoſtle Paul, Epheſus retained a great deal of its ancient grandeur. But it was a ruinous place, when the emperor Juſtinian filled Conſtantinople with its ſtatues, and raiſed his church of St Sophia upon its columns. Since then it has been almoſt quite exhauſted. Towards the end of the 11th century, a Turkiſh pirate, named *Tangripermes*, ſettled there. But the Greek admiral, John Ducas, defeated him in a bloody battle, and purſued the flying Turks up the Meander. In 1306, it was among the places which ſuffered from the exactions of the grand-duke Roger; and two years after, it ſurrendered to Sultan Sayſan, who, to prevent future inſurrections, removed moſt of the inhabitants to Tyriæum, where they were maſſacred. Epheſus appears to have ſubſiſted as an inconſiderable place for ſome time. But now, the Epheſians are only a few Greek peaſants, living in extreme wretchedneſs, dependence, and inſenſibility; the repreſentatives of an illuſtrious people, and inhabiting the wreck of their greatneſs; ſome, the ſubſtructions of the glorious edifices which they raiſed; ſome, beneath the vaults of the ſtadium, once the crowded ſcene of their diverſions; and ſome, by the abrupt precipice, in the ſepulchres which received their aſhes. Ephetæ || Ephraim.

EPHETÆ (from ἐφίημι, "I ſend forth"), in antiquity, a ſort of magiſtrates among the Athenians, inſtituted by King Demophoon, to take cognizance of murder, manſlaughter, and chance-medley.

Their number was 100, whereof 50 were Athenians, and 50 Argians: they were not admitted to the poſt till upwards of 50 years of age. Draco new-modelled it, excluded the Argians out of it, and made it to conſiſt of 51 Athenians, each above 50 years of age: Ubbo Emmius de Rep. Athen. ſays, he transferred to them part of the juriſdiction of the Areopagites. See AREOPAGUS.

EPHOD, in Jewiſh antiquity, one part of the prieſtly habit; being a kind of girdle, which, brought from behind the neck over the two ſhoulders, and hanging down before, was put acroſs the ſtomach, then carried round the waiſt, and made uſe of as a girdle to the tunic.—There were two ſorts of ephods, one of plain linen for the prieſts, and the other embroidered for the high-prieſt.

EPHORI, in Grecian antiquity, magiſtrates eſtabliſhed in ancient Sparta to balance the regal power. The authority of the ephori was very great. They ſometimes expelled and even put to death the kings, and aboliſhed or ſuſpended the power of the other magiſtrates, calling them to account at pleaſure. There were five of them, others ſay nine. They preſided in the public ſhows and feſtivals. They were entruſted with the public treaſure; made war and peace; and were ſo abſolute, that Ariſtotle makes their government equal to the prerogative of a monarchy. They were eſtabliſhed by Lycurgus, according to the generality of authors: though this is denied by others, who date their origin 130 years after the time of that legiſlator. Thus Plutarch, in his Life of Cleomenes, aſcribes their inſtitution to Theopompus king of Sparta; which is alſo confirmed by the authority of Ariſtotle.

EPHORUS, an orator and hiſtorian of Cumæ in Æolia, about 352 years before Chriſt. He was diſciple to Iſocrates, by whoſe advice he wrote a hiſtory which gave an account of all the actions and battles that had happened between the Greeks and barbarians for 750 years. It was greatly eſteemed by the ancients; but is now loſt.

EPHRAIM, in *Ancient Geography*, one of the diviſions of Paleſtine by tribes: Ephraim and the half tribe of Manaſſeh are blended together by the ſacred writer; and it only appears that Ephraim occupied the more ſouthern, and the half tribe of Manaſſeh the more northern parts, but both ſeem to have extended from the Jordan to the ſea. Ephraim alſo denotes a kingdom, on the ſeparation of the 10 tribes from the houſe of David, called alſo the kingdom of Iſrael and of Samaria.

EPHRATA,

Ephrata || Epicedon.

EPHRATA, a small town of Pennsylvania in America, and the principal settlement of the religious sect called *Dunkards* or *Tunkers*. See TUNKERS.

EPHREM, SYRUS, an ancient Christian writer, in the fourth century, deacon of Edessa, was born at Nisibe in Syria. He was greatly esteemed by St Basil, St Gregory, Nyssen, and other great men. He wrote against the opinions of Sabellius, Arius, Apollonarius, the Manichees, &c. and acquired such reputation by his virtue and his works, that he was called the *doctor and the prophet of the Syrians*. He died in 378. The best editions of his works are, that of Oxford, in 1708, in folio, and that of Rome, from 1732 to 1738, in Syriac, Greek, and Latin, 6 vols folio.

EPHYDOR, in antiquity, an officer in the Athenian courts of justice, who was to provide the plaintiff and defendant with equal water hour-glasses. When the glass was run out, they were not permitted to speak any farther; and, therefore, we find them very careful not to lose or mispend one drop of their water. Whilst the laws quoted by them were reciting, or if any other business happened to intervene, they gave orders that the glass should be stopped.

EPIBATÆ, Επιβαται, among the Greeks, marines, or soldiers who served on board the ships of war. They were armed in the same manner as the land-forces, only that more of them wore full or heavy armour.

EPIBATERION, a poetical composition, in use among the ancient Greeks. When any person of condition and quality returned home after a long absence or journey into another country, he called together his friends and fellow-citizens, and made them a speech, or rehearsed them a copy of verses, wherein he returned solemn thanks to the immortal gods for his happy return; and ended with an address by way of compliment to his fellow-citizens.—These verses made what the Greeks call επιβατηριον, *epibaterium*, of επιβαινω, "I go abroad." At going away they had another, called *apobaterium*.

EPIBATERIUM, a genus of plants belonging to the moncecia class. See BOTANY *Index*.

EPIC, or HEROIC, *Poem*, a poem expressed in narration, formed upon a story partly real and partly feigned; representing, in a sublime style, some signal and fortunate action, distinguished by a variety of great events, to form the morals, and affect the mind with the love of heroic virtue.

We may distinguish three parts of the definition, namely, the matter, the form, and the end. The matter includes the action of the fable, under which are ranged the incidents, episodes, characters, morals, and machinery. The form comprehends the way or manner of the narration, whether by the poet himself, or by any persons introduced, whose discourses are related: to this branch likewise belong the moving of the passions, the descriptions, discourses, sentiments, thoughts, style, and versification; and besides these, the similies, tropes, figures, and, in short, all the ornaments and decorations of the poem. The end is to improve our morals and increase our virtue. See POETRY.

EPICEDON (formed of επι *upon*, and κηδος *funeral*), in the Greek and Latin poetry, a poem, or poetical composition, on the death of a person.—At the obsequies of any man of figure, there were three kinds of discourses usually made; that rehearsed at his *bustum* or funeral pile, was called *nenia*; that engraven on his tomb, *epitaph*; and that spoken in the ceremony of his funeral, *epicedion*. We have two beautiful epicedions in Virgil, that of Euryalus and that of Pallas.

Epicedium || Epictetus.

EPICEDIUM, in ancient poetry, a poem rehearsed during the funeral solemnity of persons of distinction.

EPICHARMUS, an ancient poet and philosopher, born in Sicily, was a scholar of Pythagoras. He is said to have introduced comedy at Syracuse in the reign of Hiero. Horace commends Plautus for imitating him, in following the chase of the intrigue so closely as not to give the readers or spectators time to trouble themselves with doubts concerning the discovery. He wrote likewise treatises concerning philosophy and medicine; but none of his works have been preserved. He died aged 90, according to Laertius, who has preserved four verses inscribed on his statue.

EPICHIROTONIA, among the Athenians. It was ordained by Solon, that once every year the laws should be carefully revised and examined; and if any of them were found unsuitable to the present state of affairs, they should be repealed. This was called επιχειροτονια των νομων, from the manner of giving their suffrages by *holding up their hands*. See a farther account of this custom in Pott. Archæol. Græc. lib. 1. cap. 26. tom. i. p. 242.

EPICOENE, in *Grammar*, a term applied to nouns, which, under the same gender and termination, mark indifferently the male and female species. Such in Latin is *aquila*, *vespertilio*, &c. which signify equally a male or female eagle or bat.

Grammarians distinguish between *epicœne* and *common*. A noun is said to be common of two kinds, when it may be joined either with a masculine or a feminine article; and epicœne, when it is always joined to some of the two articles, and yet signifies both genders.

EPICTETUS, a celebrated Stoic philosopher, born at Hierapolis in Phrygia, in the first century, was the slave of Epaphroditus, a freedman and one of Nero's guard. Domitian banishing all philosophers from Rome, about the year 94, Epictetus retired to Nicopolis in Epirus, where he died in a very advanced age; and after his death, the earthen lamp he made use of sold for 3000 drachmas. He was a man of great modesty; which was eminent in his own practice, as well as in his recommendation to others: hence he used to say, "That there is no need of adorning a man's house with rich hangings or paintings, since the most graceful furniture is temperance and modesty, which are lasting ornaments, and will never be the worse for wearing." Of all the ancient philosophers, he seems to have made the nearest approaches to the Christian morality, and to have had the most just ideas of God and providence. He always possessed a cool and serene mind, unruffled by passion; and was used to say, that the whole of moral philosophy was included in these words, *support* and *abstain*. One day, his master Epaphroditus strove in a frolic to wrench his leg; when Epictetus said, with a smile, and free from any emotion, "If you go on, you will certainly break my leg:" but the former redoubling his effort, and striking it with all his strength, he at last broke the bone; when all the return Epictetus made was,

"Did

Epicurean Philoſophy.

"Did not I tell you, Sir, that you would break my leg?" No man was more expert at reducing the rigour of the maxims of the Stoics into practice. He conformed himſelf ſtrictly, both in his diſcourſe and behaviour, to the manners of Socrates and Zeno. He waged continual war with fancy and fortune; and it is an excellence peculiar to himſelf, that he admitted all the ſeverity of the Stoics without their ſourneſs, and reformed Stoiciſm as well as profeſſed it; and beſides his vindicating the immortality of the ſoul as ſtrenuouſly as Socrates or any Stoic of them all, he declared openly againſt ſelf-murder, the lawfulneſs of which was maintained by the reſt of the ſect. Arrian, his diſciple, wrote a large account of his life and death, which is loſt; and preſerved four books of his diſcourſes and his Enchiridion, of which there have been ſeveral editions in Greek and Latin; and, in 1758, a tranſlation of them into Engliſh was publiſhed by the learned and ingenious Miſs Carter.

EPICUREAN PHILOSOPHY, the doctrine or ſyſtem of philoſophy maintained by Epicurus and his followers.

His philoſophy conſiſted of three parts; canonical, phyſical, and ethereal. The firſt was about the canons or rules of judging. The cenſure which Tully paſſes upon him for his deſpiſing logic, will hold true only with regard to the logic of the Stoics, which he could not approve of, as being too full of nicety and quirk. Epicurus was not acquainted with the analytical method of diviſion and argumentation, nor was he ſo curious in modes and formation as the Stoics. Soundneſs and ſimplicity of ſenſe, aſſiſted with ſome natural reflections, was all his art. His ſearch after truth proceeded only by the ſenſes; to the evidence of which he gave ſo great a certainty, that he conſidered them as an infallible rule of truth, and termed them the *firſt natural light of mankind.*

In the ſecond part of this philoſophy he laid down atoms, ſpace, and gravity, as the firſt principles of all things: he did not deny the exiſtence of God, but thought it beneath his majeſty to concern himſelf with human affairs: he held him a bleſſed immortal Being, having no affairs of his own to take care of, and above meddling with thoſe of others.

As to his ethics, he made the ſupreme good of man to conſiſt in pleaſure, and conſequently ſupreme evil in pain. Nature itſelf, ſays he, teaches us this truth; and prompts us from our birth to procure whatever gives us pleaſure, and avoid what gives us pain. To this end he propoſes a remedy againſt the ſharpneſs of pain: this was to divert the mind from it, by turning our whole attention upon the pleaſures we have formerly enjoyed. He held that the wiſe man muſt be happy as long as he is wiſe; the pain, not depriving him of his wiſdom, cannot deprive him of his happineſs.

There is nothing that has a fairer ſhow of honeſty than the moral doctrine of Epicurus. Gaſſendus pretends, that the pleaſure in which this philoſopher has fixed the ſovereign good, was nothing elſe but the higheſt tranquillity of mind, in conjunction with the moſt perfect health of body: but Tully, Horace, and Plutarch, as well as almoſt all the fathers of the church, give us a very different account of it: indeed the nature of this pleaſure, in which the chief happineſs is ſuppoſed to be ſeated, is a grand problem in the morals of Epicurus. Hence there were two kinds of Epicureans, the rigid and the remiſs: the firſt were thoſe who underſtood Epicurus's notion of pleaſure in the beſt ſenſe, and placed all their happineſs in the pure pleaſures of the mind, reſulting from the practice of virtue: the looſe or remiſs Epicureans, taking the words of that philoſopher in a groſs ſenſe, placed all their happineſs in bodily pleaſures or debauchery. Epicurus II Epidaurus.

EPICURUS, the greateſt philoſopher of his age, was born at Gargettium in Attica, about 340 B. C. in the 109th Olympiad. He ſettled at Athens in a fine garden he had bought; where he lived with his friends in great tranquillity, and educated a great number of diſciples. They lived all in common with their maſter. The reſpect which his followers paid to his memory is admirable: his ſchool was never divided, but his doctrine was followed as an oracle. His birth-day was ſtill kept in Pliny's time; the month he was born in was obſerved as a continual feſtival; and they placed his picture everywhere. He wrote a great many books, and valued himſelf upon making no quotations. He raiſed the atomical ſyſtem to a great reputation, though he was not the inventor of it, but had only made ſome change in that of Democritus. As to his doctrine concerning the ſupreme good or happineſs, it was very liable to be miſrepreſented, and ſome ill effects proceeded from thence, which diſcredited his ſect. He was charged with perverting the worſhip of the gods, and inciting men to debauchery; but he did not forget himſelf on this occaſion; he publiſhed his opinions to the whole world; he wrote ſome books of devotion; recommended the veneration of the gods, ſobriety, and chaſtity; and it is certain that he lived in an exemplary manner, and conformably to the rules of philoſophical wiſdom and frugality. Timocrites, a deſerter of his ſect, ſpoke very ſcandalouſly of him. Gaſſendus has given us all he could collect from the ancients concerning the perſon and doctrine of this philoſopher; who died of a ſuppreſſion of urine, aged 72.

EPICYCLE, in the ancient aſtronomy, a little circle whoſe centre is in the circumference of a greater circle: or it is a ſmall orb or ſphere, which being fixed in the deferent of a planet, is carried along with it; and yet, by his own peculiar motion, carries the planet faſtened to it round its proper centre.

It was by means of epicycles that Ptolemy and his followers ſolved the various phenomena of the planets, but more eſpecially their ſtations and retrogradations.

EPICYCLOID, in *Geometry*, a curve generated by the revolution of the periphery of a circle, along the convex or concave ſide of the periphery of another circle.

EPICYEMA, among *Phyſicians*, denotes a ſuperfetation; being a falſe conception or mole happening after the birth of a regular fœtus.

EPIDAURUM, EPIDAURUS, or EPITAURUM, in *Ancient Geography*, a town of Dalmatia, on the Adriatic, built the ſame year, as is ſaid, with Dyrrachium, 430 years after the deſtruction of Troy: a conſiderable town formerly, but now reduced to a ſmall village, called *Raguſi Vecchio*; diſtant ſix miles from the modern Raguſi. E. Long. 19°. Lat. 42°. 20′.

EPIDAURUS, in *Ancient Geography*, a town of

Epidaurus. Argolis, in Peloponnesus, on the Saronic bay, to the south of the promontory *Spiræum*; called *sacred*, because of the religious veneration paid to Æsculapius, whose temple stood at the distance of five miles from the town. The Romans, during a pestilence, being advised to convey the god to Rome, sent a ship, with a solemn embassy, for his conveyance; but while the Epidaurians were in suspense to part with him, a huge serpent sailed to the ship; and being taken for the god, was carried to Rome in great solemnity. Epidaurus stood in a recess of the bay, fronting the east; and was fortified by nature, being inclosed by high mountains reaching to the sea, and rendering it difficult of access. It had several temples, and in the acropolis or citadel was a remarkable statue of Minerva. The site is now called *Epi-thavro*. The traces are indistinct, and it has probably been long deserted. The harbour of Epidaurus is long. Its periplus or circuit was 15 stadia or near two miles. The entrance is between mountains, and on a small rocky peninsula on the left hand are ruins of a modern fortress. This, it seems, was the point on which a temple of Juno stood. It is frequented by vessels for wood or corn. The grove of Æsculapius was inclosed by mountains, within which all the sacrifices as well of the Epidaurians as of strangers were consumed. One was called Titthion; and on this the god when an infant was said to have been exposed, and to have been suckled by a she-goat. He was a great physician, and his temple was always crowded with a sick persons. Beyond it was the dormitory of the suppliants; and near it, a circular edifice called the *Tholus*, built by Polycletus, of white marble, worth seeing. The grove, besides other temples, was adorned with a portico, and a fountain remarkable for its roof and decorations. The bath of Æsculapius was one of the benefactions of Antoninus Pius, while a Roman senator; as was also a house for the reception of pregnant women and dying persons, who before were removed out of the inclosure, to be delivered or to expire in the open air. The remains are heaps of stones, pieces of brick wall, and scattered fragments of marble; besides some churches or rather piles of rubbish miscalled, being destitute of doors, roofs, or any kind of ornament. The statue of Æsculapius was half as big as that of Jupiter Olympius at Athens. It was made of ivory and gold, and, as the inscription proved, by Thrasymedes son of Arignotus of Paros. He was represented sitting, holding his staff, with one hand on the head of a serpent, and a dog lying by him. Two Argive heroes, Bellerophon combating with the monster Chimæra, and Perseus severing the head of Medusa, were carved on the throne. Many tablets described the cures performed by the deity, yet he had not escaped contumely and robbery. Dionysius deprived him of his golden beard, affirming that it was unseemly in him to appear in that manner when his father Apollo was always seen with his face smooth. Sylla amassed the precious offerings belonging to him and to Apollo and Jupiter at Delphi and Olympia, to pay his army before Athens. The marks in the walls testified that a great number had been plucked down. A few fragments of white marble exquisitely carved occur in the heap of the temple. The inclosure of the temple once abounded in inscriptions. In the second century six marbles remained, on which were written in the Doric dialect the names of men and women who had been patients of the god, with the distemper each had laboured under, and the remedies he had directed. Dr Chandler found only a couple of votive inscriptions, and two pedestals of statues, one of which represented a Roman, and was erected by the city of the Epidaurians. The stadium was near the temple. It was of earth, as most in Greece were. At the upper end are seats of stone, but these were continued along the sides only a few yards. A vaulted passage leading underneath into the area, now choked up, was a private way by which the Agonothetæ or presidents with the priests and persons of distinction entered. Two large cisterns or reservoirs remain, made by Antoninus for the reception of rain water. Beyond them is a dry watercourse; and in the mountain-side on the right hand are the marble seats of the theatre, overgrown with bushes. The springs and wells by the ruins are now supposed to possess many excellent properties. To these and a good air, Dr Chandler thinks, with the recreations of the theatre and of the stadium, and to the medicinal knowledge and experience of the priests, may be attributed both the recovery of the sick and the reputation of Æsculapius. Epidaurus || Epidotæ.

EPIDAURUS, with the surname *Limera*, to distinguish it from the Epidaurus of Argolis; called so, either from its meadows or its commodious harbours (Stephanus, Apollodorus): a town of Laconia, on the Ionian sea, to the south of the Sinus Argolicus, situated where now Molvasia stands, in the Morea. E. Long. 23. 30. Lat. 35. 40.

EPIDEMIA, in Grecian antiquity, festivals kept in honour of Apollo and Diana, at the stated seasons, when those deities, who could not be present everywhere, were supposed to visit different places, in order to receive the vows of their adorers.

EPIDEMIC, among physicians, an epithet of diseases which at certain times are popular, attacking great numbers at or near the same time.

EPIDENDRUM, a genus of plants, belonging to the gynandria class; and in the natural method ranking under the seventh order, *Orchideæ*. See BOTANY *Index*.—This is the plant which produces the fruit called *vanilla*, and which is used in perfuming chocolate, tobacco, and snuff.

EPIDERMIS, in *Anatomy*, the cuticle or scarf-skin. See ANATOMY *Index*. The word is formed of the Greek επι, *on, over*; and δερμα, *skin*.

EPIDICASIA, among the Athenians. Daughters inheriting their parents estate were obliged to marry their nearest relation; which gave occasion to persons of the same family to go to law with one another, each pretending to be more nearly allied to the heiress than the rest. The suit was called επιδικασιας δικη: and the virgin, about whom the relations contested, επιδικος.

EPIDIDYMIS, in *Anatomy*, a little round body, on the back of each testicle; called also *parastata*. See ANATOMY *Index*.

EPIGÆA, a genus of plants, belonging to the decandria class; and in the natural method ranking under the 18th order, *Bicornes*. See BOTANY *Index*.

EPIDOTÆ, certain deities who presided over the growth

Epigaſtric growth of children. They were worſhipped by the Lacedæmonians, and chiefly invoked by thoſe who were perſecuted by the ghoſts of the dead, &c.

EPIGASTRIC REGION, a part or ſubdiviſion of the abdomen. See ANATOMY *Index*.

EPIGLOTTIS, in *Anatomy*, one of the cartilages of the larynx or wind-pipe. See ANATOMY *Index*.

EPIGONI, the ſons and deſcendants of the Grecian heroes who were killed in the firſt Theban war. The war of the Epigoni is famous in ancient hiſtory. It was undertaken ten years after the firſt. The ſons of thoſe who had periſhed in the firſt war, reſolved to avenge the death of their fathers, and marched againſt Thebes, under the command of Theriander; or, according to others, of Alcmæon the ſon of Amphiaraus, about 1307 years before Chriſt. The Argives were aſſiſted by the Corinthians, the people of Meſſenia, Arcadia, and Megara. The Thebans had engaged all their neighbours in their quarrel, as in one common cauſe. Theſe two hoſtile armies met and engaged on the banks of the Gliſſas. The fight was obſtinate and bloody, but victory declared for the Epigoni, and ſome of the Thebans fled to Illyricum with Leodamas their general, while others retired into Thebes, where they were ſoon beſieged, and forced to ſurrender. In this war Ægialeus was the only one who was killed, and his father Adraſtus was the only one who eſcaped alive in the firſt war. This whole war, as Pauſanias obſerves, was written in verſe; and Callinus, who quotes ſome of the verſes, aſcribes them to Homer, which opinion has been adopted by many writers. "For my part (continues the geographer), I own, that next to the Iliad and Odyſſey of Homer, I have never ſeen a finer poem." The deſcendants of the veteran Macedonians, who ſerved under Alexander the Great, and who had children by Aſiatic women, were alſo called *Epigoni*, (Juſtin.)

EPIGRAM, in *Poetry*, a ſhort poem in verſe, treating only of one thing, and ending with ſome lively, ingenious, and natural thought or point. The word is formed of επιγραμμα *inſcription*, of επιγραφειν *to inſcribe* or *write upon*.

Epigrams then, originally ſignify inſcriptions, and they derive their origin from thoſe inſcriptions placed by the ancients on their tombs, ſtatues, temples, triumphal arches, &c. Theſe, at firſt, were only ſimple monograms: afterwards, increaſing their length, they made them in verſe, to be the more eaſily retained: Herodotus and others have tranſmitted to us ſeveral of them. Such little poems retained the name of epigrams, even after the deſign of their firſt inſtitution was varied, and people began to uſe them for the relation of little facts and accidents, the characterizing of perſons, &c. The point or turn is a quality much inſiſted on by the critics, who require the epigram conſtantly to cloſe with ſomething poignant and unexpected, to which all the reſt of the compoſition is only preparatory; while others, on the contrary, exclude the point, and require the thought to be equally diffuſed throughout the poem, without laying the whole ſtreſs on the cloſe: the former is uſually Martial's practice, and the latter that of Catullus.

The Greek epigrams have ſcarce any thing of the point or briſkneſs of the Latin one: thoſe collected in the Anthology have moſt of them a remarkable air of eaſe and ſimplicity, attended with ſomething juſt and witty; ſuch as we find in a ſenſible peaſant, or a child that has wit. They have nothing that bites, but ſomething that tickles. Though they want the ſalt of Martial, yet to a good taſte they are not inſipid; except a few of them, which are quite flat and ſpiritleſs. However, the general faintneſs and delicacy of the pleaſantry in them has given occaſion for a Greek epigram, or *epigram à la Greque*, to denote, among the French, an epigram void of ſalt or ſharpneſs.

Epigaſtric || Epigram.

Epigraph: || Epimenides

The epigram admits of great variety of ſubjects: ſome are made to praiſe, and others to ſatirize; which laſt are much the eaſieſt, ill-nature ſerving inſtead of point and wit. Boileau's epigrams are all ſatires on one or another; thoſe of Des Reaux are all made in honour of his friends; and thoſe of Mad. Scudery are ſo many eloges. The epigram being only a ſingle thought, it would be ridiculous to expreſs it in a great number of verſes.

EPIGRAPHE, among antiquarians, denotes the inſcription of a building, pointing out the time when, the perſons by whom, the uſes, and the like, for which it was erected.

EPILEPSY, in *Medicine*, the ſame with what is otherwiſe called the *falling-ſickneſs*, from the patient's falling ſuddenly to the ground. See MEDICINE *Index*.

EPILOBIUM, the WILLOW HERB. A genus of plants, belonging to the octandria claſs; and in the natural method ranking under the 17th order, *Calycanthemæ*. See BOTANY *Index*.

EPILOGUE, in *Oratory*, the end or concluſion of a diſcourſe, ordinarily containing a recapitulation of the principal matters delivered.

EPILOGUE, in dramatic poetry, a ſpeech addreſſed to the audience, after the play is over, by one of the principal actors therein; uſually containing ſome reflections on certain incidents in the play, eſpecially thoſe in the part of the perſon that ſpeaks it; and having ſomewhat of pleaſantry, intended to compoſe the paſſions raiſed in the courſe of the repreſentation: A practice which is ridiculed by the *Spectator*; and compared to a merry jigg upon the organ after a good ſermon, to wipe away any impreſſions that might have been made thereby, and ſend the people away juſt as they came.

EPIMEDIUM, BARREN-WORT. A genus of plants, belonging to the tetrandria claſs; and in the natural method ranking under the 24th order, *Corydales*. See BOTANY *Index*.

EPIMENIDES, an ancient poet and philoſopher, was born at Gnoſſus in Crete. Contrary to the cuſtom of his country, he always wore his hair long; which, according to ſome, was becauſe he was aſhamed of being thought a Cretan: and indeed he does not ſeem to have had a high opinion of his countrymen, if that verſe cited by St Paul be, as it is generally believed to be, his; "The Cretans are always liars, evil beaſts, ſlow bellies." Many ſtories are related of him, too wonderful to merit attention; however, his reputation was ſo great over all Greece, that he was there eſteemed a favourite of the gods. The Athenians being afflicted with the plague, and commanded by the oracle to make a ſolemn luſtration of the city, ſent Nicias, the ſon of Niceratus, with a ſhip to Crete, to deſire Epimenides to come to them. He accepted their in-

Epimetheus, Epiphanius.

vitation, accompanied the meſſengers to Athens, performed the luſtration of the city, and the plague ceaſed. Here he contracted an acquaintance with Solon, whom he privately inſtructed in the proper methods for the regulation of the Athenian commonwealth. Having finiſhed his buſineſs at Athens, the citizens offered him many valuable preſents and high honours, and appointed a ſhip to carry him back to Crete; but he returned their preſents, and would accept of nothing except a little branch of the ſacred olive preſerved in the citadel; and deſired the Athenians to enter into an alliance with the Gnoſſians. Having obtained this, he returned to Crete; where he died ſoon after, aged 157 years; or as the Cretans, conſiſtently with their character, pretended, 299. He was a great poet, and wrote 5000 verſes on "the genealogy of the gods," 6500 "on the building of the ſhip Argos and Jaſon's expedition to Colchis," and 4000 "concerning Minos and Rhadamanthus." He wrote alſo in proſe, "Concerning ſacrifices and the commonwealth of Crete." St Jerome likewiſe mentions his "book of oracles and reſponſes." The Lacedemonians procured his body, and preſerved it among them by the advice of an oracle; and Plutarch tells us, that he was reckoned the ſeventh wiſe man by thoſe who refuſed to admit Periander into the number.

EPIMETHEUS, a ſon of Japetus and Clymene, one of the Oceanides, who inconſiderately married Pandora, by whom he had Pyrrha, the wife of Deucalion. He had the curioſity to open the box which Pandora had brought with her, and from thence iſſued a train of evils, which from that moment have never ceaſed to afflict the human race. Hope was the only one which remained at the bottom of the box, not having a ſufficient time to eſcape, and it is ſhe alone which comforts men under misfortunes. Epimetheus was changed into a monkey by the gods, and ſent into the iſland Pithecuſa.

EPIPHANIUS (St), an ancient father of the church, born at Beſanducan, a village in Paleſtine, about the year 332. He founded a monaſtery near the place of his birth, and preſided over it. He was afterwards elected biſhop of Salamis; when he ſided with Paulinus againſt Meletius, and ordained in Paleſtine Paulinian the brother of St Jerome; on which a conteſt aroſe between him and John biſhop of Jeruſalem. He afterwards called a council in the iſland of Cyprus, in which he procured a prohibition of the reading of Origen's writings; and made uſe of all his endeavours to prevail on Theophilus biſhop of Alexandria to engage St Chryſoſtom to declare in favour of that decree: but not meeting with ſucceſs, he went himſelf to Conſtantinople, where he would not have any converſation with St Chryſoſtom; and formed the deſign of entering the church of the apoſtles to publiſh his condemnation of Origen; but being informed of the danger to which he would be expoſed, he reſolved to return to Cyprus; but died at ſea in the year 403. His works were printed in Greek, at Baſil, 1544, in folio; and were afterwards tranſlated into Latin, in which language they have been often reprinted. Petavius reviſed and corrected the Greek text by two manuſcripts, and publiſhed it together with a new tranſlation at Paris in 1622. This edition was reprinted at Cologne in 1682.

Epiphany || Epirus.

EPIPHANY, a Chriſtian feſtival, otherwiſe called the *Manifeſtation of Chriſt to the Gentiles*, obſerved on the ſixth of January, in honour of the appearance of our Saviour to the three magi or wiſe men, who came to adore him and bring him preſents. The feaſt of epiphany was not originally a diſtinct feſtival; but made a part of that of the nativity of Chriſt, which being celebrated 12 days, the firſt and laſt of which were high or chief days of ſolemnity, either of theſe might properly be called *epiphany*, as that word ſignifies the appearance of Chriſt in the world.

The word in the original Greek, επιφανια, ſignifies *appearance* or *apparition*; and was applied, as ſome critics will have it, to this feaſt, on account of the ſtar which appeared to the magi.—St Jerome and St Chryſoſtom take the epiphany for the day of our Saviour's baptiſm, when he was declared to men by the voice, *Hic eſt filius meus dilectus, in quo mihi complacui*: "This is my beloved Son, in whom I am well pleaſed." And accordingly it is ſtill obſerved by the Cophtæ and Ethiopians in that view. Others contend, that the feaſt of Chriſtmas, or the nativity of our Saviour, was held in divers churches on this day; which had the denomination *epiphany*, or *appearance*, by reaſon of our Saviour's firſt appearance on earth at that time. And it muſt be allowed, that the word is uſed among the ancient Greek fathers, not for the appearance of the ſtar to the magi, but for that of our Saviour to the world: In which ſenſe St Paul uſes the word *epiphania* in his ſecond epiſtle to Timothy, i. 10.

EPIPHONEMA. See ORATORY, n° 96.

EPIPHORA, in *Medicine*, a preternatural defluxion of the eyes, when they continually diſcharge a ſharp ſerous humour, which excoriates the cheeks. See MEDICINE *Index*.

EPIPHYSIS, in *Anatomy*. See ANATOMY *Index*.

EPIPLOCELE, in *Medicine*, is a kind of hernia or rupture, in which the omentum ſubſides into the ſcrotum.

EPIPLOOMPHALON, in *Medicine*, an hernia umbilicalis, proceeding from the omentum falling into the region of the umbilicus or navel.

EPIPLOON. See OMENTUM, ANATOMY *Index*.

EPIRUS, a diſtrict of ancient Greece, bounded on the eaſt by Etolia, on the weſt by the Adriatic, on the north by Theſſaly and Macedon, and on the ſouth by the Ionian ſea. This country was anciently governed by its own princes, in which ſtate it made a very conſiderable figure. The country, according to Joſephus, was firſt peopled by Dodanim the ſon of Javan and grandſon of Japhet. The people were very warlike; but they continued in their ſavage ſtate long after their neighbours were civilized; whence the iſlanders uſed to threaten their offenders with tranſportation to Epirus. Their horſes were in great requeſt among the ancients, as well as the dogs produced in one of the diviſions called *Moloſſus*; and hence theſe dogs were called by the Romans *Moloſſi*.

The hiſtory of Epirus commences with the reign of Pyrrhus the ſon of Achilles by Deidamia the daughter of Lycomedes king of Scyros. He is ſaid to have behaved with great bravery at the ſiege of Troy; but it would appear that he behaved with no leſs barbarity. After the city was taken, he is ſaid to have killed old king Priam with his own hand; to have thrown Aſtyanax the ſon

of

Epirus.

of Hector and Andromache headlong from a high tower; and sacrificed Polyxena the daughter of Priam on the tomb of his father. He carried Andromache with him into Epirus, where he settled by the advice of the famous soothsayer Helenus, one of Priam's sons, who had served during the Trojan war both under his father and himself. The only remarkable period of the history of Epirus is the reign of Pyrrhus II. who made war upon the Romans. He was invited into Italy by the Tarentines; and embarked about 280 B. C. After having escaped many dangers by sea, he landed in that country, and with great difficulty gained a victory over the Romans; but he was afterwards utterly defeated by them †, and obliged to return into his own own country. To retrieve his honour, he then undertook an expedition against Macedon; where he overthrew Antigonus, and at last made himself master of the whole kingdom. He then formed a design of subduing all the other Grecian states; but met with such an obstinate resistance at Lacedæmon, that he was obliged to drop the enterprise; and was soon after killed at the siege of Argos by a woman, who from the wall threw a tile upon his head. Deidamia, the grand-daughter of Pyrrhus, was the last that sat on the throne of Epirus. She is said to have been murdered after a short reign; upon which the Epirots formed themselves into a republic.

† See *Rome*.

Under the new form of government Epirus never made any considerable figure, but seems rather to have been dependent on the kingdom of Macedon. The Romans having conquered Philip king of that country, restored the Epirots to their ancient liberty; but they, forgetful of this favour, soon after took up arms in favour of Perseus. As a punishment for this ingratitude, the Romans gave orders to Paulus Emilius, after the reduction of Macedon, to plunder the cities of Epirus, and level them with the ground. This was punctually executed throughout the whole country on the same day and at the same hour. The booty was sold, and each foot-soldier had 200 denarii, that is, six pounds nine shillings and two pence, and each of the horse the double of this sum. An hundred and fifty thousand men were made slaves, and sold to the best bidder for the benefit of the republic. Nor did the vengeance of Rome stop here; all the cities of Epirus, to the number of 70, were dismantled, and the chief men of the country carried to Rome, where they were tried, and most of them condemned to perpetual imprisonment. After this terrible blow, Epirus never recovered its ancient splendor. Upon the dissolution of the Achæan league, it was made part of the province of Macedon; but when Macedon became a diocese, Epirus was made a province of itself, called the province of *Old Epirus*, to distinguish it from *New Epirus*, another province lying to the east of it. On the division of the empire, it fell to the emperors of the east, and continued under them till the taking of Constantinople by the Latins, when Michael Angelus, a prince nearly related to the Greek emperor, seized on Etolia and Epirus, of which he declared himself despot or prince; and was succeeded by his brother Theodorus, who took several towns from the Latins, and so far enlarged his dominions, that, disdaining the title of *despot*, he assumed that of *emperor*, and was crowned by Demetrius archbishop of Bulgaria. Charles, the last prince of this family, dying without lawful issue, bequeathed Epirus and Acarnania to his natural sons, who were driven out by Amurath the second. Great part of Epirus was afterwards held by the noble family of the Castriots; who, though they were masters of all Albania, yet styled themselves princes of Epirus. Upon the death of the famous George Castriot, surnamed *Scanderbeg*, Epirus fell to the Venetians, who were soon dispossessed of it by the Turks; in whose hands it still continues, being now known by the name of *Albania*, which comprehends the Albania of the ancients, all Epirus, and that part of Dalmatia which is subject to the Turks.

Episcopacy.

EPISCOPACY, that form of church-government, in which diocesan bishops are established as distinct from and superior to priests or presbyters. We have already observed, that it is a long time since the ministers of religion have been distinguished into different orders, and that it has been much controverted whether the distinction be of divine or human right; whether it was settled in the apostolic age or afterwards. (See BISHOP.) This controversy commenced soon after the Reformation; and has been agitated with great warmth between the *Episcopalians* on the one side, and the *Presbyterians* and *Independents* on the other. Among the Protestant churches *abroad*, those which were reformed by *Luther* and his associates are in general *episcopal*; whilst such as follow the doctrines of *Calvin* have for the most part thrown off the order of bishops as one of the corruptions of popery. In *England*, however, the controversy has been considered as of greater importance than on the *Continent*; for it has there been strenuously maintained by one party, that the *episcopal order* is essential to the constitution of the church; and by others, that it is a pernicious encroachment on the rights of men, for which there is no authority in scripture. Though the question has for some time lain almost dormant, and though we have no desire to revive it; yet as a work of this kind might perhaps be deemed defective, did it contain no account whatever of a controversy which has employed some of the ablest writers of the past and present centuries, we shall give a fair though short view of the chief arguments by which the advocates of each contending party have endeavoured to support their own cause, leaving our readers to judge for themselves where the truth lies. See INDEPENDENTS and PRESBYTERIANS.

1 Commencement of the episcopal controversy.

The *Independent* maintains, that under the gospel dispensation there is nothing which bears the smallest resemblance to an exclusive priesthood; that Christ and his apostles constituted no permanent order of ministers in the church; but that any man who has a firm belief in revelation, a principle of sincere and unaffected piety, a capacity for leading devotion and communicating instruction, and a serious inclination to engage in the important employment of promoting the everlasting salvation of mankind; is to all intents and purposes a regular minister of the New Testament, especially if he have an invitation to the pastoral office from some particular society of Christians.

2 The Independent scheme.

Against this scheme, which supposes the rights of Christians all equal and common, and acknowledges no authority in the church except what may be derived from the election of her members, the Protestant Episcopalian reasons in the following manner. He admits, as an undoubted truth, that our blessed Lord gave to none

3 Episcopal arguments against it.

Epiſcopacy. none of his immediate followers authority or juriſdiction of ſuch a nature as could interfere with the rights of the civil magiſtrate, for all ſuch authority was diſclaimed by himſelf: "My kingdom (ſaid he to Pilate) is not of this world:" and to a certain perſon who aſked him to decide a queſtion of property between him and his brother, he replied, "Man, who made me a judge or a divider over you." But when it is conſidered, that Chriſt came into this world to "turn men from darkneſs to light, and from the power of Satan to the living God; that he gave himſelf for us, that he might redeem us from all iniquity, and purify to himſelf a peculiar people zealous of *good works;* that of theſe works many are ſuch as unregenerate humanity has no inclination to perform, and that the doctrines which he revealed are ſuch as human reaſon could never have diſcovered; the advocate for epiſcopacy thinks it was extremely expedient, if not abſolutely neceſſary; that, when he aſcended into heaven, he ſhould eſtabliſh upon earth ſome authority to illuſtrate the revelation which he had given, and to enforce obedience to the laws which he had enacted. There is nothing, continues he, more ſtrictly required of Chriſtians, than that they live together in unity, profeſſing the ſame faith, joining in the ſame worſhip, and practiſing the ſame virtues. But as men have very different paſſions, prejudices, and purſuits, ſuch unity would be impoſſible, were they not linked together in *one ſociety* under the government of perſons authoriſed to watch over the purity of the faith, to preſcribe the forms of public worſhip, and to explain the nature, and inculcate the neceſſity of the ſeveral virtues. The ſociety of Chriſtians, in reſpect of its unity and organization, is compared to the human body: for "as we have many members in one body, and all members have not the ſame office; ſo we being many are one body in Chriſt, and every one members one of another," (Rom. xii. 4, 5.) It is called the *church*, the *kingdom of heaven*, and *the kingdom of God;* and its affairs, like thoſe of every other kingdom, are adminiſtered by proper officers in ſubordination to the ONE LORD, who, "when he aſcended up on high, and led captivity captive, gave ſome apoſtles, and ſome prophets, and ſome paſtors and teachers, for the perfecting of the ſaints, for the work of the miniſtry, for the edifying of the body of Chriſt:" (Epheſ. iv. 8—13.) That thoſe various orders of miniſters were veſted with real authority in the church might be inferred from principles of reaſon as well as from the dictates of revelation. A ſociety without ſome ſort of government, government without laws, or laws without an executive power, is a direct abſurdity. Where there are laws, ſome muſt govern, and others be governed; ſome muſt command, and others obey; ſome muſt direct, and others ſubmit to direction. This is the voice of *nature;* it is likewiſe the language of *ſcripture.* "Obey them (ſays the inſpired author of the epiſtle to the Hebrews) who have the rule over you, and ſubmit yourſelves; for they watch for your ſouls as they that muſt give account." A text which ſhows that the authority of the miniſters of religion was diſtinct from that of the civil magiſtrate, whoſe duty is to watch, *not for the ſouls*, but for the *lives* and *properties*, of his ſubjects.

4 Chriſtians linked together in one ſociety called the *church*, the *kingdom of heaven*, and the *kingdom of God.*

5 The church governed by proper officers.

Of the ſociety thus conſtituted, it was not, as of a philoſophical ſect, left to every man's *choice* whether or not he would become a member. All who embrace the faith of the Redeemer of the world are required to be *baptiſed*, under the pain of forfeiting the benefits of redemption: but one great purpoſe for which baptiſm was inſtituted, is to be the rite of initiation into the church of Chriſt; "for by one ſpirit are we all baptized into one body, whether we be Jews or Gentiles, whether we be bond or free," (1 Cor. xii. 13.). Of baptiſm, whatever be the importance, it is evident, that to receive it, is not, like the practice of juſtice, or the veneration of the Supreme Being, a duty reſulting from the relations of man to his Creator and fellow-creatures; that its whole efficacy, which in ſcripture is ſaid to be nothing leſs than the remiſſion of ſins, is derived from *poſitive inſtitution;* and therefore, that the *external rite* can be of no avail, but when it is adminiſtered in the *manner preſcribed*, and by a perſon *authoriſed* to adminiſter it. That *all* Chriſtians are not veſted with this authority, as one of the common privileges of the faith, appears from the commiſſion which our Saviour after his reſurrection gave to his apoſtles. At that period, we are aſſured that the number of his followers was not leſs than *five hundred;* yet we find, that to the *eleven diſciples* only did "he come and ſpeak, ſaying, All power is given unto me in heaven and in earth; go ye, therefore, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghoſt."

Epiſcopacy.

6 All Chriſtians required to be members of the church.

7 All Chriſtians not authoriſed to adminiſter the ſacraments.

Of the 500 diſciples there is ſurely no reaſon to believe that there were not *many* well qualified to inſtruct either a Jew or a Gentile in the doctrines of the goſpel; and it is certain, that *any one* of them could have waſhed his convert with water in the name of the Holy Trinity as well as St Peter or St John: but ſuch an unauthoriſed waſhing would not have been Chriſtian baptiſm, nor of equal validity with it, any more than the opinion of a lawyer at the bar is the judgment of a court of juſtice, or of equal obligation. It is the commiſſion of the ſovereign which gives force to the judgment of the court; it is the commiſſion of Chriſt which gives validity to baptiſm. The ſame reaſoning is applicable to the Lord's ſupper, which, if it be not adminiſtered by thoſe who have authority for ſuch adminiſtration, cannot be deemed a ſacrament of Chriſt's inſtitution.

Theſe two rites are the external badges of our profeſſion. By the *one*, we are incorporated into that ſociety of which our Redeemer is the head and ſovereign: in the celebration of the *other*, we have a right to join, whilſt of that ſociety we continue members. But if by an open and ſcandalous diſregard of the precepts of the goſpel, we ſhould prove ourſelves unworthy of its privileges, the ſame perſons who are authoriſed to admit us into the church, are likewiſe veſted with authority to caſt us out of it: for to them were given "the keys of the kingdom of heaven (or the church), with aſſurance, that whatſoever they ſhould bind on earth, ſhould be bound in heaven; and whatſoever they ſhould looſe on earth, ſhould be looſed in heaven," (Mat. xviii. 18.) As baptiſm is to be adminiſtered ſo long as there ſhall be perſons to be enliſted under the banners of Chriſt, and the Lord's Supper to be celebrated ſo long as it ſhall be the duty of ſoldiers to adhere to the ſtandard of their leader and their head; and as it is likewiſe to be feared that there will never come a time when

Episcopacy.

when all Christians shall "walk worthy of the vocation wherewith they are called;" it follows, that this *power of keys*, which was originally given to the apostles, must continue in the church through all ages, even unto the end of the world. But as we have seen, that it was not at first intrusted to *all* the disciples in common, as one of the privileges inseparable from their profession, and as no body of men can possibly *transfer* an authority of which they themselves were *never possessed*; it is certain, that even now it cannot, by the election of one class of Christians, be delegated to another, but must, by some mode of succession, be derived from the apostles, who were sent by Christ as he was sent by his Father. To argue from the origin of *civil* to that of *ecclesiastical* government, although not very uncommon, the Episcopalian deems extremely fallacious. Of the various nations of the world, many of the sovereigns may indeed derive their authority from the suffrages of their subjects; because in a state of nature every man has an inherent right to defend his life, liberty and property; and what he possesses in his own person, he may for the good of society transfer to another: but no man is by *nature*, or can *make himself*, a member of the Christian church; and therefore authority to govern that society can be derived only from him by whom it was founded, and who died that he might "gather together in one all the children of God."

5 Christians as a body cannot transfer to one of their number an authority of which they were never possessed.

9 Authority to govern the church can be derived only from Christ.

Against such reasoning as this it hath been urged, that to make institutions, which like baptism and the Lord's supper are generally necessary to the salvation of *all* Christians, depend for their efficacy upon the authority or commission of a *particular order*, appears inconsistent with the wisdom and goodness of God; as by such an economy an intolerable domination would be established over the souls of men, and the purpose for which the Saviour of the world died might be in some degree defeated by the caprice of an ignorant and arbitrary priesthood. The objection is certainly plausible; but the Episcopalian affirms, that either it has no weight, or militates with equal force against the wisdom of Providence in the government of this world.—In every thing, he observes, relating to their temporal and to their spiritual interests, mankind are all subjected to mutual dependence. The rich depend upon the poor, and the poor upon the rich. An infant neglected from the birth would barely cry and cease to live; nor is it easily to be conceived, that in the more rigid climates of the earth a full grown man could provide even the necessaries of mere animal life. Of religion, it is certain that in such a state nothing could be known; for there is not the smallest reason to imagine that any individual of the human race—an *Aristotle*, a *Bacon*, or a *Newton*, had he been left alone from his infancy, without culture and without education,—could ever, by the native vigour of his own mind, have discovered the existence of a God, or that such speculations as lead to that discovery would have employed any portion of his time or his thoughts. Even in civilized society it would be impossible, in the present age, for any man, without the assistance of others, to understand the very first principles of our common Christianity; for the scriptures, which alone contain those principles, are written in languages which are now nowhere vernacular. In the fidelity of translators, therefore, every illiterate disciple of Jesus *must* confide, for the truth of those doctrines which constitute the foundation of all his hopes; and as no man ever pretended that the Christian *sacraments* are more necessary to salvation than the Christian *faith*, the Episcopalian sees no impropriety or inconsistency in making those persons receive baptism and the Lord's supper by the ministration of others, who by such ministration must of necessity receive the truths of the gospel.

10 An objection answered.

Episcopacy.

11 A permanent order of ministers constituted by Christ.

By such arguments as these does the Episcopalian endeavour to prove that Christ constituted some *permanent order of ministers* in the church, to whom in the externals of religion the great body of Christians are commanded to pay obedience; and thus far the Presbyterian agrees with him; but here their agreement ends. They hand in hand attack the Independent with the same weapons, and then proceed to attack each other. The *one* maintains, that originally the officers of the Christian church were all *presbyters* or *elders* of *one order*, and vested with *equal powers*; whilst the *other* holds, that Christ and his apostles appointed *divers orders* of ministers in the church; that of these orders the highest alone was empowered to ordain others; and that therefore obedience, as to those who watch for our souls, can be due only to such as are *episcopally ordained*.

12 The Presbyterian plea.

In behalf of the Presbyterian plea it is urged, that the titles of *bishop* and *presbyter*, being in the New Testament indifferently given to the same persons, cannot be the titles of distinct ecclesiastical officers; which appears still more evident from the ordination of *Timothy*, who, although he was the first *bishop* of Ephesus, received his episcopal character by the imposition of the hands of the *presbytery*.—That one and the same man is, in the New Testament, styled sometimes a *bishop* and sometimes a *presbyter*, cannot be denied; but although every apostolic bishop was therefore undoubtedly a presbyter, it does not of course follow, says the Episcopalian, that every presbyter was likewise a bishop. In the *Old* Testament, Aaron and his sons are without any discrimination of order frequently styled *priests*; and in the *New*, both St Peter and St John call themselves *presbyters*, as St Paul, upon one occasion, styles himself a *deacon*—διακονος (Eph. iii. 7.): yet no man ever supposed those apostles to have been such ecclesiastical officers as modern presbyters and deacons; and it is universally known, that in the Jewish priesthood there were different orders, and that Aaron was of an order superior to his sons. This being the case, the presbyters, by the laying on of whose hands Timothy was made a bishop, *may have been* of the same order with St Peter and St John; and if so, it follows that his ordination was *Episcopal*. At all events, we are certain, continues the advocate for Episcopacy, that it was not, in the modern sense of the word, *Presbyterian*; for the gift, which in the first epistle is said to have been "given by prophecy *with* the laying on of the hands of the presbytery," is in the second said to have been "in him *by* the putting on of the hands of St Paul." And here it is worthy of observation, that the preposition used in the former case is μετα, which signifies *concurrence* rather than instrumentality; but *that* in the latter is δια, which, as every Greek scholar knows, is prefixed to the *instrumental cause* by which any thing is effected: so that whatever may have been the order of the presbyters

13 Episcopal arguments against it.

Epiſcopacy.

byters who *concurred*, St Paul appears to have been the *ſole* ordainer. But by the confeſſion of all parties, St Paul was a biſhop in the higheſt ſenſe in which that word is ever uſed; and the powers of the epiſcopate not being parcelled out among various partners, of whom each poſſeſſes only a ſhare, the impoſition of his hands was ſufficient for every purpoſe which could have been effected by the hands of the whole college of apoſtles.

It appears, therefore, that from the promiſcuous uſe of the titles *biſhop* and *preſbyter*, and from the *ordination of Timothy*, nothing can with certainty be concluded on either ſide of this celebrated queſtion. But if, inſtead of reſting on mere *words*, which when taken alone and without regard to the context, are almoſt all of ambiguous ſignification, we attend to ſome important *facts* recorded in the New Teſtament, the Epiſcopalian thinks we ſhall in them diſcover ſufficient evidence that the government of the primitive church was prelatical.

During our Saviour's ſtay upon earth, it is undeniable that he had under him two diſtinct orders of miniſters—the twelve, and the ſeventy; and after his aſcenſion, immediately before which he had enlarged the powers of the *eleven*, we read of *apoſtles*, *preſbyters*, and *deacons*, in the church. That the preſbyters were ſuperior to the deacons, and the apoſtles ſuperior to both, is univerſally acknowledged; but it has been ſaid, that in Scripture we find no intimation that the apoſtolic order was deſigned for continuance. A Quaker ſays the ſame thing of water-baptiſm; and the Epiſcopalian obſerves, that it would be difficult to point out by what paſſage of Scripture, or what mode of reaſoning, thoſe who upon this plea reject the apoſtolic order of Chriſtian miniſters, could overthrow the principles upon which the diſciples of *George Fox* reject the uſe of that rite which our Saviour inſtituted for the initiation of mankind into his church. They were the *eleven* alone to whom Chriſt ſaid, "Go ye therefore and teach all nations, baptiſing them in the name of the Father, and of the Son, and of the Holy Ghoſt:" and therefore, although we frequently find preſbyters and deacons adminiſtering the ſacrament of baptiſm, we muſt conclude, that as a *judge* adminiſters juſtice by authority derived from his *ſovereign*, ſo thoſe *inferior officers* of the church adminiſtered baptiſm by authority derived from the *apoſtles*. Indeed, had they pretended to act by any other authority, it is not eaſily to be conceived how *their* baptiſm could have been the baptiſm inſtituted by Chriſt; for it was not with the *external waſhing* by whomſoever performed, but with the *eleven* and their ſucceſſors, that he promiſed to be "always, even unto the end of the world."

14 Three orders of Chriſtian miniſters during our Saviour's ſtay upon earth; and likewiſe after his aſcenſion into heaven.

That the *eleven* did not conſider this promiſe, or the commiſſion with which it was given, as terminating with their lives, is evident from their admitting others into their own order; for which they had competent authority, as having been ſent by Chriſt as he was ſent by his Father. When St Paul, to magnify his office and procure to it from the Galatians due reverence, ſtyles himſelf, "an apoſtle not of men, neither by man, but by Jeſus Chriſt and God the Father," he muſt have known ſome who derived their apoſtolic miſſion *by man*; otherwiſe he could with no propriety have claimed particular reſpect, as he evidently does, from what was in his own apoſtleſhip no particular diſtinction. At that very early period, therefore, there muſt have been in the church *ſecondary* apoſtles, if they may be ſo called, upon whom, by impoſition of hands, or by ſome other ſignificant ceremony, the eleven had conferred that authority which was given to them by their Divine Maſter. Such were *Matthias* and *Barnabas*; ſuch likewiſe were *Timothy*, *Titus*, and the *angels* of the ſeven churches in Aſia, with many others whoſe names and offices are mentioned in the New Teſtament.

15 The apoſtolic or higheſt order deſigned to be permanent.

That *Matthias* and *Barnabas* were of the apoſtolic order, has never been controverted; and that *Timothy* and *Titus* were ſuperior to modern preſbyters, is evident from the offices aſſigned them. Timothy was, by St Paul, empowered to *preſide* over the preſbyters of Epheſus, to receive accuſations againſt them, to *exhort*, to *charge*, and even to *rebuke* them; and Titus was, by the ſame apoſtle, left in Crete for the expreſs purpoſe of ſetting things in order, and ordaining *preſbyters* in *every* city. To *exhort*, to *charge*, and with authority to *rebuke* one's equal, is certainly incongruous; and therefore the Epiſcopalian thinks the powers conferred on Timothy altogether inconſiſtent with that parity of order and of office for which his antagoniſts ſo ſtrenuouſly plead. Even the commiſſion given to Titus appears in his eyes by much too extenſive for a Preſbyterian miniſter, who, after having ordained in *one* city, could not have proceeded to ordain in *another* without the conſent and aſſiſtance of his brother and fellow-labourer. With reſpect to the *angels* of the Aſiatic churches, he obſerves, that in the Old Teſtament the title of *angel* is ſometimes given to the *Jewiſh high-prieſt*, and particularly by the prophet Malachi, who calls him "the *meſſenger* (αγγελος) of the Lord of Hoſts;" and that the *angels* of the churches mentioned by St John, were *Chriſtian high-prieſts*, or *biſhops* preſiding over more than one congregation, as it is affirmed by all the ancient writers, cannot, he thinks, be denied by any man who will take the trouble to compare Scripture with Scripture. We read (Acts xix. 10. and 20.), that "in the ſpace of two years *all they* who dwelt in Aſia heard from St Paul the word of the Lord Jeſus, both Jews and Greeks; and that there the word of God *grew mightily* and *prevailed*:" but with what truth or propriety could this have been ſaid, if at the time of St John's writing the Apocalypſe, which was 30 years after St Paul's death, all the Chriſtians of Proconſular Aſia were compriſed in *ſeven congregations*, which aſſembled, each with its proper paſtor, to perform, in *one place*, the duties of public worſhip? In a word, the advocate for Epiſcopacy inſiſts, that no man, who reads without prejudice the acts of the apoſtles, the epiſtles of St Paul, and the Apocalypſe of St John, can ſeriouſly believe that *Timothy*, *Titus*, *Epaphroditus*, *Soſthenes*, and *Silvanus*, with the *angels* of the ſeven churches in Aſia, were *mere preſbyters*, or that the government of the church was, in thoſe days, by a college of elders.

16 Matthias, Barnabas, Timothy, Titus, and the angels of the ſeven churches in Aſia, biſhops

When from the inſpired penmen of the New Teſtament he proceeds to examine the ſucceeding writers of the Chriſtian church, the Epiſcopalian finds ſuch multiplied and concurring evidence of the apoſtolic inſtitution of epiſcopacy, as he thinks it impoſſible to reſiſt without

Epiſcopacy. without denying the truth of all ancient hiſtory, and even ſhaking the pillars of revelation itſelf; for "in the noble army of martyrs," the witneſſes of the epiſcopal government of the church are earlier, and by far more numerous, than thoſe who teſtify that the *goſpel* of *St Matthew* was written by that apoſtle, or that the book of the *Apocalypſe* is canonical Scripture. The authority of the *fathers* indeed is at preſent very low; but ſhould they be allowed to be as fanciful divines and as bad critics as their worſt enemies are pleaſed to repreſent them, this would detract nothing from their evidence when they bear witneſs to the conſtitution of the church in their own times; for of their *integrity* there can be no doubt: and what the Epiſcopalian wants of them is only their teſtimony to matters of fact which fell under the cognizance of their own ſenſes, and about which therefore they could not be deceived. It is here indeed chiefly that he triumphs over his antagoniſts. In the ſecond and third centuries there was no general council, nor any Chriſtian ſovereign.

17 The divine right of Epiſcopacy. A prelacy therefore, he urges, could not have been *univerſally* introduced, during that period, either by a concert among the clergy, or by the authority of the civil magiſtrate. Yet that even *then* there was no church under heaven, of which the government was not epiſcopal, has been confeſſed by ſome of the moſt learned writers among the Preſbyterians themſelves; whence he concludes that epiſcopacy is of divine inſtitution.

The candid Epiſcopalian, however, allows, that in the apoſtolic age there may have been ſome churches which at firſt had only biſhops and deacons to perform the offices of religion; for when the number of diſciples in any place was ſo ſmall that they could all meet in one aſſembly, there was no neceſſity for any other order of miniſters: but it appears that, from the very *beginning*, *biſhops*, *preſbyters*, and *deacons*, were ſettled in all the *larger* cities of the Roman empire; and it was in thoſe days an allowed maxim, that without a *biſhop* there could be *no church*. The better to underſtand the original ſtate and inſtitution of epiſcopacy, it is neceſſary to obſerve, that the empire, which contained almoſt all the known part of the Chriſtian world, was by Auguſtus Cæſar divided into provinces, ſubjected each to the authority of one chief magiſtrate, who was commonly a *prætor* or *proconſul*, and who reſided in the metropolis or chief city of the province. A province comprehended the cities of a whole region; and in the age of the apoſtles, each city was under the immediate government of certain magiſtrates within its own body, known by the name of *βουλη*, or *ſenatus*, *ordo* and *curia*, "the ſtates and court of the city." Thoſe magiſtrates were ſubordinate to the *prætor* or *proconſul:* but among them there was *one* ſuperior to the reſt, called ſometimes *dictator* and ſometimes *defenſor civitatis*, whoſe juriſdiction extended not only over the city itſelf, but likewiſe over all the adjacent territory. That territory was denominated *περοαστια*, or the ſuburbs, and often reached to the diſtance of 10 or 12 miles round the city, and ſometimes much farther, containing within it many villages and ſmall towns under the government of the city magiſtrates. From ſome paſſages in the New Teſtament, and from the concurring evidence of the earlieſt writers of the church, it appears to have been the purpoſe of the apoſtles to ſettle a biſhop in *every* city where there was a civil magiſtracy; but as they could not be perſonally preſent in all places at once, it was natural for them to *enter* upon the great work of converting the nations by *firſt* preaching the goſpel in that city of each province which was the ordinary reſidence of the governor; becauſe to it there muſt have been the greateſt reſort of people, who would carry the glad tidings with them into the country when they returned. Accordingly, having diſperſed themſelves over the empire, and made numbers of proſelytes in the principal cities, they fixed in each, where they ſaw it neceſſary, a *biſhop*, with a college of *preſbyters* and *deacons;* and gave to thoſe biſhops, who were at firſt called *apoſtles*, a commiſſion, as the *other* cities of the province ſhould be converted, to fix in them biſhops alſo.

18 The origin of dioceſes.

Epiſcopacy.

In ſome of the ſmaller cities, it is extremely probable that a biſhop and a deacon were for a ſhort time the only eccleſiaſtical officers, till the number of Chriſtians increaſed ſo much as to make it impoſſible for them all to aſſemble in one houſe for the purpoſes of public worſhip. The biſhop then ordained *preſbyters* to officiate in thoſe congregations where he himſelf could not be preſent, and to aſſiſt him in other parts of his paſtoral office; but in all their miniſtrations the preſbyters were ſubordinate to him, who was the chief paſtor within the city, who compoſed the prayers which were offered up in public, and to whom all the other miniſters of religion were accountable for their conduct. So long as the number of the faithful was confined within the *walls* of the city, it appears that the biſhop with his preſbyters and deacons lived together as in a college; that divine ſervice was every Lord's day, or oftener, performed in what was afterwards called the cathedral or mother-church, by the biſhop himſelf, aſſiſted by ſome of his clergy; and that the congregations which met in other churches, having no *fixed* paſtors, were ſupplied by ſuch preſbyters as the biſhop choſe to ſend to them from his own church. Whilſt matters continued in this ſtate, the clergy had no other revenues than what aroſe from the voluntary oblations of the people; which were indeed ſo large as not only to ſupport them with decency, but likewiſe to anſwer other ends of charity and munificence. They were commonly divided into four equal parts; of which one was allotted to the biſhop, a ſecond to the inferior clergy, a third to the poor, and a fourth to keep the churches in repair; and it was conſidered as a part of the biſhop's duty to take care that the offerings ſhould be faithfully applied to theſe purpoſes.

19 The origin of pariſhes. When converts increaſed in number, and churches were built in the ſuburbs, each of thoſe churches had a fixed paſtor ſimilar to a pariſh-prieſt among us; but ſtill thoſe paſtors, as well as the city-clergy, miniſtered in ſubordination to the biſhop, whoſe authority extended as far as the civil authority of the Roman magiſtrate, within which diſtrict or dioceſe it was ſupreme over all orders of Chriſtians. This every man knows who is acquainted with eccleſiaſtical hiſtory; for the biſhop alone could ordain *prieſts* and *deacons*, adminiſter the rite of *confirmation*, *abſolve penitents* who were under church-cenſure, and *exclude from communion* heretics and notorious offenders; and from his ſentence there lay no appeal but to a ſynod of comprovincial biſhops.

Such ſynods were in each province convened by the biſhop

Epiſcopacy. biſhop of the chief city; for the apoſtles having been careful to place in thoſe cities men of the moſt eminent gifts and abilities, the other biſhops of the provinces applied to them for advice upon every emergency, and paid a particular deference to them upon every occaſion. So that though all biſhops were of equal authority as *biſhops*, yet when they met to conſecrate a new biſhop, or to deliberate upon the affairs of the church, they yielded a precedency to the biſhop of the metropolis, who called them together, and who ſat as

20 The origin of metropolitans. *preſident* or *moderator* of the ſynod. Hence the origin of metropolitans or *archbiſhops;* whoſe authority was ſo conſiderable, that though there is not a doubt but the *election* of biſhops was anciently placed in the clergy and people of the vacant dioceſe, yet the biſhop *elect* could not be *conſecrated* without the conſent of the archbiſhop of the province.

In conſequence of the extenſive powers with which the primitive biſhops were veſted, they are commonly ſtyled in the writings of thoſe times *preſidents*, *provoſts*, or *inſpectors* of the church, *chief prieſts*, *princes of the clergy*, and even *princes of the people;* but their authority was wholly ſpiritual. Thoſe prelates, imitating the example of their Divine Maſter when on earth, neither poſſeſſed nor aſſumed to themſelves any juriſdiction over the *properties* or *civil rights* of men. In conſequence of St Paul's having reprimanded the Corinthians for going to law before the *unbelievers*, they were indeed often choſen as *arbiters* of ſuch civil diſputes as aroſe between individuals under their epiſcopal government; but on theſe occaſions they could not act unleſs the ſubmiſſion was *voluntarily* made by *both* the contending parties, and *then* their deciſion was final. When the empire became Chriſtian, this privilege was confirmed to them by law; for any *civil* cauſe depending before a court of juſtice could be withdrawn, and by the mutual conſent of parties be ſubmitted to the arbitration of the biſhop, whoſe award, which in former times could be enforced only by the terror of church-cenſures, was then enforced by the ſecular magiſtrate. In *criminal* cauſes, where the trial might be for life or death, they were prohibited both by the canons of the church and by the laws of the ſtate from acting as judges; and therefore they never ſuffered ſuch cauſes to come before them, except when it was neceſſary that the perſon accuſed, if found guilty, ſhould be excluded from the communion of the faithful. But they had ſo many civil cauſes flowing in upon them, that they were ſoon obliged to devolve

21 The probable origin of ſpiritual courts. part of that care upon other perſons, in whoſe knowledge, prudence, and integrity, they could fully confide: and as the perſons employed to act in the biſhop's ſtead were often *laymen*, it has been conjectured that they gave riſe to the office of *lay-chancellor* in the church, and to all that train of ſpiritual judges and ſpiritual courts againſt which ſuch numbers are diſpoſed to clamour.

Be this as it may, it is certain that, through the piety and munificence of the Chriſtian emperors, the biſhops enjoyed large revenues and many valuable privileges; but it does not appear that they had any rank or authority, as *barons* or *temporal princes*, till the Gothic nations, which ſubverted the Roman empire, had embraced the Chriſtian faith. As Chriſtianity incapacitated the leaders of thoſe tribes from officiating as chief prieſts at the religious rites which were uſually celebrated at the opening of their public aſſemblies, the biſhops came naturally to diſcharge that duty on ſuch occaſions, when they muſt have ſhared in the rank by ſharing in the functions of the chief. The ſituation in which they thus appeared at the opening of all political conventions, would enable them to join with much effect in the deliberations which enſued; and their ſuperior knowledge, their ſacred character, and their influence with the people, would ſoon acquire them power equal to their rank. They muſt therefore have been well entitled to demand admiſſion into that council which was formed by the king and the lay-chiefs at the national aſſemblies: and as they balanced the authority of thoſe chiefs, we cannot doubt that the king would be diſpoſed to give the utmoſt effect to their claim. Accordingly, we find the dignified clergy, who received large grants of land to be held on the ſame tenures with the lands of the lay-magiſtrates, preſiding along with thoſe magiſtrates in the provincial aſſemblies of every degree in all the Gothic nations, and enjoying every advantage in point of rank and authority in their national diets. Hence the biſhop of Rome, and ſeveral biſhops in Germany, have, like the dukes and marquiſes of that empire, been for a long time ſovereign princes; and hence too the biſhops of England and Ireland have always ſat, and have an equal right with the lay-peers to ſit, in the upper houſe of parliament. It is however obvious, that, ſo far as epiſcopacy is of *apoſtolical* inſtitution, thoſe peers and princes poſſeſs not the *original* character in any higher degree than the biſhops in America, who are barely tolerated, or than thoſe in Scotland who do not enjoy that privilege; and that confirmation adminiſtered, or holy orders conferred, by a perſecuted prelate, muſt be as effectual to the purpoſes of religion, as if given by a German prince or an Engliſh peer.

Epiſcopacy. 22 Biſhops had no civil rank till after the ſubverſion of the Roman empire and the converſion of the Gothic nations.

In this ſhort view of epiſcopacy, it has been our endeavour to do juſtice to the ſubject, without ſuffering ourſelves to be influenced by partiality or prejudice. As we are not ourſelves epiſcopalians, we have advanced nothing of our own; but have ſelected from Engliſh writers, who have at different times undertaken to defend the *divine right* of epiſcopacy, ſuch facts and arguments as to us appear to be of the moſt importance, or to have the greateſt weight, without remarking upon them, or offering any anſwer. The reaſoning employed to prove that the order of biſhops was inſtituted by the apoſtles, is taken from a work prepared for the preſs by Dr Berkeley prebendary of Canterbury, and ſon of the celebrated biſhop of Cloyne. For the reſt of the detail we are indebted chiefly to Bingham's *Origines Eccleſiaſticæ;* a performance in great eſtimation with thoſe Engliſh divines who are commonly known by the appellation of *high churchmen*. As editors of a work of this kind, it is not *our* buſineſs to be of *any party*, or to ſupport, in oppoſition to all others, a *particular* church, though that church ſhould be our own: We ſhall therefore treat *independency* and *preſbytery* as we have treated *epiſcopacy*, by employing ſome able writer of each ſociety to plead his own cauſe. Meanwhile, we ſhall conclude this article with a few reflections, which, though they come from the pen of an obſcure author, deſerve to be engraved deep in the memory of every controverſiſt of every communion.

" On

Epiſcopacy.

23 Moderation in controverſy recommended.

"On complicated queſtions (ſays a late apologiſt for the epiſcopal church in Scotland), men will always differ in opinion; but conſcious each of the weakneſs of his own underſtanding, and ſenſible of the bias which the ſtrongeſt minds are apt to receive from thinking long in the ſame track, they ought to differ with charity and meekneſs. Since unhappily there are ſtill ſo many ſubjects of debate among thoſe who name the name of Chriſt; it is doubtleſs every man's duty, after diveſting himſelf as much as poſſible of prejudice, to inveſtigate thoſe ſubjects with accuracy, and to adhere to that ſide of each diſputed queſtion which, after ſuch inveſtigation, appears to him to be the truth: but he tranſgreſſes the favourite precept of his divine Maſter, when he caſts injurious reflections, or denounces anathemas, upon thoſe who, with equal ſincerity, may view the matter in a different light; and by his want of charity does more harm to the religion of the *Prince of Peace*, than he poſſibly could do good, were he able to convert all mankind to his own orthodox opinions."

24 Epiſcopal church of Scotland.

The following is a ſhort hiſtory of the epiſcopal church of Scotland, extracted from a more detailed account by a member of that church.

The real tenets of the Scotch epiſcopalians, or members of what was at one period the eſtabliſhed church of Scotland, he obſerves, appear to be very imperfectly underſtood. About the time of the reformation from popery, the want of order and decency in the worſhip of the reformed church was abolithed in the reign of James VI. by the eſtabliſhment of epiſcopacy on very liberal principles. This mode of worſhip obtained the ſanction of the moſt reſpectable part of the nation, and continued to flouriſh under the auſpices of government, till it was overthrown by the ſticklers for the *national covenant*. Its reſtoration was effected in the year 1662, and twenty-ſeven years afterwards it was again abolithed by the advocates of the prince of Orange.

It may be proper to obſerve, that the Scotch epiſcopal church had no public liturgy during her legal eſtabliſhment. It is indeed true, that the Engliſh book of common prayer was uſed by the firſt reformers, and there is reaſon to believe that John Knox himſelf was by no means inimical to ſet forms of prayer, nor to clerical ſubordination; but his ſucceſſor, Andrew Melvil, a man much inferior to him in point of erudition, introduced an equality among the clergy, and excited the odium of the people againſt the liturgy to ſuch a degree, that an attempt to modify the prayer book for the uſe of the church of Scotland, was productive of the ſolemn league and covenant, and the ſubſequent ruin of the unfortunate Charles.

During the reign of William III. the epiſcopalians were treated with ſome degree of ſeverity, becauſe they could not tranſfer that allegiance to him which they had ſworn to King James. It is ſaid that they were prohibited from officiating on the ſabbath day, except "in their own hired houſes, where they received ſuch friends as choſe to come in unto them." In this manner was their worſhip conducted, praying either extempore, or from premeditation, till the acceſſion of Queen Anne, when the Engliſh liturgy was introduced by degrees into Scotland, under the ſanction of an act of parliament, paſſed on the 3d of March 1712, "to prevent the diſturbing of thoſe of the epiſcopal communion in that part of Great Britain called Scotland, in the exerciſe of their religious worſhip, and in the uſe of the liturgy of the church of England." But as their attachment to the houſe of Stuart was well known, they were, at the rebellion of 1715, laid under ſome reſtraints, yet neither ſevere in their nature, nor of any long continuance, ſince in 1720 their places of worſhip were as numerous as before, and frequented by numbers both of rank and reſpectability, many of whom held places under government. Epiſcopacy || Epiſcopius.

In England, Dr Sancroft, archbiſhop of Canterbury, with five other biſhops, were deprived of their ſees for refuſing their allegiance to King William, which occaſioned a ſchiſm in the church, as they were extremely popular. Different opinions were entertained reſpecting the nature and deſign of the Lord's ſupper, and the controverſy infected the epiſcopalians of Scotland. The introduction of prayers into public worſhip in behalf of departed friends, was at leaſt a very impolitic ſtep at ſuch a critical period, when every thing favouring of popery was held in the utmoſt abhorrence. On the death of Dr Roſe, the proſcribed biſhop of Edinburgh, the dioceſan form of church government was oppoſed by ſuch of the preſbyters as had been raiſed to the epiſcopal dignity, and it was propoſed to govern the whole church by a college of biſhops. This plan, for the adoption of which no precedent could be found in the annals of hiſtory, was ſucceſsfully oppoſed by many of the moſt enlightened biſhops, and it was of conſequence abandoned.

The Scotch epiſcopalians, it is well known, were always charged with an undue attachment to the Stuart family, which was even conſidered as their moſt diſtinguiſhing tenet; yet there is ſome reaſon to believe that the public opinion of this matter was rather exaggerated. They have invariably maintained that the Almighty, and not the people, is the ruler of princes, which fairly places them beyond the imputation of a republican or levelling ſpirit. The ſeveral reſtraints laid on Scotch epiſcopalians from time to time, with a view to eradicate their attachment to the Stuart family, were happily removed in the year 1792, and they enjoyed a free toleration like the reſt of diſſenters. It was about this time that the clergy of this church, with a very few exceptions, took the oaths of abjuration and allegiance.

It is well known, it is added by the ſame writer, from whoſe account the above is taken, that in Scotland there are chapels quite diſtinct from the Scotch epiſcopal church, where clergymen who have been ordained either in England or Ireland, make uſe of the liturgy of the church of England; but as each of theſe is ſtrictly and properly independent of the reſt, and under the guardianſhip of no biſhop whatever, thoſe who attend them have, in every ſenſe of the word, a much better claim to the appellation of *congregationaliſts* than to that of *epiſcopalians*.

EPISCOPAL, ſomething belonging to BISHOPS.

EPISCOPALIANS, in church hiſtory, an appellation given to thoſe who prefer the epiſcopal government and diſcipline to all others. See EPICOPACY.

By the teſt act, none but Epiſcopalians, or members of the church of England, are qualified to enjoy any office civil or military.

EPISCOPIUS, SIMON, one of the moſt learned

Epiſcopus || Epiſtle.

men of the 17th century, and the chief ſupporter of the Arminian ſect, was born at Amſterdam in 1583. In 1612, he was choſen divinity profeſſor at Leyden, in the room of Gomarus, who reſigned; and the functions of his office, with his private ſtudies, were light burdens to him, compared with the difficulties he ſuſtained on account of the Arminian controverſy: which, though it began in the univerſities, ſoon flew to the pulpits, from whence it ſpread and inflamed the people. The ſtates of Holland having invited Epiſcopius to take his place at the ſynod of Dort, he went thither accompanied by ſome remonſtrant miniſters; but the ſynod would not allow them to ſit as judges, nor to appear in any other capacity than as perſons ſummoned before them: they ſubmitted, were depoſed from their functions, and baniſhed the territories of the commonwealth. Epiſcopius and his perſecuted brethren retired to Antwerp; but the times growing more favourable, he returned to Holland in 1626, and was made miniſter of the church of the Remonſtrants at Rotterdam: in 1634 he was choſen rector of the college founded by the ſect at Amſterdam, where he ſpent the remainder of his days. He died in 1643 of the ſame diſorder which had killed his wife before, a retention of urine; having loſt his ſight ſome weeks previous to his end. The learned have beſtowed great eulogiums on Epiſcopius; but he did not always write with that moderation which might have been wiſhed. His works make two volumes in folio, of which the ſecond conſiſts of poſthumous publications.

EPISCOPUS, the ſame with biſhop. See BISHOP and EPISCOPACY.

EPISODE, in *Poetry*, a ſeparate incident, ſtory, or action, which a poet invents, and connects with his principal action, that his work may abound with a greater diverſity of events; though, in a more limited ſenſe, all the particular incidents whereof the action or narration is compounded are called *epiſodes*. See POETRY.

EPISPASTIC, in *Medicine*, a topical remedy, which being applied to the external parts of the body, attracts the humours to that part.

EPISTATES, in the Athenian government, was the preſident of the proedri. See PROEDRI.

EPISTEMONARCH, in the ancient Greek church, an officer of great dignity, who had the care of every thing relating to faith, in the quality of cenſor. His office anſwered pretty nearly to that of maſter of the ſacred palace at Rome.

EPISTLE, denotes the ſame with a miſſive letter; but is now chiefly uſed in ſpeaking of ancient writings, as the epiſtles of St Paul, epiſtles of Cicero, epiſtles of Pliny, &c.

EPISTLES and Goſpels, in the liturgy of the church of England, are ſelect portions of ſcripture, taken out of the writings of the evangeliſts and apoſtles, and appointed to be read, in the communion ſervice, on Sundays and holidays. They are thought to have been ſelected by St Jerome, and by him put into the lectionary. It is certain, they were very anciently appropriated to the days whereon we now read them, ſince they are not only of general uſe throughout the weſtern church, but are alſo commented upon in the homilies of ſeveral ancient fathers, which are ſaid to have been preached upon thoſe very days to which theſe portions of ſcripture are now affixed. Epiſtolary || Epitaph.

The epiſtles and goſpels are placed in an admirable order and method, and bear a ſpecial relation to the ſeveral days whereon they are read. The year is diſtinguiſhed into two parts; the firſt being deſigned to commemorate Chriſt's living among us, the other to inſtruct us to live after his example. The former takes in the whole time from Advent to Trinity-Sunday; the latter, all the Sundays from Trinity to Advent. During the firſt of theſe ſeaſons, the epiſtles and goſpels are calculated to raiſe in us a grateful ſenſe of what our Saviour did and ſuffered for us, and ſet before our eyes his nativity, circumciſion, and manifeſtation to the Gentiles; his doctrines and miracles; his baptiſm, faſtings, and temptation; his agony and bloody ſweat; his croſs and paſſion; his death, burial, reſurrection, and aſcenſion; and his miſſion of the Holy Ghoſt. During the ſecond ſeaſon of the year, the epiſtles and goſpels tend to inſtruct us in the true paths of Chriſtianity. See COLLECTS.

EPISTOLARY, ſomething belonging to an epiſtle, ſee EPISTLE.

EPISTOLARY Compoſitions. See LETTER; and the article POETRY.

EPISTROPHE. See ORATORY.

EPISTYLE, in the ancient architecture, a term uſed by the Greeks for what we call *architrave*, viz. a maſſive piece of ſtone or wood, laid immediately over the capital of a column.

EPITAPH (from επι, *upon*, and ταφος, *ſepulchre*), a monumental inſcription, in honour or memory of a perſon deceaſed. It has been diſputed whether the ancient Jews inſcribed epitaphs on the monuments of the dead; but be this as it will, epitaphs it is certain, of very ancient date, are found amongſt them.—The Athenians, by way of epitaph, put only the name of the dead, with the epithet χρηστος, ſignifying "good," or ἡρως, "hero," and the word χαιρε, ſignifying their good wiſhes: The name of the deceaſed's father and his tribe were frequently added.—The Lacedemonians allowed epitaphs to none but thoſe who had died in battle. The Romans inſcribed their epitaphs to the *manes*, *diis manibus*; and frequently introduced the dead by way of proſopopœia, ſpeaking to the living; of which we have a fine inſtance, worthy the Auguſtan age, wherein the dead wife thus beſpeaks her ſurviving huſband:

Immatura peri; ſed tu, felicior, annos
Vive tuos, conjux optime, vive meos.

The epitaphs of the preſent day are generally crammed with fulſome compliments which were never merited, characters which human nature in its beſt ſtate could ſcarce lay claim to, and expreſſions of reſpect which were never paid in the life-time of the deceaſed. Hence the proverb with great propriety took its riſe, "He lies like an epitaph."

EPITAPH, is alſo applied to certain eloges, either in proſe or in verſe, compoſed without any intent to be engraven on tombs; as, that of Alexander,

Sufficit huic tumulus, cui non ſufficeret orbis.

and that of Newton,

Iſaacum

Epitafis || Epitropus.

Epizeuxis || Epulares.

Iſaacum Newton,
Quem immortalem
Teſtantur Tempus, Natura, Cælum;
Mortalem hoc marmor
Fatetur.

EPITASIS, in ancient poetry, the ſecond part or diviſion of a dramatic poem, wherein the plot, entered upon in the firſt part or *protaſis*, was carried on, heightened, and worked up, till it arrived at its ſtate or height, called *cataſtaſis*.

EPITASIS, in *Medicine*, the increaſe of a diſeaſe or beginning of a paroxyſm, particularly in a fever.

EPITHALAMIUM, in *Poetry*, a nuptial ſong or compoſition in praiſe of the bride and bridegroom, praying for their proſperity, for a happy offspring, &c.

Epithalamia were ſung amongſt the Jews, at the door of the bride, by her friends and companions, the evening before the marriage. Pſalm xlv. is an epithalamium. Among the Greeks the epithalamium was ſung as ſoon as the married couple were gone to bed, and attended with ſhouts and ſtamping of the feet to drown the cries of the bride. They returned in the morning, and with the ſame ſong, a little altered, ſaluted them again. The evening ſong was called επιθαλαμια κοιμητικα, the morning ſalute was called επιθαλαμια εγερτικα. This was the practice amongſt the Romans alſo, but their epithalamia were often obſcene.

EPITHEM, in *Pharmacy*, a kind of fomentation, or remedy of a ſpirituous or aromatic kind, applied externally to the regions of the heart, liver, &c. to ſtrengthen and comfort the ſame, or to correct ſome intemperature thereof.

EPITHET, in *Poetry* and *Rhetoric*, an adjective expreſſing ſome quality of a ſubſtantive to which it is joined; or ſuch an adjective as is annexed to ſubſtantives by way of ornament and illuſtration, not to make up an eſſential part of the deſcription. Nothing, ſays Ariſtotle, tires the reader more than too great a redundancy of epithets, or epithets placed improperly; and yet nothing is ſo eſſential in poetry as a proper uſe of them. The writings of the beſt poets are full of them.

EPITOME, in literary hiſtory, the ſame with ABRIDGEMENT.

EPITRITUS, in proſody, a foot conſiſting of three long ſyllables and one ſhort. Of theſe, grammarians reckon four kinds: the firſt conſiſting of an iambus and ſpondee, as fălūtāntēs; the ſecond, of a trocheus and ſpondee, as cōncĭtātī; the third of a ſpondee, and an iambus, as cōmmūnĭcāns; and the fourth, of a ſpondee and trocheus, as īncāntārĕ. See the articles SPONDEUS, TROCHEUS, &c.

EPITROPE. See ORATORY, N° 83.

EPITROPUS, a kind of judge, or rather an arbitrator, which the Greek Chriſtians, under the dominion of the Turks, elect in the ſeveral cities, to terminate the differences that ariſe among them, and avoid carrying them before the Turkiſh magiſtrates. See ARBITRATOR.

Anciently the Greeks uſed the term επιτροπος, in the ſame ſenſe as the Latins did *procurator*, viz. for a commiſſioner or intendant. Thus the commiſſioners of proviſions in the Perſian army are called by Herodotus and Xenophon *epitropi*. In the New Teſtament, επιτροπος denotes the ſteward of a houſehold, rendered in the vulgate *procurator*.

EPIZEUXIS. See ORATORY, N° 68.

EPOCHA, in *Chronology*, a term or fixed point of time whence the ſucceeding years are numbered or counted. See ÆRA.

EPODE, in lyric poetry, the third or laſt part of the ode, the ancient ode being divided into ſtrophe, antiſtrophe, and epode. See ODE, &c.

The epode was ſung by the prieſts, ſtanding ſtill before the altar, after all the turns and returns of the ſtrophe and antiſtrophe, and was not confined to any preciſe number or kind of verſes.

The epode is now a general name for all kinds of little verſes that follow one or more great ones, of what kind ſoever they be; and in this ſenſe a pentameter is an epode after an hexameter. And as every little verſe, which, being put after another, cloſes the period, is called *epode*; hence the ſixth book of Horace's odes is intitled *liber epodon*, "book of epodes," becauſe the verſes are all alternately long and ſhort, and the ſhort ones generally, though not always, cloſe the ſenſe of the long one.

EPOPOEIA, in *Poetry*, the hiſtory, action, or fable, which makes the ſubject of an epic poem. The word is derived from the Greek επος, *carmen*, "verſe;" and ποιεω, *facio*, "I make."

In the common uſe of the word, however, *epopœia* is the ſame with *epos*, or epic poem itſelf. See the article POETRY.

EPOPS, or HOOPOE. See UPUPA, ORNITHOLOGY *Index*.

EPSOM, a town of Surry, about 16 miles ſouth-weſt from London, long famous for its mineral waters. Theſe were diſcovered in 1618; and though not in ſuch repute as formerly, yet they are not impaired in virtue, and the ſalt made from them is famous all over Europe, for gently cleanſing and cooling the body. The hall, galleries, and other public apartments, are now run to decay; and there remains only one houſe on the ſpot, which is inhabited by a countryman and his wife, who carry the waters in bottles to the adjacent places, and ſupply the demands of dealers in London. On the neighbouring downs are annually horſe-races; but the inns, ſhops, and bowling-greens are not near ſo much frequented as formerly. The market is on Friday; fair, July 25. The town is about one mile and a half in ſemicircle, from the church to the palace at Durdans, which was burnt down ſome years ſince, but has been rebuilt. It was once inhabited by his preſent majeſty's father. In Hudſon's Lane here was Epſom Court, an ancient Saxon ſeat, long ſince converted into a farm. Here are ſo many fields, meadows, orchards, gardens, and the like, that a ſtranger would be at a loſs to know whether this was a town built in a wood, or a wood ſurrounded by a town.

Epſom water is eaſily imitated by art; i. e. by only diſſolving half an ounce of Epſom ſalt in a quart of pure water, made ſomewhat briſk or quick by adding a little ſulphuric acid and potaſh, ſo as to let the alkali prevail.

EPULARES, in antiquity, an epithet given to thoſe who were admitted to the ſacred *epulæ* or entertainments,

Epulo || Equator.

tainments, it being unlawful for any to be preſent at them who were not pure and chaſte.

EPULO, in antiquity, the name of a miniſter of ſacrifice among the Romans.

The pontifices, not being able to attend all the ſacrifices performed at Rome to ſo many gods as were adored by that people, appointed three miniſters, whom they called *epulones*, becauſe they conferred on them the care and management of the *epula*, feaſts in the ſolemn games and feſtivals. To them belonged the ordering and ſerving the ſacred banquet, offered on ſuch occaſions to Jupiter, &c. They wore a gown bordered with purple like the pontifices. Their number was at length augmented from three to ſeven, and afterwards by Cæſar to ten. Their firſt eſtabliſhment was in the year of Rome 558, under the conſulate of L. Furius Purpureo and M. Claudius Marcellus.

EPULUM, in antiquity, a holy feaſt prepared for the gods in times of public danger. The feaſt was ſumptuous, and the gods were formally invited and attended; for the ſtatues were brought on rich beds furniſhed with ſoft pillows, called *pulvinaria*: Thus accommodated, their godſhips were placed on their couches at the moſt honourable part of the table. The care of the *epula* belonged to the *epulones*, and the gods were plentifully ſerved with the richeſt dainties, as if they were able to eat; but the *epulones* performed that function for them, and doubtleſs were competent proxies! No wonder that Pliny ſolicited Trajan to be admitted of their order.

EPULUM is alſo uſed to ſignify any ſolemn feaſt; ſo we meet with *epulum ferale*, "a funeral entertainment."

EQUABLE, an appellation given to ſuch motions as always continue the ſame in degree of velocity, without being either accelerated or retarded.

EQUAL, a term of relation between two or more things of the ſame magnitude, quantity, or quality.

Mathematicians ſpeak of *equal* lines, angles, figures, circles, ratios, ſolids.

EQUALITY, that agreement between two or more things, whereby they are denominated equal.

EQUANIMITY, in *Ethics*, denotes that even and calm frame of mind and temper, under good or bad fortune, whereby a man appears to be neither puffed up nor overjoyed with proſperity, nor diſpirited, ſoured, or rendered uneaſy by adverſity.

EQUATIONS, in *Algebra*. See ALGEBRA.

EQUATION of Time, in *Aſtronomy* and *Chronology*, the reduction of the apparent time or motion of the ſun, to equable, mean, or true time. See ASTRONOMY *Index*.

EQUATOR, or ÆQUATOR, in *Aſtronomy* and *Geography*, a great circle of the ſphere, equally diſtant from the two poles of the world, or having the ſame poles with thoſe of the world. It is called the *equator*, becauſe when the ſun is in it the days and nights are *equal*; whence alſo it is called the *equinoctial*; and when drawn on maps and planiſpheres, the *equinoctial line*, or ſimply the *line*. Every point of the equator is a quadrant's diſtance from the poles of the world; whence it follows, that the equator divides the ſphere into two hemiſpheres, in one of which is the northern, and in the other the ſouthern pole.

EQUATORIAL INSTRUMENT. See ASTRONOMY *Index*.

Equatorial || Equeſtrian.

EQUERY, or ECURY, a grand ſtable or lodge for horſes, furniſhed with all the conveniences thereof; as ſtalls, manger, rack, &c. The word is formed from the French *eſcurie*, which ſignifies the ſame thing. Some again derive *eſcurie* from the Latin *ſcuria*, which not only denotes a place for beaſts to be put up in, but alſo a grange or barn. But a more probable derivation is from *equile*, "a ſtable for horſes," of *equus*, "horſe." Some hold that the word *ſtable*, in propriety, relates only to bullocks, cows, ſheep, hogs, &c. and *equery*, to horſes, mules, &c.

A *ſimple equery* is that provided for one row of horſes; a *double equery* that provided for two, with a paſſage in the middle, or two paſſages; the horſes being placed head to head, as in the little equery at Verſailles.

Under equery are ſometimes alſo comprehended the lodgings and apartments of the equerries, grooms, pages, &c.

EQUERY (*eſcuyer*), is alſo an officer who has the care and management of the horſes of a king or prince.

EQUERIES, or EQUERRIES, popularly called *Querries*, are particularly uſed among us for officers of the king's ſtables, under the maſter of the horſe, ſeven in number, who, when his majeſty goes abroad, ride in the leading coach, are in waiting one at a time monthly, and have a table with the gentlemen uſhers during the time, and a ſalary of 300l. a-year each. They uſed to ride on horſeback by the coach ſide when the king travelled; but that being more expenſive to them than neceſſary to the ſovereign, it has been diſcontinued.

EQUERIES of the Crown Stable have that appellation, as being employed in managing and breaking the ſaddle-horſes, and preparing them for the king's riding. Theſe are two in number; the firſt having an annual ſalary of 256l. and the ſecond 200l. whereof one is, or always ſhould be, in cloſe waiting at court; and when his majeſty rides, holds the ſtirrup, while the maſter of the horſe, or one of the equeries in his abſence, aſſiſts in mounting him; and when his majeſty rides, they uſually attend him.

EQUES, in antiquity. See *EQUESTRIAN Order* and EQUITES.

EQUES Auratus, is uſed to ſignify a knight-bachelor, called *auratus*, q. d. *gilt*, becauſe anciently none but knights might gild or beautify their armour or other habiliments of war with gold. In law this term is not uſed, but inſtead of it *miles*, and ſometimes *chevalier*.

EQUESTRIA, among the Romans, a place in the theatre where the equites or knights ſat.

EQUESTRIAN (*Equeſtris*), a term chiefly uſed in the phraſe *equeſtrian ſtatue*, which ſignifies a ſtatue repreſenting a perſon mounted on horſeback. The word is formed of the Latin *eques*, "knight, horſeman," of *equus*, "horſe."

EQUESTRIAN Games, among the Romans, horſe-races, of which there were five kinds, the *prodromus* or *plain horſe-race*, the *chariot-race*, the *decurſory-race* about funeral piles, the *ludi ſevirales*, and the *ludi neptunales*.

EQUESTRIAN Order, among the Romans, ſignified their

Equiangular || Equinox.

their knights or equites; as alſo their troopers or horſemen in the field; the firſt of which orders ſtood in contradiſtinction to the ſenators; as the laſt did to the foot, military, or infantry. Each of theſe diſtinctions was introduced into the ſtate by Romulus.

EQUIANGULAR, in *Geometry*, an epithet given to figures whoſe angles are all equal: ſuch are a ſquare, an equilateral triangle, &c.

EQUIDISTANT, an appellation given to things placed at equal diſtances from ſome fixed point or place to which they are referred.

EQUILATERAL, in general, ſomething that hath equal ſides; as an equilateral triangle.

EQUILIBRIUM, in *Mechanics*, is when the two ends of a lever or balance hang ſo exactly even and level, that neither doth aſcend or deſcend, but both keep in a poſition parallel to the horizon; which is occaſioned by their being both charged with an equal weight.

EQUIMULTIPLES, in *Arithmetic* and *Geometry*, are numbers or quantities multiplied by one and the ſame number or quantity. Hence, equimultiples are always in the ſame ratio to each other as the ſimple quantities before multiplication; thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other as 6 to 8.

EQUINOCTIAL, or ÆQUINOCTIAL, in *Aſtronomy*, a great and immoveable circle of the ſphere, under which the equator moves in its diurnal motion.

The equinoctial or equinoctial line is ordinarily confounded with the equator: but there is a difference; the equator being moveable, and the equinoctial immoveable; and the equator being drawn about the convex ſurface of the ſphere, but the equinoctial on the concave ſurface of the magnus orbis.

Whenever the ſun in his progreſs through the ecliptic comes to this circle, it makes equal days and nights all around the globe; as then riſing due eaſt and ſetting due weſt, which he never does at any other time of the year. And hence the denomination from *æquus* and *nox*, "night," *quia æquat diem nocti*.

The equinoctial then is the circle which the ſun deſcribes, or appears to deſcribe, at the time of the equinoxes; that is, when the length of the day is everywhere equal to that of night, which happens twice a-year. See EQUINOX.

EQUINOCTIAL, in *Geography*. See EQUATOR.

The ſhadows of thoſe who live under this circle are caſt to the ſouthward of them for one half of the year, and to the northward of them during the other half; and twice in a year, viz. at the equinoxes, the ſun at noon caſts no ſhadow, being in their zenith.

From this circle is the declination or latitude of places accounted in the degrees of the meridian.

EQUINOCTIAL Points, are the two points wherein the equator and ecliptic interſect each other: the one being in the firſt point of Aries, is called the *vernal point* or *equinox*; and the other in the firſt point of Libra, the *autumnal point* or *equinox*.

EQUINOCTIAL Dial, is that whoſe plane lies parallel to the equinoctial. See DIAL.

EQUINOX, or ÆQUINOX, in *Aſtronomy*, the time when the ſun enters one of the equinoctial points.

The equinoxes happen when the ſun is in the equinoctial circle; when of conſequence the days are equal to the nights throughout the world, which is the caſe twice a-year, viz. about the 20th of March and the 23d of September, the firſt of which is the vernal and the ſecond the autumnal equinox.

Equipage || Equity.

It is found by obſervation, that the equinoctial points, and all the other points of the ecliptic, are continually moving backward, or *in antecedentia*, that is, weſtward. This retrograde motion of the equinoctial points, is that famous and difficult phenomenon called the *preceſſion of the equinoxes*. See ASTRONOMY *Index*.

EQUIPAGE, in the military art, denotes all ſorts of utenſils, artillery, &c. neceſſary for commencing and proſecuting with caſe and ſucceſs any military operations. Camp and field equipage conſiſts of tents, kitchen-furniture, ſaddle-horſes, baggage, waggons, bat-horſes, &c.

To EQUIP, in naval language, a term borrowed from the French marine, and frequently applied to the buſineſs of fitting a ſhip for ſea, or arming her for war.

EQUIPOLLENCE, in *Logic*, is when there is an equivalence between any two or more terms or propoſitions; i. e. when they ſignify one and the ſame thing, though they expreſs it differently. Such propoſitions, &c. are ſaid to be *equipollent*.

EQUIRIA, in antiquity, a feſtival inſtituted by Romulus, and celebrated on the 27th of February, in honour of Mars, at which there were horſe-races.

EQUISETUM, HORSE-TAIL: A genus of plants belonging to the cryptogamia claſs; and in the natural method ranking under the 51ſt order, *Coniferæ*. See BOTANY *Index*.

EQUITES, amongſt the Romans, were perſons of the ſecond degree of nobility, immediately ſucceeding the ſenators in point of rank. The *equites* or knights were required to be poſſeſſed of 400 *ſeſtertia* before they could be admitted into that order; and when the knights were ſo reduced as to fall ſhort of the preſcribed revenue, they were expunged out of the equeſtrian liſt. The equeſtrian revenue juſt mentioned amounted to about 10,000 crowns.

Part of the ceremony whereby the honour of knighthood was conferred amongſt the Romans was the giving of a horſe; for every *eques* or knight had a horſe kept at the public charge, he received alſo the ſtipend of a horſeman to ſerve in the wars, and wore a ring which was given him by the ſtate. The *equites* compoſed a large body of men, and conſtituted the Roman cavalry; for there was always a ſufficient number of them in the city, and nothing but a review was requiſite to fit them for ſervice.

The knights at laſt grew too powerful, were a balance for the ſenate and people, neglected the exerciſes of war, and betook themſelves to civil employments. The *equites* were liable to be puniſhed by the cenſors, and to ſuffer degradation. They were degraded by taking from them the horſe which was kept for each of them at the public charge; this was called *equum adimere*.

EQUITY, in a general ſenſe, the virtue of treating all other men according to reaſon and juſtice, or as we would gladly be treated ourſelves when we underſtand aright what is our due. See JUSTICE.

EQUITY, in juriſprudence, is defined a correction or qualification of the law, generally made in that part wherein it faileth or is too ſevere. It likewiſe ſignifies the

Equity || Equivocation.

the extenſion of the words of the law to caſes unexpreſſed, yet having the ſame reaſon; ſo that where one thing is enacted by ſtatute, all other things are enacted that are of the like degree. For example, the ſtatute of *Glouc.* gives action of waſte againſt him that holds lands for life or years; and by the equity thereof, a man ſhall have action of waſte againſt a tenant that holds but for one year, or one half-year, which is without the words of the act, but within the meaning of it; and the words that enact the one, by *equity* enact the other. So that equity is of two kinds. The one abridges and takes from the letter of the law; the other enlarges and adds to it: and ſtatutes may be conſtrued according to equity, eſpecially where they give remedy for wrong, or are for expedition of juſtice. Equity ſeems to be the interpoſing *law of reaſon*, exerciſed by the lord chancellor in extraordinary matters to do equal juſtice; and by ſupplying the defects of the law, gives remedy in all caſes. See CHANCERY.

EQUITY, in *Mythology*, ſometimes confounded with *Juſtice*, a goddeſs among the Greeks and Romans, repreſented with a ſword in one hand and a balance in the other.

EQUIVALENT, is underſtood of ſomething that is equal in value, force, or effect, to another.

Equivalence is of various kinds, in propoſitions, in terms, and in things.

EQUIVALENT Propoſitions. See EQUIPOLLENCE.

EQUIVALENT Terms, are where ſeveral words that differ in ſound have yet one and the ſame ſignification; as *every body was there*, and *nobody was abſent*, *nihil non*, and *omne*.

EQUIVALENT Things, are either *moral*, *phyſical*, or *ſtatical*. *Moral*, as when we ſay that the commanding or adviſing a murder is a guilt equivalent to that of the murderer. *Phyſical*, as when a man who has the ſtrength of two men is ſaid to be equivalent to two men. *Statical*, whereby a leſs weight becomes of equal force with a greater, by having its diſtance from the centre increaſed.

EQUIVOCAL TERMS or WORDS, among logicians, are thoſe which have a doubtful or double meaning.

According to Mr Locke, the doubtfulneſs or uncertainty of words has its cauſe more in the ideas themſelves, than in any incapacity of the words to ſignify them; and might be avoided, would people always uſe the ſame term to denote the ſame idea or collection of ideas: but, adds he, it is hard to find a diſcourſe on any ſubject where this is the caſe; a practice which can only be imputed to folly or great diſhoneſty; ſince a man, in making up his accounts, might with as much fairneſs uſe the numerical characters ſometimes for one ſometimes for another collection of units.

EQUIVOCAL Generation, the production of animals without the intercourſe between the ſexes, by the influence of the ſun or ſtars, &c.

This kind of generation is now quite exploded by the learned.

EQUIVOCATION, the uſing a term or expreſſion that has a double ſignification. Equivocations are expedients to ſave telling the truth, and yet without telling a falſity. The fathers are great patrons of equivocations and mental reſervations, holding that the uſe of ſuch ſhifts and ambiguities is in many caſes allowable.

EQUULEUS, or ECCULEUS, in antiquity, a kind of rack uſed for extorting a confeſſion; at firſt chiefly practiſed on ſlaves, but afterwards made uſe of againſt the Chriſtians. Equuleus || Eraſmus.

The equuleus was made of wood, having holes at certain diſtances, with a ſcrew by which the criminal was ſtretched to the third, ſometimes to the fourth or fifth holes, his arms and legs being faſtened on the equuleus with cords; and thus was hoiſted aloft, and extended in ſuch a manner, that all his bones were diſlocated. In this ſtate red-hot plates were applied to his body, and he was goaded in the ſides with an inſtrument called an *ungula*.

EQUULEUS, EQUICULUS, and *Equus Minor*, the horſe's head, in *Aſtronomy*, a conſtellation of the northern hemiſphere, whoſe ſtars in Ptolemy's catalogue are four, in Tycho's four, in Hevelius's ſix, and in Mr Flamſteed's ten.

EQUUS, a genus of quadrupeds belonging to the claſs mammalia, and order of belluæ. See MAMMALIA *Index*. And for the diſeaſes of the horſe, ſee FARRIERY *Index*.

ERA, in *Chronology*. See ÆRA.

ERANARCHA, a public officer among the ancient Greeks, whoſe buſineſs was to preſide over and direct the alms and proviſions made for the poor. Cornelius Nepos, in his life of Epaminondas, deſcribes his office thus: When any perſon was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, &c. the eranarcha called an aſſembly of friends and neighbours, and taxed each according to his means and eſtate, to contribute towards his relief.

ERANTHEMUM, a genus of plants belonging to the diandria claſs. See BOTANY *Index*.

ERASISTRATUS, a celebrated phyſician, grandſon to the philoſopher Ariſtotle. He diſcovered by the motion of the pulſe the love which Antiochus had conceived for his mother-in-law Stratonice, and was rewarded with 100 talents for the cure by the father of Antiochus. He was great enemy to bleeding and violent phyſic.

ERASMUS, DESIDERIUS, born at Rotterdam in 1467. He loſt his father and mother at 14 years of age; and was committed to the care of a certain guardians, who would force him to be an eccleſiaſtic, which he refuſed for a long time. However, he was obliged to aſſume the religious habit among the canons regular in the monaſtery of Stein near Tergou; but afterwards obtained a diſpenſation from his vows. He was the moſt learned man of the age in which he lived; and contributed, by his example and his writings, to the reſtoration of learning in the ſeveral countries in which he occaſionally reſided, viz. Italy, Switzerland, Holland, France, and England: with the laſt, he was moſt ſatisfied; and found the greateſt encouragement from Henry VIII. Sir Thomas More, and all the learned Engliſhmen of thoſe days. He publiſhed a great many books; and died at Baſil in 1536. He was buried honourably, and his memory is ſtill held in veneration. He had, however, many enemies; and as he did not embrace the reformation, and yet cenſured many things in popery, he hath been treated injuriouſly both by Catholics and Proteſtants. The works of Eraſmus in 10 vols folio were publiſhed at Leyden

in

Erastians || Erection.

in 1706, in a very handſome manner, under the care of M. le Clerc. Dr Jortin publiſhed his life in one vol. 4to, 1758.

ERASTIANS, a religious ſect or faction which aroſe in England during the time of the civil wars in 1647, thus called from their leader Thomas Eraſtus, whoſe diſtinguiſhing doctrine it was, that the church had no right to diſcipline, that is, no regular power to excommunicate, exclude, cenſure, abſolve, decree, or the like.

ERATO (from ἐραω, *I love*), in *Mythology*, the name of one of the nine muſes, who preſided over love-poetry. To this muſe ſome have aſcribed the invention of the lyre and lute; and ſhe is repreſented with a garland of myrtles and roſes, holding a lyre in one hand and a bow in the other, and at her ſide a Cupid with his torch. There is alſo a Nereid of the ſame name.

ERATOSTHENES, a Cyrenæan philoſopher, hiſtorian, and poet; called for his learning *Plato Minor*. He was keeper of the famous library at Alexandria; and was greatly in favour with Ptolemy Euergetes, by whoſe order he wrote a hiſtory of the Theban kings of Egypt, which ſucceſſion was entirely omitted by Manetho. He thus fixed the Egyptian chronology, and his authority is by many preferred to that of Manetho. He wrote many other things, a catalogue of which is to be ſeen in Fabricius, Voſſius, &c. but his only piece now remaining entire is a deſcription and fabulous account of the ſtars. He ſtarved himſelf in old age through grief for the dimneſs of his ſight, about the 10th or 12th year of Ptolemy Epiphanes, 194 B. C.

ERATOSTRATUS, an Epheſian who burnt the famous temple of Diana the ſame night that Alexander the Great was born. This burning, as ſome writers have obſerved, was not prevented or ſeen by the goddeſs of the place, who was then preſent at the labour of Olympias, and at the birth of the conqueror of Perſia. Eratoſtratus did this villany merely to eternize his name by ſo uncommon an action.

EREBUS (Ἔρεβος, from ערב *night*), in *Mythology* a term denoting darkneſs. According to Heſiod, Erebus was the ſon of Chaos and the night, and the father of the day. This was alſo the name of part of the *inferi* among the ancients: they had a peculiar expiation for thoſe who were detained in Erebus.

Erebus was properly the gloomy region, and diſtinguiſhed both from Tartarus the place of torment, and Elyſium the region of bliſs: according to the account given of it by Virgil, it forms the third grand diviſion of the inviſible world beyond the Styx, and comprehends ſeveral particular diſtricts, as the *limbus infantum*, or the receptacle for infants; the *limbus* for thoſe who have deſtroyed themſelves; the fields of mourning, full of dark groves and woods, inhabited by thoſe who died for love; and beyond theſe, an open champaign country for departed warriors.

ERECTION, in a general ſenſe, the act of raiſing or elevating any thing; as the erection of a perpendicular, &c. It is alſo uſed in a figurative ſenſe; as the erection of a biſhop, marquiſate, &c.

ERECTION is particularly uſed by medical writers for the ſtate of the penis when ſwelled and diſtended by the action of the muſcles called *erectores*. See ANATOMY *Index*.

There is alſo an erection of the clitoris, which is performed by muſcles for that purpoſe.

Eremit || Eretna.

EREMIT. See HERMIT.

ERETRIA, in *Ancient Geography*, a town of Eubœa, ſituated on the Euripus, in the ſouth-weſt of the iſland. A very ancient city, and the largeſt of the iſland, after Chalcis. After being demoliſhed by the Perſians, it was reſtored on an adjoining ſpot, according to Strabo, who mentions a ſchool of Etrurian philoſophers there. The Abantes of Homer were of Eubœa.

ERFORT, a town of Germany, in the circle of Upper Saxony, the capital of Thuringia, and ſubject to the elector of Mentz. It is defended by good ramparts; and has a caſtle on an eminence, which commands the town. Its inhabitants are almoſt all Lutherans, but its principal churches belong to the Catholics. There are ſeveral handſome ſtructures, both public and private; but the houſes in general are but indifferently built. E. Long. 11. 14. N. Lat. 50. 49.

ERGASTULUM, among the Romans, was a priſon, work-houſe, or houſe of correction, where ſlaves by the private authority of their maſters were confined and kept for their offences to hard labour. The Greeks had a place of confinement of this ſort called Σωφρονιστηριον.

ERGOT, in *Farriery*, is a ſtub, like a piece of ſoft horn, about the bigneſs of a cheſnut, placed behind and below the paſtern joint, and commonly hid under the tuft of the fetlock. See FARRIERY *Index*.

ERICA, HEATH, a genus of plants belonging to the octandria claſs, and in the natural method ranking under the 18th order, *Bicornes*. See BOTANY *Index*.

ERIDANUS, in *Ancient Geography*, a river of Attica, falling into the Iliſſus.—Another Eridanus, the more ancient name of the Padus, an appellation aſcribed by Pliny to the Greeks; followed in this by Virgil. It riſes in Mount Veſulus, in the Alpes Cottiæ, and dividing the Ciſalpine Gaul into the Ciſpadana and Tranſpadana, and ſwelled on each hand with no inconſiderable rivers from the other Alps and the Apennine, falls at ſeven mouths into the Adriatic. Famous in mythology, from the ſtory of Phaëton; whoſe ſiſters, the Heliades, were here changed into poplars, according to Ovid.

ERIDANUS, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere, in form of a river.—The ſtars in the conſtellation Eridanus, in Ptolemy's catalogue, are 34; in Tycho's, 19; and in the Britiſh catalogue, 84.

ERIE, a vaſt lake to the weſtward of Pennſylvania, in North America, ſituated between 80° and 87° W. Long. and between 41° and 42° N. Lat.

ERIGENA, or SCOTUS, JOHN, a famous ſcholaſtic divine, born about the beginning of the ninth century; but where, is a matter of diſpute among authors. Bale and Pits ſays he was born at St David's in Wales; Dempſter, Mackenzie, and Henry, that he was born at Ayr in Scotland; which they infer from his names *Erigena* and *Scotus*, by the latter of which he was generally diſtinguiſhed by his cotemporary writers. But Du Pin and Sir James Ware aſſert that he was by birth an Iriſhman; Ireland being in thoſe days called *Scotia*,

Erigena. and by the natives *Erin*. They agree, however, in relating that he travelled to Athens, where he acquired a competent knowledge of the Greek and other oriental languages; and that he afterwards reſided many years in the court of Charles the Bald, king of France, who, on account of his ſingular abilities, treated him as his intimate friend and companion. He ſlept frequently in the royal apartment; and was conſtantly admitted to the king's table. "We may judge (ſays a modern hiſtorian) of the freedom which he uſed with Charles, by the following repartee. As the king and Scotus were ſitting one day at table, oppoſite to each other, after dinner, drinking a cheerful glaſs, the philoſopher having ſaid ſomething that was not quite agreeable to the rules of French politeneſs, the king in a merry humour aſked him, Pray what is between a *Scot* and a *ſot*? To which he anſwered, "Nothing but the table." See *Henry's Hiſtory of Great Britain*, vol. i. p. 344. who quotes this ſtory from *Hovedeni Annal. ad an.* 86. Quer. What language were they talking when this *bon mot* was uttered?

During his reſidence with Charles, he wrote ſeveral books of ſcholaſtic divinity; which, though abſurd enough, were at that time not ſufficiently ſo to ſecure him from the imputation of heterodoxy; and on that account the pope commanded Charles the Bald to ſend him to Rome; but the king had too great a regard for his companion to truſt him with his Holineſs. One of the chief controverſies in which Scotus was engaged, and with which the pope was much offended, was concerning the real preſence and blood of Chriſt in the wafer. His opinion of this weighty matter is expreſſed in theſe few words: "What we receive corporally is not the body of our Lord; but that which feeds the ſoul, and is only perceived by faith." He was alſo engaged in two other controverſies of equal importance, but of a ſomewhat leſs delicate nature. The firſt was, Whether any part of the euchariſt be evacuated by ſtool? and the ſecond, Whether Chriſt was born of the Virgin Mary *aperta vulva*; Paſchaſius was of opinion, that this could not be without ſome injury to her perpetual virginity; and therefore believed that Chriſt came into the world *per vulvam clauſam*, as he came into the place where his diſciples were aſſembled, through the door and not through the wall, without opening the door. Concerning the firſt of theſe delicate queſtions, Scotus with ſeveral others declared, that part of the euchariſt was certainly evacuated by ſtool; for which they were honoured with the appellation of *Stercoriſts*. And as to the ſecond queſtion, he ſaid, that the *vulva clauſa* was a dangerous opinion: for it would thence follow, that he was not born, but iſſued; *non eſt naſci, ſed erumpi*. See Mackenzie, vol. i. p. 55.

Whether this John Scotus returned to England, or ended his days in France, is a matter of doubt. Some of our hiſtorians tell us, that he left France in the year 864; and that, after reſiding about three years in Oxford, he retired to the abbey of Malmſbury, where his ſcholars ſtabbed him with their pen knives. There is no foundation for this ſtory. Probably he died about the year 874; but whether in France or England, is uncertain,, and of little importance. Some have related, that he was invited to England by King Alfred: but in this they confound him with John, abbot of Etheling, who was aſſaſſinated in 895; and to this miſtake the various accounts concerning this author are to be attributed. Regardleſs of his hiſtory, he appears from his writings to have been a man of parts, and, in point of learning, ſuperior to any of his cotemporaries. He wrote, 1. *De diviſione naturæ*, lib. v. 2. *De prædeſtinatione Dei*. 3. *Excerpta de differentiis & ſocietatibus Græci Latinique verbi*. 4. *De corpore et ſanguine Domini*. 5. *Ambigua S. Maximi, ſeu ſcholia ejus in difficiles locos S. Gregorii Nazianzeni, Latinè verſa*. 6. *Opera S. Dionyſii quatuor in Latinam ling. converſa*. All publiſhed. 7. *De viſione Dei*, and ſeveral other works, in manuſcript, preſerved in different libraries.

Erigeron || Erivan.

ERIGERON, FLEA-BANE, a genus of plants, belonging to the ſyngeneſia claſs; and in the natural method ranking under the 49th order, *Compoſitæ*. See BOTANY *Index*.

ERIGONE, in fabulous hiſtory, daughter to Icarius, died of grief for her father's death, was tranſlated into heaven, and makes the ſign Virgo.

ERINACEUS, or HEDGE-HOG, a genus of quadrupeds belonging to the order of feræ, in the claſs mammalia. See MAMMALIA *Index*.

ERINGO. See ERYNGIUM, BOTANY *Index*.

ERINUS, a genus of plants belonging to the didynamia claſs; and in the natural method ranking under the 40th order, *Perſonatæ*. See BOTANY *Index*.

ERIOCAULON, a genus of plants, belonging to the triandria claſs; and in the natural method ranking with the ſixth order, *Enſatæ*. See BOTANY *Index*.

ERIOCEPHALUS, a genus of plants, belonging to the ſyngeneſia claſs; and in the natural method ranking under the 49th order, *Compoſitæ*. See BOTANY *Index*.

ERIOPHORUM, a genus of plants, belonging to the triandria claſs; and in the natural method ranking under the third order, *Calamariæ*. See BOTANY *Index*.

ERITHALIS, a genus of plants, belonging to the pentandria claſs; and in the natural method ranking with thoſe of which the order is doubtful. See BOTANY *Index*.

ERIVAN, a city of Perſia, in Aſia, and capital of Perſian Armenia. It is a large, dirty, ill-looking place, in which are no handſome buildings, the houſes being very mean, and raiſed with earth or mud; but it is full of gardens and vineyards. It is ſituated in a plain which is ſurrounded on all ſides with mountains. Two rivers paſs near it, the Zengui to the north-weſt, and the Queur Boulac to the ſouth-weſt. The fortreſs may paſs for a town of itſelf; it is of an oval form, and is four miles in circumference, containing about 800 houſes. It is inhabited by none but the native Perſians. The Armenians have ſhops in it, where they work and trade in the day time, but at night return to their habitations in the city. The fortreſs is ſurrounded with three walls, made with bricks dried in the ſun, which have battlements, and are flanked with towers, and defended with ramparts. On the north-eaſt there is a dreadful precipice, above 200 yards in depth, at the bottom of which the river runs. The garriſon uſually conſiſted of 2000 men; but how many there are ſince the revolution is hard to ſay. The palace of the govenor of the province is within the fortreſs. The city is-

Eriphyle ‖ Ermin.

is about a cannon's ſhot diſtant from the fortreſs, and the ſpace between is full of houſes and markets. E. Long. 44. 50. N. Lat. 40. 20.

ERIPHYLE, in fabulous hiſtory, a ſiſter of Adraſtus king of Argos, who married Amphiaraus. She was daughter of Talaus and Liſimache. When her huſband concealed himſelf that he might not accompany the Argives in their expedition againſt Thebes, where he knew he was to periſh, Eriphyle ſuffered herſelf to be bribed by Polynices with a golden necklace which had been formerly given to Hermione by the goddeſs Venus, and ſhe diſcovered where Amphiaraus was. This treachery of Eriphyle compelled him to go to the war; but before he departed, he charged his ſon Alcmæon to murder his mother as ſoon as he was informed of his death. Amphiaraus periſhed in the expedition; and his death was no ſooner known than his laſt injunctions were obeyed, and Eriphyle was murdered by the hands of her ſon.

ERIS, the goddeſs of diſcord among the Greeks. She is the ſame as the *Diſcordia* of the Latins.

ERISICHTHON, in fabulous hiſtory, a Theſſalian, ſon of Triops, who derided Ceres and cut down her groves. This impiety irritated the goddeſs, who afflicted him with continual hunger. He ſquandered all his poſſeſſions to gratify the cravings of his appetite, and at laſt he devoured his own limbs for want of food. Some ſay that his daughter had the power of transforming herſelf into whatever animal ſhe pleaſed, and that ſhe made uſe of that artifice to maintain her father, who ſold her, after which ſhe aſſumed another ſhape, and became again his property.

ERMIN. See MUSTELA, MAMMALIA *Index*.

ERMIN, or *Ermine*, in *Heraldry*, denotes a white field or fur, powdered or interſperſed with black ſpots, called *powdering*. It is ſuppoſed to repreſent the ſkin of an animal of the ſame denomination. There is however no animal whoſe ſkin naturally correſponds to the herald's ermin.

The animal is milk white; and ſo far is it from having ſpots, that tradition reports, that it will rather die or be taken than ſully its whiteneſs. Whence its ſymbolical uſe.

But white ſkins having for many ages been uſed for the linings of the robes of magiſtrates and great men; the furriers at length, to add to their beauty, uſed to ſew bits of the black tails of thoſe creatures upon the white ſkins, to render them the more conſpicuous. Which alteration was introduced into armoury.

The fable ſpots in ermin are not of any determinate number, but they may be more or leſs at the pleaſure of the painter or furrier.

ERMIN, an order of knights, inſtituted in 1450 by Francis I. duke of Bretagne, and formerly ſubſiſting in France. The collar of this order was of gold, compoſed of ears of corn in ſaltier; at the end of which hung the ermin, with this inſcription, *à ma vie*. But the order expired when the dukedom of Bretagne was annexed to the crown of France.

Ermines ‖ Erpenius.

ERMINES, in *Heraldry*, the reverſe of ermine, i. e. white ſpots on a black field.

ERMINITES, in *Heraldry*, ſhould ſignify little ermines, but it is otherwiſe; for it ſignifies a white field powdered with black, only that every ſuch ſpot hath a little red hair on each. Erminites alſo ſignify a yellow field powdered with black, which the French expreſs much better by *or ſemée d'ermine de ſable*.

ERMINOIS, in *Heraldry*, ſignifies the field or, and the ſpots black.

EROORO. See ALCEDO, ORNITHOLOGY *Index*.

EROS, (of ἐρως "love"), in *Mythology*, one of two chiefs over all the other Cupids, being the cauſe of love. See ANTEROS.

EROTIA, a feſtival in honour of Eros the god of love. It was celebrated by the Theſpians every fifth year with ſports and games, when muſicians and others contended. If any quarrels or ſeditions had ariſen among the people, it was then uſual to offer ſacrifices and prayers to the god, that he would totally remove them.

EROTIC (derived from ἐρως "love;" whence ἐρωτικος), is applied to any thing which has a relation to the paſſion of love.

In medicine we find the phraſe *delirium eroticum* uſed for a kind of melancholy contracted through exceſs of love.

EROSION, among phyſicians, denotes much the ſame with CORROSION, only in a ſtronger degree.

EROTESIS. See ORATORY, N° 94.

ERPENIUS, THOMAS, in Dutch THOMAS of ERPE, a celebrated profeſſor of the Arabic language, was born at Gorcum in Holland in 1584, and educated at Leyden. He applied himſelf to the oriental languages at the perſuaſion of Joſeph Scaliger; and afterwards travelled into England, France, Italy, and Germany, and everywhere obtained the eſteem of the learned. On his return to Holland, he was made profeſſor of Arabic in the univerſity of Leyden, and died there in 1624. He publiſhed a great many excellent works, which ſpread his reputation through the whole learned world. It is ſaid, that the king of Morocco admired ſo greatly the letters of Erpenius wrote to him in Arabic in the name of the United Provinces, that he could not ceaſe reading them, and ſhowing them to thoſe who ſpoke that language naturally.

ERPETOLOGY.

INTRODUCTION.

THE animals of which we propoſe, under the general title *Erpetology*, to give the claſſification and natural hiſtory, belong to the claſs *Amphibia*, and the order *Reptilia*, in the Linnæan arrangement. The animals included under this claſs have obtained the denomination of amphibious, from the ſuppoſed circumſtance that they are equally capable of living, both on land and in the water. But in this view, the application of the term is inaccurate, for there are few, or perhaps no animals belonging to this claſs which can always exiſt,

or even perform the functions of life for any conſiderable length of time, in the water. Many of them, however, poſſeſs this faculty to a certain degree, and therefore, the name has been extended to all which are diſtinguiſhed by the ſame peculiarity of external form, and a ſimilar ſtructure of internal organs.

Some naturaliſts have denominated this order of animals *oviparous quadrupeds*. This denomination is undoubtedly ſufficiently characteriſtic; for although ſome ſpecies are viviparous, and in this circumſtance, as well as being furniſhed with four feet, exhibit ſome reſemblance with the higher order of quadrupeds, the ſtriking difference which is diſcovered by the anatomiſt and the phyſiologiſt, affords unequivocal and decided marks of diſtinction. From the ſtructure, habits, and general economy of this order of animals, we derive characters which are ſufficiently diſtinctive between it and the claſs of birds, to which the term *oviparous* is ſtrictly applicable. This denomination, therefore, which is alſo employed by the Count de la Cepede, is ſufficiently characteriſtic of the claſs of animals which are included under it.

The word *reptile*, by which this order of animals has been diſtinguiſhed by Linnæus, ſeems not to be liable to much objection. All the individuals of which it is compoſed have very ſhort legs, and theſe are placed at a great diſtance from each other, and ſo weak, that they are unable to ſupport the weight of the body. The gray lizard, for inſtance, which is one of the moſt active of the tribe, is obliged to ſupport itſelf on its belly, as ſoon as its progreſſive motion is greatly diminiſhed; ſo that it employs its limbs rather for the purpoſe of crawling than that of walking. And indeed all the animals of the order, from the peculiar ſtructure and diſpoſition of their limbs, when their motions are ſlow, muſt drag the body along on the belly, other modifications of their locomotive powers depending only on the great length and relation of the inſtruments of motion. In this view, therefore, the Linnæan name of the order is not improperly applied to almoſt all the individuals which it comprehends.

The term *erpetology*, which we have given to this treatiſe upon the order *reptilia*, was formerly employed by the Swediſh naturaliſt Klein, in a more extenſive ſenſe. Under this title he included the order *ſerpentes*, as well as that of *reptilia*, thus comprehending the whole claſs of *amphibia*. Here we have adopted it in a more limited acceptation, and confined its meaning to the laſt order, purſuing the plan of M. Bonnaterre, in his arrangement of the ſame order of animals in the Encyclopedie Methodique.

Linnæus has adopted as a mark of diſtinction of this order of animals, the peculiar ſtructure of the heart, which in the language of the anatomiſt is ſaid to be *unilocular*, or furniſhed only with one ventricle or cavity. This doctrine has been admitted by eminent anatomiſts, as well as by ſome of the greateſt phyſiologiſts, ſuch as Boerhaave, Haller, and ſome others; and called in queſtion only when ſome exceptions have occurred, of animals belonging to this tribe, which have exhibited ſomewhat of a different ſtructure. One inſtance of this is quoted in the heart of an Indian inland tortoiſe, which was examined by the French academicians of the 17th century, and in which they diſcovered three ventricles inſtead of one. But other phyſiologiſts are of opinion, that the heart of this order of animals is really furniſhed with two ventricles, having an immediate communication between them; they muſt therefore be conſidered as having a double heart.

The lungs of the order *reptilia* are, in their appearance and ſtructure, widely different from thoſe of other animals. They are in general compoſed of two large bladders, or membranaceous bags, which, in the different ſpecies are divided into a greater or ſmaller number of *cancelli*, or ſubdiviſions; among which are diſtributed the pulmonary blood-veſſels. Theſe bear but a ſmall proportion to the veſicular part through which the ramifications are carried; in this reſpect differing greatly from the lungs of the higher order of quadrupeds, or *mammalia*, in which the proportion of the blood-veſſels is ſo much greater than that of the air-cells, that the lungs have more of a fleſhy than of a membranaceous appearance. In this order of animals, therefore, in which the blood is cold, the veſicular ſyſtem far overbalances the vaſcular; but in the claſs *mammalia*, which are warm-blooded animals, the vaſcular ſyſtem prevails over the veſicular.

Of all the animals which occupy the ſurface of the earth, and which the Almighty Creator has diſperſed throughout his works, to fill up the void of ſpace, and to produce motion, the tribe of reptiles ſeems at firſt ſight to have been leaſt the objects of beneficence and wiſdom. In their ſtructure, habits, and mode of life, when compared with other orders of animals, they exhibit marks of degradation and neglect. The body in general preſents only a rude inactive maſs; their ſenſes are extremely obtuſe; their inſtincts are limited to the groſſeſt ſenſations, and the extent of their enjoyments reaches only to the gratifications of appetite. On the boundaries of land and water, in thoſe vaſt moraſſes, which are remarkable only for immenſe depoſitions of mud, few or ſcarcely any poſſeſs the graces or elegance of other terreſtrial animals; like the latter they enjoy not the pleaſure of aſſociating together for amuſement or defence, or of indulging in ſportive tricks on the land, or in the air. On the contrary, they crawl on the earth, on the margin of extenſive lakes, ſurrounded with unwholeſome vapours; or they live in the cavities of the rocks, or in the midſt of barren deſerts, undiſturbed by other animals, and far retired from the habitations of man. Some delight in expoſing themſelves to the rays of the ſun; while others retire during the day to ſhady, moiſt, and ſequeſtered places, proceeding from their retreats only during the night, as it were to conceal their deformity, and to ſpare man thoſe feelings of fear, diſguſt, and horror, with which their preſence inſpires him. But as the ſtudy of every part of the long chain of beings is worthy of our attentive conſideration and regard, theſe animals, in the eyes of the careful obſerver of nature, are far from being wanting in exciting his intereſt and curioſity. He cannot fail to be highly gratified with contemplating the reſources which they derive from the peculiar ſtructure of their external form, as well as from the nature of their functions. Their manners, their habits, and the relations which they bear to beings of a higher order, on the one hand, and the diſtance to which they are removed from brute matter on the other, are objects worthy of the contemplation of the naturaliſt. This ſtudy, properly directed and applied, unveils to our eyes the beneficent

deſign

deſign and riches of creation, and raiſes our admiration to the wonderful and extenſive variety of animated beings.

The uſes of ſome of the animals belonging to this claſs, as valuable articles of food in thoſe regions where they abound, or as furniſhing the tables of the luxurious in other countries with a rich delicacy; the peculiarities of external form, and of internal ſtructure, as well as of ſeveral of their functions, ſuch as circulation and reſpiration; their great length of life; the reproductive power of ſome, and the long abſtinence which others can undergo, give additional intereſt and importance to the natural hiſtory of theſe animals.

In the following treatiſe, we propoſe to lay before our readers a brief but comprehenſive view of the natural hiſtory of this order of animals; and for the ſake of perſpicuity we ſhall treat this ſubject under two general heads. We ſhall firſt conſider the claſſification and natural hiſtory of the order *reptilia*; and ſecondly, we ſhall give a ſhort ſketch of their anatomy, with the principal facts connected with their phyſiology. Theſe will form the ſubjects of the two following chapters.

CHAP. I. OF THE CLASSIFICATION AND NATURAL HISTORY OF REPTILES.

In the Linnæan arrangement, the order *reptilia* is divided into four genera. Other naturaliſts have adopted a different arrangement. De la Cepede, in his hiſtory of oviparous quadrupeds, has divided this order into two great claſſes. The firſt claſs includes thoſe animals which are furniſhed with a tail, and the ſecond comprehends thoſe which have no tail. The following table exhibits a view of the claſſification of this eminent naturaliſt.

Claſs I. Animals furniſhed with a tail.
- Genus 1. *Tortoiſes*, having the body covered with a bony ſhield.
  - Diviſion 1. The fingers very unequal, and lengthened out in the form of fins.
  - Diviſion 2. The fingers very ſhort, and almoſt equal.
- Genus 2. *Lizards*: the body having no bony covering.
  - Diviſion 1. The tail flattened; five fingers on the fore feet.
  - Diviſion 2. The tail round; five fingers on each foot, and elevated ſcales on the back.
  - Diviſion 3. The tail round; five fingers on the fore feet: ſcaly bands under the belly.
  - Diviſion 4. The tail round; five fingers on the fore feet, without ſcaly bands under the belly.
  - Diviſion 5. The fingers furniſhed underneath with large ſcales, covering each other, like the ſlates on the roof of a houſe.
  - Diviſion 6. Three fingers on the fore and the hind feet.
  - Diviſion 7. Membranes in the form of wings.
  - Diviſion 8. Three or four fingers on the fore feet; four or five fingers on the hind feet.

Claſs II. Animals which have no tail.
- Genus 1. *Frogs*: the head and the body lengthened out, and the one or the other angular.
- Genus 2. *Tree-frogs*: the body long, with ſoft viſcid tubercles under the toes.
- Genus 3. *Toads*: the body thick and round.
- Appendix. Biped reptiles.
  - Diviſion 1. Two fore feet.
  - Diviſion 2. Two hind feet.

Of this arrangement it may be obſerved, that, although it exhibits much minuteneſs and ingenuity, the diſtinctive characters upon which ſome parts of it are founded, are not always conſtant and fixed; for it has been found that theſe characters vary in the different individuals in which they have been obſerved. This variety, it has been conjectured, ariſes from the difference of age, and peculiarities in their food and modes of life.

M. Bonnaterre has adopted a different arrangement. He has alſo divided the whole order of reptiles into two claſſes, as will appear from the following table.

Claſs I. Reptiles which have no tail.
- Genus 1. *Frog.*
- Genus 2. *Tree-Frog.*
- Genus 3. *Toad.*

Claſs II. Reptiles which are furniſhed with a tail.
- Genus 1. *Tortoiſe.*
- Genus 2. *Chamelion.*
- Genus 3. *Crocodile.*
- Genus 4. *Lizard.*
- Genus 5. *Flying dragon.*
- Genus 6. *Salamander.*
- Genus 7. *Chalcis.*

This arrangement is undoubtedly, in many caſes, convenient and proper; yet, as there ſeems to be in others an unneceſſary multiplication of genera, we ſhall ſtill adhere to the Linnæan claſſification, which, though more ſimple, will in general be found not to be much leſs accurate; and the objects which it comprehends not being very numerous, it is ſufficiently diſtinct. Linnæus divided this order into four genera. The following are the characters of the genera, of which we give a tranſlation, for the accommodation of the Engliſh reader.

GENERIC CHARACTERS.

Genus I. Testudo. Corpus caudatum; lorica oſſea, aut coriacea ſuperne et infernè, vel ſquamis ſuperne obtectum. Oris mandibula ſuperior inferiorem pyxidum inſtar claudens.

Genus I. Tortoise. Body having a tail: covered above and beneath with a bony or coriaceous ſhell, or ſcales above. The upper jaw cloſing over the lower like the lid of a box.

Genus II.

Tortoiſes. Genus II. Rana. Corpus tetrapodum, nudum, utplurimum ecaudatum: pedibus poſterioribus longioribus.

Genus III. Draco. Corpus tetrapodum, caudatum, alatum: alis propriis.

Genus IV. Lacerta. Corpus tetrapodum, elongatum, caudatum, nudum: pedibus æqualibus.

Tortoiſes. Genus II. Frog. Body four-footed, naked, generally without tail; the hinder feet longeſt; *and without any integument but the ſkin.*

Genus III. Flying Dragon. Body four-footed, furniſhed with a tail, and on each ſide with an expanſile wing-like ſkin.

Genus IV. Lizard. Body four-footed, elongated, furniſhed with a tail, without any additional integument: legs equal.

I. TESTUDO, or Tortoise.

From the great ſimilarity which prevails among ſeveral ſpecies, and the variety in ſize, colour, and other circumſtances, according to the different periods of their age, conſiderable difficulties have ariſen in diſcriminating them with preciſion. The obſervations of later naturaliſts have ſhown, that the ſpecific characters of Linnæus are not ſufficient for the purpoſe of accurate diſtinction; nor have the deſcriptions of the Count de la Cepede been more uſeful in furniſhing proper characteriſtic marks. One ſet of characters, which have been uſually employed for this purpoſe, it has been obſerved by Mr Schoepff, ought not be truſted. They are derived from the number of claws on the feet of marine tortoiſes, or turtles. Theſe, however, are found to vary ſo much, that they are not to be conſidered as affording uniform and conſtant characters of diſtinction. As a proof of this obſervation, if different individuals of the common green turtle (*teſtudo midas*), be compared together, it will appear that ſome have only a ſingle claw on each foot; while others are furniſhed with two, and ſometimes three; ſometimes with two on the fore feet, and with one on the hind feet. Similar variations have alſo been obſerved in the number of claws of land tortoiſes, and particularly in thoſe of the common tortoiſe, (*teſtudo græca*); in ſome individuals of which the fore feet have four, and in others five claws. Avoiding, therefore, theſe uncertain and varying characters, the ſhape, pattern, colours of the ſhell, and form of the head, Dr Shaw obſerves, furniſh the moſt accurate marks of diſtinction.

Some of the ſpecies belonging to this genus are natives of the ocean; ſome are confined to the land, or to freſh water. This affords a natural diviſion into land and ſea tortoiſes. In following out this diviſion, we ſhall treat of them in two ſections, including under the firſt thoſe that frequent freſh waters.

Sect. I. *Land and Freſh-water Tortoiſes.*

1. Testudo Græca. Lin. *Common Land Tortoiſe.*

Specif. Char.—The ſhell is hemiſpherical, and of a black and yellow colour, and having a bunch behind; the pieces of which the diſk is compoſed are convex, and the ſides are obtuſe.

Deſcription. The length of the common tortoiſe is about ſix inches, and rarely exceeds eight: when full grown, it is about forty-eight ounces weight. The ſhell is compoſed of thirteen middle pieces, and about twenty-five marginal ones; is of an oval form, and very convex above. The middle pieces, or thoſe which conſtitute the diſk of the ſhield, are moſtly of a ſquare form, ſomewhat oblong; their colour is blackiſh or dark brown, each having a broad yellow band running along one ſide, which is continued half way along the upper part. The colours vary in different individuals, and the ſhape of the pieces is alſo ſubject to occaſional variations. The ſulci or furrows which appear on the ſurface of young animals are obliterated as they grow old. The belly part of the ſhell is of a pale yellow colour; the head is rather ſmall, the upper part covered with irregular tough ſcales, and the neck with ſmaller pieces, which admit of the motion of the head; the eye is ſmall and black, and the mouth does not extend beyond the eyes. The legs are ſhort; and the feet, which are moderately broad, are covered with ſtrong ovate ſcales. The feet have uſually four ſtout claws, but their number is found to vary in different circumſtances. The tail is rather ſhorter than the legs, is covered with ſmall ſcales, and terminates in a naked, horny, pointed tip.

Native country. The land tortoiſe is a native of almoſt all the countries round the Mediterranean; but it has been ſuppoſed to be more frequent in Greece, from whence it has derived its ſpecific name. It is alſo found in the iſlands of the Archipelago, in Corſica, Sardinia, and in many parts of Africa. From the account of the Daniſh naturaliſt Forſkal, it is employed in Greece for the purpoſe of food. "The inhabitants," he ſays, "often ſwallow the blood recent, and eat the eggs boiled, which are about the ſize of thoſe of a pigeon, four or five in number, and of a white colour. In September the animal hides itſelf under ground, and again emerges in February; laying its eggs in June, in a ſmall hole, which it ſcratches in ſome ſunny ſpot, out of which, after the firſt rains of September, the young are hatched, which are about the ſize of a walnut. The males of this ſpecies are ſaid to fight often, butting at each other with ſuch force, as to be heard at a conſiderable diſtance."

The land tortoiſe, when it is kept in gardens in Italy and Germany, is commonly obſerved to conceal itſelf in October, and to reappear in April. The period of retirement in England is about the end of October, and the time of its appearance is about the middle of April; but it ought to be added, that theſe periods vary in different countries, and according to the temperature of the ſeaſon.

Great age. The land tortoiſe lives to a very great age. In ſeveral inſtances which ſeem to be well authenticated, it has conſiderably exceeded the extraordinary period of an hundred years. One inſtance which is perhaps not the leaſt remarkable, is recorded of a tortoiſe which was introduced into the archbiſhop's garden at Lambeth.

Tortoises. beth, about the year 1633, and lived till the year 1753; the ſhell of which is ſtill preſerved in the library of the palace at Lambeth. Another remarkable circumſtance reſpecting this individual is, that it was of a larger ſize than uſual. The ſhell meaſured 10 inches in length, and ſix and a half in breadth.

Very tenacious of life. None of this orde of animals is more tenacious of life than the tortoiſe. The experiments of Redi afford a remarkable proof of this fact. In the beginning of November he made a large opening in the ſkull of a land tortoiſe, extracted the whole of the brain, waſhed out the cavity, that no part might remain; and having left the hole open, let the animal go. It walked off ſeemingly uninjured, excepting that it cloſed its eyes, which never afterwards opened. At the end of three days, during which time the whole of the ſkull began to cloſe, the wound was covered with a complete ſkin; and thus without brain it walked about as uſual, and lived for ſix months. The ſame naturaliſt cut off the head of another tortoiſe, which lived for the ſpace of twenty-three days afterwards.

Abſtinence This animal is not leſs remarkable for its abſtinence. Blaſius kept an individual of this ſpecies for ten months, during which time it taſted no kind of food whatever. It died about the end of that time, but this was aſcribed to the ſeverity of the ſeaſon, rather than to the want of food; for the inteſtines being examined, they were found full of excrement of the natural colour.

Mr White, in his Natural Hiſtory of Selborne, has given ſo full and diſtinct an account of the natural hiſtory of the land tortoiſe, founded on facts drawn from his own obſervation, that we ſhall lay it before our readers in his own words.

White's account of one. "A land tortoiſe (ſays he), which has been kept for thirty years in a little walled court belonging to the houſe where I now am viſiting, retires under ground about the middle of November, and comes forth again about the middle of April. When it firſt appears in the ſpring it diſcovers very little inclination towards food; but in the height of ſummer grows voracious: and then as the ſummer declines, its appetite declines; ſo that for the laſt ſix weeks in autumn, it hardly eats at all. Milky plants, ſuch as lettuces, dandelions, ſowthiſtles, are its favourite diſh. In a neighbouring village one was kept, till by tradition it was ſuppoſed to be an hundred years old. An inſtance of vaſt longevity in ſuch a poor reptile!

p. 135. "On the 1ſt of November, I remarked that it began firſt to dig the ground in order to the forming its hybernaculum, which it had fixed on juſt beſide a great tuft of hepaticas. It ſcrapes out the ground with its fore-feet, and throws it up over its back with its hind; but the motion of its legs is ridiculouſly ſlow, little exceeding the hour-hand of a clock; and ſuitable to the compoſure of an animal ſaid to be a whole month in performing one feat of copulation. Nothing can be more aſſiduous than this creature night and day in ſcooping the earth, and forcing its great body into the cavity; but, as the noons of that ſeaſon proved unuſually warm and ſunny, it was continually interrupted, and called forth by the heat in the middle of the day; and though I continued there till the thirteenth of November, yet the work remained unfiniſhed. Harſher weather, and froſty mornings, would have quickened its operations. No part of its behaviour ever ſtruck me more than the extreme timidity it always expreſſes with regard to rain; for though it has a ſhell that would ſecure it againſt the wheel of a loaded cart, yet does it diſcover as much ſolicitude about rain as a lady dreſſed in all her beſt attire, ſhuffling away on the firſt ſprinklings, and running its head up in a corner. If attended to, it becomes an excellent weather-glaſs; for as ſure as it walks elate, and as it were on tiptoe, feeding with great earneſtneſs in a morning, ſo ſure will it rain before night. It is totally a diurnal animal, and never pretends to ſtir after it becomes dark. The tortoiſe, like other reptiles, has an arbitrary ſtomach as well as lungs; and can refrain from eating as well as breathing for a great part of the year. When firſt awakened it eats nothing; nor again in the autumn before it retires: through the height of the ſummer it feeds voraciouſly, devouring all the food that comes in its way. I was much taken with its ſagacity in diſcerning thoſe that do it kind offices: for, as ſoon as the good old lady comes in ſight who has waited on it for more than thirty years, it hobbles towards its benefactreſs with awkward alacrity; but remains inattentive to ſtrangers. Thus not only "*the ox knoweth his owner, and the aſs his maſter's crib*," but the moſt abject reptile, and torpid of beings, diſtinguiſhes the hand that feeds it, and is touched with the feelings of gratitude!" Tortoiſes. *Ibid.* p. 148.

"The old Suſſex tortoiſe, (he adds), that I have mentioned ſo often, is become my property. I dug it out of its winter dormitory in March laſt, when it was enough awakened to expreſs its reſentments by hiſſing; and, packing it in a box with earth, carried it eighty miles in poſt-chaiſes. The rattle and hurry of the journey ſo perfectly rouſed it, that, when I turned it out on a border, it walked twice down to the bottom of my garden; however, in the evening, the weather being cold, it buried itſelf in the looſe mould, and continues ſtill concealed."

"As it will be under my eye, I ſhall now have an opportunity of enlarging my obſervations on its mode of life and propenſities; and perceive already that, towards the time of coming forth, it opens a breathing place in the ground near its head, requiring, I conclude, a freer reſpiration as it becomes more alive. This creature not only goes under the earth from the middle of November to the middle of April, but ſleeps great part of the ſummer; for it goes to bed in the longeſt days at four in the afternoon, and often does not ſtir in the morning till late. Beſides, it retires to reſt for every ſhower; and does not move at all in wet days."

"When one reflects on the ſtate of this ſtrange being, it is a matter of wonder to find that Providence ſhould beſtow ſuch a profuſion of days, ſuch a ſeeming waſte of longevity, on a reptile that appears to reliſh it ſo little as to ſquander more than two thirds of its exiſtence in a joyleſs ſtupor, and be loſt to all ſenſation for months together in the profoundeſt of ſlumbers."

"While I was writing, a moiſt and warm afternoon, with the thermometer at 50, brought forth troops of ſhell-ſnails; and, at the ſame juncture, the tortoiſe heaved up the mould, and put out its head; and the next morning came forth, as it were raiſed from the dead, and walked about till four in the afternoon. This was a curious coincidence! a very amuſing occurrence! to

ſee

Tortoises. Ibid. p. 261.

see such a similarity of feeling between the two τετρωκοι! for so the Greeks called both the shell-snail and the tortoise.

"Because we call this creature an abject reptile, we are too apt to undervalue his abilities, and depreciate his powers of instinct. Yet he is, as Mr Pope says of his lord,

——"Much too wise to walk into a well:"

and has so much discernment as not to fall down a kaha; but to stop and withdraw from the brink with the readiest precaution.

"Though he loves warm weather, he avoids the hot sun; because his thick shell, when once heated, would, as the poet says of solid armour, "scald with safety." He therefore spends the more sultry hours under the umbrella of a large cabbage-leaf, or amidst the waving forests of an asparagus-bed."

"But as he avoids heat in the summer, so, in the decline of the year, he improves the faint autumnal beams, by getting within the reflection of a fruit-wall: and, though he never has read that planes inclining to the horizon receive a greater share of warmth, he inclines his shell, by tilting it against the wall, to collect and admit every feeble ray.

"Pitiable seems the condition of this poor embarrassed reptile: to be cased in a suit of ponderous armour, which he cannot lay aside; to be imprisoned, as it were, within his own shell, must preclude, we should suppose, all activity and disposition for enterprise. Yet there is a season of the year (usually the beginning of June) when his exertions are remarkable. He then walks on tiptoe, and is stirring by five in the morning; and, traversing the garden, examines every wicket and interstice in the fences, through which he will escape if possible: and often has eluded the care of the gardener, and wandered to some distant field. The motives that impel him to undertake these rambles seem to be of the amorous kind: his fancy then becomes intent on

Ibid. p. 427.

sexual attachments, which transport him beyond his usual gravity, and induce him to forget for a time his ordinary solemn deportment."

2. Testudo Marginata, *Marginated Tortoise.*

Specif. Char.—The shell is blackish-brown, variegated with yellow, oblong, and gibbose, widened and depressed on the hind part.

The length of this species is nearly fourteen inches, the breadth about ten, measuring the curvature of the shell. The head which is flat and triangular above, is nearly two inches long, above an inch broad, and one inch deep. The eyes are furnished with a nictitating membrane; but the lower eyelid only is moveable. The mandibles are strong, notched, and internally beset with protuberances which have been sometimes mistaken for teeth. The external orifices of the ears are covered with the common skin. The tail is very short. The fore legs are about three inches and a half long; the hind legs are about two and a half long. The skin is grainy, and covered with brown coloured, unequal, hard scales, extending over the head, legs, and tail. Some of these scales on the ends of the feet are large, hard, and pointed; so that at first sight they might be taken for claws. The feet are thick, and so covered with the investing membrane, that the toes are only distinguished.

Tortoises.

The disk of the shell is composed of thirteen pieces which are striated on the margin. The border consists of twenty-four pieces; all of which, especially the posterior ones, are proportionally larger than in the other species. From the position of the latter, the circumference of the upper shell appears toothed. The upper shell is very convex, being more than four inches deep: in consequence of this form, when the animal is placed on its back, it can recover its former situation.

The colour of this species is generally dark, or blackish-bay. The convex part of the pieces which compose the disk are irregularly varied with yellow. The pieces are also variegated with the same colour. This prevails chiefly on the posterior divisions, and these are distinctly striated or furrowed. The width or dilatation of these divisions, being greater than in other species, constitutes the principal characteristic mark of the present. The colour of the under shell is pale yellow; each division is marked on its upper joining with a transverse blackish band, which runs into a pair of pointed or triangular processes, extending nearly to the inferior division. Another specific difference between this and the common tortoise is, that in the former the outline of the shell, seen from above, is proportionally longer, and has a slight sinking or contraction on each side.

It is supposed that this species is a native of America, but this seems not to be certainly determined; and little, or scarcely any thing, is known of its natural history.

3. Testudo Geometrica, *Geometrical Tortoise.*

Specif. Char.—The shell is black and ovate; the scutella elevated, and radiated with yellow.

The number of pieces of which the disk is composed, is subject to variation. Instead of thirteen, fourteen pieces have been observed in different specimens. These pieces are very prominent, striated distinctly with numerous lines on their sides, and terminated above by a yellowish coloured, flat, hexagonal roughened space, from which proceed, in a radiated direction, some well defined yellow streaks towards the edge; in this forming on the black ground colour, something like geometrical figures. The marginal pieces are commonly 24, but sometimes 26. They also are streaked with yellow. As in other species, the brightness of the colours is subject to variation, but their regular distribution is never entirely obliterated.

This species, it is said, is a native of Asia, Africa, and also of America; but this seems not to be fully ascertained, which is rather surprising, as its shell is oftener met with in Europe than that of any other species. Thunberg says that it is a native of the Cape of Good Hope, where it frequents shrubby places. It is said also, that it is found on the coast of the Pine islands, between the continent of America and Cuba, where they frequent moist and marshy places in the forests. They are very easily taken, and are sought after as food. It is usual for the natives to put a mark on the shield, and then to allow them to go about in the woods, finding them again almost as readily as any domesticated animal, when they transport them to Cuba. This species

Tortoiſes. cies is ſuppoſed to be the *terrapin* of Dampier, who gives the above account, and repreſents it as beautifully variegated.

4. Testudo Radiata, *Radiated Tortoiſe.*

Specif. Char.—Shell ovate, black; ſcutella flattiſh, and radiated with yellow.

This ſpecies has ſometimes been confounded with the preceding; it often however exceeds a foot in length, and its outline is nearly ſmooth. The ſize of the geometrical tortoiſe is leſs, its outline is very much tuberculated, and the pieces of which it is compoſed riſe greatly towards their centres.

According to Grew, it is a native of Madagaſcar; and its characters correſpond nearly with one deſcribed by Browne in his hiſtory of Jamaica, ſo that it muſt alſo be conſidered as a native of that iſland. Grew has given a very particular deſcription of it.

5. Testudo Indica, *Indian Tortoiſe.*

Specif. Char.—Shell brown, reflected above the neck; the three upper ſcutella are marked with a tubercle.

This is a very large ſpecies, which was firſt deſcribed by Perrault in the hiſtory of animals publiſhed by the Royal Academy of France. It meaſured from the tip of the noſe to the tail four feet and a half; the height or convexity was about fourteen inches; the ſhell itſelf was in length three feet, and two in breadth; the colour was of a dull brown. The pieces compoſing the ſhield were large and diſſimilar, of which the three anterior were marked in the middle with a round knob or tubercle, about half an inch wide. The ſkin of the head, feet, and neck, was wrinkled and granulated; the fore legs were nine inches long, the feet undivided, with five blunt claws: the hind legs were eleven inches long, with four toes, each armed with a claw; the tail ſix inches thick at the baſe, fourteen inches in length, and terminating in a horny bent proceſs. This ſpecies is a native of the coaſt of Coromandel.

Var. 1. A variety of this ſpecies brought from the Cape of Good Hope, is deſcribed by Voſmaer: it was about 2¾ feet long, 1¼ foot broad, one foot high, with thirteen pieces in the diſk, and twenty-five in the margin. In this, the three tubercles on the anterior pieces of the ſhield are wanting.

Var. 2. Another variety of this ſpecies, of a very large ſize, has been brought from the South Sea iſlands. The ſhell, which is of a dull uniform brown, with a ſmooth ſurface, is of an ovate, oblong form, widening at the bottom, and contracting conſiderably on each ſide of the neck. It is at leaſt three feet and a half long; the diviſions are all even, but the whole ſurface of the ſhell is marked with regular elevations and depreſſions.

Testudo Rugosa, *Wrinkled Tortoiſe.*

Specif. Char.—Shell black, wrinkled, mottled and variegated with yellow; the middle dorſal piece ſubpanduriform.

This ſpecies, of which a ſpecimen is preſerved in the Leverian muſeum, is deſcribed by Dr Shaw†. The colour is dark brown, or black, thickly mottled with ſmall confluent ſpots of pale yellow, which are largeſt on the ſides of the ſhell. The form of the ſhell is long and oval, dilated or widened behind; the depth or convexity is very conſiderable. The three middle diviſions of the row of ſcutella on the back are ſomewhat panduriform, or fiddle-ſhaped. The upper piece reſembles the outline of a pitcher; the loweſt approaches to a hexagonal form. The number of the ſide pieces is four, of the uſual form; that of the marginal pieces is twenty-five, the upper one very ſmall. A carina or ridge runs down the dorſal row; the upper ſurface of the ſhell is ſtrongly wrinkled. The under ſhell is ſmooth, and of a yellowiſh white colour, mottled with black. The length of the ſhell is nine and a half inches; width in the middle five inches. Its native country is unknown. Tortoiſes. † *Gen. Zool.* vol. iii. p. 28.

Var. A variety of this ſpecies is alſo deſcribed, conſiſting chiefly in the colours of the ſhell, and owing, it is ſuppoſed, to a ſexual difference.

7. Testudo Europea, *Speckled Tortoiſe.*

Specif. Char.—Shell oval, flattiſh, ſmooth, dark-brown, marked with numerous yellowiſh ſpecks and ſtreaks. *Teſtudo orbicularis*, Lin.

This ſpecies is from four to five inches long; the colour is blackiſh or olive brown; the ſhell flattiſh, but ſlightly convex, marked with numerous, oblong, yellow ſpecks, diſpoſed in a radiated form on each diviſion of the ſhell. The ſkin of the neck and breaſt is ſimilarly ſpotted. The diſk conſiſts of thirteen, and the margin of twenty-five pieces. The under ſhell is of a whitiſh yellow, tinged with brown at the joints. The head is ovate, ſomewhat convex above, flattiſh on the ſides and beneath. The ſkin of the neck is wrinkled and looſe. The legs are ſhort, and covered with ſcales. The feet are webbed, the fore feet having five toes, the hind only four. The claws are ſharp pointed and crooked; the tail is nearly half the length of the body, and is thin and compreſſed.

This ſpecies is a native of Italy, Sardinia, France, Hungary, and Pruſſia, as well as other parts of Europe. It inhabits lakes and muddy waters, feeding on ſmall fiſh, inſects, ſnails, and aquatic plants. The fleſh is eſteemed and employed as food, and in ſome places brought to market for ſale. It is ſometimes kept in ponds for the purpoſe, and fed with lettuce leaves, bread, &c. It may be kept in a cellar, and fed with oats ſcattered on the floor, which it eats as ſoon as they begin to germinate. In the beginning of ſpring it depoſits its eggs in ſandy places, expoſed to the ſun; and it has been ſaid, that theſe are not hatched till the ſpring following. The growth of this animal is extremely ſlow, and it varies ſomewhat in colour, according to the climate where it is found.

8. Testudo Lutaria, *Mud Tortoiſe.*

Specif. Char.—The ſhell is flattiſh, and the tail is half the length of the body.

The length of this ſpecies does not exceed ſeven or eight inches from the tip of the noſe to the end of the tail. The breadth is about three or four inches. The diſk is compoſed of 13 pieces, which are ſtriated and ſlight-

Tortoiſes. ly punctated in the centre. A longitudinal ridge runs along the middle range. The margin conſiſts of 23 pieces ſlightly ſtriated on the edges. The ſhell is blackiſh, as well as the ſkin; the feet are webbed, and have five toes before and four behind.

This ſpecies is a native of many parts of Europe; it is alſo found in different parts of Aſia, as in India and Japan. It is very common in France, particularly in Languedoc, and in different parts of Provence. It is ſaid that ſuch numbers were found one time in a lake half a league wide, in the plain of Durance, that the neighbouring peaſantry were ſupported by them for more than three months.

This ſpecies always lays its eggs on land, digging a hollow in the ground, and covering the eggs with earth. When the young are firſt hatched, they are only about half an inch in diameter. The motions of this ſpecies are quicker than thoſe of the land tortoiſe. It continues to grow for a long time, and lives for upwards of 24 years. It has been found uſeful in gardens, by deſtroying ſmall ſnails, and other animals which are deſtructive to vegetables; but it ought to be obſerved, that it is diſpoſed to attack and deſtroy the fiſh in fiſh-ponds.

9. Testudo Carinata, *Carinated Tortoiſe.*

Specif. Char.—Feet digitated; ſhell gibboſe; four firſt dorſal ſcutella carinated; ſternum entire.

The ſhell of this ſpecies does not exceed three inches in length. The form is broad, and ſomewhat orbicular; the colour is brown, and each ſcutellum is marked with a pale zone of confluent ſpots, which ſurround the centre part, the edges of each being ſurrounded with three or four diſtinctly marked furrows. Marginal pieces 25 in number, including the uppermoſt, which is very ſmall. Its native country is unknown.

10. Testudo Carolina Lin. Testudo Clausa Shaw. *Cloſe Tortoiſe.*

Specif. Char.—Shell blackiſh, irregularly ſpotted with yellow; dorſal carina obtuſe; under ſhell bivalve, completely incloſing the upper ſhell.

This ſpecies is thus deſcribed by Edwards. "The head is furniſhed with a hard or ſhelly covering of a dark brown colour on the top: on the ſides and throat it is yellow, with ſmall black or duſky ſpots: its noſtrils are near together, a little above the end of the beak: the eyes are of a yellowiſh colour: the neck is covered with a looſe ſkin of a dark purpliſh fleſh colour, which partly covers the head when it is not fully extended: the hinder legs and parts about the vent are covered with a ſkin of the ſame dull fleſh colour as the neck: the fore-legs and feet are covered with yellow hard ſcales: it hath five toes on each foot forwards, and four on each of the hinder feet, all armed with pretty ſtrong claws: the ſhell above riſes pretty much, and is round, divided into ſeparate ſcales of the horny ſubſtance called tortoiſe ſhell: each ſcale is engraven, as it were, with rings round its extremities, which leſſen inwards to its centre: the ſhell above is of a duſky brown colour, with yellowiſh ſpots of various forms: underneath it is flattiſh, and of a yellow colour, with black clouds and ſpots: it has only the rudiment of a tail, on which the vent is placed: the lower ſhell is divided acroſs the middle of the belly, and joined to the upper ſhell by a tough though flexible ſkin, by which means it can, when it draws in its head and legs, cloſe up its ſhell as firmly as an oyſter." From this peculiarity in its ſtructure, this ſpecies has derived its name; and this proves ſo ſtrong a defence to the little animal, that it ſeems not only not to receive any injury, from having a weight of five or ſix hundred pounds laid upon it, but to walk under the load without any inconvenience. Tortoiſes.

The length of this ſpecies ſeldom exceeds four or five inches. It is a native of North America, and is chiefly found in marſhy ſituations; but it alſo ſometimes appears in dry and warm places. It lives both on vegetables and animals. Of the latter beetles, mice, and ſometimes ſerpents, are its prey. Theſe it ſeizes, draws them into its ſhell, and cruſhes them to death. It is much in requeſt on account of its eggs, which are eſteemed a great delicacy. They are about the ſize of a pigeon's egg.

11. Testudo Sulcata, *Sulcated Tortoiſe.*

Specif. Char.—Shell brown, ovate; ſcutella furrowed, and yellow on each ſide.

This ſpecies exceeds a foot in length, from the tip of the noſe to the end of the tail; ſo that it is one of the larger of the land tortoiſes. The ſhell is very convex. The diſk is compoſed of 13 pieces, which are five and ſix-ſided; and each is tranſverſely and ſtrongly furrowed from the lower edge to the upper area; acroſs theſe run three impreſſed lines in an oppoſite direction: the marginal pieces are furrowed in the ſame manner. The colour of the ſhell is in general a dull yellow; but both the ſhield and marginal pieces have a brown and yellow diviſion. The head is large and covered with ſix-ſided ſcales of different ſizes. The fore and hind legs are alſo ſcaly; on the former are five claws, on the latter only four. The tail is very ſhort.

This ſpecies is a native of the Weſt Indies; and it is ſuppoſed to be the ſame with the *hicatee* deſcribed by Browne in his Hiſtory of Jamaica.

12. Testudo Tabulata, *Tabular Tortoiſe.*

Specif. Char.—Shell brown, oblong, gibbous; ſcutella of the diſc rectangular and furrowed, having yelloviſh coloured centres.

The ſhape and ſize of the pieces of which the diſc is compoſed, are more uniform than in any other belonging to this genus. This ſeems to be the principal mark of diſcrimination. Each piece is ſlightly convex, and in general ſix-ſided, excepting ſome of the pieces towards the ſides, which are five-ſided. The central part of each piece is large, and ſlightly granulated, and the ſides are diſtinctly ſulcated. The whole has a kind of flattened or tabular appearance: the colour is a yelloviſh cheſnut; it is paler on the centre of each diviſion; the legs are thick, and ſpotted with red; the number of pieces on the diſc is 13, that of the margin 23. The length of the ſhell is from five to ſix inches. It is ſuppoſed to be a native of Africa but according to ſome, it has been found in Brazil.

13.

Tortoiſes.

13. Testudo Concentrica; *Teſtudo Paluſtris* Lin. *Concentric Tortoiſe.*

Specif. Char.—Shell ſomewhat depreſſed, ſlightly ridged, oval, of a yellow colour; having the ſcutella marked with brown concentric zones.

The ſhell of this ſpecies is flatter than that of others; in ſome of the larger ſpecimens nearly ſmooth: the middle row of pieces, of which the diſc is compoſed, are five in number; they are more elevated than thoſe of the ſides, are ſix-ſided, and project behind into an obtuſe carina. There are four ſide-pieces on each ſide, which are pentagonal. The ground colour of the whole is pale, and marked with brown zones and centres. The ſhell is from four to ſix inches long.

This tortoiſe is a native of North America, and is met with in the markets at Philadelphia, where it is ſold under the name of *terrapin*. It is alſo a native of Jamaica, where it is very common. It is ſaid, by Brown, who ſeems firſt to have deſcribed it, to be a wholeſome and delicate food. In that iſland, it grows to the length of eight or nine inches.

14. Testudo Picta, *Painted Tortoiſe.*

Specif. Char.—The ſhell is oblong, and ſlightly convex, ſmooth, and of a brown colour; the ſcutella are bordered with yellow.

This ſpecies is well diſtinguiſhed from all others, by the remarkable colours of the ſhield, which conſiſts of 13 ſegments nearly ſquare, and deeply edged with pale yellow. The marginal pieces are 25 in number. The ſhell is from four to ſix inches long.

The painted tortoiſe frequents freſh waters, and in particular, is found in the ſlow and deep rivers of North America. In bright ſunſhine weather they leave the water in great numbers, and baſk themſelves on ſtones, pieces of wood, and the banks of the ſtreams, ſuddenly retreating into the water, when they are diſturbed. They walk very ſlowly, but ſwim with great rapidity. They can remain for many hours together under the water, but live only a few days in the open air. They are extremely voracious, and are known to deſtroy young aquatic fowls, ſeizing them by the feet, and dragging them under water. Sometimes they are employed for the purpoſe of food.

15. Testudo Guttata, *Spotted Tortoiſe.*

Specif. Char.—Shell oblong, ſlightly convex, ſmooth, and of a brown colour, with ſcattered yellow ſpots.

This ſpecies is alſo ſufficiently diſtinguiſhed by its remarkable colour. The pieces both of the diſc and margin being marked with a few diſtantly placed round yellow ſpots. Theſe ſpots vary, as well as the ground, in different individuals. The young of this ſpecies, which itſelf is ſmall, are not larger than a pigeon's egg, are very black, and beautifully ſpotted with gold colour.

This tortoiſe is a native of North America, frequenting lakes and rivers.

16. Testudo Elegans, *Elegant Tortoiſe.*

Specif. Char.—The ſhell is round, convex, and of a yellow colour, with tranſverſe, oval, brown ſpots.

This is a very ſmall ſpecies, only about two inches long; the ſhell is of a bright yellow colour, the ſurface apparently ſmooth. At each of the joinings which compoſe the diſc, there is a large, leaf-ſhaped, dark brown tranſverſe ſpot. The marginal pieces are marked with a tranſverſe black zone; the head is ſhort and thick. Tortoiſes.

Nothing particular is known of its natural hiſtory, or to what country it belongs.

17. Testudo Areolata, *Areolated Tortoiſe.*

Specif. Char.—The ſhell is ſlightly convex; the ſcutella are nearly four-ſided, elevated, deeply furrowed, and are furniſhed with depreſſed rough areolæ.

The length of this ſpecies is from three to four inches. The ſcutella, which are nearly four-ſided, are broader than long, with a pretty large, depreſſed, central part, which is of a yellow colour, roughiſh, and ſurrounded by a pale zone. The margin is compoſed of 25 pieces; the diſc, in ſome individuals, of 15, and in others of 14.

This tortoiſe, according to ſome, is a native of Brazil, according to others, of the Eaſt Indies.

18. Testudo Serrata, *Serrated Tortoiſe. Teſtudo Spengleri*, Lin.

Specif. Char.—Shell depreſſed, of a yellow colour, and minutely freckled with duſky ſpecks. The ſcutella of the diſk are all ridged; the hinder margin of the ſhell ſerrated.

This tortoiſe is conſidered and deſcribed by Dr Shaw as a new ſpecies; it is ſmall, only about three quarters of an inch long, and about two inches and a half broad. It is of an oval form, and ſlightly convex. The colour is of a yellowiſh brown, and when cloſely examined, appears thickly marked with minute, confluent, duſky ſpots. The under ſhell is blackiſh, with a yellow margin.

The native country of this ſpecies is unknown.

19. Testudo Pusilla, *Little Tortoiſe. African Land Tortoiſe* of Edwards.

Specif. Char.—Shell hemiſpherical, with convex, trapezoidal ſcutella, ſtriated on the margin, and dotted on the diſc. Feet ſubdigitated.

The ſhell of this ſpecies meaſures only about four inches in length. The whole animal, from the tip of the noſe to the end of the tail, does not exceed ſix. This ſpecies has a conſiderable reſemblance to the common tortoiſe, or *teſtudo græca*. It is particularly deſcribed by Edwards, who kept two of them which he received from Weſt Barbary for two years in the garden of the college of phyſicians in London; but of its natural hiſtory, nothing farther is known.

20. Testudo Tricarinata, *Tricarinated Tortoiſe.*

Specif. Char.—Shell oval, ſlightly convex; margin entire; all the ſcutella of the diſc carinated.

This ſpecies reſembles a good deal the *teſtudo orbicularis*, Lin. In ſize it ſcarcely exceeds that of a large walnut; the colour is blackiſh; the ſhell is compoſed

Tortoiſes. of 13 ſcutella; the number of the marginal pieces is 23. Each ſcutella is marked in the middle with a longitudinal ridge, and wrinkled on the ſides with ſeveral furrows and roughiſh points.

Its native place, and its natural hiſtory, are unknown.

21. Testudo Scabra, *Rough Tortoiſe.*

Specif. Char.—Shell flattiſh, the intermediate ſcutella elevated on the back; feet palmated.

This tortoiſe is about two inches and a half in length, and nearly two in breadth. Its form is ſomewhat cordated, of a light reddiſh colour, finely variegated on the head and ſhell, with waved white lines and ſpots. The feet, each of which is furniſhed with five toes, with ſharp claws, are marked with red ſpots. The head is prominent, and the eyes are ſmall.

It is conſidered by ſome naturaliſts as a native of Amboyna.

22. Testudo Scripta, *Letter'd Tortoiſe. Teſtudo Scabra* of Thunberg.

Specif. Char.—Shell depreſſed, orbicular; ſcutella marked with various figured characters; marginal pieces ſpotted underneath.

This ſpecies is either very ſmall, or the ſpecimen from which the deſcriptions have been taken were very young, as it did not exceed the ſize of a half-crown piece. It is flattiſh, of a round form, and whitiſh colour tinged with yellow. The upper ſurface is marked with various figures, having ſomewhat the appearance of written characters. The pieces of the margin, which are 25 in number, are marked with ſimilar characters as thoſe of the ſcutella. The feet are large, webbed, and have five toes furniſhed with ſharp claws.

It is not mentioned to what country it belongs.

23. Testudo Galeata, *Galeated Tortoiſe.*

Specif. Char.—Shell depreſſed, oval; the three middle ſcutella ſharply ridged; marginal pieces 24.

This is a ſmall ſpecies, not exceeding two inches and a half long, and about two broad. The colour of the ſhell is pale brown, and the diſc is compoſed of 13 ſcutella, of which the middle row is very broad, and ſtrongly ridged in the middle. Marginal pieces 24 in number, and ſimilar in colour to the diſc, but having white edges. The head is ſmooth, furniſhed with a kind of ſhield, from whence it derives its ſpecific name.

Its native place is unknown; but an individual of this ſpecies, brought from India, lived two years. It was kept in freſh water, and could occaſionally remain for a few hours in the open air. Its food was bread and flies. It continued in a kind of dormant ſtate during the winter, taking no food from the beginning of October till the middle of May, and ſcarcely ever raiſing its head above the ſurface of the water.

24. Testudo Denticulata, *Denticulated Tortoiſe.*

Specif. Char.—Shell roundiſh, and heart-ſhaped; marginal ſegments denticulated; feet ſubdigitated.

This ſpecies is about four inches long and three broad. Tortoiſes. The ſhell is of a pale yellowiſh brown colour; the diſc is compoſed of broad five and ſix ſided ſcutella. They are flattiſh, and have a large diſtinct ſpace in the middle, granulated with ſmall tubercles. The other part of the ſcutellum is marked with five furrows; the marginal pieces are 23 in number, and project in a ſerrated form.

It is ſuppoſed to be a native of North America.

25. Testudo Pennsylvanica, *Pennſylvanian Tortoiſe. Small Mud Tortoiſe* of Edwards.

Specif. Char.—Shell brown, ſmooth, elliptic; back flattiſh; the middle row of ſcutella ſomewhat rhomboidal and imbricated. The firſt is ſubtriangular.

This is a ſmall tortoiſe; the length of the ſhell, at its full growth, does not exceed three or four inches. In this ſpecies, the middle row of dorſal pieces are longer than in others, and are ſo arranged as to overlap each other at the tips. The marginal pieces are 23 in number, the upper one being very ſmall. The edges of the ſhell are tinged with dull yellow. In the joinings of the pieces, this ſpecies reſembles the ſtructure of the cloſe tortoiſe, ſo that the animal has the power of concealing itſelf almoſt entirely, by cloſing up its ſhell.

It is a native of North America, and is particularly found in Pennſylvania, where it frequents muddy waters, and hence its trivial name of mud tortoiſe. When alive, it is ſaid that it gives out a ſtrong muſk ſmell.

Several varieties of this ſpecies have been noticed by naturaliſts.

26. Testudo Longicollis, *Long-necked Tortoiſe.*

Specif. Char.—Smooth, ovate; neck very long.

This ſpecies is about five inches and a half long, and four and a half broad. The ſhell is of an oval form, of a dark olive brown colour, reſembling in ſome parts of it the grain of common black leather. The diſc is compoſed of 13, and the margin of 25 pieces. The under ſhell is of a yellowiſh colour, marked with black brown at the joinings. The claws on the feet, which are four in number, are like thoſe of birds.

It is a native of New Holland.

27. Testudo Caspica, *Caſpian Tortoiſe.*

Specif. Char.—Shell orbicular, head ſcaly, tail naked; five claws on the fore feet, four on the hind.

This ſpecies of tortoiſe grows to ſuch a ſize, that ſeveral men can ſtand together on its ſhell. The pieces of which the diſc is compoſed are nearly four-ſided, and ſquare: thoſe of the margin are in the form of a parallelogram. The colour is variegated with black and green; the under ſhell is blackiſh, ſpotted with white.

It is a native of Hyrcania, and frequents freſh waters.

28. Testudo Ferox, *Fierce Tortoiſe.*

Specif. Char.—Shell ovate, cartilaginous; three claws on the feet, which are tubular; noſtrils prominent.

This

Tortoiſes. This ſpecies is about one foot and a half in length, and about 15 inches in breadth. The ſhield, which is hard or oſſeous in the middle only, while the edges become gradually flexible and coriaceous, is a ſufficiently characteriſtic mark of diſtinction. The head is ſmall, and ſomewhat trigonal, with the ſnout much elongated. The colour of this ſpecies is browniſh; olive above; and on the under parts white.

This ſpecies is a native of Pennſylvania, Carolina, and other parts of America. It is extremely vigorous and ſwift in its motions, and when it is diſturbed or attacked, it ſprings forward towards its enemy with great fierceneſs. Some which have been found in the rivers and lakes of Eaſt Florida, weighed from 30 to 40 lbs.; and it is ſaid that they even grow to ſuch a ſize as to weigh 70 lbs.

A ſpecies deſcribed by Thunberg, under the name of *teſtudo roſtrata*, is ſuppoſed by Dr Shaw to be an individual belonging to the above, not yet arrived at its full growth. The *teſtudo triunguis* of Forſkal ſeems alſo to be a variety of this ſpecies.

29. Testudo Granulata, *Shagreened Tortoiſe.*

Specif. Char.—Shell granulated, orbicular, flattiſh; border cartilaginous.

The ſhield of this ſpecies meaſures about $3\frac{1}{2}$ inches in length, and $3\frac{1}{4}$ in breadth. It appears as if it were compoſed of two ſhields, the upper of which is the ſmalleſt and ſhorteſt. This is of a bony ſubſtance, roughened all over like the ſurface of ſhagreen. It is compoſed of 23 pieces, eight of which are placed on each ſide. The borders of this ſhield are cartilaginous and ſomewhat tranſparent, through which may be ſeen the ribs of the animal.

This ſpecies is ſaid to be a native of India; but of its habits and natural hiſtory nothing is known.

30. Testudo Fimbriata, *Fimbriated Tortoiſe.*

Specif. Char.—Shell oval, a little convex, and having a triple ridge; neck fimbriated on each ſide; ſnout cylindrical, and feet ſubdigitated.

The length of the ſhell of this ſpecies is above 15 inches, and the breadth 11. The length of the animal, from the tip of the noſe to the end of the tail, is two feet three inches. The head is large and flat, edged on the ſides with wrinkled membranaceous appendages, and covered behind with a three-lobed prominence. The noſe is cylindrical, and ſomewhat reſembles a proboſcis. It is 10 lines long, truncated, and pierced at the tip by the noſtrils. The diſk of the ſhell is a little convex, and compoſed of 13 ſemicircular pieces, which are nearly conical. They are all wrinkled, and irregularly notched at the hinder part. The marginal pieces are 25 in number, nearly ſquare, radiated on the ſurface with oblique wrinkles, and toothed on the inner edge. The colour is brown, and ſomewhat paler beneath.

This ſpecies is ſaid to be a native of Guiana, and was once common in the rivers of Cayenne; but it is now rarely to be met with, having been much ſought after as a nouriſhing food. Its food is aquatic plants; and it is ſaid that it leaves the river, and wanders about in the night, to ſome diſtance from the banks, in ſearch of paſture. The individual from which the deſcription is taken by M. Bruguierre, was brought to him alive, and lived for ſome time on herbs, bread, and ſome other ſubſtances. It laid ſeveral eggs, one of which produced a young tortoiſe in the box where it was kept. Turtles.

31. Testudo Serpentina, *Snake Tortoiſe.*

Specif. Char.—Shell ovate, depreſſed, triply carinated, and ſharp ſcaled; rounded and acutely ſerrated at the poſterior margin.

This ſpecies grows to the weight of 15 or 20 lbs. The general colour is of a dull cheſnut brown, but lighter or paler underneath. The head is large, triangular, and covered with a warty ſkin. The neck is alſo covered with ſcaly warts. The toes, which are five in number on the fore feet, and four on the hind feet, are all diſtinct, but connected by means of a web. They are armed with long claws. The tail is ſtraight, two-thirds the length of the ſhell, compreſſed, and creſted on the upper part with ſharp bony ſcales, pointed backwards.

This ſpecies is a native of North America; inhabiting ſtagnant waters, where it preys on fiſh, ducklings, &c. ſeizing its prey with great force. And indeed, whatever it ſeizes with its mouth, it holds with ſuch force, that it will ſuffer itſelf to be raiſed out of the water rather than quit its hold. The more eaſily to catch its prey, it is ſaid too, that it conceals itſelf in muddy waters, leaving out only part of its back, which has the appearance of a ſtone.

32. Testudo Squamata, *Scaly Tortoiſe.*

Specif. Char.—Body ovate, ſmooth beneath; but the upper part with the neck, feet, and tail, covered with numerous ſcales.

The head of this ſpecies is ſmall, reſembling that of a ſnake; the eyes are ſmall and moveable, the teeth ſharp. All the upper part of the body is covered with ſcales; the under parts are ſoft, ſmooth, and tender; the tail is pretty long.

It is ſaid to be a native of China and Java. The fleſh is accounted a great delicacy, and the ſcales, pulveriſed and diſſolved in water, are given by the Chineſe as a remedy in caſes of dyſentery and colic.

Sect. II. *Turtles, or Sea Tortoiſes.*

The large and long fin-ſhaped feet, which incloſe the bones of the toes, are the moſt obvious characteriſtic marks of diſtinction between the ſea tortoiſes, and the ſpecies included under the preceding ſection. In the ſea tortoiſes the ſhield is alſo compoſed of a ſtrong bony covering, which is coated externally with hard horny plates, which in ſome of the ſpecies are much thicker and ſtronger than thoſe of the land tortoiſes.

33. Testudo Coriacea, *Coriaceous Turtle.*

Specif. Char.—Colour brown, paler beneath; ſhell coriaceous, marked with five longitudinal, tuberculated ribs.

This ſpecies, in the form of its body, which is proportionally longer, and in its outer covering, which is not-

Turtles. not of a horny ſubſtance, but reſembles ſtrong leather, is ſufficiently diſtinguiſhed from others. Five diſtinct, prominent, tuberculated ridges run along the whole length of this covering. This ſpecies is not furniſhed with an under or thoracic ſhell. The head is large, and the upper mandible is notched at the tip, which gives it the appearance of having two large teeth. The fins are large and long, and covered with a tough leathery ſkin. The general colour is duſky brown, but paler beneath.

The coriaceous turtle is a native of the European ſeas. It is alſo found on the coaſts of South America and Africa. It frequents the Mediterranean ſea, and has been occaſionally met with on the coaſts of France and England. This ſpecies, of all the turtles, grows to the largeſt ſize. Some have been taken eight feet in length, and weighing no leſs than 1000 lbs. One was taken in the month of Auguſt 1729, not far from the mouth of the Loire in France, which meaſured ſeven feet one inch in length, three feet ſeven inches in breadth, and two in thickneſs. It is reported that it uttered ſo hideous a noiſe when it was taken, that it might be heard at the diſtance of a quarter of a league. At the ſame time it foamed at the mouth, ſeemingly with rage, from which it emitted a noiſome vapour. Another was taken in 1778, on the coaſt of Languedoc, which meaſured ſeven feet five inches in length. One taken on the coaſt of Cornwall in July 1756, meaſured, from the tip of the noſe to the end of the ſhell, ſix feet nine inches, and the weight was ſuppoſed to be near 800 lbs.

The Greeks, it is ſuppoſed, were acquainted with this ſpecies of turtle, which they employed in the conſtruction of the ancient lyre or harp. The fleſh of this ſpecies is extremely fat, but coarſe and ill-flavoured; but the religious order of Carthuſians prefer it to that of every other.

34. Testudo Mydas, *Green Turtle.*

Specif. Char.—Of a browniſh colour, with 13 ſcales on the diſc.

This is the eſculent, or common green turtle; the latter name being derived from the colour of the fat. This is ſuppoſed to be owing to the vegetable matters on which the animal feeds, and eſpecially the *zoſtera marina*, or turtle graſs, of which it is ſaid to be extremely fond. This ſpecies is one of the largeſt of the genus, often exceeding five feet in length, and weighing 500 or 600 lbs. The ſhell is ſomewhat heart-ſhaped, pointed at the extremity, and compoſed of 13 dorſal diviſions, with 25 marginal pieces. The colour is of a dull pale brown, more or leſs variegated with deeper undulations, but leſs ſtrong and beautiful colours, than the hawkſbill turtle, which yields the tortoiſe ſhell.

The green turtle is a native of all the ſeas within the torrid zone.

This ſpecies of turtle has been long eſteemed a delicious food by the inhabitants of many of the iſlands and continents within the torrid zone. In the time of Sir Hans Sloane, the inhabitants of Port Royal in Jamaica employed 40 ſloops for the purpoſe of catching them. The markets were at that time, as they are at preſent, ſupplied with turtle in the ſame way as thoſe of Europe are with butcher's meat. Many of them, according to Cateſby, are carried from the Bahama iſlands to Carolina, where they are eſteemed as a great delicacy. "They feed," he adds, on a kind of graſs, growing at the bottom of the ſea, commonly called *turtle graſs*. The inhabitants of the Bahama iſlands, by frequent practice, are very expert at catching turtles, eſpecially the green turtle. In April they go in boats to Cuba, and other little neighbouring iſlands, where, in the evening, eſpecially on moon-light nights, they watch the going and returning of the turtle, to and from their neſts, at which time they turn them on their backs, where they leave them, and proceed on, turning all they meet, for they cannot get on their feet again when once turned. Some are ſo large, that it requires three men to turn one of them (A). The way by which the turtle is moſt commonly taken at the Bahama iſlands, is by ſtriking them with a ſmall iron peg of two inches long, put in a ſocket at the end of a ſtaff of 12 feet long. Two men uſually ſet out for this work in a little light boat or canoe, one to row and gently ſteer the boat, while the other ſtands at the head of it with his ſtriker. The turtle are ſometimes diſcovered by their ſwimming with their head and back out of the water; but they are oftenеſt found lying at the bottom, a fathom or more deep. If a turtle perceive he is diſcovered, he ſtarts up to make his eſcape; the men in the boat purſuing him, endeavour to keep ſight of him, which they often loſe, and recover again, by the turtle putting his noſe out of the water to breathe. Thus they purſue him, one paddling or rowing, while the other ſtands ready with his ſtriker. It is ſometimes half an hour before he is tired; then he ſinks at once to the bottom, which gives them an opportunity of ſtriking him, which is by piercing him with an iron peg, ſlipping out of the ſocket, but is faſtened with a ſtring to the pole. If he is ſpent and tired by being long purſued, he tamely ſubmits when ſtruck, to be taken into the boat, or hauled athore. There are men who, by diving, will get on their backs, and by preſſing down their hind parts, and raiſing the fore part of them by force, bring them to the top of the water, while another ſlips a nooſe about their necks".

Turtles. Mode of taking the turtle.

"The turtle never go on ſhore, except to lay their eggs, which is in the month of April. They then crawl up from the ſea above high-water mark, where they dig a hole two feet deep in the ſand, into which in a ſingle night they drop above 100 eggs. At this time they are ſo little liable to be diſturbed, that they have been known to drop their eggs into a hat held by a perſon under them. If, however, they happen to be diſturbed before they begin to lay, they forſake the place, and ſeek another. They lay their eggs at three, and ſometimes at four different times, a period of fourteen days elapſing between each time. When they have laid their complement of eggs, they fill the hole with

Eggs hatched by the ſun.

(A) We have ſeen the ſame mode of watching and turning the turtle practiſed in Jamaica, and the phraſe there is not to take or ſeize the turtle, but to *turn* it.

Turtles.

with ſand, and leave them to be hatched by the heat of the ſun. This is uſually accompliſhed in about three weeks". The eggs are round, white, covered with a ſmooth parchment-like ſkin, and about the ſize of tennis balls.

Although the green turtle be a native of the ſeas within the torrid zone, it is ſometimes found on the coaſts of Europe, where it has probably been driven by ſtorms, or has fallen overboard from ſhips from the Weſt Indies. A turtle of this kind, of the enormous ſize of ſix feet long, by four broad, and of the weight of 800 or 900 pounds, was taken at Dieppe in France in 1752; and two years afterwards, another ſtill larger was taken on the ſame coaſt.

Introduced into Europe.

The fleſh of the green turtle is not only highly eſteemed in thoſe countries of which it is a native, but alſo ſo much ſought after in Europe, that the importation of it now forms a conſiderable article of trade, few ſhips returning from the Weſt Indies without bringing ſome turtle. But the turtle which now forms a diſh, by no means uncommon at the tables of the luxurious, ſeems to have been little known in Britain previous to the middle of the 18th century; and indeed it was ſo rare an occurrence, that when one was eaten, it was announced to the public as a piece of news. This appears from the following articles of intelligence. "Friday, Auguſt 31. a turtle weighing 350 pounds was eaten at the King's Arms tavern, Pallmall; the mouth of an oven was taken down to admit the part to be baked." Gent. Mag. for 1753. "Saturday, September 29. the Turtler, Capt. Crayton, lately arrived from the iſland of Aſcenſion, has brought in ſeveral turtles of above 300 pounds weight, which have been ſold at a very high price. It may be noted, that what is common in the Weſt Indies, is luxury here." Ibid. 1753. "Saturday, July 13th, the Right honourable Lord Anſon made a preſent to the gentlemen of White's chocolate houſe, of a turtle which weighed 300 pounds weight, and which laid five eggs ſince it was in their poſſeſſion. Its ſhell was four feet three inches long, and about three feet wide. When its head was cut off, at leaſt five gallons of blood iſſued from it, and ſo full was it of life, that the mouth opened and ſhut for an hour after it was cut off." *Ibid.* 1754.

35. Testudo Caretta, *Loggerhead Turtle.*

Specif. Char.—Variegated with 15 dorſal ſcales, of which thoſe of the middle row are gibbous toward the tip.

This ſpecies moſt reſembles in general appearance the laſt ſpecies, or green turtle. The larger ſize of the head, the proportional breadth of the ſhell, the deeper and more variegated colours, are marks of diſtinction ſufficiently characteriſtic; but the number of dorſal ſegments amounting to 15, affords the principal character; for not only the middle row, but thoſe of the ſides contain five pieces; and this number is almoſt always uniform and conſtant. There is a conſiderable protuberance on each of the pieces of the middle row, which conſtitutes a range of tubercles along the back of the ſhield; the fore feet are very large and long; the hind feet are broad, but much ſhorter.

This ſpecies frequents the ſame ſeas with the green turtle, but it is alſo found occaſionally in very diſtant latitudes, as in the Mediterranean, and particularly about the coaſts of Italy and Sicily. Turtles.

Excepting the coriaceous turtle, this ſpecies is the largeſt in ſize which has yet been diſcovered. In the Leverian muſeum, there is a ſkull which ſeems to belong to this ſpecies. It meaſures above a foot in length, and it is ſaid that it was taken from a turtle, the weight of which exceeded 1600 pounds.

In a commercial point of view the loggerhead turtle is of little importance; for the fleſh is coarſe and rank, and the plates of the ſhell are too thin to be applied to the uſual purpoſes of tortoiſe ſhell. It yields, however, a conſiderable quantity of oil, which is fit for burning in lamps.

Great ſtrength of this ſpecies.

This ſpecies is very ſtrong and fierce; it can defend itſelf very vigorouſly with its legs, and with its mouth it is able to break the ſtrongeſt ſhells and other ſubſtances. One which was exhibited at Bologna, in an inſtant bit in two a thick walking ſtick which was offered to it.

and fierceneſs.

The following is the account of this ſpecies of turtle which is given by Cateſby. "The loggerhead turtles, ſays he, are the boldeſt and moſt voracious of all others: their fleſh is rank, and therefore little ſought for, which occaſions them to be more numerous than any other kind. They range the ocean over; an inſtance of which, among many others that I have known, happened in April 1725, in N. Lat. 30°. when our boat was hoiſted out, and a loggerhead turtle ſtruck as it was ſleeping on the ſurface of the water. This, by our reckoning, appeared to be the mid way between the Azores and the Bahama iſlands, either of which places being the neareſt land it could come from, or that they are known to frequent, there being none on the north continent of America farther north than Florida. It being amphibious, and yet at ſo great a diſtance from land in the breeding time, makes it the more remarkable. They feed moſtly on ſhell fiſh, the great ſtrength of their beaks enabling them to break very large ſhells, as the large *buccinum* and *trochi*."

36. Testudo Imbricata; *Imbricated* or *Hawkſbill Turtle.*

Specif. Char.—Variegated, and having thirteen imbricated ſcales on the diſk.

In this ſpecies the outline of the ſhell exhibits more of a cordated form than any other; and the termination of the ſhell is more acute. Each of the middle row of ſcales on the back is alſo of a ſharpened form at the tip, and a ridge runs down the middle. The head is proportionally ſmaller than in other turtles; and the neck is longer, narrower, and more curved, thus reſembling the bill of a hawk; hence deriving its trivial name. The ſpecific name of imbricated is taken from the peculiarity in the diſpoſition of its ſcales, which overlap each other at the extremities like the tiles on the roof of a houſe.

The length of this ſpecies is about three feet from the tip of the bill to the end of the ſhell; but ſome individuals have been found which meaſured five feet in length, and weighed from five to ſix hundred pounds; and it is ſaid that ſome have been met with in the Indian ocean, of enormous magnitude.

The hawkſbill turtle is a native both of the Ame-

rican

Turtles. rican and Aſiatic ſeas; ſometimes, but more rarely, it is met with in the Mediterranean.

The ancients employed the ſhell of this ſpecies of turtle for the purpoſe of a ſhield; and even at the preſent day it is uſed for a ſimilar purpoſe among rude nations. The fleſh of the animal is not held in any eſtimation as a food; but the plates of the ſhell being thicker, ſtronger, and clearer, than thoſe of any other ſpecies, render it of great importance as an article of trade. Theſe plates conſtitute the ſubſtance which is well known under the name of *tortoiſe ſhell*. Being ſemitranſparent and finely variegated with many beautiful colours, they afford, after proper preparation and poliſhing, numerous elegant ornaments.

Tortoiſe ſhell.

Mode of obtaining

To obtain the tortoiſe ſhell, the external coating is ſeparated from the bony part by means of heat. A fire is placed under the ſhell, the effect of which is to make the plates ſtart, and then they are eaſily detached from the bone: the thickneſs of the plates varies according to the age and ſize of the animal. They meaſure from one-eighth to a quarter of an inch in thickneſs. Eight pounds of tortoiſe ſhell, it is ſaid, may be obtained from a large turtle. Some even yield, according to other accounts, fifteen or twenty pounds; but unleſs the weight of the animal itſelf be equal to 150 pounds, the ſhell is worth little.

and preparing it.

It may, perhaps, not be unintereſting to our readers, to mention the method which is employed by the artiſt, to give to tortoiſe ſhell the particular forms which are wanted for the different purpoſes to which it is applied. The firſt part of the proceſs is to ſoften it ſufficiently. This is done by ſteeping it in boiling water, after which it is introduced into a ſtrong metallic mould of the form wanted, and to this great preſſure is applied. When a conſiderable extent of ſurface is required, different pieces muſt be joined together. This is done by ſcraping the edges of the pieces to be united, thin, and laying them over each other, while they are in the heated and ſoftened ſtate. Srong preſſure being then applied, they become completely agglutinated. It is in this way that gold, ſilver, and other metals, for different ornaments, are made to adhere to tortoiſe ſhell.

This ſubſtance was greatly ſought after by the Greeks and Romans for ornamental purpoſes. It was not unuſual, among the latter people, to ſee their beds, the doors, and pillars of their houſes, decorated with tortoiſe ſhell; and eſpecially in the reign of Auguſtus, when this kind of luxury reached its greateſt height.

"The Egyptians, according to Mr Bruce, dealt very largely with the Romans in this elegant article of commerce. Pliny tells us, that cutting them for veneering or inlaying, was firſt practiſed by Carvilius Pollio, through which we ſhould preſume that the Romans were ignorant of the art of ſeparating the laminæ by a fire placed in the inſide of the ſhell when the meat is taken out; for theſe ſcales, though they appear perfectly diſtinct and ſeparate, do yet adhere, and oftener break than ſplit, where the mark of ſeparation may be ſeen diſtinctly. Martial ſays that beds were inlaid with it. Juvenal, and Apuleius in his tenth book, mentions, that the Indian bed was all over ſhining with tortoiſe ſhell on the outſide, and ſwelling with ſtuffing of down within. The immenſe uſe made of it in Rome may be gueſſed at by what we learn from Velleius Paterculus, who ſays, that when Alexandria was taken by Julius Cæſar, the magazines or warehouſes were ſo full of this article, that he propoſed to have made it the principal ornament of his triumph, as he did ivory afterwards, when triumphing for having happily finiſhed the African war. This too, in more modern times, was a great article in the trade to China, and I have always been exceedingly ſurpriſed, ſince near the whole of the Arabian gulf is comprehended in the charter of the Eaſt India Company, that they do not make an experiment of fiſhing both pearls and tortoiſes, the former of which being ſo long abandoned, muſt now be in great plenty and excellence; and a few fiſhers put on board each ſhip trading to Jidda, might ſurely find very lucrative employment, with a long-boat or pinnace, at the time the veſſels were ſelling their cargo in the port; and, while buſied in this gainful occupation, the coaſts of the Red ſea might be fully explored."

Frog.

37. Testudo ———, *Green-ſhelled Turtle. La Tortue Ecaille Verte* of Cepede.

Specif. Char.—Shell green and variegated.

This ſpecies, in general, reſembles the common green turtle, both in appearance and manners; but is diſtinguiſhed from it in having a ſmall rounded head, and never growing to ſo large a ſize. It derives its name from the colour of the ſhell, which is of a fine green, beautifully tranſparent, and although it is thin, may be applied to many ornamental purpoſes.

The green-ſhelled turtle is a native of the ſouth ſeas, and is found near the American rivers within the torrid zone. It is found particularly in great abundance near Cape Blanco in New Spain. The fleſh is in great eſtimation, and is even preferred by ſome to that of the green turtle.

38. *Trunk Turtle.*

This ſpecies is mentioned by Cateſby, who ſays that he never ſaw it; but from information he has deſcribed the upper ſhell as being more convex than in any other ſpecies. It is ſaid that it grows to a very large ſize.—The fleſh is rank; but it yields a great quantity of oil, on which account only it is valued.

39. *Rhinoceros Turtle.* Cepede.

This ſpecies alſo bears a ſtrong reſemblance to the common turtle; but it is diſtinguiſhed from it in having a large ſoft tubercle on the tip of the ſnout, and in this are placed the noſtrils.

This turtle is ſaid to be a native of the American ſeas, within the torrid zone, and is eaten in the ſame way as the common turtle.

II. RANA, Frog.

This genus has been divided by ſome naturaliſts into three genera; and undoubtedly there is ſome foundation for this diſtinction, both from the form and ſtructure of their bodies, and from their manners and habits. 1. The *ranæ* or *frogs*, properly ſo called, and by the French *grenouilles*, have light active bodies, and are furniſhed with ſtrong limbs, which enable them to perform their motions by leaping. 2. The *hylæ*, in French *rainettes*, or tree-frogs, have ſlender limbs, and have ſoft tubercles on the toes, by which they can adhere to ſmooth ſurfaces,

Frogs. faces, as to the leaves of trees on which many of them reside. 3. The *toads* or *bufones*, in French, *crapauds*, which constitute the third genus or division, have large heavy bodies, thick short limbs, and a slow crawling motion. But without multiplying genera, we shall consider the whole under one, distributing them into three sections, according to the division which we have just mentioned.

Sect. I. RANÆ, or *Frogs*.

1. RANA TEMPORARIA, *Common Frog*.

Specif. Char.—Colour yellowish brown, spotted with black; a lengthened brown patch beneath the eyes.

Of all the European species this is the most common. The general colour is of an olive brown, variegated on the upper parts of the body, with irregular blackish spots. The patch beneath each eye, which reaches to the setting on of the fore legs, seems to constitute one of the principal specific distinctions. The under part of the body is of a pale greenish colour, and but obscurely spotted. But it ought to be observed, that the colour of the frog varies at different seasons of the year, and perhaps in different places. Towards the end of summer, for instance, the colours are much brighter; and as this species frequently casts its skin, the cuticle falling off irregularly from different parts of the body, produces considerable variations in the intensity of the colours.

The frog has a light elegant form, and a lively appearance; the limbs are well calculated for its peculiar motions, and the hind feet being strongly webbed, enable it to swim well. The frog, it is said, does not reach its full size till it is five years old, and it lives from 12 to 15 years. It retires during the heat of summer to the water, and in winter it becomes torpid, and is generally found in the soft mud at the bottom of stagnant waters, or in the cavities beneath their banks, where it remains till the return of spring.

The frog, as well as many other of the reptile tribe, is extremely tenacious of life. It survives for a considerable time, the loss even of some of its essential organs, and it has been found to exist for several days when entirely confined under water.

History of the tadpole. The frog deposits its spawn in the month of March. This is composed of a gelatinous transparent mass, including the ova or eggs, in each of which is imbedded the embryo or tadpole, which has then the appearance of a round black globule. The period of hatching varies according to the temperature of the season, but it is commonly about a month or five weeks. In its progress the egg becomes gradually larger, and before the tadpole is excluded, it is seen in motion within the surrounding gluten. When they are first hatched, their only food is the remains of the gluten in which they were included. A few days afterwards, if they are minutely examined, a pair of ramified branchiæ, or temporary organs, may be observed on each side of the head, which after a short time disappear. The tadpole, which is so extremely unlike the animal in its perfect state, seems to consist only of a head and tail. The head is large, black, and roundish; the tail is slender, and margined with a broad transparent fin. The motions of the tadpole are very lively. Its food consists of duckweed and other small water plants, with different kinds of animalcula. The mouth is furnished with very minute teeth, and when the tadpole has reached a certain size, it may sometimes be heard gnawing the edges of the leaves on which it feeds. By means of a sucker placed between the lower jaw, with which the animal in this state is furnished, it can attach itself at pleasure to the under surface of aquatic plants. When it is very young, it sometimes hangs from this part by means of a glutinous thread, similar to some small slugs. Frogs.

Structure and changes. The internal structure of the organs of the tadpole is very different from that of the future animal. In no respect is this difference greater than in the disposition of the intestines, which are coiled in the form of a flat spiral, like a cable. The first change which appears on the tadpole is at the end of five or six weeks after it is hatched. It is about this time that the hind legs first appear; and gradually increasing in length and size, they are succeeded about two weeks afterwards by the fore legs. These latter, indeed, are formed at an earlier period beneath the skin, and are sometimes protruded and again drawn back by the animal, through a small hole on each side of the breast, before their complete evolution. The tail now gradually decreases, and afterwards more rapidly, so that in the space of a day or two it is quite obliterated. After this change, the animal leaves the water, and covers the banks in myriads. The sudden appearance of such multitudes of young frogs, has probably induced the groundless but popular belief, of their having fallen from the clouds in showers. The frog having now arrived at its perfect form, it changes entirely the nature of its food. It lived formerly on vegetables, now it depends solely for its existence on animal food. It lives chiefly on small snails, worms, and insects. To seize its prey, the structure and position of the tongue are remarkably well fitted. It is of considerable length, and it is attached to the fore part of the mouth, and when at rest it lies backwards. The extremity is bifid, and secretes a glutinous matter, so that in this way it can secure its prey, by darting out its tongue with great celerity, and to some distance from the mouth. This it does with so instantaneous a motion, that it is scarcely perceptible to the eye.

2. RANA ESCULENTA, *Green Frog*, or *Edible Frog* of Pennant.

Specif. Char.—Olive colour, spotted with black, with three yellowish lines on the back; abdomen whitish.

This is the largest species of the European frogs. The general appearance resembles that of the preceding; but it is larger in size, and of an olive-green colour, strongly marked on the upper part of the body with roundish black spots. The limbs are elegantly marked with transverse bands of the same colour. Three distinct pale yellow stripes run from the tip of the nose down the whole length of the back, the middle one being slightly depressed; but the two lateral ones are considerably elevated. The head is proportionally larger than that of the common frog.

The green frog is rare in England, but is very common in France, Italy, and Germany, where it is employed as an article of food.

This species, it is observed by naturalists, does not

Frogs. leave its winter retirement till a much later period than the common frog; and in thoſe countries where it is uſed as food, it is worth while to attend to this fact, for if they are pretended to be brought to market at an earlier period, the common frog, and ſometimes even toads, muſt be ſubſtituted. During the breeding ſeaſon, the croaking of the male is ſo loud, that it may be heard at a great diſtance; and in thoſe places where they are numerous, it becomes ſo intolerable to thoſe who are unaccuſtomed to hear them, that they are often deprived of ſleep. At this time, too, a large inflected globular veſicle is protruded from each ſide of the head of the male. The globules of ſpawn in the green frog are proportionally ſmaller than in the former ſpecies. They have ſomewhat of a yellowiſh caſt. The progreſs of the tadpole, towards the evolution of the perfect animal, is conſiderably ſlower in this ſpecies. The fore legs do not appear before October, and the animal does not aſſume its perfect ſhape till the beginning of November. The tail at this time begins to decreaſe, and in the ſpace of four days entirely diſappears.

This ſpecies is extremely voracious, ſeizing, it is ſaid, on young birds of different kinds, mice, and even ducklings, and, as it does with the reſt of its prey, ſwallowing them whole. At the age of four years it has reached its full growth. It begins to breed the year following, and the period of its life is ſometimes extended to ſixteen years.

3. Rana Pipiens, *Piping Frog.*

Specif. Char.—Olive-coloured, with ovate black ſpots, edged with yellow.

This ſpecies is ſmaller than the green frog, but in its general habit bears a conſiderable reſemblance to that animal. From the noſe to the tips of the hind feet, it meaſures only five or ſix inches. The body and limbs are of a duſky green, ſpotted with black. Two yellow lines run from the eyes to the rump, and two white lines from each eye to the noſe. In the living animal the ears have a bright golden colour.

It is a native of North America. It frequents rivulets and ditches of water, and is ſo ſtrong and vigorous, that it is ſaid it can leap to the diſtance of five or ſix yards. In the ſpring and beginning of ſummer, it is ſuppoſed to indicate the approach of rain, by a peculiar ſound which it emits.

4. Rana Catesbeiana, *Bull Frog.*

Specif. Char.—Olive brown, ſpotted with black; large ocellated ſpots near the ears; hind feet palmated.

This ſpecies grows to a very large ſize, meaſuring, it is ſaid, more than 18 inches from the tip of the noſe to the end of the hind feet. The upper part of the body is browniſh, and ſomewhat irregularly marked with numerous ſpots of a deeper brown. The under parts are of a whitiſh caſt, with a ſhade of yellowiſh green. They are alſo marked with numerous ſpots; but theſe are leſs bright than thoſe of the upper part.

The bull frog is a native of many parts of North America. It derives its name from the ſound of its voice, which reſembles the diſtant lowing of cattle. It uſually frequents ſprings; and in Virginia, where theſe abound in the ſides of the hills, a pair of theſe frogs are uſually ſeen ſitting on the edge of the ſmall pond formed by the running of the water from the ſpring; and when they happen to be ſurpriſed, they retreat to the mouth of the ſpring, and, entering it, find themſelves in ſafety. In Virginia, too, a popular opinion prevails, that they are uſeful in purifying the water of the ſpring. This opinion is greatly in their favour, and ſaves them from that perſecution with which the frog and other reptiles are wantonly and unneceſſarily haraſſed in other countries. But the bull frog being extremely voracious, and ſometimes devouring young ducks and goslings, is occaſionally devoted to deſtruction. Frogs.

5. Rana Ocellata, *Argus Frog.*

Specif. Char.—Feet having each five toes, and unwebbed; toes tuberculated beneath; back faſciated, and ſides ocellated.

This is one of the largeſt of the genus, exceeding, perhaps, the bull frog in the ſize of its body, but having limbs proportionally thicker and ſtronger. It has ſometimes been confounded with the bull frog; but it is diſtinguiſhed from it in its general appearance, and particularly in the form of the feet.

This frog is a native of Pennſylvania, Carolina, and other parts of North America, frequenting moiſt places in the vicinity of ſprings and rivulets. In its manners and habits it is ſuppoſed to be nearly the ſame with the bull frog.

6. Rana Virginica, *Lineated Frog.*

Specif. Char.—Cinereous, ſpotted with red; beneath yellowiſh; back angular, and marked with five pale ſtripes.

This ſpecies, in ſhape, ſize, and ſtructure of the feet, reſembles the common frog. It is greeniſh above, and paler beneath. The back and limbs are variegated with dark-brown marks of different ſizes.

It is a native of Virginia.

7. Rana Ovalis, *Oval Frog.*

Specif. Char.—Colour browniſh, beneath yellowiſh; the head beaked, and ſcarcely diſtinct from the globoſe body.

The ſnout projecting beyond the lower jaw, conſtitutes the ſpecific character. The hind legs are ſhort, the feet unwebbed, and there is a callus at the baſe of the inner toe. Its native country is unknown.

8. Rana Cyanophlyctis, *Studded Frog.*

Specif. Char.—Browniſh blue, having a tuberculated line on each ſide; beneath whitiſh, ſpotted with brown.

In this ſpecies the legs are banded with blackiſh blue and white. In the upper jaw there is a row of thickſet conical teeth, reſembling thoſe of lizards. The hind feet are webbed, and furniſhed with a callus like a ſixth toe.

It is a native of India.

9. Rana Spinipes, *Spiny-footed Frog.*

Specif. Char.—Brown, beneath bluiſh; ſides ſpeckled with

Frogs.

with an ochreous colour; toes of the fore feet furniſhed with ſpines.

This ſpecies is larger than the common frog. The feet are unwebbed, and in its habit it approaches to the toad.

It is a native of New Holland.

10. RANA CERULEA, *Blue Frog.*

Specif. Char.—Blue, ſpeckled, with grayiſh beneath; feet divided into four toes; hind feet webbed.

The blue frog is of the ſize of the common one. The toes are not orbiculated; but in its habit and ſlender limbs it approaches ſomewhat to the tree frogs.

It is a native of New South Wales.

11. RANA VESPERTINA, *Veſpertine Frog.*

Specif. Char.—Cinereous, and tuberculated above; a tranſverſe ſpot between the eyes, and forked behind; marked with longitudinal, ſubconfluent, brown dorſal ſpots, which vary into green.

In this ſpecies the head is ſhort, and the body is covered with warts or papillæ. It is about the ſize of a toad, having the habit of a frog. It can ſcarcely be ſaid to leap.

It is a native of Siberia.

12. RANA RIDIBUNDA, *Laughing Frog.*

Specif. Char.—Cinereous, the body ſpotted with brown, the thighs duſky, with milk-white ſpots.

This ſpecies is of a very large ſize, weighing half a pound. It has the habit of the common frog, but is broader.

It is very frequent about the rivers Wolga and Ural, and the Caſpian ſea. It never leaves the water. In the evening it emits a ſound, ſomewhat reſembling a hoarſe laugh, whence it derives its ſpecific name.

13. RANA SITIBUNDA, *Thirſty Frog.*

Specif. Char.—Glaucous gray, variegated with blackiſh green ſpots; beneath whitiſh; the hind feet ſemipalmated, and having the appearance of ſeven toes.

The body is warted, the head ſhort, and has the general habit of a toad, but is larger. There are two curious toes on the hind feet.

It is a native of deſert places about the river Ural. It conceals itſelf during the day.

14. RANA LEVERIANA, *Leverian Frog.*

Specif. Char.—Duſky blue, whitiſh beneath; hind feet palmated, body marked above, with two long and two ſhort white ſtripes.

Excepting that the body is plumper, and the limbs proportionally ſhorter, this ſpecies has the habit of the common frog. On the back of the head there is a ſmall trifurcated ſpot, two upper diviſions of which point forwards. The lower ſurface of the body is yellowiſh white and granulated. The fore feet have four toes, which are ſlightly orbiculated at the tips.

Its native country is unknown.

15. RANA IGNEA, *Fire Frog.* *Rana Bombina*, Lin. Frogs

Specif. Char.—Olive brown, orange colour beneath, ſpotted with blue.

This is the ſmalleſt of the European frogs, and is not equal even to the tree frog in ſize. It derives its name of fire frog from the peculiar colour of the under ſurface of the body; but this is ſubject to conſiderable variation.

It is a native of Germany, Italy, and other parts of Europe, but has not been found in England. It frequents turbid ſtagnant waters, and ſcarcely ever appears on land. It breeds at the age of three years, and may therefore be ſuppoſed to live about ten. It depoſits its ſpawn in the month of June, and the ova are proportionally larger than thoſe of others. The tadpoles, which are of a pale yellowiſh brown colour, are hatched towards the end of June. When young, they have been frequently obſerved to hang from the ſurface of leaves by means of a glutinous thread, iſſuing from the ſmall tube near the lower lip. About the end of September they are at their full ſize. At that time the tail appears more fleſhy and muſcular, and therefore proportionally ſtronger than in other tadpoles. In the beginning of October they aſſume their perfect form.

This is one of the moſt active and lively of the whole genus. It leaps and ſwims even with greater celerity than the common frog. When it is ſurpriſed on the land, and finds that it cannot eſcape, it ſquats down cloſe to the ground, turning back its head and limbs in a ſingular manner. If it be farther diſturbed, it emits from the hinder part of the thighs a frothy kind of fluid which has no diſagreeable ſmell, but ſome degree of acrimony when it comes in contact with the eyes and noſtrils. The ſound emitted by the male of this ſpecies is ſharper than that of other frogs, and ſomewhat reſembles a kind of laugh, or according to ſome, the note of a cuckoo or the tone of a bell. Hence the Linnæan ſpecific name, *rana bombina.*

16. RANA SALSA, *Saline Frog.*

Specif. Char.—Colour olive brown, whitiſh beneath, with duſky variegations: all the toes are unwebbed.

When this ſpecies is firſt taken out of the water, the brown colour has a ſhade of blue; the back is beſet with tubercles; the legs are faſciated with brown, and the inſides of the feet are yellow.

It is a native of the ſalt marſhes of ſome parts of Germany.

17. RANA PARADOXA, *Paradoxical Frog.*

Specif. Char.—Yellowiſh and olive-coloured; variegated with rufous bands; hind legs obliquely ſtriated.

This ſpecies reſembles in its general form the common frog. The oblique longitudinal ſtripes on the hind legs conſtitute the principal mark of diſtinction. There are four toes on the fore feet, and they are unwebbed. The hind feet have five toes, and are deeply palmated to the very ends of the toes. Near the ſhorteſt toe there is an oblong callus, forming a ſpurious one. The upper jaw is beſet with a row of ſmall denticulations.

This ſpecies is a native of South America, and is more common in Surinam than in other places.

Naturaliſts have been extremely puzzled with regard to the real nature of what has been taken for the tadpole of this frog. At one time it was conſidered by Linnæus as a ſpecies of lizard, and therefore arranged by him under the genus *Lacerta*. At another time he has placed it under the preſent genus, with the ſpecific name *piſcis*. It was deſcribed by Edwards under the denomination of the *frog fiſh of Surinam*. The ſtructure of the animal, which has been the ſubject of ſo much diſcuſſion, ſhews clearly that it is the larva or tadpole of a frog; and it is ſuppoſed, with no ſmall degree of probability, that the differences in the accounts given of this animal by naturaliſts have ariſen from the different ſtages of its progreſs in which it has been found. But as this tadpole is ſo much larger in ſize, in proportion to the perfect animal, than any other ſpecies yet known, it may be the larva or tadpole of ſome of the larger ſpecies, and not that of the rana paradoxa, which is but a ſmall frog.

Sect. II. Tree Frogs.

Tree frogs have ſlender bodies, long limbs, and the tips of the toes are flat, orbicular, and dilated. The ſpecies included under this ſection have been formed, according to the arrangement of ſome naturaliſts, into a ſeparate genus, under the name of *Hyla*; and no doubt the peculiar ſtructure of the toes, which enables them to adhere to ſmooth bodies, affords a very ſtriking character, and in ſome meaſure warrants the arrangement.

18. Rana Zebra, *Zebra Frog. Rana Maxima*, Linn.

Specif. Char.—Yelloviſh and rufous, ſpotted and faſciated with brown. There are double bands on the legs, and the feet are palmated.

This ſpecies is the largeſt of the whole of this ſection, meaſuring about five inches from the noſe to the end of the body. The colour is an elegant, pale, rufous brown, beautifully marked on the back and limbs, and even to the very ends of the toes, with tranſverſe cheſnut-coloured bands. The head is large, the eyes protuberant, and the mouth wide. The fore feet have four toes, and the hind ones five.

It is a native of Carolina and Virginia.

Two other ſpecies have been deſcribed by naturaliſts, which more accurate obſervation has ſhewn to be nearly allied to the preceding. The firſt is the *rana boans*, Linn. in which the difference is ſo ſlight, that as Dr Shaw obſerves, it may depend on a ſexual diſtinction. The other is the *rana venuloſa*, which is ſuppoſed to be the ſame animal as the zebra frog, before it has arrived at its full ſize.

19. Rana Bicolor, *Blue-and-Yellow Frog.*

Specif. Char.—Colour blue, ochreous beneath; feet unwebbed; toes flattened and orbicular.

This elegant ſpecies is of a moderate ſize; it meaſures more than four inches in length. The whole of the upper ſurface is of a beautiful blue, while the under parts are of a pale orange or ochre colour. The head is large, the mouth wide, and the tip of the noſe truncated. All the toes are furniſhed with a large orbicular tip; and beneath each of the joints there is a proceſs or tubercle. The upper parts of the female have a deeper ſhade of violet than thoſe of the male.

It is ſuppoſed to be a native of Surinam.

20. Rana Leucophyllata, *White-Leaf Frog.*

Specif. Char.—Colour rufous, variegated above, with ſnow-white ſpots of different ſhapes.

The variegated ſpots on the body and limbs are milk-white, and are obſerved to vary greatly in different individuals, in number, form, and diſpoſition. The toes of the fore feet are ſlightly webbed at the baſe.

It is a native of America.

21. Rana Quadrilineata, *Four-Lined Frog.*

Specif. Char.—Colour blue, having a double, longitudinal, yellow line on each ſide of the body.

This ſpecies bears a near reſemblance to the preceding, but the blue colour above, and the double yellow line, which runs along each ſide of the body, from the eyes to the vent, ſufficiently diſtinguiſh it.

Its native country is unknown.

22. Rana Castanea, *Cheſnut Frog.*

Specif. Char.—Cheſnut-coloured and granulated; whitiſh beneath, with a white line on each ſide of the body.

In this ſpecies, the whole of the upper ſurface, both of body and limbs, is ſcattered over with minute warts or tubercles. On each ſhoulder there is a large, long, white ſpot; the fore arms, hind legs and thighs are barred tranſverſely with white; the feet are unwebbed, the toes rounded, and all the joints tuberculated beneath.

It is ſuppoſed to be a native of Surinam.

23. Rana Fasciata, *Faſciated Frog.*

Specif. Char.—Colour rufeſcent, with whitiſh tranſverſe bands.

In this ſpecies the colour is pale rufous; the head, body, and upper parts of the limbs, are marked with pale, tranſverſe bands; the eyes are blue, with a ſilvery luſtre; the outſide of the arms and legs are of a blackiſh brown colour.

Its native place is unknown.

24. Rana Arborea, *Tree Frog.*

Specif. Char.—Colour green, whitiſh beneath, with a blackiſh lateral line and granulated abdomen; feet unwebbed.

This ſpecies is of a ſmaller ſize than any other of the European frogs. The colour of the upper part of the body is green; the abdomen is whitiſh, and marked with numerous granules. The under ſurface of the limbs is reddiſh, and on each ſide of the body there is a longitudiual blackiſh or violet-coloured ſtreak, which ſeparates the green of the upper parts from the white of the lower. The lower edge of the dark lateral ſtripe is ſhaded with yellow. The hind legs are long and ſlender. There are four toes on the fore feet, and five on the

Frogs. the hind feet. All of the toes terminate in flat, round, and dilated tips. It is by means of this peculiar ſtructure that the animal is enabled to hang from the leaves of trees, or from any ſmooth ſubſtance; for the under ſurface of theſe tips or tubercles on the toes is ſoft and glutinous. There is a ſimilar ſtructure on the ſkin of the abdomen.

The tree-frog is a native of France, Germany, Italy, and other parts of Europe. It has never been found in the Britiſh iſlands. During the ſummer months, it chiefly frequents the upper parts of trees, and wandering among the leaves in ſearch of inſects, it ſeizes them with extreme celerity. It ſteals ſoftly towards its prey, and when it has reached the proper diſtance, it makes a ſudden ſpring of more than a foot in height. For this it is peculiarly fitted, from its nimble and active movements. It conceals itſelf beneath the ſhade of the leaves, by attaching itſelf to their under ſurface by means of the feet, or abdomen.

On the approach of winter, the tree frog leaves the woods, and retires to the waters, where it buries itſelf in the ſoft mud, or conceals itſelf beneath the banks, where it remains torpid till the ſpring, when it depoſits its ſpawn in the water. At this time the throat of the male is greatly inflated, and the loud ſharp croak which it then emits, is heard at a very conſiderable diſtance. The ſpawn is depoſited in ſmall cluſtered maſſes, about the end of April, and the tadpoles aſſume the form of the perfect animal about the beginning of Auguſt, at which time they begin to aſcend the neighbouring trees, where they reſide while the warm ſeaſon continues. It has been obſerved that they are more noiſy on the approach of rain; and the males particularly, if kept in glaſſes, and furniſhed with food, afford certain indications of the changes of the weather.

25. Rana Meriana, *Merian Frog.*

Specif. Char.—Colour yelloviſh green, variegated with brown, with conically ſhaped, auricular veſicles.

This ſpecies is three times the ſize of the common tree frog, and on each ſide of the neck there is a remarkable protuberance like an obtuſely conical, inflated pouch.

This ſpecies is ſometimes found on trees, and ſometimes in the water, according to the different periods of its growth. According to Madame Merian's deſcription, theſe frogs are found in ſtagnant waters. They have, ſhe obſerves, ears in their heads, and knobs or balls on their feet, which have been given them by nature to enable them to paſs eaſily over the moraſſy places which they inhabit.

26. Rana Aurantia, *Orange Frog.*

Specif. Char.—Orange-coloured; body and limbs very ſlender.

This ſpecies is entirely of a reddiſh orange colour, long-limbed and ſlender-bodied. It is ſmaller than the European tree frog.

It is a native of South America, inhabiting trees.

27. Rana Tinctoria, *Tinging Frog.*

Specif. Char.—Of a reddiſh colour; the body faſciated with white.

Toads. It is of a bright red or ferruginous colour above, marked longitudinally with a pair of white ſtripes. Theſe at an early age are often croſſed with a tranſverſe ſtripe; and indeed the individuals of this ſpecies have been found to vary greatly in the diſpoſition of the colours.

It is a native of South America, and inhabits trees.

The Indians employ this ſpecies of frog to change the colour of green parrots. For this purpoſe they pluck the feathers from that part of the parrot on which they wiſh the new colour to be introduced. They rub the ſkin with the blood of the animal, and the renovated feathers, inſtead of being green as formerly, are yellow or red.

28. Rana Alba, *White Frog.*

Specif. Char.—Entirely of a white colour.

On the upper part of the body there are ſome ſpots or patches, which are of a brighter white than the ground. It is, however, ſubject to ſome variations.

It is a native of the woods in the warmer parts of North America.

29. Rana Bilineata, *Bilineated Frog.*

Specif. Char.—Colour green, with a ſtraight yellow line on each ſide of the body.

The only difference between this ſpecies and the common tree frog is, in the yellow line on each ſide of the body of the former being ſomewhat ſtraighter, and without undulations.

It is a native of the warmer parts of North America, inhabiting the woods.

Sect. III. Toads.

30. Rana Bufo, *Common Toad.*

Specif. Char.—Colour brown, with reddiſh brown tubercles, pale beneath.

The common toad is too well known to require any detailed deſcription. The colour is generally of an obſcure brown above, but much paler, and irregularly ſpotted beneath. It is, however, ſubject to conſiderable variations, being ſometimes found of an olive cait; and in the earlier part of ſummer, the ſhoulders and limbs are marked with reddiſh ſpots, while the under parts of the body have a yelloviſh tinge. The body is always covered with puſtules or tubercles of a darkiſh green, or bright red colour, and they are of different ſizes in different individuals. The common toad is not only a native of Europe, but of other countries of the world.

History of the toad. The common toad uſually frequents ſhady places, in gardens or fields; is found under ſtones, or makes its way into cellars or other obſcure receſſes, anxious, as it would ſeem, to conceal itſelf, or, that it may lie protected from exceſſive cold, and find a ſupply of food. The toad, like the common frog, becomes torpid in winter; and it would appear, that they ſometimes collect together in numbers, and take up their habitation in the ſame hole or cavity, with the view of preſerving and retaining their heat for a greater length of time. At the return of ſpring, the toad leaves its lurking place, and retires to the waters, where it depoſits its ſpawn.

Toads.

ſpawn. The ova are included in a tranſparent gluten, which is in the form of chains or ſtrings, ſomewhat reſembling a necklace. The length of theſe ſtrings is from three to four feet; and through the whole length the ova, which have the appearance of black globules or beads, are diſpoſed in a double ſeries. The tadpole is hatched at the end of 14 or 15 days, according to the temperature of the ſeaſon; and having burſt from the ſurrounding gluten, they ſwim about in the water, feeding on different animalcules, and leaves of water plants. Early in the autumn they aſſume the form of the perfect animal, when they retire from the water, and are ſometimes found in ſuch numbers on the ground in its vicinity, that it has probably given riſe to the common opinion of their having fallen from the clouds in ſhowers.

Age.

The age of the toad is ſuppoſed to be about 15 or 20 years, but ſometimes they exceed this period. One, of which Mr Pennant has given an account in his Britiſh Zoology, lived to the great age of 40 years. This individual had been known for that time in a domeſticated ſtate. It was kept by a Mr Aſcot in Devonſhire, and had become ſo tame, that it left its hole at the approach of its maſter, to receive food. It grew to a very large ſize, and had become an object of ſo much curioſity, that in ſpite of the averſion and horror which this animal uſually inſpires, it was viſited by all, and even by ladies, who came to the houſe. It was frequently brought to table, and fed with inſects, and without any degree of embarraſſment, or ſeeming deſire to get away, it ſeized them with great celerity. Its uſual place of reſidence was under the ſteps of the door of the houſe which led to the garden. It was unfortunately ſeized by a raven, and ſeverely wounded, before it could retreat to its hole; and although it was liberated from its enemy, and lived for more than a year afterwards, it never recovered its uſual health and vigour, otherwiſe the period of its life might have been greatly extended.

It has been long ſuppoſed that the toad, when it is irritated, ſecretes a fluid from its ſkin which is of a poiſonous quality. This fluid, however, has no effect whatever, except producing a little irritation, on larger animals. A dog, it has been obſerved, carrying a toad for a ſhort time in his mouth is affected with a ſlight ſwelling of the lips, and an increaſed diſcharge of ſaliva. This fluid undoubtedly anſwers ſome purpoſe in the economy of the animal, and it is probably intended for its protection againſt the troubleſome attacks of ſmaller animals. This ſeems to be in ſome meaſure proved from the experiments of Laurenti. In theſe experiments it appeared that ſmall lizards which had bitten the common toad, became diſordered, and paralytic, and even apparently dead. They were, however, completely recovered in the ſpace of a few hours.

Not poiſonous to large animals.

Many wonderful ſtories have been related of the toad having been found incloſed in the ſolid ſubſtance of wood and ſtone, or marble; and what is ſtill more wonderful, that it has been in ſuch circumſtances without any viſible outlet, or the ſmalleſt paſſage for the acceſs of air, alive, and ſeemingly uninjured. It is not indeed a little ſurpriſing, that a ſuppoſed fact of this kind, ſo contrary to the nature of animal exiſtence, ſhould even for a moment have gained any degree of belief; yet many ſuch ſtories have been currently reported, and readily, we might almoſt ſay, univerſally admitted to be true; for being eſtabliſhed on what was ſaid to be the moſt undoubted teſtimony, they were received and acknowledged as fully authenticated. But on cloſer inveſtigation, in all caſes where inquiry could be made, it was found that ſome links in the chain of evidence were always wanting. In no inſtance whatever, it may be aſſerted, has the fact been aſcertained from direct information, founded on any credible or reſpectable authority. It has always been firſt communicated by report, or from a diſtance; circumſtances which always give room for miſtake and error. Toads may have been found incloſed in wood, or even in ſtone, perhaps without having received any material external injury; but that they ſhould have remained in ſuch ſituations for any great length of time, as for years, nay, in ſome caſes, for hundreds of years, totally deprived of food, and completely excluded from all acceſs of air, is not only highly incredible, but impoſſible. But if farther evidence were neceſſary, this ſuppoſed fact is fully diſproved by the experiments of Heriſſant, which he performed in preſence of the French Academy. It had been aſſerted that a living toad was found in the year 1771, in a wall at a ſeat belonging to the duke of Orleans. The wall, which was then pulled down, had been built 40 years; and its hind feet were found imbedded in the mortar. In Heriſſant's experiments, three toads were incloſed in ſeparate boxes, and theſe were immediately covered with a thick coat of mortar, and kept in the apartments of the academy. At the end of 18 months the boxes were opened, and two of the toads were found living. They were again encloſed; but being re-opened after ſome months had elapſed, they were found dead.

Error concerning its being found alive encloſed in ſolid ſubſtances.

Toads.

31. Rana Alliacea, *Alliaceous Toad.*

Specif. Char.—Colour pale gray, marked with brown, and having a whitiſh dorſal line; pupils perpendicular.

This ſpecies, excepting in a greater proportional length of the head, has a conſiderable reſemblance to the common toad. It differs from it alſo in being nearly ſmooth. The colour above is a browniſh gray, with ſpots of deep brown, which on the ſides are diſpoſed in a reticular form. The eye has a very peculiar ſtructure. The form of the pupil, when the eye is contracted, is perpendicular, as in the eyes of cats. On the hind feet there is a ſpurious claw, or horny callus, ſituated beneath the heel.

This animal gives out, when irritated, a peculiar odour, which reſembles that of onions or garlic, and produces a ſimilar acrid effect on the eyes. A ſmell like that of the ſmoke of gunpowder is alſo ſometimes combined with the garlic ſmell.

This ſpecies is a native of Germany. It is found in the neighbourhood of Nuremberg.

It has been already mentioned, that the ſpawn of the common toad is depoſited in the form of a double ſtring; but in this ſpecies there is only one ſtring, which is of conſiderable thickneſs, and the numerous ova are diſpoſed, not in a double row, as in the former, but in a confluent manner through the length of the ſpawn, which is ſometimes found nearly two feet long.

The tadpole of the alliaceous toad, like the ſuppoſed one of the *rana paradoxa*, is conſiderably larger in ſize than the young frog when it has firſt aſſumed its perfect form.

Toads

form. Indeed it is ſo large, that in the vicinity of the places where it is found, it is employed as food by the country people, who conſider it as a kind of fiſh. It ſeems alſo to be one of the moſt voracious tadpoles.

The alliaceous toad, contrary to the habits of the common toad, remains almoſt conſtantly in water, and but very rarely appears on land. It is alſo more lively and active in its nature, and its motions are performed by a kind of leaping, rather than by the crawling ſluggiſh pace of the latter.

32. Rana Mephitica, *Mephitic Toad.*

Specif. Char.—Colour olive, ſpotted with brown; warts on the ſkin reddiſh; dorſal line ſulphur-coloured.

Excepting in the colour, and being of a ſmaller ſize, this ſpecies greatly reſembles the common toad. The body and limbs are ſhort and thick; the fore feet are furniſhed beneath with a pair of bony proceſſes, by means of which it is enabled to climb up the ſides of walls. The hind feet have no webbed ſtructure. In its motions it runs ſomewhat like a mouſe. It comes out only in the night, from the cavities of walls and rocks, where it conceals itſelf by day.

This ſpecies is a native of Germany, in ſome parts of which it is known by the name of *roerkling*, or reed frog, becauſe in the ſpring it frequents places which are overgrown with reeds. At this ſeaſon, too, it is well known by the ſtrong and peculiar note or croak which it utters.

In the month of June, when this ſpecies breeds, it reſorts to the water, to depoſit its ova. Theſe are emitted, as is the caſe with the common toad, in double rows, in a pair of long glutinous ſtrings; and ſo rapid is the progreſs of hatching, that the tadpoles appear in the ſpace of five or ſix days, having ſeparated themſelves from the ſpawn. The hind legs appear about the end of Auguſt, are ſoon ſucceeded by the fore legs, and by September or October the animal has aſſumed its complete form.

The mephitic toad has derived its name from a moſt offenſive ſmell which it diffuſes when it is irritated. This odour proceeds from a white acrid fluid which exſudes from the pores of the ſkin. The animal has the power of emitting this fluid to the diſtance of three or four feet, and it is ſaid that if it fall on any part of the room where the animal is kept, it will ſcarcely be entirely diſſipated for two months afterwards. This odour reſembles the ſmoke of gunpowder, but is conſiderably ſtronger; or that of the fumes of arſenic.

Var. The natter-jack of Pennant is, according to ſome, a variety of the above ſpecies. It is not, however, ſaid, that, like the mephitic toad, it emits any peculiarly offenſive odour; but its running motions bear a near reſemblance; for it does not leap, nor does it crawl with the ſluggiſh pace of the common toad.

It is a native of England, and is found in Pulteney common, and near Reeveſley abbey in Lincolnſhire, frequenting dry and ſandy places.

33. Rana Viridis, *Green Toad.*

Specif. Char.—Colour pale, varied with greeniſh ſpots; tubercles reddiſh. *Rana variabilis*, Linn.

In this ſpecies the green ſpots or patches are bounded with a blackiſh margin, and the whole has ſomewhat of the appearance of a map. The ſpots on the legs and thighs are tranſverſe, forming a kind of bars; the eyes are remarkable for a beautiful golden colour, and when the animal is irritated, ſeem to emit a kind of phoſphoric light.

Toads

This ſpecies is a native of Germany and other parts of Europe, and is not unfrequently found about Vienna, where it inhabits the cavities of walls.

This ſpecies, like the mephitic toad, emits a very ſtrong odour, which reſembles that of garden nightſhade. It is ſo powerful, that it diffuſes itſelf through a large room.

During the breeding ſeaſon this ſpecies frequents the waters, and in winter it retires under ground. Its croaking is ſaid to reſemble the creaking of the hinge of a door. It would appear, that the fluid which exſudes from the ſkin of this toad, and probably alſo from that of others, is poiſonous to ſmall animals; for it is ſaid that the ſmaller kinds of the gray lizard, on biting this toad, became immediately ſtrongly convulſed, and died in a few minutes.

34. Rana Marina, *Marine Toad.*

Specif. Char.—Colour yelloviſh brown, with a large porous prominence over each ſhoulder; very large ſize.

This ſpecies even exceeds the bull frog in ſize. On each ſhoulder there is a protuberance of a light-brown colour, which is marked with many pores. Theſe are the parotid glands, which are peculiarly conſpicuous. The feet have no webs, and there are four toes on the fore feet, and five on the hind. The toes are furniſhed with claws, ſomewhat reſembling the human hair. There are ſome tubercles at the extremity of the body, which are ſaid to be owing to the folding of the ſkin, when the animal is placed in a particular attitude; for theſe diſappear when the attitude is changed.

This ſpecies is ſaid to be a native of America; and, according to ſome, is calculated to live both by land and ſea.

35. Rana Dubia, *Doubtful Toad.*

Specif. Char.—Colour yelloviſh brown, warty, having a large porous prominence over each ſhoulder; hind feet ſubpalmated and ſubhexadactyle.

In ſize this ſpecies comes near that of the common toad; but it is different in ſhape, as it tapers from the ſhoulders to the hind legs like the tree frogs. The upper ſurface of the body is covered with oval tubercles, and there are protuberances on the ſhoulders like the *rana marina*. The under parts of the body are alſo beſet with ſmaller tubercles. The joints of the toes of the fore feet are tuberculated beneath, and there are two remarkable protuberances under the foot.

Of the native country of this ſpecies, or of its manners and habits, nothing is yet known.

36. Rana Typhonia, *Mitred Toad.*

Specif. Char.—Colour brown, dorſal line whitiſh; head triangular.

This ſpecies is about the ſize of the common toad; the

Toads. the thighs are barred with brown, and the ſkin of the whole body is covered with numerous ſmall protuberances of a pearly colour. The ſides of the head beyond each eye have ſomewhat of an angular appearance, and from this it has derived the name of *mitred toad*.

37. RANA BRAZILIANA, *Brazilian Toad.*

Specif. Char.—Colour rufous, with numerous brown ſpots on every part of the body.

In its general appearance this ſpecies reſembles the common toad, but is much larger, and the head is proportionally ſhorter. The ſpots or ſtripes on the body are red brown, placed tranſverſely, and are ſomewhat waved.

It is a native of South America; but, according to ſome, has been found in the iſland of Cuba.

38. RANA VENTRICOSA, *Granulated Toad.*

Specif. Char.—Colour pale brown; abdomen dilated, and marked on the ſides with blackiſh ſpots.

In this ſpecies the head and eyes are large, the mouth wide, the body ſomewhat depreſſed; the abdomen is very broad; the limbs are rather ſhort. The upper ſurface of the body and limbs is covered with tubercles of different ſizes, pretty diſtinctly arranged.

It is ſuppoſed to be a native of Brazil.

39. RANA CORNUTA, *Horned Toad.*

Specif. Char.—Colour cinereous, banded with brown; eyelids conical.

In this ſpecies a broad white band runs along the back, from the head to the extremity of the body, and becoming gradually narrower. It is covered with ſmall ſpecks like pearls. The reſt of the body, excepting the head, is rough, with ſharp points. The head is large and thick, and a broad thick tongue appears when the mouth is opened. It is covered with papillæ, and faſtened to the anterior part of the lower jaw. The gape of the mouth extends almoſt half the length of the body; the eyes are rather ſmall, and are placed nearer than in other frogs. Each of the upper eyelids riſes up into a large conical callus, or horn. From this extraordinary width of the mouth, and ſingular ſtructure of the upper eyelids, this ſpecies exhibits the moſt deformed and hideous aſpect of any of the whole tribe.

It is a native of South America.

40. RANA PIPA, *Pipa*, or *Surinam Toad.*

Specif. Char.—Colour brown; toes of the fore feet quadrifid at the extremities.

This ſpecies is conſiderably larger than the common toad. The body is flattiſh; the head ſomewhat triangular; the mouth wide, and the corners are furniſhed with a kind of rugged appendage. There are four long thin toes on the fore feet, and each of the toes is divided into four diſtinct proceſſes; and theſe, when minutely examined, are found to be ſtill farther divided. The hind feet have five toes, and are webbed to the tips. The male is larger than the female, meaſuring ſometimes ſeven inches from the tip of the noſe to the extremity of the body. The noſe in both ſexes is truncated, and the eyes very ſmall.

Toads.

This ſingular ſpecies is a native of Surinam.

The economy and habits of the pipa greatly occupied the attention of naturaliſts for a long time after it was firſt known to Europeans, which was about the end of the 17th century. It was then ſuppoſed that the ova were produced in cells on the back of the animal, without being firſt excluded, as in the other ſpecies of this tribe, in the form of ſpawn. But future obſervers have added new facts, and greater accuracy to the natural hiſtory of this ſpecies; and it is now found, that the ſpawn being excluded in the uſual manner, is received into a number of open cells on the back of the animal, and is there retained till the young have reached ſome degree of maturity. This diſcovery is owing to Dr Fermin, who made his obſervations on the ſpot, during a reſidence at Surinam. The female pipa, he obſerves, depoſits her ſpawn near ſtagnant water. The male collects the ova, and places them carefully on the back of the female, where, after being impregnated, they are preſſed into the cells, which are then open to receive them. The cells cloſe over them, and retain them for near three months, when the young animals, having arrived at their perfect ſtate, emerge from the back of the parent. During this period of concealment, it has been diſcovered by other naturaliſts, that the ova undergo the ſame change as in thoſe which are hatched out of the body; firſt aſſuming the form of the tadpole, and then acquiring the complete ſhape before they are excluded from the cells. In this mode of hatching its young, ſome naturaliſts have obſerved an analogy in this proceſs of nature between the Surinam toad and the opoſſum.

Ova hatched in a ſingular manner.

This animal, from the uncouthneſs of its ſhape, and its general appearance, will, by many, be conſidered at firſt view as little leſs hideous and deformed than the horned toad.

41. RANA BREVICEPS, *Short-headed Toad.*

Specif. Char.—Colour brown, pale beneath; body ovate, convex, and marked with a longitudinal, aſh-coloured, dentated band. *Rana gibboſa*, Linn.

This is a ſmall ſpecies, and ſcarcely exceeds half the ſize of the common toad. The head is very ſmall, obtuſe, and ſunk in the thorax. The toes of the fore feet are unwebbed, have no claws, and are furniſhed with tubercles beneath the joints. The hind feet are furniſhed with ſix toes.

It is a native of Senegal, and ſome other parts of Africa.

42. RANA SYSTOMA, *Indiſtinct Toad.*

Specif. Char.—Body ſomewhat globoſe; head indiſtinct, and mouth ſmall.

In its general appearance this ſpecies greatly reſembles the preceding. The body is thick and roundiſh, and the head is ſo little diſtinguiſhed from the body, that the mouth is ſcarcely perceptible. The legs are very ſhort, and the thighs ſeem encloſed in the wrinkled ſkin of the ſides. The whole body is ſmooth.

It is a native of the Eaſt Indies.

43. Rana Acephala, *Headleſs Toad.*

Specif. Char.—Colour browniſh, marbled with white; head indiſtinct, and mouth very ſmall, bending downwards.

Excepting in the colour, which is very different, and in the head being ſtill leſs diſtinguiſhed from the body, this ſpecies in appearance comes very near the two former. The mouth alſo is ſmaller, and is curved downwards at each corner. Its native country is unknown.

44. Rana Lentiginosa, *Carolina Toad.*

Specif. Char.—Colour gray, freckled with brown; head ſomewhat pointed.

This ſpecies in its general appearance greatly reſembles the common toad, excepting that the head is ſmaller, and the ſnout ſharper. The colour is of a duſky brown, mottled with minute blackiſh or dark-brown ſpots. In its motions this ſpecies is different from the common toad, for it leaps rather than crawls.

It is a native of North America, and particularly of Carolina and Virginia. It is ſaid to be moſt common in wet weather, and frequents the higher grounds, appearing not only in the evening, but even in the hotteſt part of the day.

This ſpecies, like others of the ſame tribe, feeds on inſects, and ſeems to be extremely fond of luminous inſects, as fire-flies, glow-worms, &c. It is ſaid that it will ſeize a piece of live wood coal, miſtaking it for a luminous inſect, and ſwallow it, ſeemingly with impunity.

45. Rana Semilunata, *Creſcent Toad.*

Specif. Char.—Colour blackiſh, paler beneath; a white creſcent-ſhaped ſpot at each ear.

This ſpecies is larger than the common toad, and is particularly diſtinguiſhed by a large, round, white ſpot behind the parotids. The body is covered above with tubercles.

46. Rana Melanosticta, *Black-lipped Toad.*

Specif. Char.—Colour yellowiſh brown; warts black, ſpeckled; upper lip and eyelids edged with black; hind feet ſubhexadactylous and ſemipalmated.

This ſpecies is nearly the ſize of the common toad, and reſembles it in its general appearance. The ſpace between the eyes is depreſſed and ſmooth. The edges of the projecting orbits of the eyes are black; the upper jaw is ſurrounded with a ſimilar border, and the tips of the toes and the two tubercles of both hind and fore feet are alſo black.

It is ſuppoſed to be a native of China.

47. Rana Arunco, *Arunco.*

Specif. Char.—Body warted; all the feet webbed.

This ſpecies is nearly of the ſame colour as the common frog, but it is larger in ſize. The body is warted, and all the feet are palmated.

It is a native of Chili.

48. Rana Lutea, *Yellow Toad.*

Specif. Char.—Colour yellow; feet ſubpalmated.

In its general habit this ſpecies reſembles the common frog, but is ſmaller in ſize. The ſkin is covered with warts, and all the feet are ſubpalmated.

It is alſo a native of Chili, and frequents the waters.

III. DRACO, Dragon.

Gen. Char.—The body is four-footed, and is furniſhed with a tail: on each ſide there is an expanſile, radiated, wing-like ſkin.

1. Draco Volans, *Flying Dragon.*

Specif. Char.—The fore legs are unconnected with the wings.

The flying dragon, in many reſpects, both in its ſtructure and habits, reſembles the tribe of lizards; but on account of the expanſile cutaneous proceſſes with which the ſides are furniſhed, Linnæus has arranged it under a diſtinct genus.

The body of this animal is about four inches in length; but from the tip of the noſe to the extremity of the tail, it is commonly about nine or ten inches, and ſometimes a foot. The form of the head is very ſingular; it is furniſhed beneath with a large triple pouch or proceſs, one part of which hangs beneath the throat, while the other two project on each ſide. They are all ſharp-pointed, and are more conſpicuous, in proportion to the ſize of this animal, than the ſame proceſſes in lizards. The mouth is wide; the tongue large and thick at the baſe; the teeth are ſmall and numerous; the neck is alſo ſmall; the body and limbs are ſlender, and entirely covered with ſmall pointed ſcales. On the upper part of the body the colour is pale blue, or bluiſh gray; but the back and tail are marked with tranſverſe duſky bars. The wings are elegantly ſpotted with patches of black, deep brown, and white, of different forms. The under ſurface is of a whitiſh-brown colour.

The flying dragon is a native of Aſia and Africa, where it is found frequenting trees; and for this it is peculiarly adapted, from the cutaneous proceſſes with which it is furniſhed on each ſide. For by means of theſe lateral membranes, it is enabled to ſpring with more facility from branch to branch, and even to ſupport itſelf for ſome time in the air, like the bat or flying ſquirrel. Like the lizard, it feeds on inſects.

2. Draco Præpos, *American Flying Dragon.*

Specif. Char.—Wings united with the arms.

This ſpecies is conſidered by ſome naturaliſts only as a variety of the former. The circumſtances in which it differs are, that the body and neck are more ſlender, and the pouch at the throat is ſingle.

It is ſaid to be a native of America.

The real dragon of modern naturaliſts, it may be obſerved, is not that terrible and deſtructive monſter, the mere creature of imagination, which exiſted only in the deſcriptions of romance, and the older poetry; nor is it

Lizards. the animal which we find deſcribed and figured in ſome of the writings of the older naturaliſts. For theſe, it is now well known, are either entirely fictitious beings, or have been prepared artificially, by joining together the limbs of different animals; and thus producing a monſter, under the name of dragon, unknown in nature. This has been done by warping ſome ſpecies of the ſkate tribe, into what was ſuppoſed to be the ſhape of a dragon, and having raiſed the fins, and dried them in this poſition, by adding the legs of birds or other animals. Hence have originated the monſtrous repreſentations, which are found in ſome of the older naturaliſts, of many-headed dragons, having necks and tails like thoſe of ſnakes, and feet like thoſe of birds. Deceptions of this kind, it would appear, have been often ſucceſsfully practiſed, by which means, not only the vulgar, but alſo men of ſcience, have been miſled and impoſed upon. The following is an inſtance of this kind, which happened about the end of the 17th century. It is quoted by Dr Shaw, and he obſerves, is thus commemorated by Dr Grainger from a note of Dr Grey, in his edition of Hudibras, vol. 1ſt. page 125.

"Mr Smith of Bedford obſerves to me on the word dragon, as follows: Mr Jacob Bobart, botany profeſſor (or rather ſuperintendant of the garden) of Oxford, did about 40 years ago, find a dead rat in the phyſic garden, which he made to reſemble the common picture of dragons, by altering its head and tail, and thruſting in taper ſharp ſticks, which diſtended the ſkin on each ſide, till it mimicked wings. He let it dry as hard as poſſible. The learned immediately pronounced it a dragon, and one of them ſent an accurate deſcription of it to Dr Magliabechi, librarian to the grand duke of Tuſcany. Several fine copies of verſes were wrote on ſo rare a ſubject; but at laſt Mr Bobart owned the cheat; however, it was looked upon as a maſterpiece of art, and as ſuch depoſited in the muſeum or anatomy ſchool, where I ſaw it ſome years after."

We ſhall relate another inſtance of an artificial dragon, with which a ſimilar deception was practiſed, and which was detected by Linnæus. This dragon was in the poſſeſſion of a merchant at Hamburgh, and was valued by the proprietor at 10,000 florins. Linnæus, while he was on a viſit to that city, detected the cheat, and ſhewed that it was entirely an artificial animal, compoſed of the ſkins of ſnakes, the teeth of weaſels, the claws of birds, &c. It is even ſaid, that Linnæus having made this diſcovery, was obliged to make a precipitate retreat from Hamburgh, to avoid a proſecution which was threatened by the proprietor on the ſcore of the reputation and value of his property being injured by this diſcovery.

IV. LACERTA, Lizard.

Gen. Char.—The body is four-footed, elongated, and furniſhed with a tail; there is no ſecondary integument.

The numerous genus Lacerta includes a great variety of animals which, although they poſſeſs many characters in common, yet they exhibit conſiderable differences, not only in their economy and habits, but alſo in ſtructure and external form. On this account this genus has been divided by ſome naturaliſts into a number of diſtinct genera. We have here, however, according to the Linnæan arrangement, retained the whole under the ſame genus; but we ſhall divide the ſpecies comprehended under it, as other naturaliſts have done, into different ſections, as follows: 1. Crocodiles; 2. Guanas; 3. Cordyles; 4. Lizards proper; 5. Chameleons; 6. Geckos; 7. Scinks; 8. Salamanders, Newts, or Efts; 9. Snake Lizards. Lizards.

Sect. I. Crocodiles.

The character of the animals included under this ſection is, that they are furniſhed with very ſtrong ſcales.

1. Lacerta Crocodilus, *Common Crocodile*, or *Crocodile of the Nile.*

Specif. Char.—Head mailed; neck carinated; tail furniſhed on the upper part with two lateral creſted proceſſes.

The crocodile ſometimes arrives at a very great ſize. Individuals of 20 feet long have frequently been ſeen, and inſtances are mentioned of ſome which have exceeded the length of 30, and even 40 feet. When it is full grown, the colour of the upper part of the body is blackiſh brown; beneath it is yelloviſh white. The upper parts of the legs and ſides are varied with deep yellow, and in ſome parts tinged with green. The colour of the younger animal is different; for that of the upper parts is a mixture of brown and pale yellow, while the under parts are nearly white. The opening of the mouth is of great width, and exhibits ſomewhat of a flexuous outline. Both jaws are furniſhed with numerous ſharp-pointed teeth; thoſe in the middle part of the jaw being largeſt, and reſembling the canine teeth of viviparous quadrupeds. Each jaw contains 30 teeth or more, for the number is found to vary in different individuals, perhaps from the difference of age. The diſpoſition of the teeth is ſuch, that when the mouth is ſhut, they alternate with each other. When the teeth have been taken out, and the alveoli examined, it has appeared that ſmall teeth were forming beneath, to ſupply the loſs of the others when ſhed. The external openings of the ears are placed on the top of the head, above the eyes; they are of moderate ſize, of an oval form, and covered with a membrane, in which there is a longitudinal ſlit, giving them the appearance of cloſed eyes. The eyes are furniſhed with a nictitating membrane, or tranſparent moveable pellicle, ſimilar to that of birds. The legs of the crocodile are ſhort, ſtrong, and muſcular. There are five toes on the fore feet, and they are unwebbed. On the hind feet there are only four toes, which, towards the baſe, are united by means of a ſtrong membrane. The two anterior toes on each of the fore feet, and the interior one of the hind feet, have no claws; but the other toes are furniſhed with claws, which are ſtrong, ſharp and curved. The tail is long, compreſſed on the ſides, and furniſhed above with an upright proceſs, formed by the gradual approach of two elevated creſts which proceed from the lower part of the back. The upper part of the body of the crocodile is covered with ſtrong armour; which, in its ſtructure exhibits the appearance of a regular and curious carved work, and is indeed a moſt elaborate piece of mechaniſm. It is ſo

ſtrong

Lizards. ſtrong and thick, when the animal has reached its full growth, that it eaſily reſiſts the force of a muſket-ball. On the lower parts of the body, it is more pliable, and much thinner, ſo that it is in theſe parts only that wounds can be inflicted.

The crocodile depoſits its eggs in the ſand or mud, in the banks of the rivers which it inhabits; and as ſoon as the young are hatched, they proceed to the water. When the young are firſt excluded, the head is proportionally much larger than that of the full grown animal. The egg of the common crocodile is about the ſize of that of a gooſe, and reſembles greatly that of a bird. It is covered with a calcareous ſhell, which is lined with a membranous ſubſtance. Various birds, the ichneumon and other animals, make great havock among the eggs of the crocodile during the period of hatching, thus diminiſhing the numbers which would otherwiſe be produced. The eggs of the crocodile, and indeed the fleſh itſelf, are regarded as delicacies among ſome African nations, and compoſe a part of their favourite repaſts.

The crocodile is a native of Aſia and Africa, but it ſeems to be more common in the latter than in the former country. It inhabits the large rivers, as the Nile, the Niger, &c. frequenting the low ſand iſlands of theſe rivers; and preys chiefly on fiſh, although, being extremely voracious, it ſeizes any other animal that comes within its reach.

The crocodile has been long regarded as one of the moſt formidable animals of the countries which it inhabits; but from the accounts of later naturaliſts, it appears, that it is by no means ſo ferocious as has been pretended. Denon, who viſited Egypt along with the French army, obſerves, that many ſtories are related of crocodiles, but that he had not any opportunity of verifying a ſingle one. "Daring, (ſays he) even to imprudence, our ſoldiers ſet them at defiance. Even I myſelf bathed daily in the Nile; for the tranquil nights that I thus obtained, rendered me regardleſs of dangers, which we had not as yet verified by a ſingle fact. If the crocodiles had devoured a few of the carcaſes which the war left at their diſpoſal, ſuch a food, it might be imagined, would only excite their appetite, and engage them to purſue, when alive, ſo favourite a prey. And yet we were never once attacked by them, nor did we ever meet with a ſingle crocodile at a diſtance from the water. Hence it appears probable, that they find in the Nile itſelf a ſufficient quantity of eaſily procurable food, which they digeſt ſlowly, being like the lizard and ſerpent, cold-blooded, and of an inactive ſtomach. Beſides, having in the Egyptian part of the Nile no enemies but each other and man, they would be truly formidable; if, covered as they are, with an almoſt impenetrable defenſive armour, they were alert and ſkilful in making uſe of thoſe which nature has given them for attack *."

* *Travels*, vol. iii. p. 310.

The ſame author obſerves, that no crocodiles were ſeen at Syene on the river Nile, but that they are to be met with above the cataracts. "They ſeem (he ſays) to prefer certain reaches of the river, and particularly from Tentyra to Ombos; they abound moſt of all near Hermontes. We here ſaw three of them; one much larger than the reſt, was nearly 25 feet long: they were all aſleep, ſo that we could approach them within 20 paces, and we had time to diſtinguiſh all the peculiarities which gave them ſuch a hideous aſpect. They reſembled diſmounted cannon. I fired on one with a heavy muſket; the ball ſtruck him, and rebounded from his ſcales. He made a leap of 10 feet, and dived into the river †." Lizards.

† *Ibid.* 136.

In the large rivers of Africa, vaſt ſhoals of crocodiles are ſeen ſwimming together, when they exhibit the appearance of the trunks of large trees floating on the water. It is ſaid that the negroes venture to attack, and often ſucceed in killing a ſingle crocodile, by ſtabbing it with a ſharp inſtrument under the belly, where the ſkin is ſoft and vulnerable. In ſome countries, we are told, the hunting of the crocodile with ſtrong dogs, is practiſed for amuſement. For this purpoſe the dogs are properly trained and inſtructed; and to protect them againſt the attack of the crocodile, they are armed with collars furniſhed with ſpikes.

It is even ſaid, that crocodiles are occaſionally tamed in ſome parts of Africa, and that they conſtitute an article of royal magnificence with ſome of the African monarchs, in which caſe, they are kept in large ponds or lakes. It is well known that crocodiles were exhibited by the ancient Romans during their public ſpectacles. In the edileſhip of Scaurus, he preſented the people with a fight of five crocodiles in a temporary lake; and one was introduced by Auguſtus in his triumph over Cleopatra, for their entertainment.

Var.—A variety of the common crocodile, it is ſaid, has been found in the river Senegal; according to M. Adanſon, it has a longer ſnout, and is almoſt entirely black. It is ſaid that it is very rapacious, and has only been obſerved in the above river, where the common crocodiles are very numerous.

2. LACERTA ALLIGATOR, *the Alligator* or *American Crocodile.*

Specif. Char.—Head flat, imbricated; neck naked, or uncarinated; tail furniſhed above with two lateral lines.

The alligator is conſidered by ſome naturaliſts only as a variety of the crocodile; any differences which are obſervable, they ſuppoſe, may be aſcribed to the effect of climate. They have the ſame number of teeth, and their manners and habits are nearly ſimilar in the old and new world; but the difference, although not at firſt ſight obvious, ſeems to be fully eſtabliſhed from the more accurate obſervations of others. The head of the alligator is ſmooth, and is not furniſhed with the rugoſities and hard carinated ſcales which appear on the head of the crocodile; and beſides, the ſnout of the alligator is flatter, wider, and more rounded at the extremity. The ſize of the alligator is little inferior to that of the crocodile. Individuals have been often ſeen from 18 to 20 feet long.

Cateſby, in his hiſtory of Carolina, has given a fuller account of the economy and habits of the alligator, than any other author. "Though the largeſt, ſays he, and greateſt numbers of alligators, inhabit the torrid zone, the continent abounds with them 10° more north, particularly as far as the river Neus in North Carolina. In the latitude of about 33°, beyond which I have never heard of any, which latitude nearly anſwers to the northermoſt parts of Africa, where they are likewiſe found, they frequent not only ſalt rivers near

Lizards.

the ſea, but ſtreams of freſh water in the upper parts of the country, and in lakes of ſalt and freſh water; on the banks of which they lie lurking among reeds, to ſurpriſe cattle and other animals. In Jamaica, and many parts of the continent, they are found about 20 feet in length. They cannot be more terrible in their aſpect than they are formidable and miſchievous in their natures, ſparing neither man nor beaſt they can ſurpriſe, pulling them down under water; that being dead, they may with greater facility, and without ſtruggle or reſiſtance, devour them. As quadrupeds do not ſo often come in their way, they almoſt ſubſiſt on fiſh; but as providence, for the preſervation, or to prevent the extinction of defenceleſs creatures, hath in many inſtances reſtrained the devouring appetites of voracious animals by ſome impediment or other; ſo this deſtructive monſter, by the cloſe connection of his vertebræ, can neither ſwim nor run any way but ſtraight forward, and is conſequently diſabled from turning with that agility requiſite to catch his prey by purſuit; therefore, they do it by ſurpriſe in the water, as well as by land; for effecting which, nature ſeems in ſome meaſure to have recompenſed their want of agility, by giving them a power of deceiving and catching their prey by a ſagacity peculiar to them, as well as by the outer form and colour of their body, which on land reſembles an old dirty log or tree, and in the water frequently lies floating on the ſurface, and there has the like appearance; by which, and his ſilent artifice, fiſh, fowl, turtle, and all other animals are deceived, ſuddenly catched, and devoured.

Carnivorous animals get their food with more difficulty and leſs certainty than others; and are often neceſſitated to faſt a long time, which a ſlow concoction enables them to endure: reptiles particularly, by ſwallowing what they eat whole, digeſt ſlowly, eat ſeldom, and live long without food. Wolves are ſaid to gorge themſelves with mud, to ſupply the want of better food. For the like cauſe, many alligators ſwallow ſtones and other ſubſtances to diſtend and prevent the contraction of their inteſtines when empty, and not to help digeſtion, which they ſeem in no need of. For in the greater number of many which I have opened, nothing has appeared but lumps of light wood and pieces of pine-tree coal, ſome of which weighed eight pounds, and were reduced and worn ſo ſmooth from their firſt angular roughneſs, that they ſeemed to have remained in them many months. They lay a great number of eggs at one time on the ſandy banks of rivers and lakes, which are hatched by the heat of the ſun without further care of the parents. The young, as ſoon as they are diſengaged from their ſhells, betake themſelves to the water, and ſhift for themſelves; but while young, they ſerve as a prey not only to ravenous fiſh, but to their own ſpecies. It is to be admired, that ſo vaſt an animal ſhould at firſt be contained in an egg no better than that of a turkey.

In South Carolina they are very numerous; but the northern ſituation of that country occaſions their being of a ſmaller ſize than thoſe nearer the line; and they rarely attack men or cattle, yet are great devourers of hogs. In Carolina they lie torpid from about October to March in caverns and hollows in the banks of rivers; and at their coming out in the ſpring, make a hideous bellowing noiſe. The hind part of their belly and tail are eaten by the Indians. The fleſh is delicately white, but has ſo perfumed a taſte and ſmell, that I never could reliſh it with pleaſure. Lizards.

The alligators of South America, like the turtles, depoſit their eggs at two or three different periods, at the diſtance of ſeveral days, and from 20 to 24 eggs each time. They have been obſerved to raiſe a ſmall hillock near the banks of the river; and, after hollowing it out in the middle, to collect a quantity of leaves and other vegetable matters, in which they depoſit their eggs. Theſe are covered with the leaves, and are hatched by means of the heat extricated during their putrefaction, along with that of the atmoſphere. The alligators about Cayenne depoſit their eggs in the month of April."

To the account of the alligator which we have now given, we add the following particulars concerning its natural hiſtory by Don Ulloa, in his voyage to South America. The obſervations were made on the river Guayaquil; and we ſhall detail them in his own words.

"The increaſe of fiſh, ſays he, in this river is greatly hindered by the prodigious numbers of alligators, an amphibious creature, living both in the rivers and the adjacent plains, though it is not often known to go far from the banks of the river. When tired with fiſhing, they leave the water to baſk themſelves in the ſun, and then appear more like logs of half-rotten wood thrown aſhore by the current, than living creatures; but upon perceiving any veſſel near them, they immediately throw themſelves into the water. Some are of ſo monſtrous a ſize as to exceed five yards in length. During the time they lie baſking on the ſhore, they keep their huge mouths wide open, till filled with muſquetoes, flies, and other inſects, when they ſuddenly ſhut their jaws and ſwallow their prey. Whatever may have been written with regard to the fierceneſs and rapacity of this animal, I, and all our company know from experience, they avoid a man, and on the approach of any one, immediately plunge into the water. Its whole body is covered with ſcales impenetrable to a muſket ball, unleſs it happens to hit them in the belly near the fore legs, the only part vulnerable.

"The alligator is an oviparous creature. The female makes a large hole in the ſand near the brink of a river, and there depoſits her eggs, which are nearly equal to thoſe of an oſtrich, and as white as thoſe of a hen, but much more ſolid. She generally lays about a hundred, continuing in the ſame place till they are all depoſited, which is about a day or two. She then covers them with the ſand; and the better to conceal them, rolls herſelf not only over her precious depoſitum, but to a conſiderable diſtance. After this precaution ſhe returns to the water, till natural inſtinct informs her, that it is time to deliver her young from their confinement; when ſhe comes to the ſpot, followed by the male, and tearing up the ſand, begins breaking the eggs, but ſo carefully, that ſcarce a ſingle one is injured; and a whole ſwarm of little alligators are ſeen crawling about. The female then takes them on her neck and back in order to remove them into the water; but the watchful gallinazos make uſe of this opportunity to deprive her of ſome; and even the male alligator, which indeed comes for no other end, devours what he can, till the female has reached the water with the few remaining; for all thoſe which either fall from her

Lizards. back, or do not ſwim, ſhe herſelf eats; ſo that of ſuch a formidable brood, happily not more than four or five eſcape.

"The gallinazos mentioned in our account of Carthagena, are the moſt inveterate enemies of the alligators, or rather extremely fond of their eggs, in finding which they make uſe of uncommon addreſs. Theſe birds often make it their whole buſineſs to watch the females during the ſummer, the ſeaſon when they lay their eggs, the ſands on the ſides of the river not being then covered with water. The gallinazo perches in ſome tree, where it conceals itſelf among the branches, and there ſilently watches the female alligator till ſhe has laid her eggs and retires, pleaſed that ſhe has concealed them beyond diſcovery. But ſhe is no ſooner under the water, than the gallinazo darts down on the repoſitory, and with its beak, claws and wings, tears up the ſand, and devours the eggs, leaving only the ſhells. This banquet would indeed richly reward its long patience, did not a multitude of gallinazos, from all parts join the fortunate diſcoverer and ſhare in the ſpoil. I have often been entertained with this ſtratagem of the gallinazos, in paſſing from Guayaquil to the cuſtom-houſe of Babahoyo; and my curioſity once led me to take ſome of the eggs, which thoſe who frequent this river, particularly the mulattoes, make no difficulty of eating when freſh. Here we muſt remark the methods uſed by providence in diminiſhing the number of theſe deſtructive creatures, not only by the gallinazos, but even by the males themſelves. Indeed neither the river nor the neighbouring fields would otherwiſe be ſufficient to contain them; for, notwithſtanding the ravages of theſe two inſatiable enemies, their numbers can hardly be imagined.

"Theſe alligators are the great deſtroyers of the fiſh in this river, it being their moſt ſafe and general food; nor are they wanting in addreſs to ſatisfy their deſires, eight or ten, as it were by compact, draw up at the mouth of a river or creek, whilſt others of the ſame corps go a conſiderable diſtance up the river, and chaſe the fiſh downwards, by which none of any bigneſs eſcape them. The alligators, being unable to eat under water, on ſeizing a fiſh, raiſe their heads above the ſurface, and by degrees draw the fiſh from their jaws, and chew it for deglutition. After ſatisfying their appetite, they retire to reſt on the banks of the river

"When they cannot find fiſh to appeaſe their hunger, they betake themſelves to the meadows bordering on the banks of the river, and devour calves and colts; and in order to be more ſecure in ſeizing their prey, take the opportunity of the night, that they may ſurpriſe them in their ſleep; and it is obſerved that thoſe alligators which have once taſted fleſh, become ſo fond of it, as never to take up with fiſh but in caſes of neceſſity. There are even too many melancholy inſtances of their devouring the human ſpecies, eſpecially children, who, from the inattention natural to their age, have been without doors after it is dark; and though at no great diſtance, theſe voracious animals have dared to attack them, and having once ſeized them with their mouth, to make ſure of their prey againſt that aſſiſtance which the cries of the victim never fail to bring, haſten into the water, where they immediately drown it, and then return to the ſurface and devour it at leiſure. Lizards.

"Their voracity has alſo been felt by the boatmen, who, by inconſiderately ſleeping with one of their arms or legs hanging over the ſide of the boat, theſe animals have ſeized, and drawn the whole body into the water. Alligators who have once feaſted on human fleſh are known to be the moſt dangerous, and become, as it were, inflamed with an inſatiable deſire of repeating the ſame delicious repaſt. The inhabitants of thoſe places where they abound are very induſtrious in catching and deſtroying them. Their uſual method is by a caſonate, or piece of hard wood ſharpened at both ends, and baited with the lungs of ſome animal. This caſonate they faſten to a thong, the end of which is ſecured on the ſhore. The alligator, on ſeeing the lungs floating on the waters, ſnaps at the bait, and thus both points of wood enter his jaws in ſuch a manner, that he can neither ſhut nor open his mouth. He is then dragged aſhore, where he violently endeavours to reſcue himſelf, while the Indians bait him like a bull, knowing that the greateſt damage he can do is to throw down ſuch, as for want of care or agility do not keep out of his reach.

"The form of this animal ſo nearly reſembles that of the lagarto or lizard, that here they are commonly called by that name; but there is ſome difference in the ſhape of the head, which in this creature is long, and towards the extremity ſlender, gradually forming a ſnout, like that of a hog, and, when in the river, is generally above the ſurface of the water; a ſufficient demonſtration that the reſpiration of a purer air is neceſſary to it. The mandibles of this creature have each a row of very ſtrong and pointed teeth, to which ſome writers have attributed particular virtues; but all I can ſay to this is, that they are ſuch as I and my companions, notwithſtanding all our enquiries to attain a complete knowledge of every particular, could never hear any ſatisfactory account of *." * Vol. i. 200.

3. Lacerta Gangetica, *Gangetic* or *Indian Crocodile.*

Specif. Char.—Jaw ſomewhat cylindrical, elongated; tail furniſhed above with two creſts uniting in one towards the extremity.

In this ſpecies the jaws are long, narrow, and ſtraight; and the upper mandible is terminated above by an elevated tubercle. This ſtructure of the ſnout is more remarkable in the young animal. The teeth of this ſpecies are more numerous than in the common crocodile, being nearly double the number, and they are of equal ſize through the whole length of the jaws. Excepting that the third and fourth toes, both on the fore and hind feet are connected together by a web; the ſtructure of the feet is the ſame as that of the common one. The eyes are extremely prominent; and it has been obſerved, are ſo conſtructed, that they may be raiſed above the water, when the reſt of the body is under the ſurface; by which the animal is enabled to ſee its prey either on the ſurface of the water, or on the banks of rivers. In the general form and colour of the body and limbs, this ſpecies reſembles the common crocodile, only the number of tranſverſe bands formed by the rows of ſcales on the back, is greater.

It

Lizards. It is a native of India, and is chiefly found in the Ganges, where it is nearly equal in ſize to the common crocodile.

Sect. II. Guanas.

The animals belonging to this ſection have the back and tail ſerrated or carinated.

4. Lacerta Iguana, *Common* or *Great American Guana.*

Specif. Char.—Tail long and round; back ſerrated; gular creſt denticulated.

The guana, which of all the lizard tribe is of the moſt peculiar form, grows to a conſiderable ſize. It is often ſeen, three, four, and ſometimes five feet long. The general colour is green, ſhaded with brown. The back is ſtrongly ſerrated; which, as well as the denticulations of the pouch at the throat, gives it a formidable appearance.

The guana is a native of many parts of America, and the Weſt Indies. It is ſaid alſo that it has been found in ſome parts of the Eaſt Indies. It frequents rocky and woody places, and feeds chiefly on inſects and vegetables.

The guana itſelf is reckoned very nouriſhing and delicate food. The uſual method of taking it, is by caſting a nooſe over its head, and then drawing it from its place; for without making any attempt to eſcape, it ſtands with its eyes fixed ſtedfaſtly at its diſcoverer, while at the ſame time it inflates its throat to a very large ſize.

Cateſby has given a good account of the guana, which we ſhall detail in his own words. "They are," "he ſays," of various ſizes, from two to five feet in length; their mouths are furniſhed with exceeding ſmall teeth, but their jaw is armed with a long beak, with which they bite with great ſtrength. They inhabit warm countries only, and are rarely to be met with anywhere north or ſouth of the tropics. Many of the Bahama iſlands abound with them, where they neſtle in hollow rocks and trees. Their eggs have not a hard ſhell, like thoſe of alligators, but a ſkin only like thoſe of a turtle, and are eſteemed a good food. They lay a great number of eggs at a time in the earth, which are there hatched by the ſun's heat. Theſe guanas are a great part of the ſubſiſtence of the inhabitants of the Bahama iſlands, for which purpoſe they viſit many of the remote keys and iſlands in their ſloops to catch them, which they do by dogs trained up for that purpoſe, which are ſo dexterous as not often to kill them; which, if they do, they ſerve only for preſent ſpending; if otherwiſe, they ſew up their mouths to prevent their biting, and put them into the hold of their ſloop till they have catched a ſufficient number; which they either carry alive for ſale to Carolina, or ſalt and barrel up for the uſe of their families at home. Theſe guanas feed wholly on vegetables and fruit, particularly on a kind of fungus growing at the roots of trees, and on the fruits of the different kinds of anonas. Their fleſh is eaſy of digeſtion, delicate, and well taſted. They are ſometimes roaſted, but the more common way is to boil them, taking out the leaves of fat, which are melted and clarified, and put into a calabaſh or diſh, into which they dip the fleſh of the guana as they eat it. It is remarkable that this fat, which adheres to the inſide of abdomen, imbibes the colour of the fruit the animal eats laſt, which I have frequently ſeen tinged of a pale red, yellow, or ſometimes of a purple colour; which laſt was from eating the *prunus maritima*, which fruit at the ſame time I took out of them. Though they are not amphibious, they are ſaid to keep under water above an hour. When they ſwim, they uſe not their feet, but clap them cloſe to their body, and guide themſelves with their tails. They ſwallow all they eat whole; they cannot run faſt, their holes being a greater ſecurity to them than their heels. They are ſo impatient of cold, that they rarely appear out of their holes but when the ſun ſhines." Lizards.

Dr Brown, in his natural hiſtory of Jamaica, gives the following particulars of the guana. "Like moſt of the tribe, he obſerves, it lives a very conſiderable time without food, and changes its colour with the weather, or the native moiſture of its place of reſidence. I have kept a grown guana about the houſe for more than two months: it was very fierce and ill-natured at the beginning; but after ſome days it grew more tame, and would, at length, paſs the greateſt part of the day upon the bed or couch, but it went out always at night. I have never obſerved it to eat any thing, except what imperceptible particles it had lapped up in the air; for it frequently threw out its forked tongue, like the chamelion, as it walked along. The fleſh of this creature is liked by many people, and frequently ſerved up in fricaſees at their tables; in which ſtate they are often preferred to the beſt fowls. The guana may be eaſily tamed while young, and is both an innocent and beautiful creature in that ſtate."

Var. Horned guana. This is conſidered as a variety of the former. It is nearly the ſame in ſize and general proportion; the back is alſo ſerrated, and the form of the ſcales is the ſame. It wants, however, the gular pouch, and there are in front of the head, between the eyes and noſtrils, four pretty large ſcaly tubercles, behind which there is a bony conical proceſs, which is covered with a ſingle ſcale.

It is a native of St Domingo, where it is ſaid to be very common.

5. Lacerta Amboinensis, *Amboina Guana.*

Specif. Char. Variegated, tail long, tail fin radiated, dorſal future dentated.

This ſpecies, which grows to the length of three feet, and ſometimes more, is at once diſtinguiſhed by the ſingularity of its appearance, and the beauty of its colours. The head and neck are green, and variegated with white tranſverſe undulations. The back and tail are brown, with a ſhade of purple. The ſides and belly are grayiſh, or pale brown; the head is tuberculated above, and covered with ſmall roundiſh ſcales; the mouth is wide, and the teeth are ſharp and numerous.

This ſpecies is a native of the Eaſt Indies, but is moſt frequent in the iſland of Amboina, frequenting the neighbourhood of rivers and other freſh waters. It is often ſeen on the banks of riſing grounds, and on low ſhrubs which grow near the water. It does not aſcend tall trees. Whenever it is diſturbed by the approach

Lizards.

proach of men or any animal, it plunges into the water, and conceals itſelf beneath the rocks or ſtones under the banks. It may be eaſily taken, as it does not attempt to bite or defend itſelf, but ſeems in ſome meaſure ſtupified.

This ſpecies, like others of the tribe, depoſits its eggs in the ſand, on the banks of the rivers which it frequents. The eggs in the body of the animal are diſpoſed in two long groups or cluſters, and are of a yellow colour; but when they are excluded, they are white, and of an oblong ſhape. The Amboina guana is reckoned a more delicate food than the common one; its fleſh is ſaid to be white, ſweet, and of a penetrating odour.

6. Lacerta Basiliscus, *Baſiliſk.*

Specif. Char.—Tail long; dorſal and caudal fins radiated; occipital creſt pointed.

The baſiliſk is about one foot and a half in length, of a pale aſh-brown colour, with ſome darker variegations about the upper part of the body. In the young animal, the dorſal or caudal proceſs, and the pointed occipital creſt mentioned in the ſpecific deſcription, are leſs diſtinct.

The baſiliſk is chiefly a native of South America. It reſides principally among trees, and feeds on inſects.

It is ſaid to be a very active animal, and by means of its dorſal creſt or fin, it is enabled to ſpring from tree to tree. It can alſo ſwim with great eaſe.

This animal has a very formidable appearance, but is quite harmleſs; but in the poetical deſcriptions of the ancients, we find that it was conſidered to be the moſt malignant of all poiſonous animals; even its look was regarded as fatal. The terrific glance of the baſiliſk in the African deſerts, according to the poetical repreſentation of Lucan, obliged the reſt of the poiſonous tribe to keep at a diſtance.

7. Lacerta Calotes, *Galeot Lizard.*

Specif. Char.—Tail long and round; back dentated on the fore part, and the head on the hind part.

This ſpecies ſeldom exceeds a foot and a half in length, from the tip of the noſe to the extremity of the tail; but otherwiſe in its general habit and appearance, it reſembles the common guana. It wants, however, the gular pouch; in its place there is only a ſlight enlargement of the throat. The colour, which occaſionally varies, is moſt commonly of an elegant bright blue, variegated with broad, irregular, white, tranſverſe bands on each ſide of the body and tail. The limbs are ſlender, and this is particularly the caſe with the toes.

This ſpecies is a native of the warmer regions of Africa, Aſia, and many of the Indian iſlands. It is very common in Ceylon. It is ſaid alſo to be a native of Spain, where it wanders about the tops of houſes, in ſearch of ſpiders. According to ſome, it preys on rats, and, like ſome other lizards, attacks ſmall ſerpents.

8. Lacerta Agama, *American Galeot.*

Specif. Char.—Tail long, round; neck above, and head behind, aculeated; ſcales of the hind head reverſed.

This ſpecies in ſome reſpects reſembles the calotes; but it wants the ſtrong ſerratures on the back, in place of which it has only a ſmall denticulated carina. The head is proportionally larger, and on the back part is furniſhed with ſharp-pointed ſcales, ſome of which are reverſed at their extremities. The colour is brownish, and variouſly clouded. In the male, the creſt on the back is compoſed of longer ſpines, and extends to the lower part.

Lizards.

It is a native of South America, and ſome of the iſlands of the Weſt Indies.

Var. *Lacerta Muricata*, Muricated Lizard. Tail long, round; body grayiſh; ſcales carinated and ſharp-pointed.

This lizard, which is conſidered as a variety of the preceding, meaſures more than a foot in length, and has even been ſometimes found to exceed that ſize. The want of the reverſe ſcales on the back part of the head, conſtitutes the principal difference between this and the former ſpecies.

It is a native of New South Wales.

9. Lacerta Bicarinata, *Bicarinated Lizard.*

Specif. Char.—Tail of moderate length; four rows of ſtrong carinated ſcales on the back.

In its general habit, this ſpecies bears ſome reſemblance to a ſmall crocodile, on account of the hard tuberculated and carinated ſcales on the upper parts of the body, two rows of which are more prominent than the reſt, and extend from the upper part of the back to the tail, where they coaleſce and form a ſerrated creſt to the extremity.

The head is ſmall, the mouth wide, and the ſnout ſomewhat ſharp. The colour is reddiſh-brown, tinged in ſome parts with various ſhades of green.

It is a native of South America, where it is ſometimes uſed as food. The eggs, it is ſaid, are alſo greatly eſteemed for the ſame purpoſe. Woody and marſhy regions are the uſual places of its reſort. One of this ſpecies which was kept alive for ſome time by M. de la Borde, was obſerved to remain for hours together in the water, and when it was diſturbed or alarmed, it concealed itſelf, but delighted to come out occaſionally and baſk in the ſun.

Var. A lizard known by the name of *iguaruca*, and ſaid to be a native of Brazil, is conſidered as a variety of the preceding, differing only in the colour, which is darker, and the claws which are ſhorter; but, like it, it has ſome reſemblance to the crocodile, and readily climbs trees.

10. Lacerta Monitor, *Monitory Lizard.*

Specif. Char.—Colour black; tail very long, compreſſed, carinated; body marked with tranſverſe rows of white, ocellated.

This is one of the largeſt of the whole tribe of lizards. From the tip of the noſe to the extremity of the tail, it ſometimes meaſures no leſs than four or five feet. It is alſo one of the moſt beautiful. The head is ſmall, the ſnout gradually tapers, the limbs are ſlender, and the tail which is laterally compreſſed, gradually decreaſes towards the extremity. Indeed the ſhape altogether is ſlender and elegant, and although the colours are ſimple, they

Lizards. they are so disposed as to produce an agreeable and pleasing effect. This species is a native of South America, inhabiting woody and marshy places.

It is said that the monitory lizard from the gentleness of its disposition, is remarkable for its attachment to mankind, warning them of their danger from the alligator by emitting a peculiar and shrill sound.

Var. *Lacerta Varia*, Variegated Lizard.—Although this lizard is somewhat different in colour, and in the disposition of its variegations, which are rather of a pale yellow than white, yet it is considered only as a variety of the preceding. It is a native of New Holland.

11. Lacerta Acanthura, *Spine-tailed Lizard.*

Specif. Char.—Throat plaited beneath; body covered with minute scales; tail long and verticillated with carinated triple-spined scales.

The length of this species is about a foot and a half. The head is covered with scales, which are small and nearly six-sided; it is quite distinct from the body. The whole skin about the neck, throat, and beginning of the sides, is quite loose, which in the specimen described, may have had a pouched appearance. All the other parts of the body are covered with very small scales. The tail is very long, and strongly marked into numerous rings, which are composed of long and strongly carinated scales, each of which terminates in a lengthened point, and produces the spiny appearance. There are five long toes on each foot; the claws are strong and sharp. The colour on the upper parts of the body is glaucous, variegated with small whitish clouds and marblings.

It is described by Dr Shaw from a specimen in the British Museum.

12. Lacerta Lophura, *Sharp-tailed Lizard.*

Specif. Char.—Body covered with dissimilar scales; back serrated; tail long, and somewhat compressed.

This is a very large species; there are large, rounded, and oval scales scattered here and there among the smaller ones. The tail is long and sharp-pointed; the back and tail are serrated throughout their whole length.

This species is also described by Dr Shaw from a specimen in the British Museum.

13. Lacerta Dracæna, *Dracæna Lizard.*

Specif. Char.—Large tail; long and denticulated along the upper part.

This is one of the largest species belonging to the tribe. Not only in the size of the body, but in the proportion of the limbs and tail, it exceeds that of the guana. The colour is brown, with a slight shade of chesnut. On the out sides of the limbs there are numerous small pale yellowish spots. The head is small, and the snout tapering.

It is a native of South America, and some of the Indian islands; and it is said that in some countries it is preferred as an article of food to the guana.

14. Lacerta Superciliosa, *Supercilious Lizard.*

Specif. Char.—Tail carinated; back and eyebrows ciliated, with upright lanceolated scales.

The general appearance of this species bears some resemblance to the guana, and still more to the horned guana, in having the appearance of a pair of sharp pointed horn-like processes above and beyond each eye; between these are placed some aculeated scales. The size of one which has been described, measures from 12 to 16 inches, from the tip of the nose to the extremity of the tail. Lizards.

It is a native of Asia, and of some of the Indian islands.

15. Lacerta Scutata, *Scutated Lizard.*

Specif. Char.—Tail of moderate length, compressed; dorsal suture dentated; two pointed processes on the back of the head.

This species is distinguished from the former by having a proportionally larger head, and a row of scales more elevated than the rest, passing over each eye; and from these a ridge is continued towards the back of the head, where they unite and extend down the middle of the back, in form of a short denticulated crest, to the beginning of the tail. The body is covered with acuminated scales which are but small; the limbs and tail with larger ones.

It is a native of the island of Ceylon.

16. Lacerta Principalis, *Smooth Crested Lizard.*

Specif. Char.—Tail subcarinated; gular crest plain edge; back smooth.

This species is in general of a slender form, and small, rarely exceeding eight or nine inches in length, including both the body and tail. The colour is blue, the head small, and the snout taper.

It is a native of South America.

Var. *Lacerta bimaculata*, Linn.

This is considered as a variety of the former; the colour is blue, spotted here and there with black, with two larger black spots over the shoulders.

It is a native of St Eustatia, and is found also in Pennsylvania.

Var. Le Roquet, of Cepede, is considered by Dr Shaw also as a variety of the smooth-crested lizard, as it resembles it both in size and habit; it is however destitute of the gular crest.

It frequents gardens, moving nimbly among trees, and devours great multitudes of smaller insects.

17. Lacerta Strumosa, *Strumous Lizard.*

Specif. Char.—Tail long, round; breast gibbose, projecting.

This is of a small size, has no dorsal serratures, but is furnished with a large flat gular crest, of a pale red colour; the rest of the animal is of a pale bluish gray, with some slight shades of a more dusky hue. The limbs are slender.

It is a native of South America.

18. Lacerta Marmorata, *Marbled Lizard.*

Specif. Char.—Tail long, round; throat subcrestated, back smooth.

This species is of a slender and elegant form, and measures, including the tail, about a foot in length. The

The head is ſmall, the ſnout taper. The colour is pale blue, variegated with undulating tranſverſe bands of a whitiſh ſhade. The belly is of a pale roſe colour.

It is a native of America and the Weſt Indies.

19. Lacerta Umbra, *Umber Lizard.*

Specif. Char.—Tail long, round; neck ſubcreſtated above; hind head callous; back ſtriated.

This is a ſmall ſpecies; the body is covered with ſcales, which are carinated and pointed; the head is obtuſe, and marked on the hind part with a large callous bare ſpot.

It is a native of North America.

Sect. III. Cordyles.

Having denticulated or ſpiny ſcales on the body or tail, or both.

20. Lacerta Pelluma, *Pelluma Lizard.*

Specif. Char.—Tail long, and verticillated with rhomboidal ſcales.

This lizard is about two feet in its total length, and is diſtinguiſhed on the upper parts of its body by a beautiful variety of green, yellow, blue, and black colours. The under parts of the body are of a gloſſy yellowiſh green.

It is a native of Chili.

21. Lacerta Azurea, *Azure Lizard.*

Specif. Char.—Tail ſhort, verticillated with mucronated ſcales.

This is of a fine blue colour, tranſverſely banded with black or blue. It is ſometimes only a few inches long, but others are found of a larger ſize.

The larger variety is a native of South America, the ſmaller of ſome parts of Africa.

22. Lacerta Cordylus, *Cordyle Lizard.*

Specif. Char.—Body ſmooth; tail ſhort and verticillated with denticulated ſcales.

This ſpecies, at firſt ſight, bears a conſiderable reſemblance to the former; but the ſcales which cover the body are of an oblong-ſquare form, and larger, and the tail is verticillated with rows of large ſcales of the ſame form. The colour is ſometimes blue, ſometimes a livid brown, and the total length is about ten inches.

23. Lacerta Stellio, *Rough Lizard.*

Specif. Char.—Tail verticillated, with denticulated ſcales; body and head muricated.

The whole upper ſurface of the body is remarkably rough, from being covered with projecting pointed ſcales. It is of a pale bluiſh brown colour, with ſome deeper and lighter tranſverſe variegations. It is about eight inches long.

This ſpecies is a native of many parts of Africa.

24. Lacerta Angulata, *Angulated Lizard.*

Specif. Char.—Tail long, hexagonal, and furniſhed with carinated and mucronated ſcales.

This is a ſmall ſpecies of a brown colour. Beneath the throat there are two large rounded ſcales. The tail is longer than the body, and ſtrongly marked with ſix longitudinal ridges.

It is a native of America.

25. Lacerta Orbicularis, *Orbicular Lizard.*

Specif. Char.—Body brown, round; tail ſhort, round; ſcales muricated.

The colour of this ſpecies is duſky brown, variegated with different ſhades; the body is large and ventricoſe, and in this reſpect it reſembles the toad.

This is a native of South America, but is a rare ſpecies.

Sect. IV. Lizards Proper.

The ſurface of the body is ſmooth, and they are generally furniſhed with broad ſquare plates or ſcales on the abdomen.

26. Lacerta Agilis, *Green Lizard.*

Specif. Char.—Of a green colour, with minute duſky variegations. There is a collar of large ſcales beneath the neck; tail long, verticillated.

The length of this ſpecies is from 10 to 15 inches; but it ſometimes arrives at ſuch a ſize as to meaſure more than two feet to the end of the tail. The colour conſiſts of a mixture of different ſhades of green, with ſpots of yellow, brown, black, and ſometimes red. The head is covered with angular ſcales, and the reſt of the upper parts of the body with ſmall ovate ones. The tail is longer than the body, and is marked with numerous rings of oblong ſquare ſcales.

This ſpecies is a native of all the warmer parts of Europe. It is found in gardens about warm walls, buildings, &c. It is a very active animal, and purſues its prey, which conſiſts of inſects, with great celerity. When it is caught, it ſoon becomes familiar, and may even in ſome meaſure be tamed.

Var. The gray lizard, or little brown lizard, which is alſo a native of many parts of Europe, is conſidered as a variety of the former. It is about ſix or eight inches long, of a greeniſh brown, or pale grayiſh colour.

This variety is a native of Britain, and is found on the ſides of dry banks, or ſand hills, where it is occaſionally ſeen baſking during the heat of ſummer. It is alſo found about the roots of trees, old walls, &c.

27. Lacerta Teguixin, *Variegated Lizard.*

Specif. Char.—Tail long, round; ſides ſomewhat wrinkled; plate under the throat triple.

This ſpecies is ſometimes larger than the guana. The head is covered with large ſcales or plates, and the body with ſmaller and ſquare ſcales. The colour is extremely beautiful; it conſiſts of an elegant variega-

tion of black, brown, and purple ſpots, on a pale bluiſh, white, and yellowiſh ground.

It is a native of South America.

28. Lacerta Erythrocephala, *Red-headed Lizard.*

Specif. Char.—Colour blackiſh green, undulations tranſverſe and black; abdomen longitudinally banded with black, white, and blue; breaſt black; top of the head red.

This ſpecies is of a moderate ſize; the ſcales on the head are largeſt, and there is a row of tubercles beneath the thighs.

It is a native of the iſland of St Chriſtopher.

29. Lacerta Cerulea, *Ameiva Lizard.*

Specif. Char.—Colour blue, with black and white variegations; tail long, verticillated; abdominal ſcuta 30.

The ameiva greatly reſembles the green lizard, but it wants the ſcaly collar. The ſcales on the upper part of the body are not diſtinctly viſible; thoſe of the abdomen are compoſed of ſquare plates, and there is a row of tubercles beneath each thigh.

It is a native of South America, and it is ſaid that it is ſometimes found in Africa and Aſia.

30. Lacerta Lemniscata, *Striped Lizard.*

Specif. Char.—Colour duſky blue; eight white lines down the back; limbs ſpotted with white; tail long, round.

This is of a ſmaller ſize than the laſt ſpecies, but in its general appearance bears a conſiderable reſemblance. The white ſtripes on the back vary in breadth, and ſometimes in number.

It is a native of Guinea, but is alſo found in ſome parts of India and South America.

31. Lacerta Quadrilineata, *Four-ſtriped Lizard.*

Specif. Char.—Colour blackiſh blue; four white or yellowiſh lines down the back; tail long, round; fore feet tetradactylous.

This is a ſmaller ſpecies than the laſt, but reſembles it greatly. The claws are very ſmall.

It is ſuppoſed to be a native of North America.

32. Lacerta Teniolata, *Ribband Lizard.*

Specif. Char.—Body marked above with black and white ſtripes; beneath white; tail long and round.

This is a ſmall ſpecies; the colour above is cheſnut brown, and the ſcales on every part of the body are ſmooth, round, and imbricated. From the head to the middle of the tail there are ſix white linear ſtripes. The limbs are ſtriped longitudinally with black.

It is a native of New Holland.

33. Lacerta Sexlineata, *Six-lined Lizard.*

Specif. Char.—Colour gray brown; ſix white lines down the back; tail long, verticillated.

This is a ſmall ſpecies. Beneath the throat there is a double plate, and a row of tubercles beneath the thighs. The legs are long and the feet ſlender; the tail is carried curved over the back, from which it has been called the lion lizard.

It is a native of the Weſt Indies, where it frequents the rocks on the ſea coaſt.

34. Lacerta Fasciata, *Faſciated Lizard.*

Specif. Char.—Colour of the body brown; tail blue and rather long. There are five yellowiſh lines down the back.

This is a ſmall ſpecies, rarely exceeding eight inches in its whole length. The head is ſhort.

It is a native of Carolina, inhabiting hollow trees.

35. Lacerta Quinquelineata, *Five-lined Lizard.*

Specif. Char.—Colour duſky; five whitiſh lines down the back; tail round, and of a moderate length.

This is a ſmall ſpecies. The tail is twice the length of the body. There are ſix ſtripes on the head. The abdomen is imbricated with ſtriæ.

It is a native of Carolina.

36. Lacerta Interpunctata, *Punctated Lizard.*

Specif. Char.—Tail long, round; dorſal lines two, and yellow, having black ſpecks interſperſed.

This is a ſmall ſpecies; the body is ſmooth and gloſſy, and the head is covered with large ſcales.

It is a native of Aſia.

37. Lacerta Bullaris, *Red-throated Lizard.*

Specif. Char.—Colour green; gular pouch red; tail long, round.

This ſpecies is about ſix inches long, of a ſhining graſs-green colour. When it is approached, the throat ſwells into a globular form, and the protruded ſkin becomes of a bright red colour. This is ſuppoſed to be a threatening aſpect, but probably without foundation.

This ſpecies is a native of Jamaica, where it is common about hedges and trees.

Var. Green Carolina lizard.—This reſembles the former in every reſpect, except in the appearance of the gular pouch. In dry hot weather it appears of a bright green colour; but in cold weather this changes to a brown.

It is a native of Carolina, where it is very common about houſes.

38. Lacerta Cruenta, *Red-tailed Lizard.*

Specif. Char.—Colour brown; on the neck there are ſeven white ſtripes, and four on the back. Under the throat there is a plate; the tail is verticillated and red beneath.

This is a very ſmall ſpecies, reſembling the *lacerta velox*, but differs from it in having a ſharper ſnout. The limbs are marked with white round ſpots; the tail is red beneath and white at the tip. There is a row of tubercles on the thighs.

It is a native of the ſouthern parts of Siberia, and is found about the ſalt lakes.

39.

39. Lacerta Lobata, *Lobe-cheeked Lizard. Lacerta Aurata*, Linn.

Specif. Char.—Colour browniſh, with a roundiſh denticulated lobe on each ſide of the neck.

This ſpecies is of moderate ſize, and in appearance is ſomewhat thick or ventricoſe. Body rather depreſſed; the head rounded on each ſide. From the corner of the mouth extending to the ſhoulders, there is a flat ſemiorbicular lobe of a red colour, with ſerrated edges. The whole of the body is rough, with ſmall pointed granules.

It is a native of the ſouthern deſerts of Siberia, and is found among the ſand hills.

40. Lacerta Helioscopa, *Sun-gazing Lizard.*

Specif. Char.—Colour browniſh; head rough, with calli; a tranſverſe plate beneath the throat; tail imbricated, thick at the baſe, and ſharp at the tip.

This is a ſmall ſpecies, ſcarcely exceeding a finger's length. The colour of the upper parts of the body is gray, with brown and bluiſh ſpots and linear ſtreaks. The neck is often marked above with a red ſpot. The tip of the tail is red beneath.

It is a native of the ſouthern parts of Siberia, where it baſks in ſunny ſituations, with its head turned up towards the ſun.

41. Lacerta Turcica, *Turkiſh Lizard.*

Specif. Char.—Colour brown; body roughiſh; tail of moderate length, and ſomewhat verticillated.

This is a ſmall ſpecies; the head is rather large, and the body thickiſh; the tail ſhort, thick at the baſe, and pointed at the tip.

It is a native of eaſtern countries.

42. Lacerta Platura, *Broad-tailed Lizard.*

Specif. Char.—Colour gray brown, paler beneath; body rough; tail depreſſed, lanceolated, and ſpiny on the margin.

This ſpecies is from four to ſix inches long, and is remarkably diſtinguiſhed by the ſingular form of its tail. The feet are pentadactylous; the toes ſlender, and the claws curved.

It is a native of New Holland.

43. Lacerta Plica, *Plica Lizard.*

Specif. Char.—Hind head callous; eyebrows excoriated above; neck plated beneath, and warted at the ſides; tail long and round.

This is a ſmall ſpecies, not exceeding a finger's length. It is entirely covered with conical ſcales; there is a double plate beneath the throat.

It is a native of South America and India.

44. Lacerta Japonica, *Japaneſe Lizard.*

Specif. Char.—Tail long, round; feet unguiculated; fore feet tetradactylous; a ſingle ſtripe on the back.

This is a ſmall ſpecies; the colour above is livid brown, and the yellow ſtripe from the hind head to the beginning of the tail is broad and dentated. The claws are black.

45. Lacerta Nilotica, *Nilotic Lizard.*

Specif. Char.—Tail long and triquetrous; body ſmooth, with four lines of ſcales down the back.

This likewiſe is a ſmall ſpecies.

It is a native of Egypt.

46. Lacerta Tiliguerta, *Tiliguerta Lizard.*

Specif. Char.—Tail verticillated, twice the length of the body, and having eighty abdominal ſcuta.

This, like the former, is a ſmall ſpecies, meaſuring not more than ſeven or eight inches long. The female is of a brown, and the male of a green, colour, with black ſpots. It ſeems to bear ſome relation to the green lizard.

It is a native of Sardinia, where it is to be met with in fields, about walls, &c.

47. Lacerta Deserti, *Deſert Lizard.*

Specif. Char.—Tail round, longiſh; feet pentadactylous; body black above, and marked with ſix longitudinal white lines.

This is a very ſmall ſpecies; the body is white beneath, and the ſtripes on the back are compoſed of oblong ſpots.

It is a native of the Uralian deſert.

48. Lacerta Arguta, *Argute Lizard.*

Specif. Char.—Tail ſhort, verticillated; thick at the baſe and filiform at the tip; collar marked with obſcure ſcales. There is a remarkable double plate under the neck.

This ſpecies is ſomewhat ſimilar to the green lizard, but is ſhorter and more ventricoſe, and has a ſharper ſnout.

It is a native of the ſouth of Siberia.

49. Lacerta Algira, *Algerine Lizard.*

Specif. Char.—Tail long, verticillated; two yellow lines on each ſide of the body.

This ſpecies is about a finger's length, brown above, and yellowiſh beneath.

It is a native of Algiers.

50. Lacerta Velox, *Swift Lizard.*

Specif. Char.—Tail longiſh, verticillated; ſcaly collar beneath the neck; body cinereous, with five longitudinal paler bands, variegated with black ſpecks; the ſides ſpotted with black, and ſpeckled with blue.

This ſpecies is much ſmaller and more ſlender, but in other reſpects comes very near to the *lacerta agilis*. The hind feet are marked with orbicular ſpots.

It is a native of Siberia.

51. Lacerta Uralensis, *Ural Lizard.*

Specif. Char.—The tail is long and round; the neck plated

plated beneath; the feet are pentadactylous, and the back is livid, rugoſe, and ſubverrucoſe.

The length of this animal is about four inches; the head is roundiſh; the colour of the upper parts is livid brown, and the ſkin is wrinkled and ſlightly tuberculated.

It is a native of the deſert of Ural, and moves about with great ſwiftneſs.

52. Lacerta Seps, *Seps Lizard.*

Specif. Char.—Colour bluiſh brown; tail longiſh, verticillated; lateral future reflexed; ſcales ſquare.

This is a ſmall ſpecies, and is eaſily known from the thin lengthened form of its body, and long ſlender tail, as well as from the ſquare ſcales with which it is entirely covered. The tail is marked with about 50 diviſions.

It is a native of the ſouthern parts of Europe.

Sect. V. Chameleons.

Theſe are diſtinguiſhed by having a granulated ſkin, a large head, a long miſſile tongue and cylindrical tail.

53. Lacerta Chamæleon, *Common Chameleon.*

Specif. Char.—Crown flat; tail cylindrical and incurvated; toes united by two and three.

The length of the chameleon, from the tip of the noſe to the beginning of the tail, is about ten inches. The tail is nearly of the ſame length. The ſkin on every part of the animal is granulated. A ſeries of obſcure denticulations runs down the back, and forms a ridge on that part. There are five toes on each foot, two and three of which are united by a common ſkin, as far as the claws; the two outward and three inward toes of the fore feet are united, and the two inward and three outward of the hind feet. The ſtructure of the tongue of the chameleon is very peculiar; it is very long, and furniſhed with a dilated ſomewhat tubular tip, by which means it is enabled eaſily to ſeize inſects, which are its prey, by darting it out and ſecuring them on the tip.

The chameleon, like others of the amphibia, has the power of inflating its lungs, and retaining the air for a long time. It is in this way that it ſometimes appears plump and fleſhy, while at other times, when the air is ejected, and the lungs in a collapſed ſtate, it exhibits nothing but ſkin and bone. The natural colour of the ſkin of the chameleon is of a bluiſh aſh, and the uſual changes are from this to a green or yellowiſh colour, ſpotted unequally with red. When the animal is expoſed to full ſunſhine, the darkened ſide appears in a few minutes of a pale yellow, with large roundiſh ſpots of red brown; but when the animal is turned round, the reverſe takes place. The ſide formerly in the ſhade appears of a brown or aſh colour, and the other ſide yellow and red. Theſe changes, however, vary greatly, both with regard to the diſpoſition of the ſpots and the intenſity of the colours.

The chameleon is a native of Europe, Africa, and Aſia. It is indeed chiefly found in tropical regions; but it is alſo ſometimes met with in the warmer parts of Spain and Portugal.

No animal has been more celebrated than the chameleon, and particularly on account of the power which it was ſuppoſed to poſſeſs of changing its colour. This account was greatly exaggerated when it was aſſerted, that it could produce this change at pleaſure, and aſſimilate it to that of any particular object. But the more accurate obſervations of modern naturaliſts have ſhewn, that this change of colour varies greatly, and ſeems to depend on the ſtate of the animal's health, the temperature of the weather, and probably ſome other unknown cauſes. Another erroneous aſſertion with regard to the chameleon was, that it could live entirely on air. This no doubt aroſe from the long abſtinence which this animal, as well as many others belonging the claſs *amphibia*, can endure.

54. Lacerta Africana, *African Chameleon.*

Specif. Char.—Colour blackiſh; crown carinated.

This is one of the largeſt yet diſcovered. Along the back to the end of the tail there runs a pure white ſtripe, bounded by a broad blackiſh band. The other parts of the animal are variegated with pale aſh-coloured undulations.

It is ſuppoſed to be a native of Barbary.

55. Lacerta Pumila, *Little Chameleon.*

Specif. Char.—Body bluiſh on each ſide, and marked with two yellowiſh lines.

The head of this ſpecies is ſomewhat flatter than the former, but ſtill elevated in the middle, and edged on each ſide with a denticulated margin.

By ſome the two latter ſeem to be conſidered only as varieties.

Sect. VI. Geckos.

In the animals of this diviſion the ſkin is granulated or tuberculated; the feet are lobated, and the toes lamellated beneath.

56. Lacerta Gecko, *Common Gecko.*

Specif. Char.—Livid, with brown variegations; upper part of the body warted, and the lamellæ of the feet not divided.

This animal is ſaid to have received the name of *gecko* from the peculiar ſound of its voice, which bears ſome reſemblance to that word when uttered in a ſhrill tone. Its length, in general, is about a foot or more, and therefore it ranks among the middle-ſized animals of the lizard tribe. Its form is thicker and ſtronger than the greater part of lizards. Its head is flattiſh, ſomewhat triangular and large, with a covering of minute ſcales; its mouth is wide, eyes large, teeth ſmall, and its tongue is broad and flat. The limbs of this animal are moderately long, with broader feet than the reſt of the tribe; the toes are dilated on the margins, and beneath are divided into a number of tranſverſe lamellæ parallel to each other, without any longitudinal furrow. The general colour of the gecko is a pale brown.

Lizards.

brown, with ſome irregular duſky or bluiſh variegations; but this colour becomes much more brilliant in warmer regions.

It is a native of Aſia and Africa, and ſome of the warmer parts of Europe, inhabiting obſcure receſſes, caverns, old walls, &c. It has been ſuppoſed to be of a poiſonous nature. A fluid exſudes from the lamellæ of the feet, which is ſaid to be extremely acrid; and when any of it has remained on fruit, when it is eaten, it is ſaid that it produces troubleſome ſymptoms. The peculiar ſtructure of the feet enables the animal to attach itſelf to the ſmootheſt ſurfaces.

Var. *Tokai.*—This, which is conſidered as a variety of the former, is about a foot long. The body is covered above with a granulated ſkin, varied with red and blue undulations; the belly is aſh colour, and interſperſed with red ſpots; the head is large and triangular.

This is a native of Siam, where it occaſionally enters the houſes, and is conſidered as a poiſonous animal.

The Indian ſalamander, deſcribed by Bontius, ſeems to be of the ſame kind; the length is about a foot; the colour ſea-green, ſpotted with red; the head large, and like that of a toad; the body is broad and the tail long.

It is a native of Java. It is ſaid that the inhabitants hold up the animal by the tail to make it diſcharge ſaliva from its mouth, which is collected for the purpoſe of poiſoning their arrows.

57. Lacerta Dubia, *Geckotte.*

Specif. Char.—Livid colour; upper ſurface covered with pointed warts; no femoral papillæ.

This ſpecies bears ſome reſemblance to the gecko; but differs from it in being thicker and ſhorter, and in wanting the papillæ under the thighs. The tail in the young animal is divided into ſtrongly marked aculeated rings. Theſe become gradually leſs conſpicuous with the age of the animal, and are at laſt totally obliterated.

It is a native of the ſouth of France, where it is known by the name of *tarente*, and is regarded as an innocent animal. It frequents ruins, walls, houſes; delights greatly in ſunſhine, and avoids damp ſhady ſituations. It remains concealed in the hollows of walls during winter, not, however, in a torpid, but in an inert ſtate.

58. Lacerta Perfoliata, *Perfoliated Gecko.*

Specif. Char.—Colour browniſh, ſmooth above; lamellæ of the feet divided by a furrow; tail frequently turbinated.

This ſpecies is of a thicker form, has ſhorter limbs, and the tubercles on the back are leſs diſtinct than the common gecko. It is alſo different in wanting the papillæ under the thighs. The tail is remarkably ſwelled immediately beyond its origin, and then tapers to the extremity, ſomewhat reſembling a young turnip root, from whence it has been denominated *lacerta rapicauda.*

Its native country is not mentioned.

59. Lacerta Mauritanica, *Mauritanic Gecko.*

Lizards.

Specif. Char.—Colour brown, covered above with ſharp warts; tail flat, and furniſhed with ſcuta beneath; lamellæ of the feet lunulated and divided.

This ſpecies reſembles the common one, but is different from being covered with ſpiny or ſharp-pointed warts on the upper ſurface. The toes are lamellated beneath, but are not divided by a middle ſulcus.

60. Lacerta Sinensis, *Chineſe Gecko.*

Specif. Char.—Tail flat, all the toes unguiculated; face perforated with ſeveral pores.

The head is broad and flat; the teeth ſmall; the tongue flat, and emarginated at the tip. About the ſides of the noſe and eyes there are ſeveral ſcattered pores.

It is a native of China, and is frequently ſeen in houſes, running about the walls, and climbing readily on the ſmootheſt ſurfaces. It preys chiefly on the ſmaller kind of cock-roach. It is conſidered as an innocent animal.

61. Lacerta Vittata, *White-ſtriped Gecko.*

Specif. Char.—Colour yelloviſh brown, with a white dorſal band, which is forked over the head.

This is a ſmall ſpecies, not exceeding ſeven or eight inches in length; the head is large in proportion to the body; the toes are lamellated beneath, divided by a ſulcus, and terminated by curved claws. The upper ſurface is covered with extremely ſmall tubercles: they are ſo minute as to be ſcarcely perceptible.

This ſpecies is ſaid to be a native of India.

62. Lacerta Fimbriata, *Fimbriated Gecko.*

Specif. Char.—A membranaceous fimbriated border on each ſide of the body; tail flat; lamellæ of the feet divided by a furrow.

This is a very remarkable ſpecies, which, as the count de Cepede, who deſcribes it, obſerves, ſeems in ſome degree to connect the chameleon, the gecko, and the water-newts. The largeſt individual which he examined meaſured about eight inches and a half in length. The head is large and flattened, and its outline ſeen from above is nearly triangular, as in the chameleon; but the triangle is of a longer form, and there is no riſing creſt. The moſt remarkable part of its ſtructure is the fringed proceſs which commences on each ſide of the head, and is continued along the ſides of the body. The colour of this animal varies as in the chameleon, exhibiting different ſhades of red, yellow, green, and blue.

It is a native of Madagaſcar, where it is pretty common. It is a harmleſs animal, and yet is regarded with great abhorrence by the natives, who conſider it as of a poiſonous nature, and run from it with great precipitation. This popular prejudice is ſuppoſed to have ariſen from a peculiar habit of the animal, of running with open mouth towards the ſpectator, inſtead of making its eſcape when it is diſcovered. It appears chiefly in rainy weather, moving about with great agility, and ſpringing

Lizards.

ing from one branch of a tree to another in ſearch of inſects, which are its proper food.

63. Lacerta Tetradactyla, *Four-toed Gecko.*

Specif. Char.—Colour yellow, varied with green; tail flat; feet tetradactylous.

This ſpecies is about 12 inches long, and is nearly allied to the preceding ſpecies, except that it wants the fimbriated margin, and the number of the toes on the fore feet being only four.

It is alſo a native of Madagaſcar, and is not held in leſs abhorrence by the inhabitants than the former. It lives in the woods, appearing in the rainy ſeaſon during the night.

64. Lacerta Caudiverbera, *Scollop-tailed Gecko.*

Specif. Char.—Tail flat, pinnatifid; feet palmated.

This ſpecies, which is a very ſingular one, is about 16 inches long, and of this the tail meaſures above one half. The head is large and flat, the body thick, and the limbs ſhort. The fore feet are like the reſt of the ſpecies, but the hind feet are ſtrongly palmated. The tail tapers gradually to the tip, but through its whole length is edged with a broad deep ſcolloped fin: this gradually widens towards the tip, and is conſiderably broader than on the ſides. The back is marked with numerous diſtant red tubercles, each of which is ſurrounded by a circle of ſmall white ſcales. The webs of the hind feet, and the finny part of the tail, are of a bright red.

This ſpecies is ſaid to be a native of Arabia; but being a very rare animal, its natural hiſtory is not well known.

65. Lacerta Schneideriana, *Schneiderian Gecko.*

Specif. Char.—Colour gray; tail convex above and flat below; a black band on each ſide of the head; lamellæ of the feet lunulated and divided.

The colour of this ſpecies is cinereous, with a brown band on each ſide of the head; on each ſide of the body there is a future or wrinkling of the ſkin; the tail is edged with a row of ſharper and longer ſcales than on the other parts.

66. Lacerta Sparmanniana, *Sparmannian Gecko.*

Specif. Char.—Body papillated above; tail lanceolated; fore feet tetradactylous.

This is a ſmall ſpecies, meaſuring not more than three inches in total length. The colour on the upper part of the body is variegated with darker and lighter ſhades; on the under part it is whitiſh.

It is a native of the Cape of Good Hope, where it is regarded as a poiſonous animal. It is ſaid that the fluid ſecreted from its pores, as well as the ſaliva, produces inflammatory tumors, and ſometimes even gangrenes.

67. Lacerta Spitator, *Spitting Gecko.*

Specif. Char.—Colour gray, marked above with brown tranſverſe bands; tail round, furniſhed with ſcuta beneath.

The total length of this ſpecies does not exceed four inches, and ſometimes it is ſmaller. The ſcales on the whole animal are ſmooth and gloſſy. Lizards.

It is a native of the iſland of Euſtatia, where it is found about houſes, walls, &c. When it is alarmed, it is ſaid to eject from its mouth a black acrid fluid, which occaſions ſlight inflammation of the ſkin, and is uſually removed by rubbing the part with camphorated ſpirit of wine.

Sect. VII. Scinks.

The animals of this diviſion are covered with rounded fiſh-like ſcales.

68. Lacerta Scincus, *Officinal Scink.*

Specif. Char.—Colour a yellowiſh brown, with tranſverſe brown bands on the upper part of the body; tail ſhort, compreſſed at the tip; upper jaw longeſt.

The ſcink is from ſix to ſeven inches long, and ſometimes more. The head is rather ſmall, the body thick and round, and the tail in general ſhorter than the body. The ſurface of the body has a gloſſy appearance.

This ſpecies is a native of many of the eaſtern countries. It is very common in Libya, Syria, Egypt, and Arabia, frequenting dry and ſandy ſoils. It was once in conſiderable eſtimation as a medicine, in leprous and ſimilar diſeaſes.

This animal is deſcribed under the name of *el adda*, by Mr Bruce, and is repreſented as very common in the province of Atbara in Abyſſinia. "It burrows, ſays he, in the ſand, and performs this operation ſo quickly, that it is out of ſight in an inſtant, and appears rather to have found a hole than to have made one; yet it comes out often in the heat of the day and baſks itſelf in the ſun, and, if not very much frightened, will take refuge behind ſtones, or in the withered ragged roots of the abſinthium, dried in the ſun to nearly its own colour. Its length is rather more than ſix inches; though its legs are long it does not make uſe of them to ſtand upright, but creeps with its belly almoſt cloſe to the ground. It runs, however, with very great celerity. It is very long from its ſhoulder to its noſe, being nearly two inches: its body is round, having ſcarce any flatneſs in its belly; its tail, too, is perfectly round, having no flatneſs in its lower part; it is exceedingly ſharp-pointed, and very eaſily broken. Yet I have ſeen ſeveral, where the part broken off has been renewed, ſo as ſcarcely to be diſcernible. It is the ſame length between the point of the tail and the joint of the hinder leg, as was between the noſe and the ſhoulder of the fore leg; its forehead from the occiput is flat; its ſhape conical, not pointed, but rounded at the end, in ſhape of ſome ſhovels or ſpades: the head is darker than the body, the occiput darker ſtill. Its face is covered with fine black lines, which croſs one another at right angles like a net; its eyes are ſmall, defended with a number of ſtrong black hairs, or eyelaſhes. Its upper jaw is longer, and projects conſiderably over the under. Both its jaws have a number of ſhort, fine, but very feeble teeth; and when holding it in my hand, though it ſtruggled violently to get looſe, it never attempted to make uſe of its teeth: indeed it ſeems to

turn

Lizards.

turn its neck with great difficulty. Its ears are large, open, and nearly round. Its body is a light yellow, bordering on ſtraw colour, croſſed with eight bands of black, almoſt equally diſtant, except the two next the tail. All theſe decreaſe both in breadth and length, from the middle towards each extremity of the animal. The ſcales are largeſt along the back. They are very cloſe, though the diviſions are ſufficiently apparent. Their ſurface is very poliſhed, and ſeems as if varniſhed over. Its legs, from the ſhoulder to the middle toe, are nearly an inch and three quarters long. Its feet are compoſed of five toes, the extremity of which is armed with a brown claw of no great ſtrength, whoſe end is tipped with black."

The ſame author, ſpeaking of the immenſe multitudes of lizards which are found in eaſtern countries, adds, " I am poſitive that I can ſay, without exaggeration, that the number I ſaw one day in the great court of the temple of the ſun at Balbec, amounted to many thouſands. The ground, the walls, and the ſtones, were covered with them; and the various colours of which they conſiſted, made a very extraordinary appearance, glittering under the ſun, in which they lay ſleeping and baſking."

69. Lacerta Rufescens, *Greater Scink.*

Specif. Char.—Colour yelloviſh, rufous; feet ſhort; tail of moderate length.

This ſpecies ſometimes exceeds 15 inches in total length. The head is covered in front with large angular ſcales; the legs are ſhort and thick; the feet pentadactylous, and furniſhed with ſmall claws.

It is a native of Arabia and Egypt, living both on land and in water. It is frequent on the ſhores of the Nile. It is alſo met with in ſome European iſlands, and particularly in the iſland of Cyprus.

70. Lacerta Longicauda, *Long-tailed Scink.*

Specif. Char.—Colour olivaceous yellow; tail very long.

The great length of the tail in this animal forms the ſpecific diſtinction; the colour, which is greeniſh yellow, varies in the ſhade in different individuals.

It is ſaid to be a native of America, and frequents the ſea coaſts, where it feeds on ſmall crabs and ſpiders.

71. Lacerta Mabouya, *Mabouya Scink.*

Specif. Char.—Colour golden yellow; ſides browniſh; jaws equal; tail of middling length.

The length of this ſpecies is about eight inches; it greatly reſembles the common ſcink, but differs from it in the length of the legs, and the jaws being equal.

It is a native of America, of Jamaica, and ſome other Weſt India iſlands. It is alſo found in the iſland of Sardinia.

72. Lacerta Occidua, *Galliwaſp.*

Specif. Char.—Colour browniſh; tranſverſe bands ſomewhat waved; legs ſhort; tail of middling length.

Except being larger, ſomewhat thicker, and having a tail proportionally ſhorter, this ſpecies comes very near the greater ſcink. It is about two feet in total length. The teeth are ſmall in front; but as they approach the back part of the jaws, they gradually increaſe in ſize, like the *molares* teeth of the mammalia. Lizards.

The galliwaſp is a native of the American iſlands. It is very common in woody and marſhy places in Jamaica, and has been reckoned, but without foundation, a poiſonous reptile.

Var. *Lacerta ſcincoides*, auſtralaſian galliwaſp.—This, although it is of a darker colour, has a longer tail, and larger ſcales, is conſidered only as a variety of the former. On each ſide of the neck there is commonly a longitudinal brown ſpot.

It is a native of New Holland.

73. Lacerta Guttata, *Spotted Scink.*

Specif. Char.—Colour gray, ſpotted with white; tail long, marked with four tranſverſe black bands, and black tip.

This ſpecies does not exceed three inches in length. It is a native of the Ural deſert.

74. Lacerta Ocellata, *Ocellated Scink.*

Specif. Char.—Colour greeniſh gray, white beneath, marked above with roundiſh ocellated brown ſpots, which have white rectangular diſks.

This ſpecies is about a ſpan long. The body is depreſſed; the feet are ſhort and pentadactylous. It has no femoral warts.

It is a native of Egypt, and frequents houſes.

Sect. VIII. Salamanders, *Newts* or *Efts.*

The ſpecies included under this ſection have ſoft ſkins, and ſome of them are water lizards.

75. Lacerta Salamandra, *Salamander.*

Specif. Char.—Colour black, ſpotted with golden yellow; tail round, and of moderate length.

The colours of the ſalamander afford ſufficient marks of diſtinction. It is of a deep ſhining black, variegated with large oblong and irregular ſpots of bright orange yellow. The ſides are marked with many large tranſverſe wrinkles. The parotid glands form protuberances on each ſide of the head. On the back and ſides of the body there are ſeveral large open pores, from which is exſuded a peculiar fluid, which ſerves to lubricate the ſkin. This fluid is of an acrid nature; and when the animal is irritated, is copiouſly ſecreted, and even it is ſuppoſed, ejected to ſome diſtance for its defence. It is in general from ſeven to eight inches in length. Sometimes it is ſeen entirely black.

The ſalamander is a native of many parts of Germany, Italy, France, and other parts of Europe, delighting in moiſt ſhady places, woods, &c. During the winter it conceals itſelf in receſſes under ground, in the cavities of old walls, or about the roots of old trees.

This ſpecies lives chiefly on inſects, ſmall ſnails, &c. It is capable of living in waters as well as on land, and ſometimes reſorts to ſtagnant pools. It is ſlow in its motions, and torpid in its manners.

The

The ſalamander is viviparous. The young are produced perfectly formed in the ſame way as the viper. It is ſaid that it retires to the water to depoſit its young, the number of which at one birth amounts to 30 or 40, and when they are firſt excluded, they are furniſhed with branchial fins on each ſide of the neck, which are temporary organs, and are afterwards obliterated like thoſe of the tadpole.

Many popular errors concerning the ſalamander have long prevailed. One of theſe was, that it was a venomous animal, and that its poiſon is of ſo malignant a nature, as ſcarcely to admit of any remedy. It is now, however, found from the obſervations of later naturaliſts to be perfectly innocent, and although the fluid ſecreted from the ſkin may be noxious to ſmaller animals, it is incapable of inflicting either wound or poiſon on any large animal. In an experiment made on purpoſe, a gray lizard, which had bitten a ſalamander, and ſwallowed ſome of the fluid ſecreted from the ſkin, was almoſt immediately ſeized with convulſions, and ſoon after died. It was another popular error that the ſalamander could exiſt uninjured in the fire, and that it could even extinguiſh it by means of the fluid ſecreted from its ſkin. This fluid, it is probable, is ſecreted in greater abundance when the animal is expoſed to heat, and thus it is protected for a ſhort time againſt the action of the fire, which can produce no effect till the moiſture on the ſkin is evaporated; and from this circumſtance, and haſty obſervation, has ariſen the improbable ſtory of its being able to reſiſt the action of fire.

76. Lacerta Vulgaris, *Common Newt.*

Specif. Char.—Colour yelloviſh brown; dorſal line double; abdomen orange coloured, ſpotted with brown.

This ſpecies is the ſmalleſt of the Britiſh lizards, the general length not exceeding three inches and a half.

It is a native of Europe, and is found in gardens in the neighbourhood of dunghills, &c. Like the ſlug and toad, it makes its way into cellars. It is altogether a land ſpecies, and it ſeems to be viviparous; for ſome of a very ſmall ſize, yet perfectly formed, have been diſcovered at a very great diſtance from any water.

77. Lacerta Palustris, *Great Water Newt.*

Specif. Char.—Colour blackiſh; ſides ſpeckled with white; abdomen orange, with irregular black ſpots.

This ſpecies is ſmaller in ſize, and marked with a different diſtribution of colours, but in its general appearance it bears a conſiderable reſemblance to the ſalamander. It is from five to ſix inches in length. The tail is flat, with thin ſharp edges, and terminating in a point; on each ſide of it in the male there is a ſilvery white broad band, accompanied with a bluiſh tinge. This ſtripe and the dorſal creſt are ſometimes wanting in the female.

It is a native of Europe, but is rare in Britain. It frequents ſtagnant waters in cool ſhady places, and lives entirely on inſects. It is to larger animals quite innoxious; but the fluid exſuded from its ſkin ſeems to act as a poiſon on ſmall animals.

78. Lacerta Aquatica, *Common Water Newt.*

Specif. Char.—Colour olive brown, ſpotted with black; abdomen orange-coloured; tail ſharp-edged and ſinuated.

The general length of this ſpecies is from three to four inches. The male is readily diſtinguiſhed from the female by a conſpicuous dorſal creſt, which is more elevated, and more regularly ſinuated than that of the former ſpecies. This broad creſt is very tranſparent, and when examined with a magnifying glaſs, ſhews the ramifications of the blood veſſels and the circulation of the blood. In the female the dorſal creſt is nearly wanting. The colour of the male is olive brown, marked with numerous round black ſpots, which are largeſt on the ſides and tail. The female is of a pale yelloviſh brown, and the ſpots are much leſs diſtinct. The fore feet are tetradactylous; the hind feet pentadactylous, and in all the claws are wanting; but with regard to the colour, the breadth of the tail, and that of the toes, it ought to be obſerved, that the water newt, at different times of the year, different ſtates of the weather, and even in the courſe of the ſame day, is ſubject to conſiderable variation.

This ſpecies is a native of Europe, and is met with in Britain in all ſoft ſtagnant waters.

This animal breeds early in the ſpring, and depoſits ſmall oblong ſtrings or cluſters of ſpawn. The ova, according to Spallanzani, are of a kidney ſhape, and the larva are ready formed, becauſe long before they leave the gluten, their motions are briſk and frequent. In about 10 days they extricate themſelves from the gluten. When they are firſt excluded, the branchial fins are diſtinctly ſeen, and ſoon after the fore legs appear. After a fortnight the hind legs are viſible, and about the beginning of September the branchial fins become obliterated, and the animal aſſumes its perfect form. While the animal remains in the larva ſtate, it is furniſhed with a triple pair of ramified branchial fins on each ſide of the neck, which gives it the appearance of a ſmall fiſh.

The water newt frequently caſts its ſkin, which may be occaſionally ſeen floating on the waters which they frequent, and is ſometimes ſo perfect as to repreſent the whole form of the complete animal. The reproductive power of the water newt is a ſtriking circumſtance in its natural hiſtory. They have been known to have their legs, tails, and even the eyes, according to ſome, completely reſtored, after they were cut off or deſtroyed. This animal is alſo remarkable for its tenacity of life. Caſes have occurred in which the water newt has been found completely incloſed in a maſs of ice, in which it muſt have remained for weeks, or even months, and yet, when the ice is melted, the animal was reſtored to its former health and vigour. Yet it is very readily deſtroyed by the application of certain ſubſtances. The water newt immerſed in ſalt water, ſoon dies; or even by having common ſalt rubbed on the back for a ſhort time.

79. *Leverian Water Newt.*

This is a very large ſpecies of the water newt, deſcribed by Dr Shaw, and of which there is a ſpecimen in the Leverian muſeum. The total length is 17½ inches, and

Lizards. and of this the tail meaſures 6½ inches. The head is flattened, the mouth moderately wide, and the upper jaw is furniſhed in front with two concentric rows of numerous, ſmall, briſtly teeth. The under jaw has only a ſingle row. The eyes are ſmall, round, and ſituated on each ſide of the front of the head, ſo that they are very remote from each other. The colour is pale brown, marked in a confluent manner with darker variegations. The legs are about one inch in length, and they are all furniſhed, along their whole length behind, with a dilated ſkin or creſt. The tail is like that of the common water newt, but is ſhorter, and leſs deeply finned.

Its native country, and farther particulars of its natural hiſtory, are unknown.

80. LACERTA MACULATA, *Spotted Water Newt.*

Specif. Char.—Colour blackiſh; a double row of white ſpots down the back.

The length of this ſpecies is about five inches. The head is large; there are four toes on the fore feet, and five on the hind. The colour is deep brown, and the double row of white ſpots, which begins at the top of the head and continues to the tail, becomes a ſingle row to the end.

It is a native of Carolina, and inhabits ponds, ditches, and ſtagnant waters.

Sect. IX. SNAKE LIZARDS.

The ſpecies belonging to this ſection have very long bodies, and ſhort legs.

81. LACERTA CHALCIDES, *Chalcides Lizard.*

Specif. Char.—Colour ferruginous; feet tetradactylous; body long, and marked with ſix brown dorſal lines.

The uſual length of this animal is about eight or nine inches; but it is ſometimes found only a few inches long, and ſometimes exceeds a foot. The head is anteriorly covered with large ſcales; the ſnout is tapering; the eyes are ſmall, and the openings of the ears are very diſtinct. The colour is ferruginous or chefnut brown above, and yellowiſh brown beneath.

This animal is a native of Africa and the warmer parts of Europe, frequenting moiſt ſhady places. It is quite inoffenſive, and feeds on inſects, ſmall worms, &c. The motions of the chalcides are rather ſlow. It is viviparous, and is ſaid to produce a great number of young.

82. *Annulated Chalcides. Chalcide* Cepede.

This is nearly allied to the former, but differs from it in having ſquare ſcales, and in being marked through its whole length with a continued ſeries of annuli or rings, to the number of 48. The length of the body is about 2½ inches, and is ſomewhat ſhorter than the tail. The feet are ſhorter than in the former ſpecies, and are all tetradactylous.

The native country of this ſpecies is unknown.

83. LACERTA SERPENS, *Serpent Lizard.*

Specif. Char.—Head, body, and tail cylindrical; feet ſmall, remote, pentadactylous.

The length of this ſpecies is about 5½ inches. The colour is cinereous or pale ferruginous above, marked with from 15 to 20 duſky lines; beneath it is aſh coloured, with a ſilvery gloſs. It is entirely covered with imbricated ſcales. Lizards.

This animal is a native of Java.

84. LACERTA ANGUINA, *Snake Lizard.*

Specif. Char.—Body long; tail very long; feet oval-ſhaped, and without toes.

The body of this ſpecies meaſures four, the whole length 15 inches. The colour is brown above, aſh-coloured on the ſides, yellowiſh beneath, and the upper ſurface is marked throughout its whole length with ſeveral dark ſtripes. The head is ſmall; the legs very ſhort, and placed near the head and vent, and ſeemingly terminated in one undivided proceſs. The whole body is covered with ovate ſcales.

It is a native of the Cape of Good Hope, and is frequently found in the water, and about the rocks in Table bay.

85. LACERTA APUS, *Apodal Lizard.*

Specif. Char.—This ſnake-formed lizard is ferruginous, has no fore feet, and its hind feet are very ſhort and monodactylous.

The chalcides itſelf does not approach ſo near to the ſnake tribe as this large and ſingular ſpecies of the lizard. It meaſures almoſt three feet in length, and its general appearance bears ſuch a ſtriking reſemblance to a large ſnake, that it requires a very attentive examination to aſcertain the difference; as it has only a pair of extremely ſhort pointed proceſſes by way of feet, at a great diſtance from the anterior parts of the body, almoſt on either ſide of the vent, and without toes. The head is rather large, and covered with large ſcales; the ſnout is tapering; the upper jaw projects a little over the lower; the mouth is of a moderate wideneſs, and the ears are very viſible. There is no appearance of a neck, as the body gradually tapers from the head to the extremity of the tail, which is longer than the body, and terminates in a point. The whole animal is covered with rows of ſcales of a moderately large ſize, in a longitudinal direction, and emarginated at the tips. From the head to nearly half the length of the tail, a deep continued channel runs along each ſide of the body. Its colour is a pale chefnut, and beneath a pale yellow-brown.

Two ſpecimens of this lizard were brought from Greece by Dr John Sibthorp, profeſſor of botany in the univerſity of Oxford. It is rather a ſingular circumſtance that an animal of ſuch magnitude ſhould have remained ſo long unknown to the inquiſitive naturaliſt.

It is a native of Greece, of the ſouthern parts of Siberia, and unqueſtionably of many other parts both of Europe and Aſia, although the knowledge of it has been but lately acquired, the firſt deſcriber of it being Dr Pallas, by whom it was found in the ſouth of Siberia. It frequents moiſt and ſhady places, and, as far as is yet known, is an innocent animal.

86. LACERTA BIPES, *Biped Lizard.*

Specif. Char.—Long bodied, cylindrical, pale yellow, ſpeckled

Anatomy. speckled with brown, having no fore feet; hind feet very small, and didactylous.

This species, which is not larger in diameter than that of a goose quill, measures about six inches in length; its colour is a pale yellow, spotted with brown; the head is small, body cylindrical, tail short and taper; on each side of the vent there is a small subulated foot, which is furnished with two small unequal toes.

It is a native of India and South America.

87. LACERTA LUMBRICOIDES, *Lumbriciform Lizard.*

Specif. Char.—Body cylindrical, two-footed, and annulated with square scales, having a lateral furrow, and no hind feet.

This is about eight inches long, and half an inch in diameter. The whole body, including head and tail, is of the same diameter, and is covered with rings of square scales. Along each side there is a continued furrow, which separates the upper and lower surfaces. The legs are two, very short, and placed near the head. They are divided into five minute toes, which are furnished with claws. The colour of the living animal is supposed to have been green, and paler beneath. Anatomy.

It is a native of Mexico.

Number of species in each genus, included under the order *Reptilia*.

CHAP. II. OF THE ANATOMY AND PHYSIOLOGY OF REPTILES.

HAVING in the former chapter taken a brief and comprehensive view of the classification, and such particulars of the natural history of reptiles, as were connected with the different species, we now proceed to give a slight sketch of the anatomy and physiology of this order of animals. These shall be the subjects of the two following sections. In the first we shall treat of the anatomy, in the second of the physiology of reptiles.

SECT. I. *Of the Anatomy of Reptiles.*

BETWEEN this order of animals, and the quadrupeds belonging to the class mammalia, there are many points of resemblance, making allowances for the difference of size; and hence they have been denominated *oviparous quadrupeds*. This resemblance, however, only extends to external appearance.

The body of reptiles is supported by four feet, and these form the principal external character. They are disposed like those of the mammalia, two before and two behind. With the exception of some animals which have been arranged under this order, and which have only two feet, all reptiles are furnished with four feet.

The body is furnished with a tail, which is different from that of quadrupeds, in having no hair. This is common to the tortoises and the whole of the lizard tribe. The genus *rana* is an exception to this. All the species included under it are unprovided with a tail.

The body is either lengthened, that is, when it is considerably longer than broad, as is the case with lizards; or rounded, that is, when the body, seen from above, exhibits an orbicular form, as in the tortoise and some toads.

With regard to the surface of the body, it is never covered with hairs, but sometimes with scales; such are reptiles without a tail, the salamanders and some lizards. It is sometimes covered with inequalities or asperities, the whole surface being rough with elevated points, which resemble warts or pustules. This is the case with some lizards, and several frogs and toads. The body is covered sometimes with a shell both above and below; this bony covering protects the animal from external injury. With such a covering the genus tortoise is furnished.

In the sketch which we propose to give of the anatomy of reptiles, the parts of the body may be divided into external and internal; the external parts comprehend the head, the trunk, the tail, and the feet. Under the internal parts are included the skeleton, the muscles, and the viscera.

External Parts of the Body.

1. The HEAD.—The head is that part of the body which is articulated with the first vertebra of the neck. It is rounded, that is, when its external surface is round in every direction, as is the case with tortoises; or flattened or depressed, when it is compressed above and below, which is the case with almost the whole order; or triangular, when the head, seen from above, represents a triangle, as in some toads and frogs.

The mouth is semicircular, when the outline forms a semicircle, as in the genus *rana*, and in almost all the lizard tribe; or inferior, when the upper jaw comes over the lower, so that the mouth necessarily occupies the lower part of the head. This is the case with the tadpole.

The beak or snout either forms an inclined plane from the top of the head to the end of the jaws, as in the chameleon, and many lizards; or conical, when the two jaws gradually diminish, as in the crocodile; or reflected upwards, when both jaws are flattened and turned upwards towards the extremity of the beak; or rounded, when they are thick and ventricose towards the extremity, as in several tortoises; or pointed, when the upper jaw terminates like the beak of a bird.

The jaws are either equal, as in most part of the genus *rana*, in many of the lizards, and salamanders; or unequal, as is the case with many of the tortoises and lizards, in which case, the upper jaw is always the longest. Among the whole order of reptiles, there is

no

Anatomy. no inſtance of the contrary; that is, of the lower jaw being longeſt, and perhaps this ſtructure would be inconvenient, or incompatible with the nature of the animal, or its habits and mode of life.

A common error long prevailed with regard to the motion of the jaws of the crocodile. It was aſſerted, that this animal only moved its upper jaw; but the more accurate obſervations of later anatomiſts have proved the contrary, and that the articulations of the head and jaws of this animal are preciſely the ſame as in other quadrupeds. The head is articulated with the laſt vertebra of the neck, and the lower jaw is articulated with the upper, ſo that the former, namely the lower jaw, only has the power of motion.

All the animals belonging to the order of reptiles, are not furniſhed with teeth. The tortoiſes and ſome lizards, have none. All the ſpecies belonging to the genus *rana* may be conſidered alſo as having none, the jaws being only crenulated or notched; but in other tribes belonging to this order, the teeth are conical, as thoſe of the crocodile, which are hollow, and filled with a ſoft ſubſtance; or recurved, when the extremity of the tooth turns backward towards the throat, as in the Indian crocodile; or ſtraight, as in moſt of the lizard tribe; compreſſed at the ſides, as in the guana; or notched, when the ſummit of the tooth is truncated and crenulated, as in the horned lizard.

Tongue.—In almoſt all the tribes of animals belonging to this order, the tongue is peculiarly fitted for ſeizing their prey. The form of it varies in all the families. Another error has prevailed with regard to the tongue of the crocodile. It was ſaid that it had no tongue, but in place of it is furniſhed with a ſtrong membrane, which adheres to the two edges of the lower jaw. Even the obſervations of later naturaliſts tend to confirm this error. Denon, who had numerous opportunities of ſeeing the crocodile both dead and alive, in its native haunts on the borders of the Nile, believes in this opinion, that the crocodile has no tongue; but it does not appear that any accurate anatomical inſpection was made, to aſcertain this point, or indeed that he was accompanied by any anatomiſt at all, by whom alone the truth or falſehood of the opinion could be inveſtigated. This organ of the crocodile, however, is very large, and even proportionally larger than that of the ox, but it is ſtrongly connected with the ſides of the lower jaw, and being thus fixed or tied down, cannot be ſtretched forwards, as is the caſe with other animals.

Tongue of the crocodile.

In ſome of the animals belonging to this order, the tongue is nearly of equal length and breadth. This is the caſe with the tongue of frogs, tortoiſes, the ſalamander, and the guana.

In ſome it is very narrow at the baſe, and divided in two at the extremity, as in moſt of the lizard tribe, which are thus furniſhed with a bifid tongue.

Of the chameleon. But the ſtructure of the tongue of the chameleon, is perhaps the moſt ſingular of any belonging to the order. It is compoſed of a white ſolid fleſh, 10 inches long, and about three broad. It is round, and flattiſh towards the end; hollow and open, ſomewhat reſembling the termination of the trunk of the elephant. The tongue is attached to the os hyoides by a kind of trunk, of the ſhape of an inteſtine, about ſix inches long, and a line in breadth. This trunk is furniſhed externally with a membrane, and internally with a ſoft, but ſolid and compact, nervous ſubſtance, which is with difficulty divided into fibres. It is by means of this trunk that the tongue, which is attached to it, is projected from the mouth. This is done by the extenſion of the trunk, and it is again drawn back by its contractile power. Theſe motions are performed by a kind of cartilaginous ſtilus, to which the inveſting membrane is attached, and over which it is plaited like a ſilk ſtocking on the leg. This ſtilus is an inch long, and originates from the middle of the baſe of the os hyoides. In conſequence of this extenſile and retractile powers which the tongue of the chameleon poſſeſſes, it has obtained the epithet of *vermiform*, becauſe in thoſe motions it reſembles thoſe of an earth-worm. Anatomy.

There is no great peculiarity about the noſtrils of any of this order of animals. In general, they are almoſt always of a round form. In ſome, however, they are lunulated, or ſhaped ſomewhat like a creſcent, the horns of which are turned backwards. This is the caſe with the noſtrils of the crocodile. Noſtrils.

The eyes, as in moſt other animals, are placed on the ſides of the head; but in ſome they are vertical, or placed on the top of the head, as in ſeveral of the toads and the crocodiles; approximating, when the diſtance between the eyes is very ſmall; or protuberant, when the globe of the eye on each ſide forms a conſiderable projection, as in thoſe belonging to the genus *rana*, the *crocodiles*, and the *ſalamanders*. Eyes.

The nictitating membrane, which is peculiar to ſome birds, belongs alſo to ſome of the animals of this order. By means of extending this membrane over the eye, the exceſſive brightneſs of ſunſhine, to which many of them, being natives of warm climates, are expoſed, is greatly moderated, and perhaps this membrane may be uſeful to thoſe animals of this order which frequent the water.

The iris of the eye is differently coloured in the animals of this order. In many it is red; in the chameleon it is of a golden yellow colour.

Externally, the ears of reptiles do not exhibit any remarkable peculiarity. The opening is more or leſs round, and it is uſually covered with a membrane. There is no external ear, by which the vibrations of the air might be collected, and conveyed to the ſenſe of hearing; from which it has been concluded, that this ſenſe is more obtuſe than in quadrupeds. Ears

2. The TRUNK.—The trunk of the body includes the neck, the breaſt, the back, the ribs, the abdomen, and the anus; and ſome of theſe parts in different reptiles, preſent conſiderable varieties.

The neck, which unites the head with the trunk, is very different in the different tribes belonging to this order. In all thoſe included under the genus *Rana*, the head is ſo cloſely attached to the trunk, that the neck is ſcarcely to be diſtinguiſhed. In others, however, it is conſiderably elongated, and quite diſtinct, as in the crocodile and the ſalamander. The neck is alſo pretty long in ſome of the tortoiſes. Sometimes it is covered with wrinkles or folds, when the ſkin forms ſeveral tranſverſe wrinkles, as in the neck of ſome of the tortoiſes. Neck.

The breaſt or thorax is ſituated on the anterior part of Thorax.

Anatomy. of the trunk; it forms a close cavity which is covered beneath by the sternum, on the sides by the ribs, and above by the vertebræ at the back bone.

The back is the upper part of the trunk, extending from the last vertebra of the neck to the first of the tail. In reptiles it is sometimes convex, sometimes more or less flattened. It is either furnished with scales, when there extends along the superior surface a row of scales from the neck to the extremity of the tail, as in the guana and horned lizard; or it is furnished with a toothed suture, when the upper extremity of the trunk terminates in a notched ridge, as in the chameleon of the Cape; or is supplied with a kind of radiated fin, somewhat resembling the fin of a fish, as in the basiliſk; or it is protected with a strong bony covering, known Calipash of the turtle. by the name of *calipash*. This is the name by which the bony covering of the turtle is distinguished. This covering is composed of different pieces closely united to each other, and they are sometimes smooth and convex, sometimes striated and flat, disposed in three rows; and there are about 24 pieces situated on the edges of this covering.

Ribs. The ribs include the lateral parts of the trunk, from the neck to the anus. In the tortoises, the ribs are defended by the edges of the calipash, which is here united with the inferior shell, or bony covering.

Abdomen. The abdomen or belly constitutes the inferior part of the body, and extends from the extremity of the breast or thorax to the anus. In the tortoises, this part is composed of a bony covering; and in some species belonging to this tribe, there are openings in those places which correspond to the head, the four feet, and the tail; but in some other species, as in the *testudo clausa*, there is no opening whatever, but the bony covering is transversely divided into two parts, which play on a kind of hinge, so that when the animal wishes to move, it opens the anterior division to put out the head and the fore feet; and in the same way for the opening behind. This inferior bony covering is united with the upper one by means of a cartilage placed near the middle of the body. This is usually known by the Calipee. name of *calipee*. Sometimes the abdomen is covered with plates or scuta, which is the case with most of the lizards, which have on the inferior surface of the body, very large plates regularly arranged.

The anus is not only the passage for the evacuation of the excrement, but is besides the canal in which are contained the parts of generation of the male lizards and tortoises. The males of the animals belonging to the genus *Rana*, which are destitute of these parts, eject by this opening the fluid which impregnates the ova of the female.

3. The Tail.—This part terminates the trunk. Many reptiles, as those belonging to the genus *Rana*, have no tail whatever; but the animals belonging to the other genera of this order are furnished with a tail of different lengths. The tail is covered with scales, as in almost all the lizards; and these scales are sometimes disposed in rings or circular bands, as in several lizards; or they are somewhat elevated, forming a kind of notched appearance on the upper surface of the tail, as in the guana.

4. The Feet. The feet of the animals belonging to this order greatly resemble those of quadrupeds; their position and articulations are nearly the same, but they are much shorter, and placed at a greater distance Anatomy. from each other. The feet terminate in a certain number of toes, and thence, according to the number of the toes, assume different names; as tridactylous, tetradactylous, &c. The structure of the toes is similar to that of other animals. They are separated from each other, as in lizards; palmated, when united by means of an intermediate membrane, as in the hind feet of the frog; furnished with nails or claws at the extremity, which are sometimes flat, as in the frogs; or hooked, as in the lizards; or destitute of nails or claws, as in the salamander.

Internal Parts.

Under the internal parts are included the skeleton, the muscles, and the viscera.

1. The Skeleton.—With regard to the skeleton of reptiles, it may be observed, that the structure of the bones is less complicated than that of quadrupeds, and the texture is less compact. They possess at the same time somewhat of the transparency of cartilages. The bones may be divided into those of the head, the neck, the thorax, the spine, the tail, and the feet.

The bones of the head are composed of those of the Bones of cranium, and those of the lower jaw. In the greatest the head. number of reptiles, the cranium consists of a single bone. The bone of the upper jaw, and that of the forehead, are completely united in the crocodile, the chameleon, and some others. They do not seem to be separated by any distinct suture. The lower jaw of the chameleon terminates on each side in a separate bone, which unites on one hand with the region of the temples, and forms on the other an angular articulation with the jaw.

The bones of the neck are composed of a series of Of the vertebræ, the number of which varies in the different neck. tribes of this order. The species belonging to the genus *Rana* have no cervical vertebræ; but in the other tribes the number varies, as has been mentioned, as will appear from the following table.

	Number of vertebræ.
Chameleon,	2
Most of the Lizards,	4
Crocodile,	7
Tortoise,	8

The number of processes with which the vertebræ are furnished, also varies. In those of the chameleon there are seven; but in those of the crocodile, there are nine, viz. five above, and four below.

The bones of the thorax comprehend those of the Of the tho- vertebral column, corresponding to this cavity, the ribs, rax. and the sternum. The vertebræ, which correspond to the cavity of the thorax, are not the same in all the individuals belonging to this order. In the crocodile there are only 12, but in the chameleon, the number amounts to 18. Each of these vertebræ is in general furnished with seven processes, which are sometimes simple, and sometimes spiny.

The ribs are wanting in the reptiles belonging to Ribs. the genus *Rana*: the salamander also is destitute of ribs. In the other tribes they are always found, but unequal in number. In the tortoise there are eight on each side; in the crocodile 12; in the chameleon 18. The ribs

Anatomy. ribs are articulated with one vertebra only; but in the ſtructure and articulations of theſe bones there is a peculiarity in the crocodile and chameleon. The two firſt and the two laſt ribs of the crocodile do not terminate in the ſternum. The cartilages which attach the other eight are broken, ſo that each rib from the vertebra to the ſternum is compoſed of three parts, one of which is bony, the other two cartilaginous. In the chameleon the two firſt anterior ribs are not ſupported by the ſternum; the four following are attached to it by means of appendages which form at the point of junction an angle with the ribs, and which are not compoſed of a ſubſtance purely cartilaginous, but as hard as that of the ribs. The 10 other following ribs do not reach the ſternum. Each is joined to that which is oppoſed to it by a bony appendage, forming an arch on the middle of the thorax and abdomen. The three laſt are looſe, ſeparated, and as it were truncated in the middle.

Sternum. The ſternum or breaſt-bone is a flat bone, placed on the anterior part of the thorax, the figure and dimenſions of which vary conſiderably. In the crocodile this bone reaches to the third rib; it is compoſed of a ſingle piece, having at its upper part a kind of cartilage which forms a point towards the throat, and which enlarging at the ſides covers the clavicles. The ſternum of the chameleon and the frog is compoſed of four bones, the firſt of which is very large.

Spine. The back-bone comprehends the vertebræ which occupy the upper part of the back, including thoſe of the loins. In the chameleon there are 22; in the crocodile 19, and in the gray lizard 22.

The vertebræ of the tail form the poſterior extremity of the ſpiral column. Their number is always proportional to its length. The tail of the chameleon is furniſhed with 50 vertebræ; that of the crocodile 33, and that of the gray lizard 60. All theſe vertebræ are furniſhed with tranſverſe, oblique, and ſpinous proceſſes, excepting thoſe towards the end of the tail, which are uſually deſtitute of the oblique proceſſes.

Feet. The bones of the feet bear a conſiderable reſemblance to thoſe of other animals. The fore feet are compoſed of the ſcapula, the humerus, the cubitus and radius, the bones of the carpus and metacarpus, and the joints of the toes.

Scapula. The ſcapula or ſhoulder-blade is ſometimes ſingle, and ſometimes double, in the animals belonging to this order. The frog, the chameleon, and the ſalamander, have only one; but it is of ſuch a length that it extends from the dorſal ſpine to the ſternum, with which it is articulated, anſwering the purpoſe of a clavicle. In the tortoiſes and crocodile, there are two ſhoulder-blades, viz. one on the back, and one placed anteriorly, and articulated with the ſternum. Theſe alſo perform the functions of the clavicle. The humerus is articulated on the one hand with the ſcapula, and with the two bones, the cubitus and radius of the arm, on the other. The two latter bones, the cubitus and radius, are placed parallel to each other, between the humerus and the bones of the carpus and metacarpus. Theſe latter are ſituated between the two bones of the fore-arm, and the phalanges or joints of the toes.

The hind feet are compoſed alſo of the femur or thigh-bone, the tibia, and the peronea of the leg; the bones of the tarſus and metatarſus, and the phalanges or joints of the toes. Theſe, excepting that they differ ſomewhat in ſtructure, bear ſo near a reſemblance to thoſe of the fore feet, that it would be quite unneceſſary to enumerate or deſcribe them particularly. Anatomy.

2. The Muscles.—The muſcles are the inſtruments of motion. The muſcles of the back of the crocodile take their origin from the vertebræ and ribs, and they are attached by means of their tendons, to the bands or rings which are formed by the tubercles of the back. Theſe tendons act in different directions; ſome of them pull theſe bands from above downwards, while others pull them from below upwards. The uſe of theſe muſcles is apparently to lock together more ſtrongly the rings of which the tubercles of the back are compoſed. Muſcles of the back.

The muſcles of the abdomen in the ſame animal, which are four in number, one external, and one internal on each ſide, are not only different from thoſe of other quadrupeds in number, but alſo in their ſituation and ſtructure. The external muſcle is placed upon the ribs, and the internal under them, immediately above all the viſcera, which it embraces in the manner of a peritoneum. The internal muſcle is attached on one ſide to the bones of the pelvis, and to the tranſverſe proceſſes of the lumbar vertebræ; and on the other it terminates in a broad tendon, which envelopes all the inteſtines in the form of a membrane. The fibres of theſe two muſcles are diſpoſed lengthwiſe. Of the abdomen.

3. The Viscera.—The parts contained in the three great cavities of the body are the viſcera. Theſe are the brain, the heart, the lungs, the ſtomach, the inteſtines, the liver, the ſpleen, and the kidneys.

The brain is ſituated within the cavity of the ſkull. This organ in reptiles, is in general of ſmall ſize. The brain of the chameleon, which is of a reddiſh or grayiſh red colour, is not more than a line in diameter. The ſame organ in the crocodile is very ſmall, and ſimilar to that of fiſhes. The cavity within which it is contained, does not exceed 14 lines in length, and about 12 in breadth and depth. Brain.

The heart is a ſtrong muſcular body, from which proceed the great arteries, and in which the great veins terminate. From the contractile force of this organ, the blood receives its firſt impulſe. The heart in this order of animals is ſmall. It has in general been conſidered as having only one ventricle and two auricles; differing from the heart of the more perfect animals, which is furniſhed with two ventricles and two auricles. But from the obſervations of later naturaliſts, it would appear that the ſtructure of the heart of reptiles has not been accurately deſcribed; for, according to ſome anatomiſts and phyſiologiſts, the heart of this order of animals is really double; that is, conſiſting of two auricles which have a direct communication with each other, and two ventricles, as in other animals. Heart.

The lungs which conſtitute the principal organ of reſpiration, are ſpongy cellular bodies, in which the bronchia or air-veſſels are ramified. The ſubſtance of which the lungs of reptiles are compoſed, is not fleſhy and parenchymatous like thoſe of quadrupeds, but they conſiſt of a bundle of veſicles divided into two lobes. The lungs of the turtle are remarkable for a veſicle which adheres to their ſurface on the left ſide, and which may be contracted and dilated at the pleaſure of the animal. It is conjectured, that it is by means of this Lungs.

Phyſiology. this organ, like the ſwimming bladder in fiſhes, that the turtle raiſes itſelf to the ſurface of the water.

Stomach. The ſtomach which is deſtined to receive the food, is ſituated between the gullet and the inteſtinal canal. This organ in reptiles is very like that of birds. The ſtomach of a crocodile four feet long is not larger than four inches in length, and the ſame in breadth; and although the fibres of which it is compoſed are neither ſo ſtrong, nor ſo numerous, as thoſe of the ſtomach of birds, they form a body which is incapable of extenſion or enlargement. This renders it extremely difficult to believe what is ſaid of the crocodile, of its prodigious voracity, ſwallowing animals of ſo conſiderable a ſize, ſince it is neither furniſhed with teeth fit for the maſtication of its food, nor a ſtomach of ſufficient capacity to receive ſo great a quantity.

Inteſtines. The inteſtines form a canal compoſed of different convolutions, extending from the ſtomach to the anus. It is quite unneceſſary to enter into a minuter deſcription, than merely to ſtate, that they are divided, as in other animals, into great and ſmall. In the crocodile and other reptiles, the inteſtines going out from the ſtomach, form two great convolutions ſimilar to thoſe of birds. They are afterwards convoluted in different ways, till they reach the bottom of the cavity and terminate in the anus.

Liver. The liver is the organ deſtined for the ſecretion of bile. In this order of animals it is large, and divided into two unequal lobes, between which the heart is ſituated. The right lobe is ſomewhat larger, and the gall bladder occupies the middle of this lobe.

Spleen. The ſpleen is an organ placed on the left ſide. In this ſituation it is expoſed to the preſſure of the diaphragm and the abdominal muſcles. The ſpleen of frogs is double, and of an oblong form. In the crocodile it is oval, ſomewhat oblong and equal at the two extremities. The ſubſtance of which this organ is compoſed, conſiſts of a great number of large whitiſh points on a dark red ground.

Kidneys, &c. The kidneys are bodies of an oval lengthened form, ſituated within the abdomen, and deſtined for the ſecretion of urine. In the frog, between the kidneys and the teſticles, there are certain appendages which reſemble ſome kind of leaves. The kidneys are attached to the back, having at their poſterior extremity the ſeminal veſſels. The urinary bladder is ſituated near the orifice of the anus.

Sect. II. *Of the Phyſiology, Manners, and Habits of Reptiles.*

We ſhall now, according to the arrangement propoſed, make a few obſervations on the phyſiology, manners and habits of reptiles.

From the ſmall proportion of brain, and dull habits of reptiles, it ſeems to be juſtly concluded that their ſenſes are not very acute.

Sense of Sight.—Of all the ſenſes, that of ſight is probably the moſt perfect among reptiles; but as their moſt common haunts are on the ſhores of the ocean, on the margin of lakes, and of ſtagnant waters, and on the banks of rivers, where the rays of the ſun are ſtrongly and inceſſantly reflected, it was neceſſary that the eyes of theſe animals ſhould be protected from the too powerful impreſſions of light. For this purpoſe the moveable eye-lids, and the nictitating membrane, are peculiarly fitted; as by their means the animal is enabled to diminiſh the quantity of light received into the eye. The peculiar power which many of them poſſeſs alſo of contracting and dilating the pupil at pleaſure, like the cat, and ſome other animals, which ſeek their prey in the dark, extends the utility of this organ, and renders it more ſenſible and delicate. From this peculiar ſtructure of the eye, the animal is enabled to ſee objects at a conſiderable diſtance, and is thus fitted to purſue its prey in the dark, or at great depths under the ſurface of the water; circumſtances which are highly neceſſary for the ſituation in which many of the tribes of reptiles are placed, and exactly accommodated to their habits and mode of life. Phyſiology. Peculiarities in this ſenſe.

Sense of Hearing.—This ſenſe in reptiles is probably not very acute. The ſtructure of the internal ear is conſiderably different from that of the more perfect animals. Indeed ſome of the parts which ſeem to render perception more acute, are wanting in theſe animals. There is neither *cochlea* nor *feneſtra ovalis*, and the ſemicircular canals are deſtitute of extremities. The membrane of the tympanum is very thick, and the bone immediately connected with it is of a very irregular figure. But, beſides, theſe animals have no external ear whatever, by which means the vibrations of the air might be collected, and condenſed in the ſeat of ſenſation. In place of theſe external parts, there are only very narrow openings, which can admit but a ſmall number of vibratory undulations. As a farther proof of the dulneſs of this ſenſe in theſe animals, few of them emit any ſound, excepting a harſh croaking, whence it may be concluded, that their perception of ſound is very indiſtinct, or they are deſtitute of the organs neceſſary to expreſs it; otherwiſe, with theſe requiſites, the habit of hearing diſtinctly would very ſoon improve the power of expreſſion. Not very acute.

Sense of Smelling.—Almoſt all reptiles are furniſhed with the external organs of this ſenſe. The noſtrils of the crocodile are placed in a round ſpace, filled with a black, ſoft, and ſpongy ſubſtance; thoſe of the tortoiſe and lizard occupy the extremity of the ſnout, and conſiſt of two very diſtinct openings. It appears, indeed, from anatomical inſpection, that the nerves which terminate in theſe organs are of a very large ſize, which circumſtance leads us to conclude, that the ſenſe of ſmelling muſt be pretty acute. But when it is conſidered that a great proportion of reptiles have their abode in the midſt of putrid marſhes, it would incline us to ſuppoſe, that the ſenſe of ſmelling is not very acute. Suppoſed to be more perfect.

Dr Townſon, in ſome experiments which he made with the water lizard, very juſtly concludes, that their ſenſe of ſmell is extremely acute. "I kept, ſays he, a conſiderable number of water lizards, in a jar, which I fed from time to time with worms; if they were in the greateſt ſtillneſs, and I dropt in a worm ever ſo gently, they all immediately began to fight, each attacking its neighbour and ſeizing it by the foot or tail. This was not a contention for the worm, which often lay for a ſhort time unnoticed, but it originated rather from the acuteneſs of their ſenſe of ſmell, which immediately informed them of the preſence of their food, and in the dullneſs of their diſcriminating powers. This is ſimilar to what I have invariably obſerved in frogs and toads,

Physiology. toads, which will suffer their natural food to remain before them untouched, yet seize it instantly on the smallest motion it makes. It was from a knowledge of this instinct that I was able in winter to feed my constant companion and favourite pet, Musidora.

"Before the flies, which were her usual food, had disappeared in autumn, I collected a great quantity as provision for winter. When I laid them before her, she took no notice of them; but the moment I moved them with my breath she sprung and ate them. Once when flies were scarce, I cut some flesh of a tortoise into small pieces, and moved them by the same means, she seized them, but instantly rejected them from her tongue. After I had obtained her confidence, she ate from my fingers dead as well as living flies.

"Frogs will fly at the moving shadow of any small objects, and both frogs and toads will soon become so tame as to sit on one's hand and be carried from one side of the room to the other, to catch the flies as they settle on the wall. At Gottingen, I made them my guards for keeping these troublesome creatures from my desert of fruit, and they acquitted themselves to my satisfaction. I have seen the small tree-frogs eat humble bees, not indeed without a battle; they are in general obliged to reject them, being incommoded by their stings and hairy roughness; but at each attempt the bee is further covered with the viscid matter from their tongue, and is then easily swallowed.

"Nothing appears more awkward and ludicrous than a frog engaged with a large worm or little snake; for nature seems to have put a restraint upon their voracity, by forming them very inapt to seize and hold their larger prey. One of my largest frogs, whether the *rana temporaria*, or *esculenta*, I forget, swallowed in my presence an *anguis fragilis* near a span long, which, in its struggles, frequently got half its body out again; when completely swallowed, its contortions were very visible in the flaccid sides of the conqueror *."

* *Tracts on Nat. Hist.* p. 113.

Very feeble. Sense of Taste.—If the perception of taste is to be taken in proportion to the sensibility of the organ which is the seat of it, this sense in reptiles must be considered as the feeblest of the whole. The tongue of most reptiles is rather to be considered as an instrument for seizing its prey, than as an organ destined for the perception of taste; and for the former purpose it is remarkably fitted, both from its structure and mechanism, by which means the animal can project it instantaneously from its mouth, and also from the viscid fluid which is secreted on its surface. We have already described, in speaking of the anatomy of reptiles, this peculiarity of structure in the tongue of the chameleon.

Sense of Touch.—This sense cannot be supposed to be very acute in this order of animals. Most of them have the body covered with hard scales, with large tubercles, or with a strong bony substance. In a great number belonging to this order, the extremities of the feet even are furnished with scales; and the toes are so united together, that they can only be applied with difficulty to the surface of bodies. And if in some lizards it is found that the toes are long, and distinctly separated from each other, the inferior surface is covered, either with a hard skin, or with very thick scales, which must undoubtedly deprive this part of all sensibility. The sense of touch, therefore, in reptiles, may, in general, be considered as dull and imperfect. Physiology.

Circulation of the Blood.—In animals which have been usually dignified with the name of *perfect*, and which are furnished with a double heart, the blood which has been collected from all parts of the body, returns to the right side of the heart; is thence conveyed to the lungs; from the lungs it passes to the left side of the heart, and thence is again distributed through the body. But this course of the blood can only go on when the function of respiration continues without interruption; because on the cessation of the action of the lungs, the circulation through them is interrupted; and therefore, without some other structure of the heart, the circulation through the body must stop, and the death of the animal ensue.

Peculiarity of the circulation. Many of the animals included under the order of reptiles are distinguished by a peculiarity of structure, which allows the circulation to go on during the necessary interruption of the function of respiration to which they are subjected. The blood therefore, instead of passing through the lungs, is conveyed through an oblong opening called *foramen ovale*, situated between the two auricles, and is discharged directly from the pulmonary artery into the aorta. Hence it is that these animals come under the denomination of cold-blooded. This diminished temperature of the blood is ascribed to the less complicated circulation which goes on in their system. For the blood in the course of the circulation being less exposed to the action of the air in the lungs, undergoes fewer of these changes, on which, according to the present chemical theory of respiration, the temperature of the body, or animal heat, depends.

Respiration different from that of other animals. Respiration.—The function of respiration exhibits one of the greatest peculiarities in the animals belonging to the order of reptiles. For, as in these animals the structure of the thorax, and the other parts necessary to the process of respiration in other animals are quite different, the means also by which it is conducted in them must also be different. It is to Dr Townson that we are indebted for the elucidation of this part of the physiology of reptiles. This naturalist, as he himself observes, at least revived a doctrine which had been acknowledged by former physiologists, to whom it seems to have been distinctly known. Among these he mentions Laurenti, who, in his *Synopsis Reptilium*, has derived the character of his class from the peculiar mode of respiration of these animals, of which he says that they are furnished with lungs, but are destitute of diaphragm and ribs, but by means of the gular pouch the air is alternately drawn into this reservoir, and by its contractions propelled to the lungs.

In quadrupeds, Dr Townson observes, there are no perceptible motions in the throat, excepting those which accompany the process of deglutition; but in the frog tribe, whether they are awake or asleep, if they are not excluded from the air, there are some remarkable motions of the throat which are quick and constant: these are the motions which are subservient to inspiration. The bony and muscular parts, which in hot-blooded animals are the mechanical instruments of respiration are entirely wanting in this order of amphibia. It must then be by means of some other contrivance, that they are enabled to fill the lungs with air. In the hot-blooded Process of inspiration.

Physiology. blooded animals the alternate contraction and dilatation of the thorax effects this, but in this tribe the same purpose is accomplished by the dilatations and contractions of the throat. When the cavity of the throat is enlarged the air rushes through the nostrils and fills it; the nostrils being closed by their proper muscles, the glottis is opened; the muscles designed for this office contract, diminish the cavity of the throat, and impel the air which is contained in it into the lungs; and in this way, he adds, is inspiration performed in these animals.

"When the lungs, says he, were laid bare, I have observed that these did not inflate, if the frog, exhausted with pain and loss of blood, or when the nostrils were covered with it, opened its mouth to take in a greater supply of air, till the throat contracted; this, then, was the immediate consequence. Likewise, if I put a tube down the throat, the glottis and mouth being by this kept open, the lungs collapsed, and in this state remained; but as soon as the tube was removed, respiration immediately recommenced: nothing similar to this is to be observed in hot-blooded animals

Of expiration. "Expiration is very easily accomplished; for, the glottis and the nostrils being open, the lungs by their own contraction from a state of distention, and by their own weight, aided by that of superincumbent parts, will gradually expel the air; but the muscles which cover the sides act also on this occasion, and in their croakings, (which, in the time of their amours, are heard to a great distance), with great force. But in the ordinary expirations of these animals, no more than in quadrupeds, do the lungs wholly collapse; if not viewed with attention, no motion is ever perceived in their sides, though there is a regular contraction and distention. They likewise have the faculty of compressing one lobe of the lungs singly, by the contraction of the muscles of that side; this is easily induced by touching them gently on the side with a pin or other sharp body.

"As these animals are known to be able to live a much longer time without air than those with hot blood, it has been said by many that they respire slower. But although probably they do not vitiate so much air, they respire very rapidly. Man respires about twenty times in a minute: and, according to Forgaro, birds, which breath the quickest of all hot-blooded animals, from 25 to 50; but the esculent frog (*rana esculenta*), respires about 70 times in a minute; the *rana variabilis* (a species of toad), about 100, and the tree frog (*rana arborea*), so rapidly that I could not reckon the number of the motions of its throat. The contractions of the throat I have considered as inspirations; yet, as the nostrils do not close with each contraction, I cannot venture to affirm that at each the whole contents of the throat are driven into the lungs. As there is frequently one contraction in four or five greater than the rest, it may be then that the greatest quantity of air is driven into them. When these animals sleep, and in cold weather, these motions are slower and more feeble.

"According then to the doctrine which I have advanced on the mechanism of respiration in the frog tribe, which may easily be subjected to experiment, and then thrown aside, if it bears not this test, but candidly received if it does, their lungs possess no secret power of dilatation, any more than those of hot-blooded animals. In both, this organ is inactive in respiration, which process principally differs in this, that, whilst in the *hot-blooded the air is sucked into the lungs by the expansion of the thorax; it is driven into them, in the frog tribe, by the motions of the throat.*

Physiology.

"Let us now proceed to examine anatomically the mechanism subservient to respiration; and when, for the sake of brevity, in speaking of the throat, I make use of the terms of muscles of inspiration and expiration, I mean by the former those muscles which serve for forming a vacuum in the throat, and by the latter those which serve to diminish it. Mechanism of respiration.

"Instruments of Respiration.—When the skin is stripped off from the throat, a broad muscle comes into view, which is the mylo-hyoideus. It covers the whole throat, being extended from the end of the maxilla to the condyles; its fibres run transversely, and are inserted into the maxilla through its whole length. In the middle, from the point of this bone, it becomes thin and membranous, but at the condyles thicker; it is not united with the os hyoides, as in man, but slightly connected with the skin. When the cavity of the throat is diminished, its muscular fibres are seen evidently to contract, but chiefly at the condyles, where the muscle is thickest. Thus, this muscle seems well adapted to assist in driving the air from the throat into the lungs; nevertheless, if it be cut away, respiration continues.

"The mylo-hyoideus being cut away, the genio-hyoidei appear; and, under these, in the middle, is the muscle of the tongue; the muscle at the point of the maxilla, the sterno-hyoidei and the coraco-hyoidei are likewise seen. The genio-hyoidei, which are slit where the sterno-hyoidei are inserted in the os hyoides, from their direction and connection, ought, one would think, greatly to assist in drawing the os hyoides forwards, and, by this means diminish the cavity of the throat; yet these being cut away, respiration continues.

"The sterno-hyoidei are strong and powerful; they rise from the whole length of the last bone of the sternum, and are inserted all along the os hyoides. As the os hyoides is not in the same direction as the sternum, but higher, and its cornua, which are fastened by the stylo-hyoidei, likewise higher and oblique, these muscles in their contractions draw this bone downwards and backwards, and thus form a cavity in the throat. These are the principal muscles used in forming this cavity, and when they are cut respiration ceases.

"The coraco-hyoidei rise from the inferior side of the neck of the scapula, and are inserted into the os hyoides near the insertions of the sterno-hyoidei. They direct the movements of the os hyoides, and draw it downwards; one being cut, this bone loses its natural direction and inclines to the other side.

"If we search deeper, we find the stylo-hyoidei muscles, otherwise the *constrictores medii pharyngis*, (B) of which there are three pairs (C). One pair, which is stronger

(B) Either the stylo-hyoidei or these constrictors are wanting.

(C) In the common toad (*Rana Bufo*), and in the *Rana variabilis*, I only found two pairs.

Phyſiology. ſtronger than the reſt, riſes from the poſterior region of the ear, and is inſerted into the points of the cornua of the os hyoides. The other two pairs have the ſame origin, and are likewiſe inſerted into the cornua of the ſame bone, but more forward. Theſe muſcles are likewiſe of great moment in contracting the cavity of the throat, by elevating the os hyoides, and drawing it forward. I have obſerved ſome muſcular fibres in the vicinity of the ſtylo-hyoidei, upon the membrane which lies immediately under the muſcles now deſcribed, and which forms the interior part of the throat: theſe may aſſiſt likewiſe as conſtrictors.

"If we take away the muſcles and the membrane of the throat, leaving only the ſterno-hyoidei muſcles, although reſpiration is now totally deſtroyed, the motions uſed in reſpiration continue. The os hyoides is ſtill drawn backwards and forwards, and the glottis opens and ſhuts, but the lungs remain collapſed; if even all the muſcles which move the os hyoides, are cut away, the glottis, whoſe muſcles remain untouched, continues to open and ſhut, juſt as in hot-blooded animals, whoſe reſpiration is deſtroyed by a large wound in the thorax, efforts to reſpire continue, though ineffectual, to remove the painful ſenſation of incipient ſuffocation.

"On expiration little is to be ſaid; I have always found the lungs of theſe animals, whether alive or dead, to collapſe as ſoon as the glottis is open; yet, as I have already obſerved, the oblique muſcles, which extend from the glottis to the os pubis, and thus envelope the lungs through their whole extent, have a great power to compreſs them, and thus produce expiration. Whether I have properly applied the name of obliques to theſe muſcles I will not contend, as I have not examined them with particular care; they may probably be compoſed of ſeveral muſcles, but thus much I have obſerved that their fibres run more or leſs tranſverſely, and are therefore well adapted to produce this effect *."

* *Tract. on Nat Hiſt.* p. 17.

Propagation of Reptiles.—Although reptiles, from their ſenſes being leſs acute than thoſe of other animals, ſeem in general dull and ſtupid; on the return of ſpring, they exhibit a very different character. As the warm ſeaſon advances, they become lively and active, and thus ſhew that they are actuated by a new ſet of deſires. It is at this time that the frog tribe, which at no other ſeaſon of the year emits the ſmalleſt ſound, become remarkable for the croaking and diſagreeable noiſe, by means of which they expreſs theſe new or once dormant feelings. When theſe feelings acquire force, even ſome of the external parts of ſome of the frog tribe undergo a change. The fore feet of the male are then furniſhed with a kind of wart, which is ſupplied with papillæ, that it may more firmly attach itſelf to the female. The male then places itſelf on the back of the female, and embraces her ſo ſtrongly with the fore feet, that it can only be ſeparated by a conſiderable force. In this ſituation the two remain together for about a month. About the end of this time, or ſooner or later, according to the temperature of the ſeaſon, the female begins to exclude the ova. The eggs form a kind of ſtring, and are united together by a viſcid matter, and included in a thick glairy ſubſtance. At the moment that the ova are excluded by the female, the male ejects a fluid with which they are impregnated, at the ſame time giving a peculiar cry during the courſe of this proceſs. So ſtrongly is the male attached to the female, that nothing can diſturb or interrupt his operations. Nay, what will appear ſtill more ſurpriſing, in an experiment by Spallanzani, in which the head of a male frog was cut off in this ſituation, the animal continued for ſome time to impregnate the ova as they were excluded, and died only at the end of four hours.

Change on the male frog.

When the ovum of the frog is examined with the microſcope, a ſmall point is diſtinguiſhed, black on the one ſide and white on the other, placed in the centre of a globule, whoſe glutinous and tranſparent ſubſtance is ſurrounded with two concentric membranes, which are analogous to the ſhell of the egg. At the end of a certain time, which is longer or ſhorter, according to the temperature of the ſeaſon, the embryo begins to be developed, and is afterwards known by the name of tadpole. Spallanzani has obſerved, that the proceſs of incubation or hatching in the ova of the toad goes on, although the temperature of the atmoſphere does not exceed 6° above zero of Reaumur's thermometer, which is equal to about 39° of Fahrenheit.

Ova of the frog.

It is unneceſſary to mention, that the ova of the frog are depoſited and hatched in water. It may be obſerved alſo that this proceſs is interrupted in the ova of the toad, which happen to be dropt on the earth, unleſs they are ſupplied with moiſture.

The tadpole, as the proceſs of incubation proceeds, and the organs which are deſtined to perform the functions of life are developed, exhauſts the glutinous matter with which it is ſurrounded; this gradually dilates; and the more it increaſes in volume, the leſs is the quantity of its maſs. It becomes at length only a light and almoſt inviſible ſubſtance, from which the tadpole makes a ſhort occaſional excurſion in the water, in making its firſt efforts in ſwimming; but returns again, finding itſelf either unable to procure its food, or to ſupport itſelf long in the water on account of the ſhortneſs of the fins, which have not yet attained their full ſize. But as the little animal advances in its growth, the glutinous matter, its former habitation, being entirely diſſipated, it roams at large in the waters.

Progreſs of the tadpole.

According to the obſervations of Swammerdam, a tadpole is about ſix lines in length at the end of 15 days after it has been depoſited by the female. The firſt traces of the hind feet may then be ſeen; and the place of the toes is marked with ſo many ſmall protuberances. In this ſtage of its progreſs the little animal exhibits a very different appearance from that which it aſſumes after the change it is to undergo. The mouth is not placed at the anterior part of the head, but on the lower ſurface; and when it wiſhes to ſeize any object for its prey, or to expel the air from its lungs by expiration, its motion in turning its body is ſo rapid and inſtantaneous, that the eye can ſcarcely follow it.

In a tadpole of 36 days old the hind legs are protruded; but the fore legs are ſome days later, ſo that to ſee them at the ſame period the animal muſt be opened, at leaſt the external covering which veils in ſome meaſure, or diſguiſes its future form. At laſt, at the end of about two months of confinement, which is about the middle of June, the young frog having reached its perfect form, and acquired ſufficient ſtrength, burſts from its priſon. It contrives at firſt to contract its

Phyſiology. covering by elevating its back; by this the ſkin is torn near the head of the animal, which paſſes through the opening. That part of the membrane which formed the mouth of the tadpole is retracted over the body; the fore-legs are ſucceſſively unfolded; and the ſkin puſhed to the poſterior extremity of the body, leaves the whole of it, as well as the hind-legs and the tail, uncovered. The tail then gradually diminiſhing in volume, at laſt entirely diſappears, ſo that the ſmalleſt trace of it no longer remains in the perfect animal.

Time of the turtle breeding varies.

According to the ſituation of the countries in which they are found, the temperature of the climate, and the period and duration of the rainy ſeaſons in tropical regions, the time of the turtle depoſiting its eggs is regulated. At this ſeaſon the female quits the ocean, and often, it is ſaid, makes a voyage of 300 leagues to find a ſafe and convenient ſpot for the reception of the embryons of her future offſpring. The male, according to the accounts of ſome naturaliſts, accompanies the female in this expedition, with the view of reconducting her to their former haunts. We are informed that they arrive in ſuch multitudes on the banks of the Oroonoko about the beginning of March, that there is not ſufficient ſpace on the ſhore to contain them, ſo that vaſt numbers are ſeen with their heads above water, waiting the departure of thoſe on land, that they may occupy their place. When the turtle has reached the ſhore, ſhe fixes on a ſpot covered with ſand or gravel; digs with her fins, in a place beyond the reach of the tide, one or more holes of about a foot broad and two feet deep; and there depoſits her eggs to the number of more than a hundred. She then covers them with a little ſand, but ſo lightly, that the action of the rays of the ſun may not be interrupted hatching them. The turtle depoſits her eggs commonly at three different times, a period of fourteen days intervening between each time. The dangers to which theſe animals are expoſed, when the light of day favours the purſuit of their enemies, and perhaps alſo, it has been conjectured, the fear of ſuffering from the burning rays of the ſun, make them almoſt always prefer the darkneſs and temperate coolneſs of night to come on ſhore for this purpoſe.

The period of hatching is longer or ſhorter according to the temperature of the climate. In more temperate regions, it continues about 20 or 25 days. At the iſland of St Vincent, (one of the Cape de Verd iſlands), this proceſs is completed in 17 days; and Gumilla the hiſtorian of the river Oroonoko aſſerts, that three days only are required for hatching on the banks of this river. He placed, he ſays, a ſtick near the place where the turtle depoſited her eggs, and at the end of three days, ſo great is the influence of the ſun upon the ſand, the ſmall turtles had made their appearance.

Travellers who have had opportunities of obſerving the ſmall turtles ſoon after they are hatched, when they are only about an inch long, inform us, that in this ſtate they do not quit their holes during the day, being inſtinctively warned to protect themſelves in this manner from the heat of the ſun, and the voracity of birds of prey, but they wait till night to make their way to the ocean. "I have been often aſtoniſhed, (ſays Gumilla,) when I have obſerved that the place where they have been hatched, being ſometimes half a league diſtant from the river, they direct their courſe towards it without any deviation by the ſhorteſt poſſible way. I have ſometimes carried the young turtle to a great diſtance from the water. I have covered them up and made ſeveral holes for them that they might wander. But I no ſooner left them at liberty, than they took the direct courſe to the river, without turning either to the right hand or to the left." The inſtinct with which theſe little animals are impreſſed, conducts them towards the neareſt waters, where they find ſafety and proper food. They move on very ſlowly, and as yet too feeble to reſiſt the force of the waves, great numbers are thrown back by the ſurge on the ſea ſhore, where ſea fowl, crocodiles, tigers, and other animals are in waiting to devour them, ſo that but a ſmall number eſcapes the numerous dangers to which they are conſtantly expoſed. Phyſiology.

Of the alligator.

It is alſo at the return of the ſpring ſeaſon that the alligator depoſits its eggs. It lays about 100 in the ſpace of one or two days; and in the ſame way as the turtle, covers them with ſand, and it is ſaid, rolls itſelf round the place, that it may be the better concealed from its enemies. Having thus ſecured its future offſpring, it returns to the water, when the proceſs of hatching goes on by the heat of the ſun. About the time that the neceſſary period has elapſed for the evolution of the young animal, it is ſaid that the female returns, accompanied by the male, ſcrapes up the ſand, and uncovering the eggs, breaks the ſhell, to allow the young animal to eſcape. It is ſaid that the young alligator, before it leaves the eggs, is at leaſt ſix inches long, and that it is rolled up, having its head placed in the centre. When the ſhell is broken with a ſtick, they bite it furiouſly, and ſink their teeth in this ſubſtance. This ſeems not improbable, ſince it is recorded by different naturaliſts, that the teeth of the young alligator are completely formed before it leaves the egg.

The mode of propagation, ſo far as it has been obſerved among the tribe of lizards, is ſimilar to that of the frog. The male remains for ſome time on the back of the female, embracing her cloſely. This does not prevent them from running about, or leaping from branch to branch. When the female is about to depoſit her eggs, ſhe makes a hole in the earth, of about two inches deep, at the foot of a tree or a wall; in that the egg is dropped and covered with the earth, and, as in the other tribes, the proceſs of incubation is accompliſhed by the heat of the ſun.

But ſome ſpecies of lizards are viviparous. This is conſidered by naturaliſts as exactly the ſame mode of propagation as in the others which are produced from eggs, with this difference only, that the proceſs of incubation goes on in the former within the body of the female, and the young are excluded completely formed.

Size of the eggs.

The Eggs of Reptiles.—The ſize of the eggs of this order of animals is always proportioned to that of the female by whom they are produced. From the ſmalleſt ſpecies of lizard to the huge crocodile, they may be found of every ſize. The ſmalleſt are ſcarcely more than two lines in diameter, while the largeſt are three inches long.

The covering of theſe eggs is different in the different tribes. In the greateſt number, but eſpecially in the eggs of the turtle, it is flexible, ſoft, and ſimilar to moiſtened parchment. The eggs of the crocodile, and of ſome large lizards, are covered with a ſhell of a hard, calcareous

Physiology. calcareous ſubſtance, like that of the eggs of birds. It is however, conſiderably thicker, and conſequently leſs brittle.

Uſed as food. In India and America, theſe eggs are very much ſought after, and are eſteemed by the natives a very rich and delicate food. About the time that the turtle depoſits its eggs on the banks of the Oroonoko, the neighbouring inhabitants repair to the banks of that river with their families, for the purpoſe of collecting them; and they not only live upon them at this time of the year, but dry them, that they may carry them home to be laid up in ſtore for their future ſuſtenance.

It is ſaid that the Indians are extremely fond of the eggs of the alligator, which they ſearch out with great induſtry, and rejoice when they diſcover the place where they have been depoſited. They bake them when they prepare them for food, and although the young animal has begun to be evolved, or is nearly formed, they are not leſs ſcrupulous in eating them.

Food of Reptiles.—It is only in extraordinary caſes that reptiles abſtain from food for any length of time. When they are at perfect liberty, and find that kind of food which is ſuited to their nature, they in general indulge in it voraciouſly. Frogs and lizards feed on leeches, worms, ſnails, beetles, and different ſpecies of winged inſects. Some of the toads live on aquatic plants; the turtles find in the water or on the land, vegetables and ſhell-fiſh; the crocodile is carnivorous, and devours, greedily, fiſhes, ſea-fowl, and turtles; and when preſſed by hunger, attacks men, but eſpecially, it is ſaid, the negro race, whom he prefers to others. This latter fact has probably no foundation whatever. The very largeſt crocodiles, which are more eaſily ſeen and avoided, it is ſaid, employ ſome artifice in ſeizing their prey. They watch about the margin of ſtagnant waters, and lie there covered with mud, like a fallen tree, remain immoveable, and patiently wait the favourable moment to ſeize ſome unſuſpecting animal. Sometimes when they ſwim down any large river, they ſtop at the moſt frequented places, and raiſe only the upper part of their head above the ſurface of the water. In this attitude, which leaves the eyes at liberty, they ſurpriſe the animals which come to cool themſelves, or to drink in the river. As ſoon as they perceive any one, they plunge under the water, ſwim towards it, and ſeize it by the limbs, drag it along to drown it, and afterwards make it their prey.

Reptiles feed voraciouſly.

Abode of Reptiles.—Reptiles, like plants, are profuſely diſtributed over the whole ſurface of the globe; but from their nature and habits are more abundant and numerous in ſome places than in others. Some tribes live entirely on dry land, while others are confined to the bottom of the water. Others may be conſidered as intermediate tribes, living on the confines of the two elements, exhibiting in them the degrees and ſhades of different habits, which reſult from the diverſity of forms. Among thoſe which have their abode on dry land, as many of the tortoiſes, moſt of the lizards, the chameleons, ſome prefer dry and elevated ſituations, while others dwell in caverns or in the holes of rocks; and as theſe are different in their economy and habits, ſo we find that they are different in their motions; while the one is ſluggiſh and inactive, moving ſlowly, the others ſpring or creep rapidly among the branches of trees. Almoſt all of them, however, take the water, and ſwim with great facility; but they are obliged, as well as the reptiles which remain conſtantly in the water, to come to the ſurface from time to time to reſpire the air of the atmoſphere. The intermediate tribes, or ſuch as have their uſual haunts on the limits of the land and water, can only exiſt in climates which correſpond to their temperament. And thus they are found in innumerable multitudes in the immenſe extent of moraſs in the deluged ſavannahs of the new continent, where the moiſture of the atmoſphere and the temperature of the climate are favourable to their reproduction.

Different character of reptiles in different ſituations.

Physiology.

In Kamtſchatka, where the cold of winter is ſo rigorous, no ſpecies of toad, of frog, or even of ſerpent, is ever ſeen. Lizards, however, are very numerous, which are regarded by the inhabitants with a ſuperſtitious horror. They ſuppoſe that they are ſent by ſome evil deity, as ſpies on their actions, or to predict their death; and hence it is that they uſe every precaution to ſecure themſelves againſt their miſchievous effects. Wherever they find them they cut them to pieces, that they may not be able to return to the malignant being by whom they have been ſent, to witneſs againſt them. Should the animal accidentally make its eſcape, they are ſeized with the moſt violent grief and deſpair. They expect every moment the approach of death, and ſometimes bring on, by their fears and terror, what they ſo much dread. All this contributes ſtill more to increaſe and ſtrengthen this ridiculous and groundleſs ſuperſtition.

Reproductive Power of Reptiles.—Many of the animals belonging to the order of reptiles undergo very conſiderable changes, in the reproduction of different parts of the body, either in the ordinary proceſſes of nature, or when they are deprived of them by accident. The caſting of the ſkin, and its reproduction in different reptiles, as in the toad and newt, may be regarded as a natural operation, in ſome way neceſſary to the economy of theſe animals. It is obſerved, that the water-newts frequently caſt their ſkins; and theſe are occaſionally ſeen floating in the waters which they inhabit. The ſkin is ſometimes ſo perfect, that it exhibits the whole form of the complete animal.

The following account of this proceſs by Bonnet will, we doubt not, be intereſting to the reader.

Caſting the ſkin.

"When, ſays he, the period of change approaches, the fine ſkin is obſerved detaching from the body. The head firſt loſes it; then the reſt of the anterior part; next the middle, and the poſterior part. Sometimes the ſpoil, caſt by the head, forms like a gauze collar or cravat around the neck; or it is adjuſted on the head, like a capuchin or head-dreſs.

"The commencement of ſeparation, from the back and belly, is diſcovered by viewing the newt obliquely from one ſide, in a ſtrong light. The ſkin of the belly is further detached, becauſe it falls down by its own weight.

"Approaching ſpoliation is recognized by conſpicuous and unequivocal ſymptoms. The back, viewed obliquely, appears whitiſh, and as if covered with a ſpider's web. This is the effect of the ſpoil beginning to ſeparate. If cloſely examined with the naked eye, or a magnifier of ſmall power, it ſeems compoſed of minute ſcales covering the calloſities or tubercles, which ſhagreen the body of the newt. But, when examined

Physiology. with more attention, and in a favourable light, this epidermis is discovered to be a beautiful reticulation, the meshes of which are visible to the naked eye.

"Many observations could be made on the texture of this delicate membrane; and these might greatly tend to elucidate the nature and origin of the epidermis, which, notwithstanding all the researches of physiologists, are so little known; and newts would afford frequent opportunities for deeply investigating the point.

"From particular attention to the newts in my possession, I have observed, that there is not the smallest resemblance between this operation and what is exhibited by caterpillars, and many other insects. The skin is detached here and there, and often in different sized plates; and the change is slow, for it occupies one or two days, and I have even known it take three. During spoliation, the newt continues moving about in the water, with all the usual motions of newts that undergo none; therefore it is no disease, and it does not affect them as it does insects. While the change is going on, the animal darts on its prey, holds and devours it.

"Sometimes spoliation is difficult to be accomplished; but, in these cases, the newt knows to practise certain manœuvres, to facilitate the operation, which I have often beheld with pleasure. It alternately raises and depresses the right arm and left leg at the same time, with gentle vibrations of the whole body. It frequently darts suddenly towards the surface of the water, and the next moment precipitates itself to the bottom; and these manœuvres I have seen continued above half an hour. But the sudden exertion, in all its motions, indicated that the newt was impatient at the tediousness of the change.

"When most of the spoil is thrown off, and the animal, to disengage itself from the rest, rapidly rises to the surface, it seems carried along in a cloud; for the whiteness, fineness, and semitransparency of the spoil, floating around it, is no imperfect representation of a cloud.

"I never observed the fingers employed in detaching the spoil. Both young newts and those full grown cast several successive skins: some of large size are in my possession, that have done so before me. Reproducing limbs throw off the epidermis as well as the original.

"I have seen the skin of the head, which formed like a collar or cravat round the neck, gradually come down the belly of a large newt that had lost the arms, and fasten like a tight girdle.

"Nothing can accurately be said of the number and interval of mutations. Between the 14th of July and the 7th of September, a newt has changed its skin 11 times.

1st change,	14th July.	6th change,	9th August.
2d	17th	7th	—
3d	20th	8th	19th
4th	24th	9th	24th
5th	30th	10th	26th
		11th	6th Sept.

"Spoliation sometimes makes a slight change in the colour."*

The manner in which toads throw off the old cuticle is quoted by Dr Shaw, as related by Mr Schneider, from Grignon, who was an eye witness of it. "The skin splits or cracks in a longitudinal direction, both above and below, and the animal pulls off that of the left side with its left foot, and, delivering it into the right foot, applies it to its mouth and swallows it. It then performs the same process on the right side, and, delivering the cuticle into the left foot, swallows it like the former." Physiology.

But the most remarkable circumstance in the economy of these animals is the reproduction of mutilated limbs, such as the legs, the tail, and even the eyes. The completest set of experiments to ascertain these curious facts, were made by Spallanzani and Bonnet. The following is an account of some of these experiments in the words of the author.

"EXPERIMENT. *The right arm and left leg of a newt amputated.*—On the 6th of June, I cut the right arm and left leg off a large newt, very near the body. A stream of florid blood spouted a minute and a half from each wound; however, the vessels soon closed, and the newt was apparently as well as those unmutilated. But it will easily occur that it did not swim with equal facility.

"When about a month had elapsed, I began to perceive a papilla, of a violet gray colour, near the edge of the trunk or section. This was the origin of a new arm and leg, which gradually increased; and, from the 14th of July, the two papillæ continued growing on the subsequent days, but more in length than thickness. They became minute stumps; and, on the first of August, were about two lines long. A kind of cleft, hardly perceptible, announces the appearance of two toes, which nature labours to produce, or rather to expand, on the new foot. No cleft appears on the originating arm.

"The two toes were easily recognised on the 7th. They were real miniatures, and truly most minute. The stump of the arm continued nearly as it was on the first of the month, but is now somewhat larger; but as yet there is no indication of fingers.

"It is pleasing to observe the little hand fully unfolding, while only three fingers of unequal length are visible: the middle one is the longest. The arm has made no sensible progress. The new foot had four toes also of unequal length, the first and second of which are longest; other two only begin to appear; the fourth is scarcely perceptible. One can never tire contemplating these miniatures, and admiring the wonders of the organic kingdom.

"Evolution advanced every day. On the 22d of August, the regenerated members began to deepen in colour, so that the line, discriminating the old parts from the new, was no longer so conspicuous; but the black specks on the toes of unmutilated newts were still imperceptible. Leg and arm reproduced.

"I continued my observations on the daily evolution of the members; and the following were their dimensions in length, on the 20th of September.

Longeſt finger,	$3\frac{1}{2}$	Longeſt finger,	$1\frac{1}{2}$
Longeſt toe,	$4\frac{1}{2}$	Longeſt toe,	$1\frac{1}{2}$

Even in the beginning of October, the fifth toe of the new foot was not viſible.

" EXPERIMENT.—*A newt deprived of the right arm and left hand.* On the 12th of June, I cut the left hand and right arm off a newt: my chief object in this experiment was to verify Sig. Spallanzani's aſſertion, that nature reproduces exactly the portion amputated, which was a fact of the utmoſt importance in the theory of animal reproductions, and could not be too well eſtabliſhed.

" Towards one ſide of the ſection, a little conical nipple began to appear about the 7th or 8th of July, of a violet gray colour. An incipient cleft, indiſtinctly ſeen with the naked eye, was perceptible near the middle of July: the papilla ſeemed ready to divide in two; and the cleft was the origin of two fingers.

" In two or three days, I remarked a new cleft at the upper extremity of the papilla, which was the beginning of a new finger: the third, in its turn, appeared on the 19th. The conical papilla had then diſappeared; and in its place was ſeen a ſmall open hand with four fingers, ſtill very minute, but quite well ſhaped.

" On the 3d of Auguſt, the cone began to divide, that is, two fingers became evident.

" On the 9th, a hand extremely minute, but the moſt beautiful object imaginable, was obſerved at the extremity of the arm. The fingers, all of unequal length, were diſtinguiſhed, the ſmalleſt being juſt perceptible. The trunk, or part of the original arm, connected to the body, may be recogniſed by the brown colour, and from being covered with white points. The new arm is of a lighter and uniform colour. Four fingers of the hand are viſible: the largeſt not above half a line in length.

" The hand of the left arm had made conſiderable progreſs on the 21ſt: it had expanded, and nearly acquired the figure peculiar to the newt's hand. The fingers alſo had extended, and become thicker in proportion. The whole hand began to colour, and brown ſpecks were diſtinguiſhable on different parts; they were more evident on the back of the hand than on the fingers.

" On the 21ſt, the hand has already aſſumed its natural ſhape, and the rapid progreſs of evolution is ſuſpended. Colouring of the arm begins near the trunk: but all the reſt is of a mixed gray and violet colour.

" Though I have not hitherto expreſsly ſaid ſo, it will obviouſly be preſumed, that there is a kind of ſemi-tranſparency in the reproduced parts, which the original members have not. This continues long, and changes ſlowly as the reproductions colour. The tranſparency is evidently greater on the edges of the fingers than elſewhere; if examined with a magnifier, they ſeem incloſed in a fine diaphanous envelope: but nothing of this is evident in the old fingers. Parts beginning to unfold naturally have a degree of tranſparency wanting in thoſe further advanced, or fully expanded, becauſe, with the progreſs of evolution, the calibre of the veſſels increaſes, which allows admiſſion to more groſs and colouring particles. Whiteneſs and tranſparence apparently conſtitute the primitive ſtate of organic bodies. It is this primitive ſtate which we deſign by the word *germ*; and which we can comprehend, when the organic whole is expanded to a certain extent. But there is here a term beyond which we cannot aſcend; for the organic whole either becomes ſo minute or ſo tranſparent, that it eſcapes all reſearch and our moſt perfect inſtruments. Physiology.

" The dimenſions of the old and new members, in length, were as follows, on the 2d of September.

Old Members.		*New Members.*	
Arm,	$3\frac{1}{2}$ lines	Arm,	$2\frac{1}{2}$
Cubit,	$3\frac{1}{2}$	Cubit,	$2\frac{1}{2}$
Longeſt finger,	$1\frac{1}{2}$	Longeſt finger,	$1\frac{1}{2}$

Ibid. ii. 372.

" EXPERIMENT.—*The tail of a newt amputated tranſverſely.* Something important would have been wanting, had I neglected amputation of the tail, which is a very intricate great organic ſubſtance. It is formed of a ſeries of minute vertebræ, with arteries, veins, and nerves; and it is covered with muſcles and fleſh.
